of New Jersey (now Princeton University), where he graduated in 1832. He studied medicine in the Medical Department of the University of Pennsylvania, and received his degree of M.D. in 1836. In 1840 he offered his services as a medical missionary to the Presbyterian Board of Foreign Missions, and in the following year he sailed with his wife for Siam. His destination was afterwards changed to China, five new ports having been opened there by the treaty of 1842. He arrived at Amoy, one of the newly opened ports, in 1843, and labored in that field until 1846, when, on account of impaired health, he resigned and returned to New York City. Here he was a successful practitioner until the opening of Japan in 1859, when he again volunteered for service. In that year he went to Yokohama and engaged in such medical and evangelistic work as could then be carried on in view of the hostile attitude of the Government to Christianity. He mastered the language, and in 1867 brought out his Japanese-English and English-Japanese Dictionary, a work of great learning which has remained the standard dictionary until the present day. In 1873 an abridged edition was published in New York. Dr. Hepburn took a leading part in the translation of the Scriptures into Japanese. His medical work included the training of many young Japanese as physicians. In 1892 he published a valuable *Dictionary of the Bible* in Japanese, and in the same year retired, and made his home in East Orange, N. J.

HEPBURN, Sir JOHN (c.1598-1636). A Scotch soldier of fortune, born at Athelstanford, and probably educated at Saint Leonard's College, Saint Andrews. He fought under Gray in Bohemia (1620); and under Mansfeldt in Holland (1622). Subsequently he served in the army of Gustavus Adolphus, and entered the French Army in 1633. After two years of brilliant fighting in Lorraine, and at the sieges of Hagenau and Saverne, he was killed. He was a Catholic and a prime favorite with Richelieu.

HEPHÆSTION, *hē-fēs'ti-ōn* (Lat., from Gk. *Ἡφαίστιον*, *Hephaistion*) (c.357-324 B.C.). A Macedonian courtier, known as the friend of Alexander the Great. The two are said to have been companions in childhood; but further than this we do not hear of Hephæstion till B.C. 334, when Alexander visited Troy. Hephæstion is there said to have performed the same service at the grave of Patroclus as Alexander performed at that of Achilles. After that time the two were close friends. In his campaigns Alexander often gave Hephæstion important commissions, and he rewarded him with a golden crown and the hand of Drypetis, daughter of Darius and sister to his own wife, Statira. When, in B.C. 324, Hephæstion died at Ecbatana, the grief of Alexander was extravagant. He sent to inquire of Jupiter Ammon how he should honor his dead friend, and was told to offer sacrifice to him as a hero. The funeral was one of the grandest recorded in history. A funeral pyre was erected at Babylon at a cost of over 10,000 talents, and temples were built in honor of Hephæstion in many places.

HEPHÆSTION. An Alexandrian grammarian of the second century A.D., tutor to the Emperor Verus. He was the author of a work on prosody in forty-eight books, of which he himself made several abridgments. The manual on metres entitled *Ἐκχρησίδιον περὶ μέτρων* (*En-*

cheiridion peri metron), which is still extant, is supposed to have been his final abridgment. Though it gives merely a bare sketch of prosody, without any theoretical explanation of the facts, it is of great value; it is the only treatise on Greek prosody preserved complete from antiquity, and contains quotations from many lost poets. An incomplete treatise on the different forms of poetry and composition is appended to it. The manual has been edited by Gaisford (Oxford, 1810) and by Westphal in his *Scriptores Metrici Græci* (Leipzig, 1866).

HEPHÆSTUS, hê-fês'tūs. See VULCAN.

HEPTAGON (from Gk. ἑπτάγωνος, *heptagōnos*, seven-cornered, from ἑπτά, *hepta*, seven + γωνία, *gōnia*, angle). A plane geometric figure of seven sides. It has especial interest because the regular heptagon cannot be constructed by elementary geometry. See POLYGON.

HEPTAMERON (Gk. ἑπταήμερον, *heptāēmeron*, from ἑπτά, *hepta*, seven + ἡμέρα, *hēmera*, day). The name of a collection of tales made by several writers at the Court of Marguerite de Valois (q.v.). Le Maçon, at the Queen's behest, translated Boccaccio's *Decameron* in 1445. The *Decameron* inspired the form and other elements of the *Heptameron*. The ten story-tellers of Boccaccio fled from pest-stricken Florence to a beautiful villa, where ten stories are told every day for ten days. In the *Heptameron* five elegant men and women, being caught by a storm at the foot of the Pyrenees, determine to while away the time by having each of the company tell a story every day for ten days. But Marguerite left only seven days and two stories of the eighth day. The *Joyeux Devis* of Bonaventure des Périers continues the tradition of the old French *fabliaux* and farces, whereas the *Heptameron*, as has been shown, is Italian in genesis and in tone. The body of the work is, like the old *fabliaux*, cynical and often licentious; but the *Heptameron* shows more feeling for natural beauty, and there is an occasional touch of altruistic devotion and even of lyric passion. Thus the *Heptameron* introduces into French fiction an element of emotional psychology. It makes of a story designed to amuse an instrument of observation and a method of description of human passion. It transfers the interest, rarely and tentatively, yet really, from act to motive—bearing witness to the keener psychology that resulted from the Protestant training in controversial dialectics, universal in the Court circle of Marguerite, to whom the editing at least of the *Heptameron* is to be attributed. The *Heptameron* was first published in 1558. There are many later editions of textual accuracy, and there is a partial and unfaithful English version.

HEPTANOMIS. A name given by the Greeks to the interior of Egypt from 30° to 27° N., which comprised nearly all the greatest Egyptian cities and monuments.

HEPTARCHY (from Gk. ἑπτά, *hepta*, seven + ἀρχή, *archē*, kingdom, from ἀρχαί, *archai*, to rule). The name formerly given to the kingdoms established by the Angles and Saxons in England. It was believed that there were seven kingdoms, which were contemporaneous and well established, but all that can be safely asserted is that England before the beginning of the ninth century was peopled by various tribes,

which were constantly at war with each other, and that sometimes one tribe was conquered, and sometimes another. At no time was there a counterpoise of power among seven of them, so that they could be said to have a separate, much less an independent, existence. Still, seven names do survive. Occasionally the King who was most powerful for the time being was styled Bretwalda, but in most instances the power of this supposed ruler, beyond the limits of his own territory, must have been very small. The hegemony among the Saxon States generally rested with one of the three great frontier kingdoms, Northumbria, Mercia, and Wessex. The supremacy of Northumbria was established by Edwin (q.v.), who fell in battle against Penda, King of Mercia, in 633. Under Egbert (802-39) Wessex rose to be supreme, and virtually swallowed up the others. The following are the seven kingdoms commonly said to have formed the heptarchy: Kent, Sussex, Wessex, Essex, Northumbria, East Anglia, and Mercia. Consult: Ramsay, *The Foundations of England*, vol. i. (London, 1898); Green, *The Making of England* (London and New York, 1881). See ANGLO-SAXONS; also the articles under the seven names mentioned.

HEPTASOPHS, IMPROVED ORDER OF. A fraternal association in the United States, organized in 1878, as an offshoot from the Order of Heptasophs (q.v.), from which it differed by the adoption of death benefits as one of its features. The ritual, governing principles, conditions of membership, and methods of business are identical with the original order. At the close of 1902 the order had 722 conclaves, representing a membership of 52,825; had paid during the last fiscal year \$944,615 in death benefits, and claimed to have disbursed since its organization the sum of \$6,970,010.

HEPTASOPHS, ORDER OF. A benevolent fraternal order in the United States, founded in New Orleans in April, 1852, by Alexander Leonard Saunders and several prominent Free Masons. It was originally called the order of "Seven Wise Men," but the title was later changed to the Greek form. The ritual is very elaborate, and much significance is attached to the number seven, the membership in each chapter being either seven or a multiple of that number. After 1872 the adoption of a death benefit system was agitated, but aroused great opposition, leading in 1878 to the secession of the Zeta Conclave of Baltimore, which organized the Improved Order of Heptasophs. (See HEPTASOPHS, IMPROVED ORDER OF.) In 1880 the order finally adopted the benefit feature. Membership is confined exclusively to white male persons, and a belief in the existence of a Supreme Being is required. In 1891 the membership in 18 States was about 4000.

HEPTATEUCH, hêp'tā-tūk (from Gk. ἑπτά, *hepta*, seven + τεύχος, *teuchos*, tool, book). A word formed on the analogy of Pentateuch, meaning the first seven books of the Bible. It is applied particularly to an abridgment and translation of these books, with the Book of Job, into Anglo-Saxon, made by Ælfric the Grammarian (q.v.) in the tenth century. There are copies of it in the British Museum and the Bodleian Library. It was first printed in 1698 by Edward Thwaites.

HEPWORTH, GEORGE HUGHES (1833-1902). An American clergyman and journalist. He was born in Boston, graduated at Harvard Divinity School in 1855, and entered the Unitarian ministry at Nantucket, Mass. He was pastor of the Church of the Unity, Boston, from 1858 to 1870, meantime serving as a chaplain in the Union Army on the staff of General Banks. In 1870 he took charge of the Church of the Messiah in New York, but resigned within two years, renouncing the Unitarian faith, and soon afterwards established in the same city the Church of the Disciples. He resigned this charge in 1878, and went abroad for rest. He preached at the Belleville Avenue Congregational Church in Newark, N. J., from 1882 until 1885, when he became connected editorially with the New York *Herald* and *Evening Telegram*. He had charge of a famine relief fund for Ireland in 1880, and later investigated the condition of the Armenian Christians. Among his writings are: *Whip, Hoe, and Sword* (1864); *Rocks and Shoals* (1870); *Hiram Golf's Religion* (1892); *Brown Studies* (1895); *The Farmer and the Lord* (1896); and *Through Armenia on Horseback* (1898).

HE'RA. See JUNO.

HERACLEA, hēr'ā-klē'a (Lat., from Gk. Ἡράκλεια, *Hērakleia*, from Ἡρακλῆς, *Hēraklēs*, Hercules). The name of a number of Greek towns, in both Europe and Asia. Of these the most important were: (1) Heraclea in Lucania, near the Gulf of Tarentum, not far from the modern Policoro. It was founded in B.C. 432 by Tarentines and Thurians, and the inhabitants of the earlier colony Siris, which continued to exist only as its port. In a fertile territory it seems to have enjoyed great prosperity, but in dependence upon Tarentum. In B.C. 280 the first great battle between Pyrrhus (q.v.) and the Romans was fought near by, and two years later the Romans concluded with Heraclea a treaty of alliance on very favorable terms. It was still a flourishing place in the time of Cicero, but later fell into decay, and is now a heap of ruins. Near the ancient site were found in 1732 and later two bronze tablets, the *Tabulae Heracleenses*, containing on one side a long Greek inscription of the fourth century B.C. relating to certain sacred lands of Dionysus and Athena, whose boundaries had been disturbed in a recent war, and on the other a much more important Latin document, the *Lex Julia Municipalis* (B.C. 45), which is one of the chief authorities for the municipal law of Italy. These inscriptions have often been published, but may best be found in Kaibel, *Inscriptiones Græcæ Siciliae et Italiae*, 645 (Berlin, 1890), and *Corpus Inscriptorum Latinarum*, i. (Berlin, 1863).

(2) Heraclea Minoa, on the south coast of Sicily, east of Agrigentum. The city seems to have been originally a Phœnician trading station, Rus Melkart, but was later occupied by Selinus, and about B.C. 510 by Spartans under the leadership of Euryleon. The name Minoa was due to a legend attributing the founding of the city to Minos of Crete. It was afterwards destroyed by the Carthaginians, though a small settlement continued to exist under Carthaginian rule, and after B.C. 314 rose to renewed importance, and was one of the chief Carthaginian naval stations during the First Punic War. The site, on Cape

Bianco, is now wholly deserted, and but few traces of the ancient city are visible.

(3) Heraclea Pontica, a Megarian colony on the south coast of the Black Sea, the modern *Eregli* (q.v.). It seems to have been founded about the middle of the sixth century B.C., and after a period of party strife, passed under the rule of a moderate oligarchy, which soon made it master of the neighboring territory including some of the lesser Greek colonies. Even when the aristocracy was supplanted by a tyrant, the prosperity of the city continued to increase; but after the overthrow of the Persian Empire by Alexander the growth of the Bithynian power and the wars with the Galatians lessened its influence. It was plundered by the Romans in the Mithradatic war, and from that time gradually declined. It was the birthplace of the philosopher Heraclides Ponticus (q.v.).

HER'ACLE'ON (Lat., from Gk. Ἡρακλέων, *Hērakleōn*). A Gnostic Christian, who flourished in Italy during the third quarter of the second century. Clement of Alexandria calls him the most distinguished follower of Valentinus (q.v.). His writings survive only in fragments, and each quotation is accompanied by unfriendly comments by his orthodox opponent. He wrote a Gospel commentary, entitled *Hypomnemata*, which dealt especially with Saint John. Origen preserves considerable fragments of this work in his own commentary on the same Gospel. Clement also quotes from Heracleon, but we are not certain that it is from this work. Hippolytus says that Heracleon and other Western Valentinians taught that Christ's body was of animal substance, while the Oriental School regarded it as spiritual. But we know little about the details of their systems. Heracleon's influence was sufficient to perpetuate his name among his followers, who are called Heracleonites. Consult Brooke, *The Fragments of Heracleon* (Cambridge, 1901). See Gnosticism.

HER'ACLE'ONAS (Lat., from Gk. Ἡρακλειώνας, *Hērakleionas*) (c. 614-?). An Emperor of Byzantium, son of the Emperor Heraclius. He fought with his father in Syria, and was appointed Cæsar in 638 or 639. When his father died (641) his mother, Martina, asked that he be permitted to rule with his invalid stepbrother, Constantine III. But Constantine died after a reign of less than five months and Heracleonas became sole Emperor. The Senate suspected that Martina had had this in view and had possibly hurried the death of her stepson; a revolution broke out; Heracleonas was dethroned, his nose cut off, his mother's tongue torn out, and the two were exiled to Constantinople. Constans II., son of Constantine, succeeded to the throne.

HERAC'LEONITES. See HERACLEON.

HERACLEOPOLIS (Lat., from Gk. Ἡρακλεόπολις, *Hērakleous polis*, city of Hercules). A city of ancient Egypt on the right bank of the Bahr Yūsuf (Joseph's Canal), about 10 miles west of the Nile. It was called by the Egyptians *Henen-suten*, whence its Coptic name *Hnēs*, and its modern Arabic name *Ahnas* and *Henassiye*. Heracleopolis was the seat of worship of the ram-headed god Hershef, whom the Greeks identified with Heracles. Of the temples and other buildings, for which the place was renowned in ancient times, scarcely anything remains. An extensive necropolis lies upon the opposite bank of

the Bahr Yūsuf. Consult Naville, *Ahnas el Medīneh*, Egyptian Exploration Fund, vol. xi. (London, 1891).

HER'ACLES. See HERCULES.

HERACLEUM, hēr'á-klē'üm. See COW-PARS-NIP.

HER'ACLI'AN (A.D. ?-413). A Roman general. At the instance of the Emperor Honorius, he put Stilicho to death (A.D. 408), and received the Government of Africa as his reward. After supporting the Emperor during the invasion of Alaric and the usurpation of Attalus, whom Alaric had made Emperor, Heraclian revolted and invaded Italy. His enterprise failed, however, and on his return to Carthage he was put to death by order of Honorius.

HERACLIDÆ, hēr'á-klī'dē (Lat., from Gk. Ἡρακλῆϊδαι, *Hērakleīdai*, descendants of Hercules, from Ἡρακλῆς, *Hēraklēs*, Hercules). (1) The name is applied specifically to those legendary descendants who were said to have led the Dorians in the conquest of the Peloponnesus. The legend told of an unsuccessful attempt by Hyllus, son of Hercules, to recover the inheritance from which Eurystheus had driven him, and then, 100 years later, of the successful invasion, led by his great-grandsons Temenus, Cresphontes, and Aristodemus, sons of Aristomachus. They defeated Tisamenus, son of Orestes and grandson of Agamemnon, and gained possession of the Peloponnesus. Argos fell to Temenus; Lacedæmon to Procles and Eurystheus, the sons of Aristodemus; Messenia to Cresphontes; Elis to the Ætolian Oxylus; Arcadia alone remained undisturbed. This story of the return of the Heraclidæ seems to owe its development to the epic, rather than to popular tradition, and is an attempt to explain the change from the conditions of the Homeric poems to those of the period after the Dorian conquest. The poems of Tyrtæus show its general acceptance in Sparta about B.C. 650. It is the later legendary account of the Dorian conquest, which from its nature must in reality have been a much more obstinate and protracted struggle. Consult the histories of Greece by Thirlwall, Grote (older views), Holm, and Busolt, and especially Meyer, *Geschichte des Altertums*, ii. (Stuttgart, 1893).

(2) A tragedy by Euripides, brought out about B.C. 420. It tells of the persecution of the sons of the dead Hercules by Eurystheus and their reception and protection by Athens. The children of Hercules, under the leadership of Iolaus, come to Marathon, and the Athenians gain a victory over the Argives through the voluntary sacrifice of Macaria, daughter of Hercules. Eurystheus is taken prisoner and surrendered to Alcmena, who demands his death. The play was meant to represent to Sparta how unnatural her contemplated alliance with Argos during the Peloponnesian War would be, and was directed against the Argive party in Athens.

HER'ACLI'DES PONTICUS (Lat., from Gk. Ἡρακλῆδης, *Hēracleīdēs*, and *Pontus*). A Greek philosopher of the fourth century B.C., born at Heraclea in Pontus. At Athens he became a disciple of Plato, whom he represented during the latter's absence in Sicily. Later, however, he attached himself to Aristotle. His numerous writings covered many fields, including philosophy, grammar, music, physics, rhetoric, political and literary history, and geography. Critical and phil-

sophical ability were apparently not possessed by him in a high degree, for his philosophical works were early neglected. His biographical and grammatical treatises, however, enjoyed a long popularity. Diogenes Laërtius praises his style, while Cicero blames him for his fondness for marvelous tales. The extracts, *On Constitutions*, which bear the name of Heraclides, are only a poor compilation from Aristotle's *Politics*, and should be attributed to Heracleides Lembos (second century A.D.). This work was edited by Schneidewin (Göttingen, 1847), and by Kaibel and Wilamowitz, as an appendix to their edition of Aristotle's *Constitution of Athens* (Berlin, 1898). The fragments of Heraclides's writings were collected by Müller, *Fragmenta Historicorum Græcorum*, vol. ii. (Paris, 1848). Consult: Voss, *De Heraclidis Pontici Vita et Scriptis* (Leipzig, 1896); and Schmidt, *De Heraclidæ Pontici et Dicæarchi Messenii Dialogis Deperditis* (Breslau, 1867).

HER'ACLI'TUS (Lat., from Gk. Ἡράκλειτος, *Hērakleitōs*). A Greek philosopher who flourished about B.C. 500, born at Ephesus in Asia Minor. From the obscurity of his writings he was nicknamed 'The Dark' (ὁ σκοτεινός). Only one work, that *On Nature*, can be attributed to him. Of this, numerous fragments are preserved by later writers. Heraclitus's philosophy was a development of the Ionic doctrine under the influence of Xenophanes. The principle of all things according to him was fire, a self-determined ether, which by condensation and rarefaction creates the phenomena of the sensible world. To the 'being' of his predecessors he added the principle of 'becoming.' He held that all things are in constant flux, and that the appearance of stability is due to the uniformity of motion. His philosophy had a strong influence on later thinkers; Zeno recalled it, and Stoicism was based on its teaching. The fragments of his work are to be found in Mullaeh, *Fragmenta Philosophorum Græcorum*, vol. i. (Paris, 1860); Ritter and Preller, *Historia Philosophiæ Græcæ* (7th ed., Gotha, 1888). Consult: Zeller, *Philosophie der Griechen* (5th ed., vol. i., Leipzig, 1892); Patrick, *The Fragments of the Work of Heraclitus* (Baltimore, 1889).

HERACLIUS, hēr'á-klī'ūs (c.575-641). Byzantine Emperor from 610 to 641. He was a native of Cappadocia and belonged to a distinguished family, his father having been Exarch of Africa. In 610, when the tyranny of the Emperor Phocas had become unbearable, and the mother and bride to be of Heraclius himself were imprisoned, he equipped a fleet in Africa, and appeared before Constantinople. The citizens rose in rebellion, Phocas was beheaded, and Heraclius became Emperor in his stead. The condition of the Byzantine Empire at this time was deplorable. Years elapsed before Heraclius could put forth any vigorous efforts for its reorganization. In 619 the Avars plundered the country to the gates of Constantinople and carried off an immense number of captives. In the East, the conquests of the Persians threatened the very existence of the Empire. Jerusalem was stormed by the generals of Khosru in 615 and Egypt was overrun in the following year. The stopping of the export of corn from Egypt to Constantinople caused a severe famine in the capital. The Emperor, however, was meanwhile disciplining and

equipping an army for the invasion of Persia, and in 622 he took the field. In the plain of Issus he routed a Persian army and forced his way through the passes of the Taurus and Anti-Taurus, into the ancient Pontus, where his soldiers wintered. In 624 he crossed Armenia, conquered several of the Perso-Caucasian countries, and reached the Caspian Sea. There he formed an alliance with the Khazars, and with their assistance attacked Media, and carried his arms as far south as Ispahan. Before going into winter quarters, he defeated the main body of the Persians, commanded by Khosru himself. In 625 Heraclius descended from the Caucasus into Mesopotamia, and thence proceeded into Cilicia, where he routed the Persians once more with immense slaughter. During the next two years (626-628) Heraclius carried the war into the heart of the Persian Empire, and in December, 627, cut to pieces the forces of Rhazates, the Persian general, near the junction of the Little Zab and the Tigris. An immense booty fell into the hands of the victors. Khosru fled into the interior of Persia, and was soon afterwards put to death by his son Siroes, who concluded a peace with Heraclius, by which the Persians gave up all their former conquests (628). Not the least of the trophies Heraclius brought back to Constantinople was the alleged wood of the true cross, which the Persians had carried off from Jerusalem in 615. The fame of Heraclius was now at its height, but the rise of the Mohammedan power in Arabia brought a new and terrible enemy against the old Empire, where religious dissensions still created bitter factions, whose strife weakened the State. Heraclius seems to have exhausted his splendid energies and ambition in the remarkable Persian campaigns, and now spent his time in his palace at Constantinople, partly in sensual pleasures, and partly in theological disputations. In his efforts to mediate between the orthodox party and the monophysites (q.v.) Heraclius sought to impose the monothelite doctrine on the Empire, arousing thereby great disturbances in the capital. (See MONOTHELITES.) Before the close of his life, Syria, Palestine, Mesopotamia, and Egypt were in the hands of the caliphs. He died February 11, 641. Consult: Bury, *A History of the Later Roman Empire from Arcadius to Irene*, vol. ii. (London, 1889); Finlay, *History of Greece* (London, 1877); Gibbon, *Decline and Fall of the Roman Empire*, ed. Bury (London, 1896-1900); Drapeyron, *L'empereur Heraclius et l'empire byzantin au VIIème siècle* (Paris, 1869), with bibliographical notes. There is also a contemporary account by Sepeos, an Armenian bishop, that was published in Constantinople in 1850. See BYZANTINE EMPIRE.

HÉRACLIUS, à'rà'klé-us'. A minor tragedy by Corneille (1647). The play is exceedingly complicated in plot, and contains few passages of great excellence.

HERÆUM (Lat., from Gk. Ἡραῖον, *Hērāion*), THE ARGIVE. The oldest and most noted sanctuary of Argolis, and the chief seat in Greece of the worship of Hera, situated on a spur of Mount Eubœa, between Argos and Mycenæ. The original temple was burned in B.C. 423, and a new one built with great magnificence by the architect Eupolemos of Argos. Of the second building, Pausanias gives a detailed description. It con-

tained two images of the goddess—one of wood, brought from Tiryns, and a statue of gold and ivory by Polyclitus. A few remains of the sculptures are preserved at Athens. The site of the Heræum has been excavated by the American School of Classical Studies (1891-95).

HERALD (from OF. *heralt*, *heraut*, Fr. *héraut*, from ML. *heraldus*, *haraldus*, herald, from OHG. *hari*, *heri*, Ger. *Heer*, AS. *here*, army + OHG. *-walto*, AS. *-wealda*, power, from OHG. *waltan*, Ger. *walten*, AS. *wealdan*, Eng. *wield*). In England, an officer whose duty consists in the regulation of armorial bearings, the marshaling of processions, and the superintendence of certain public ceremonies. In the Middle Ages heralds were highly honored, and enjoyed important privileges; their functions included, in addition to those mentioned, the bearing of messages, whether of courtesy or defiance, between royal or knightly personages; the superintending and registering of trials by battle, tournaments, jousts, and all chivalric exercises; the computation of the slain after battle; and the recording of the valiant acts of the fallen or surviving combatants. The person of a herald, while in the exercise of his duties, was inviolable. The word *heraldus* was used in Germany as early as 1152; the first use in an English document occurs in 1337. The heralds became very influential in the latter half of the fourteenth century. The Herald's College (q.v.) was incorporated in 1483. Three orders of officials, kings-at-arms, heralds, and pursuivants, are still appointed. There are now in England four kings-at-arms, named by their offices Garter, Clarenceux, Norroy, and Bath; six heralds—Somerset, Chester, Windsor, Richmond, Lancaster, and York; and four pursuivants—Rouge Dragon, Portcullis, Blue Mantle, and Rouge Croix. In Scotland there are at present three heralds and three pursuivants, the principal heraldic officer being Lyon King-at-Arms. Ireland has one king-at-arms, Ulster; two heralds, Cork and Dublin; and two pursuivants, of whom the senior bears the title of Athlone, and the other is called the pursuivant of Saint Patrick. The official costume of a herald consists of a satin tabard or surcoat embroidered with the royal arms, and a collar of SS. See HERALDS' COLLEGE; KING-AT-ARMS; PURSUIVANT.

HERALDRY. Properly, the knowledge of the multifarious duties devolving on a herald (see HERALD); in the more restricted sense, in which it will be considered here, it is the science of armorial bearings.

HISTORY. Though there are many instances in remote times of nations and individuals distinguishing themselves by particular emblems or ensigns, nothing that can properly be called armorial bearings existed before the middle of the twelfth century. The shield of the French knights in the First Crusade presented a plain face of polished metal, and there were only a very few heraldic devices in use in the Second Crusade in 1147. The Anglo-Norman poet Wace, who wrote in the latter half of the twelfth century, mentions devices or cognizances as being in use among the Normans, at the conquest of England, and Wace is corroborated by the Bayeux tapestry of the twelfth century, where there are figures of animals on the shields of the invaders, while the Saxon shields have only borders or crosses. The rude devices on these shields

have nothing approaching to an armorial form or disposition, and in some cases the same device is represented on different shields. Heraldry developed during the Crusades, where it was necessary for a knight to have some mark by which he might be known; it may have been influenced by the Saracen custom of wearing richly embroidered devices. Some armorial insignia were depicted on the shields used in the Third Crusade, which took place in 1189 and the following years; and in the same half-century originated the *fleurs-de-lis* of France and the lions of England. The transmission of arms from father to son seems to have been fully recognized in the thirteenth century, and in the practice then introduced of embroidering the family insignia on the surcoat, worn over the hauberk or coat of mail, originated the expression *coat of arms*. Arms were similarly embroidered on the *jupon*, *cyclas*, and *tabard*, which succeeded the surcoat, a practice which survived till the time of Henry VIII., when the *tabard* came to be entirely disused except by heralds, who still continue to wear on their *tabards* the royal arms.

It was by slow degrees that the usage of arms grew up into the systematized form which it assumes in the works of the established writers on heraldry. The principal existing data for tracing its progress are English rolls of arms yet extant of the times of Henry III., Edward I., and Edward III. The earliest formal treatises date no further back than the end of the fourteenth century, before which time the whole historical part of the subject had been obscured by a tissue of gratuitous fiction, which has misled most subsequent writers up to a very recent period. The writers on the subject represented the heraldry of the tenth and eleventh centuries as equally sharply defined with that of the fifteenth and sixteenth. The arms of William the Conqueror and his sons are described with all their differences; arms are ascribed to the Saxon Kings of England, to Charlemagne, to biblical characters, and even to half-mythical persons and heroes of classical times.

In the infancy of heraldry, every knight assumed what arms he pleased, without consulting sovereign or king-at-arms. Animals, plants, imaginary monsters, things artificial, and objects familiar to pilgrims, were all fixed on. Thus the scallop-shell, the emblem of Saint James and most generally in heraldry called a 'clam,' was frequently borne by Crusaders. Often the object chosen was one whose name bore sufficient resemblance in sound to suggest the name or title of the bearer of it. Devices and mottoes were sometimes chosen on account of their allusive associations: e.g. a broken spear for Brakespeare, or *Festina lente* for the Onslows. This is called *Canting Heraldry* by the English, *Armes parlantes* by the French. The charge fixed on was used with great latitude, singly or repeated, in any way which the bearer chose, or the form of his shield suggested. But as coats of arms became more numerous, confusion often arose from different knights adopting the same symbol; and this confusion was increased by a practice which crept in of sovereigns or feudal chiefs allowing their arms, or part of them, to be borne as a mark of honor by their favorite followers in battle. Hence different coats of arms came in many instances so closely to resemble each other that it was imperative, for distinction's sake, that the

fancy of the bearer should be restrained, and regulations laid down regarding the number and position of the charges, and the attitudes of the animals represented. This necessity led, in the course of time, to the systematizing of heraldry, a process which the rolls alluded to show us was going on gradually throughout the thirteenth and fourteenth centuries. By the time that heraldry was consolidated into a science, its true origin had been lost sight of, and the credulity and fertility of imagination of the heralds led them to invest the most common charges with mystical meanings, and to trace their original adoption to the desire of commemorating the adventures or achievements of the founders of the families who bore them. It was only when heraldry began to assume the dignity of a science that augmentations of a commemorative character were granted. After the science became thoroughly systematized, augmentations and new coats were often granted with a reference to the supposed symbolical meanings of the charges.

In England, the assumption of arms by private persons was first restrained by a proclamation of Henry V., prohibiting their assumption by any one who had not borne arms at Agincourt, except in virtue of inheritance or a grant from the Crown. To enforce the observance of this rule, heralds' visitations or processions through the counties were instituted, and continued from time to time till the reign of William and Mary.

Jurisdiction in questions of arms is executed by the Herald's College (q.v.) in England, the Lyon Court in Scotland, and the College of Arms in Ireland. No one within the United Kingdom is entitled to bear arms without an hereditary claim by descent or a grant from the competent authority; and the wrongful assumption of arms is an act for which the assumer may be subjected to penalties. The use of arms, whether rightfully or wrongfully, subjects the bearer of them to an annual tax. It is illegal to use without authority not only a coat of arms, but even a crest. Any figure or device placed on an heraldic wreath is considered a crest in questions with the Herald's College or Lyon Court.

CLASSIFICATION. Besides individuals, communities and States are entitled to the use of arms, and heralds have classified arms, in respect of the right to bear them, under the following ten heads: (1) Arms of dominion; the arms borne by sovereigns as annexed to their territories. (2) Arms of pretension, which sovereigns have borne, who, though not in possession, claim a right to the territories to which the arms belong. Thus, England bore the arms of France from the time of Edward III. till 1801. (3) Arms of community; the arms of bishops' sees, abbeys, universities, towns, and corporations. (4) Arms of assumption; arms which one has a right to assume with the approbation of the sovereign. Thus, it is said, the arms of a prisoner of war may be borne by his captor, and transmitted by him to his heirs. (5) Arms of patronage, added by governors of provinces, lords of the manor, patrons of benefices, etc., to their family arms, as a token of superiority, right, or jurisdiction. (6) Arms of succession, borne quartered with the family arms by those who inherit fiefs or manors, either by will, entail, or donation. Thus, the Dukes of Athole, as having been lords of the Isle of Man, quarter the arms of that island, and the Duke of Argyll

quarters the arms of the lordship of Lorne. (7) Arms of alliance, taken up by the issue of heiresses, to show their maternal descent. (8) Arms of adoption, borne by a stranger in blood, to fulfill the will of a testator. The last of a family may adopt a stranger to bear his name and arms and possess his estate. Arms of adoption can only be borne with permission of a sovereign or king-at-arms. (9) Arms of concession; augmentations granted by a sovereign of part of his royal arms, as a mark of distinction, a usage which, we have already observed, obtained in the earliest days of heraldry; and hence the prevalence among armorial bearings of the lion, the fleur-de-lis, and the eagle, the bearings of the sovereigns of England and Scotland, of France, and of Germany. (10) Paternal or hereditary arms, transmitted by the first possessor to his descendants.

THE ESCUTCHEON. A coat of arms is composed of charges depicted on an escutcheon representing the old knightly shield. The shields in use in England and France in the eleventh and twelfth centuries were in shape not unlike a kite, a form which seems to have been borrowed from the Sicilians; but when they became the recipients of armorial bearings, they were gradually flattened and shortened. From the time of Henry III. the escutcheon has been most frequently represented on seals as approaching a triangular form, with the point downward, the chief exceptions being that the shield of a lady is lozenge-shaped, and of a knight banneret square. To facilitate description, the surface or field of the escutcheon has been divided into nine points, technically distinguished by the following names: A, the dexter chief point; B, the middle chief; C, the sinister chief; D, the honor or collar point; E, the fess point; F, the nornbril or navel point; G, the dexter base point; H, the middle base; and I, the sinister base point. It will be observed that the dexter and sinister sides of the shield are so called from their position in relation, not to the eye of the spectator, but of the supposed bearer of the shield.

TINCTURES. Coats of arms are distinguished from one another, not only by the charges or objects borne on them, but by the color of these charges, and of the field on which they are placed. The field may be of one color or of more than one, divided by a partition line or lines varying in form. The first thing, then, to be mentioned in blazoning a shield—that is, describing it in technical language—is the color, or, as it is heraldically called, *tincture* of the field. (See Illustration, TINCTURES.) Tinctures are either of metal, color strictly so called, or fur. The metals used in heraldry are two—gold, termed *or*, and silver, *argent*—represented in painting by yellow and white. The colors are five—red, blue, black, green, and purple, known as *gules*, *azure*, *sable*, *vert*, and *purpure*. Two other colors have been used occasionally: *tawny* or *tenné* and *murrey* or *sanguiné*. But these are now discarded in most countries. Metals and colors are indicated in uncolored heraldic engravings by points and hatched lines, an invention ascribed to Silvestro di Petrasancta, an Italian herald of the seventeenth century. *Or* is represented by small dots; for *argent*, the field is left plain. *Gules* is denoted by perpendicular and *azure* by horizontal lines; *sable*, by lines perpendicular and horizontal crossing each other; *vert*, by diago-

nal lines from dexter chief to sinister base; *purpure* by diagonal lines from sinister chief to dexter base; *murrey*, by a combination of vert and purple; *tawney*, by a combination of vert and gules. The furs were originally but two,

ermine and *vair*. The former is represented by black spots or tails on a white ground. *Vair*, said to have been taken from the fur of a squirrel, bluish-gray on the back, and white on the belly, is expressed by blue and white shields, or bells in horizontal rows, the bases of the white resting on the bases of the blue. If the *vair* is of any other colors than white and blue, they must be specified. Various modifications of these furs were afterwards introduced, among them: *ermine*s, or ermine with the field sable and the spots argent; *erminitis*, with a red hair on each side of the black spot; *erminois*, with the field gold and the spots, black; *pean*, with the field sable, and the spots *or*; *counter-vair*, or *vair* with the bells of one tincture placed base to base; *potent*, with figures like the heads of crutches; and *counter-potent*, with the heads of crutches alternately erect and reversed.

It is an established rule of heraldry that metal should not be placed on metal, nor color on color; a rule more rigidly adhered to in English than in foreign heraldry. Among early arms there is one remarkable transgression of it in the arms of the Kingdom of Jerusalem, founded by the Cru-

saders, which are five golden crosses on a silver field. A recognized exception exists wherever a charge lies over a field partly of metal and partly of color, or where an animal is attired, armed, unguled, crowned, or chained with a tincture different from that of his body. Marks of cadency, chiefs, cantons, and bordures are also occasionally exempted from the general rule, being, according to some heralds, not laid on the shield, but *cousu*, or sewed to it.

CHARGES. Everything contained in the field of an escutcheon is called a *charge*. Charges are divided by heralds into the three classes of honorable ordinaries, subordinaries, and common charges. Under the name of ordinaries or *honorable ordinaries* are included certain old and very frequent bearings, whose true peculiarity seems to be that, instead of being taken from extraneous objects, they are representatives of the wooden or metal strengthenings of the ancient shields. Nine are recognized by the best usage. See Plate, ORDINARIES and SUBORDINARIES.

(1) The *chief* (Fig. 1) is the upper part of the shield separated from the rest by a line, and comprising, according to the requirements of heralds, one-third of the whole, though this proportion is seldom rigidly adhered to. Its diminutive is the *fillet* (Fig. 3), supposed to take up one-fourth the space of a chief, in whose lowest part it stands. The line at the base of the chief may be straight, indented, or irregular.

(2) The *pale* (Fig. 4) is a band or stripe from top to bottom, said, like the chief, to occupy one-third of the shield. It has two diminutives, the *pallet*, one-half the breadth of the pale (Fig. 5), and the *endorse*, one-half of the pallet (Fig. 6).

(3) The *bend* (Fig. 8) is a band crossing the shield diagonally from dexter chief to sinister base. Its diminutives are the *bendlet* or *garter*, one-half of its breadth (Fig. 9), the *cost*, or *cotise*, one-half of the bendlet (Fig. 10), and the *riband*, one-half of the cotise. The bend is sometimes borne between two cotises, in which case it is said to be *cotised* (Fig. 11), a term sometimes applied to the other ordinaries when accompanied with their diminutives.

The *bend sinister* (Fig. 12) is a diagonal band from sinister chief to dexter base. Its diminutives are the *scarp*, one-half of the bend sinister (Fig. 13), and the *baton*, one-half of the scarp (Fig. 14). The baton stops short of the extremity of the field at both ends, and has been considered a mark of illegitimacy.

(4) The *fess* or *fesse* (Fig. 15) is a horizontal band in the middle of the shield, said, like the ordinaries already enumerated, to occupy one-third of it. The lines which bound it may be straight or irregular (Fig. 16).

(5) The *bar* is similar in form to the *fess*, but narrower and never placed in the centre of the shield (Fig. 17). It is rarely used singly. When in pairs they are called *bars gemelles*. The diminutives are the *closet*, theoretically half the width of the *bar* (Fig. 19), and the *barrulet*, half the width of the *closet* (Fig. 18). But these terms are seldom used.

(6) The *chevron* (Fig. 20) is composed of two stripes forming an inverted V. Its diminutives are the *chevronel* (Fig. 21) of half, and the *couple-close* (Fig. 23) one-fourth its width.

(7) The *cross* (Fig. 24) unites the pale and fess, an ordinary which was originally, like the rest, composed of the clamps necessary to the

strength of the shield, but had also the deeper meaning of the symbol of the Christian faith. Besides its plain form, the cross was varied in numerous ways, most of these varieties being, however, rather common charges than ordinaries. Of the 39 lesser crosses mentioned by Guillim, or the 385 by Berry in the *Encyclopædia Heraldica*, a few of the most frequently occurring are the following: The *cross moline* (Fig. 26), with the ends turned round both ways; the *cross fleury* (Fig. 27), of which each limb terminates in a fleur-de-lis; the *cross patonce* (Fig. 28), the limb of which has three points; the *cross potent* (Fig. 29), crutch-shaped at the ends; the *cross patté* (Fig. 30), small in the centre, but widening toward the ends; and the *cross crosslet* (Fig. 31), crossed at the ends. The latter is the most frequent of all, and is borne oftener in numbers than singly. Any of these crosses is said to be *fitchy* when the lower limb terminates in a sharp point, as in Fig. 36. There is also the *cross Maltese*; though not frequent as a heraldic charge, it derives an importance from being the badge of the Knights of Malta, and of many other orders (Fig. 32).

(8) The *saltire*, or Saint Andrew's cross (Fig. 57), is formed by a junction of the bend dexter and bend sinister.

(9) The *pile* (Fig. 59) is a wedge with the point downward. A single uncharged pile should, at its upper part, occupy one-third the breadth of the shield, but if charged, it may be double that width. It is used ordinarily either singly or in threes (Fig. 60).

The *quarter*, consisting of the upper right-hand fourth part of the shield cut off by a horizontal and a perpendicular line, is classed by some authorities with the *honorable ordinaries*, but it is more common to consider it one of the *subordinaries* (see below). It is frequently termed a *canton* (Fig. 61).

It has been observed that the field of an escutcheon may be of two different tinctures, divided by a partition-line which may vary in direction. (See illustration PARTITIONS.) When divided by a partition-line in the direction of one of the ordinaries, the shield is said to be *party*

per that ordinary; thus we may have a shield party *per pale*, bend, fess, chevron, saltire, or cross, though *quartered* is a more usual term than *party per cross*. A shield divided into any number of parts by lines in the direction of a pale, bend, or bar, is said to be *paly*, *bendy*, *barry*, the number of pieces being specified, as *barry of six*. When the field is of a metal and color separated by any of the lines of partition, then the charge placed on it is said to be *counter-changed*; this means that the part of the charge which is on the metal is of the color, and vice versa.

The partition-line which bounds the field, or the boundary-line of an ordinary, is not always even. The commonest forms of irregular partition-lines in use are the *engrailed*, *invected*, *wavy*, *nebuly*, *embattled*, *indented*, and *dancetté*. An ordinary engrailed has the points of the engrailed line turned outward, and an ordinary invected, inward. *Dancetté* differs from the indented by having much larger spaces between the points. All of these terms, even when unmistakably French in origin, are pronounced as if they were English.

The *subordinaries*, or subordinate ordinaries, are generally enumerated as the following, though there is no very broad line of demarcation between them and the common charges.

The *Gyron*.—When a shield is at once quartered and party *per saltire*, the division is called *gyronny* of eight, and each of the triangles is a *gyron* (Fig. 66). *Gyronny* of six, ten, or twelve, also occasionally occur, so called according to the number of the triangles.

The *fret* (Fig. 76) is a cognizance derived from the banding or ornamenting of the shield, and a shield covered with this latticework decoration is said to be *fretty*.

The *bordure*, or border (Fig. 62), is a band encircling the shield. It is much used to distinguish different branches of a family, and is often charged with small devices, on which account it has sometimes been reckoned an honorable ordinary (Fig. 63).

The *orle* (Fig. 64) differs from a *bordure* in not touching the extremity of the shield and is narrower.

The *tressure*, regarded as a diminutive of the *orle*, is generally borne double, and fleury counterfleury, as in the arms of Scotland (Fig. 65).

The *pall* (Fig. 77) is the archiepiscopal ornament of that name, sent from Rome to metropolitans, and resembling in form the letter Y. By some authorities this is classed as a common charge and not as a subordinate.

The *flanches* (Fig. 67) are the dexter and sinister sides of the shield cut off by a curved line.

Flanches are always borne in pairs, and sometimes charged.

The *lozenge* (Fig. 68) is a figure of four equal sides, with the upper and lower angles acute, and the others obtuse.

The *fusil* (Fig. 72) is longer and more acute than the *lozenge*.

The *mascle* (Fig. 69) is a *lozenge* perforated, and showing a narrower border. *Mascles* may have been originally links of chain armor.

A field is said to be *lozengy*, *fusilly*, or *mascally* when divided by diagonal lines in the direction of these subordinaries. A field divided by horizontal and perpendicular lines into squares of different tinctures is said to be *checky*; in the case of a *fess checky* there are three such rows of squares.

The *inescutcheon* is a small shield charged upon the coat of arms.

The *billet* (Fig. 73) is a rectangle about twice as high as it is wide. When the shield is freely sprinkled with billets it is termed *billety*. Some think the billets represent bricks, stones, or billets of wood; others think they represent letters or *billets*.

Among subordinaries are sometimes reckoned certain circular charges called *roundles* or *roundlets* (Fig. 74), distinguished in English heraldry by different names according to their tinctures. When of or, they are called *bezants*; of argent, *plates*; of gules, *torteaux*; of azure, *hurts*; of purple, *golps*; of sable, *ogresses* or *pellets*; and of green, *pommes*.

COMMON CHARGES. The third class of figures occurring in armorial bearings are the *common charges*. These are representations more or less conventional of familiar objects, which have no necessary relation to the shield, but are in some way emblematic as concerns family or individual history and character. We can enumerate only a few of the charges of most frequent occurrence.

Among the animals borne in coats of arms the lion holds the most important place. As early as the twelfth century the king of beasts was assumed as an appropriate emblem by the sovereign of England. The kings of Scotland, Norway, and Denmark, the native princes of Wales, the counts of Flanders and Holland, and various other European rulers also chose the king of beasts. Lions occur in different positions. The earliest attitude of the heraldic lion is *rampant*, erect on his hind legs, and looking before him, the head being shown in profile, as he appears in the arms of Scotland, and originally did in those of England. This was the normal position of a lion; but as the royal animal came to be used by all who claimed kindred with royalty, and to be granted to favorite followers by way of augmentation, a diversity of attitude was adopted for distinction's sake: *Rampant gardant*, erect on the hind legs, and affronté or full-faced; *Rampant regardant*, erect on the hind legs and looking backward; *Passant*, in walking position, with the head seen in profile; *Passant regardant*, walking and with the head looking behind; *Stantant*, with all the four legs on the ground; *Salient*, in the act of springing forward on his prey; *Sejant*, rising to prepare for action; *Sejant affronté*, rising and full-faced, as in the crest of Scotland; *Couchant*, lying down, but with his head erect, and his tail beneath him; *Dormant*, asleep, with his head resting on his fore paws. Some of these terms are used for the other ani-

mals. The lion passant gardant is often blazoned as the *lion of England*, and at a time when terms of blazonry were comparatively few it was confounded with the leopard, and hence the lion passant and rampant gardant came to be called respectively the *lion-leopardé* and *leopard-lionné*.

hoofs are said to be *armed* in respect to them. The heads and limbs of animals are often borne as charges, and they may be either *couped*, cut off in a straight line, or *erased*, cut off with a jagged edge. When the head is borne without any part of the neck, and full-faced, it is said to be *caboched* or *caboshed*. When the hair of an animal is of a different tincture from the body the animal is said to be *crined* of this color. Animals, as well as other common charges, are usually represented in a purely conventional manner, and frequently bear no resemblance to the object for which they are named.

Of birds, there is the *eagle*, which was, next to the lion, the most favorite cognizance of royal personages, and was adopted by the German emperors, who claimed to be successors of the Cæsars of Rome. The Imperial eagle had at first but one head; the monstrosity of a second head seems to have arisen from a dimidiation of two eagles, to represent the Eastern and Western empires. (See below, MARSHALING OF ARMS.) The eagle of heraldry is most generally *displayed*, i.e. its wings are expanded; sometimes it is *preying*, or standing devouring its prey. Two lions may be depicted: *rampant combatant*, i.e. face to face; or *rampant addorsed*, placed back to back, or *counter-passant*, i.e. passing the contrary way to each other. The lion is said to be *naissant* when he appears to be rising out of the centre of an ordinary. Among leonine monsters we have two-headed lions, bicorporate and tri-corporate lions, lion-dragons, and lion-poissons. There is also the Bohemian lion, with two tails, and the more celebrated winged lion of Saint Mark, adopted by the Republic of Venice. Two or more lions borne on one shield are sometimes (though never when on a royal coat) blazoned *lionceels*.

Bears, boars, bulls, and stags are favorite heraldic beasts. A stag walking is said to be *trippant*; when lying down with his head erect he is *lodged*; when running he is *courant*; he is *at gaze* when a lion would be *stavant-gardant*; he is *attired* of any tincture when his horns are of that tincture. The animals that possess horns and

and the family of Montmorency, was originally but a synonym for the eagle (assumed, perhaps, as an anagram for the word Lorraine), but modern heralds have degraded it into a nondescript creature without beak or feet. The *martlet* was originally a martin, which has also in course of time been deprived by heralds of its legs and

beak. (See CADENCY.) The mythical phoenix, the pelican, the swan, the cock, the falcon, the raven, the parrot, or popinjay, and the peacock are all of tolerably frequent occurrence. The pelican generally has her wings placed back to back, and is depicted pecking her breast; she is then said to be *vulned*, i.e. wounded. When in her nest, feeding her young, she is called a pelican *in her piety*. A peacock borne affronté with his tail expanded is said to be *in his pride*. Birds of prey are armed of the color of which their beak and talons are represented. Such as have no talons are *beaked and membered*; i.e. the beak and legs are of a different color from the body. The cock is said to be armed crested and jelloped, the latter term referring to his comb and gills. Birds having the power of flight are, in respect to their attitude, *close, rising, or volant*.

Fishes and reptiles occur as charges: the former are said to be *naïant* if drawn in a horizontal, and *haurient* if drawn in a perpendicular position; and the *dolphin*, in reality straight, is conveniently borne *embowed* or bent. Sometimes the conventional heraldic form of an animal differs very greatly from its true form, as in the case of the antelope of heraldry, which has the head of a stag, a unicorn's tail, a tusk issuing from the tip of the nose, a row of tufts down the back of the neck, and similar tufts on the tail, chest, and thighs. Of 'animals phantastical,' we have, among others, the griffin, wyvern, dragon, unicorn, basilisk, harpy. We have the human body in whole or part, as a naked man or 'savage,' also arms, legs, hearts, Moors' heads, Saracens' heads, and that strange heraldic freak, the three legs conjoined carried in the escutcheon of the Isle of Man.

Of plants, there are *roses, trefoils, quatrefoils, cinquefoils* (conventional representations of flowers with three, four, and five leaves), *leaves,*

garbs (i.e. sheaves of corn), *trees, often eradicated or fructuated* of some other color, and above all the celebrated *fleur-de-lis*, used as a badge by Louis VIII. of France in 1223. When the charge is repeated a large number of times the term *semé* is applied to it. When a plant, animal, or other charge is blazoned *proper*, what is meant is that it is of its natural color.

The heavenly bodies, the sun, moon, and stars, are also pressed into the service of heraldry, as are things inanimate and artificial without number, particularly such as were familiar to the warriors and pilgrims of the twelfth and thirteenth centuries. Helmets, buckles, shields, hatches, horseshoes, swords, arrows, battering-rams, pilgrim's staves, mullets (or spur-rowels), and water-boujets, or bags, in which in crusading times water was carried long distances across the desert; also the clarion or war-trumpet, sometimes erroneously called a *rest*, because it was supposed to represent a rest for a lance. Even the letters of the alphabet have been used as charges.

When the field or any charge is covered with drops it is called *guty*; when adorned with fleurs-de-lis it is called *fleury* or *flory*. When an ordinary is made up of squares of alternate metal and color it is called *compony* or *gobony*. When an ordinary has a border of different tinctures it is said to be *fimbriated*.

Charges may be placed either simply on the field or on one of the ordinaries; in some instances one of the ordinaries is placed over a charge, in which case the charge is said to be *debruised* by the ordinary. Three charges of one kind are placed two above and one below, unless blazoned *in fess* or *in pale*. In the fourteenth and fifteenth centuries the simplicity of early heraldry began to be departed from by accumulating a variety of charges on one shield, and in later times we have sometimes a charge receiving another charge like an ordinary. The growing complexity of shields arose from augmentations granted to distinguish the younger branches of a family, or charges assumed from the maternal coat by the descendants of an heiress. In the end of the eighteenth and beginning of the nineteenth century, a practice prevailed for a time of introducing into armorial bearings matter-of-fact landscapes, representations of sea fights, and of medals and decorations worn by the bearer, setting all heraldic conventionalities at defiance, and dealing in details not discernible except on the minutest inspection.

The arms of the different members of a family have been distinguished from one another, sometimes by the use of a bordure or other difference; and sometimes, especially by English heralds, by the use of certain figures called *marks of cadency*. (See CADENCY.) Sometimes the differences and marks of cadency are called *diminutions*.

Besides the heraldic devices depicted on the shield, there are the following borne external to it—the helmet, the mantling, the wreath, the crest, the motto and scroll, the supporters, and the coronet.

The *helmet*, originally a piece of defensive armor, became in the course of time one of the usual accompaniments of the shield; and placed over the arms, it came by its form to mark the rank of the wearer. These distinctions date from the reign of Queen Elizabeth, and are applicable only to British heraldry.

CHINA

The *mantling* is an embellishment of scroll-work flowing down on both sides of the shield, and originating in the *cointoise*, or scarf, wrapped round the body in the days of coat armor.

From the centre of the helmet, within a *wreath* of two pieces of silk usually of the first two colors of the armorial bearings, issues the crest, originally a special mark of honor worn only by heroes of great valor, or advanced to a high military command; now an inseparable adjunct of the coat of arms in English, though not in Continental heraldry, and sometimes assumed or changed arbitrarily, although this is illegal.

The *scroll*, placed over the crest or below the shield, contains a *motto* bearing in many cases an allusion to the family name or arms. The motto was originally the war-cry of the bearer.

Supporters are figures or animals standing on each side of the escutcheon, and seeming to defend or support it. They were in their origin purely ornamental devices, which only gradually acquired a heraldic character. In England the right to use supporters is confined to the royal family, peers, peeresses, and peers by courtesy, Knights of the Garter, Knights Grand Cross of the Bath, and a very few families whose ancestors bore supporters before their general use was restricted. In Scotland supporters are also used by the baronets of Nova Scotia and the chiefs of various families. They have sometimes been conferred on towns, e.g. Liverpool, Belfast.

The crown of the sovereign, the mitre of the bishop, and the coronet of the nobility are adjuncts appended to the shield of those whose dignity and office entitle them to that distinction.

BLAZONRY. This is the art of describing, in technical terms, the charges borne in arms—their positions, gestures, tinctures, etc., and the manner of arranging them on the shield. As heraldry, though arbitrary, is very exact, the rules of blazoning are observed on all occasions with the most rigid precision. The following are the most important: In blazoning or describing a coat of arms, avoid repetitions and use as few words as possible. Begin with the field, naming the tincture or tinctures, and mentioning the lines by which it is divided—*per pale*, *per fess*, etc., if such there be—and noticing if they are indented, engrailed, or the like, it being taken for granted that they are straight unless the contrary is mentioned. The charges are named next, beginning with the most important and nearest the centre, giving their number, position, and tincture; e.g. the Affleck family bear *argent, three bars, sable*; the Aldboroughs, *barry of ten, argent and azure, a lion rampant, gules*. Usually the ordinaries and their diminutives come first; but the *chief*, *bordure*, or *canton* generally comes last; e.g. the Gainsboroughs bear *or frettygules, a canton, ermine*. Where the principal charge is not in the centre its position must be named, as in *first quarter*. When an ordinary *debruis*es another charge, the latter is named first unless some other direction is given. Two charges are *in pale*, i.e. one above the other; three are represented two above, one below; when a *fess* or *bend* is between six similar charges, three are in chief and three in base. In all other cases the position of the charges must be described. When the ordinary bears a charge and there are also other charges in the field, the latter are named

before the charges on the ordinary. When a tincture occurs twice it is not repeated, but of the field, of the first, etc., are used. The Anglesey family bears *sable, on a cross engrailed between four eagles displayed argent, five lions passant-gardant of the field*. When there is an equal number of two charges, 'as many' is used instead of repeating the number. The Leiths bear *or, a cross-crosslet fitchy, sable, between three crescents in chief, and as many lozenges in base, gules*. The Parkers bear *gules, on a chevron, between three keys erect, argent, as many fleurs-de-lis of the field*. Finally the differences, crests, and supporters are described. A full knowledge of blazonry can be acquired only by the careful study of many examples.

MARSHALING OF ARMS. This is the combining of different coats of arms in one escutcheon, for the purpose of indicating family alliance or office. In the earlier heraldry it was not the practice to exhibit more than one coat in a shield, but the arms of husband and wife were sometimes placed *accollé*, or side by side, in separate escutcheons; or the principal shield was surrounded by smaller ones, containing the arms of maternal ancestors; and not infrequently maternal descent or marriage was indicated by the addition of some bearing from the wife's or mother's shield. Then followed *dimidiation*, where the shield was parted per pale, and the two coats placed side by side, half of each being shown. By the more modern custom of impaling, the whole of each coat is exhibited, a reminiscence of the older practice being retained in the omission of bordures, orles, and tressures on the side bounded by the line of impalement. The most common case of impalement is where the coats of husband and wife are conjoined, the husband's arms occupying the dexter side of the shield, or place of honor, and the wife's the sinister side. Bishops, deans, heads of colleges, and kings-at-arms impale their arms of office with their family coat, giving the dexter side to the former.

A man who marries an heiress (in heraldic sense) is entitled to place her arms on a small shield called an *escutcheon of pretense*, in the centre of his achievement, instead of impaling them.

Quartering, or the exhibiting of different coats on a shield divided at once perpendicularly and horizontally, is the most common mode of marshaling arms, a practice which, however, was unknown till the middle of the fourteenth century. The divisions of the shield are called quarters, and are numbered horizontally, beginning at the dexter chief. The most common object of quartering is to indicate descent. The coats quartered in an escutcheon must all have been brought in by successive heiresses, who have intermarried into the family. In the case of a single quartering, the paternal arms are placed in the first and fourth quarters, and the maternal in the second and third. The third and fourth quarters may, in after-generations, be occupied by the arms of a second and third heiress. Sometimes an already quartered coat is placed in one of the four quarters of the escutcheon, then termed a grand quarter. We occasionally find a shield divided by perpendicular and horizontal lines into six, nine, or even more parts, each occupied by a coat brought in by an heiress; and in case of an odd number of coats, the last division is inconveniently crowded by the accu-

mulation of coats, including the several coats to which each heiress may, in a similar way, have become entitled. In Germany, sometimes twenty or thirty coats are found marshaled in one escutcheon; but in British heraldry, families entitled to a number of quarterings generally select some of the most important.

Sovereigns quarter the ensigns of their several States, giving precedence to the most ancient, unless it be inferior to the others in importance. In the royal escutcheons of the United Kingdom, England is placed in the first and fourth quarters, Scotland in the second, and Ireland in the third; the relative positions of Scotland and England being, however, reversed on the official seals of Scotland. Spain bears the arms of Leon in the first and fourth quarters, and Castile in the second and third. An elected king generally places his arms surtout on an escutcheon of pretense.

NATIONAL COATS OF ARMS. The coats of arms whose use has obtained official sanction by national governments present in most cases the family heraldic insignia of their sovereigns. The English arms, for instance, have reflected every claim of family inheritance of the royal line since the origin of coats of arms in the twelfth century. They were, under Richard Cœur de Lion and his immediate successors, the three leopards of the Plantagenet House. When Edward III. laid claim to the crown of France he quartered with his arms the lilies of the royal house of that country. The Irish harp was added when Henry VIII. took the title of king of that country. Similarly, when the Stuart line succeeded they placed the rampant lion of Scotland in the upper right-hand field. William III. placed a scutcheon with the line of the House of Orange in the centre of the British shield, and the Hanoverian sovereigns replaced this by their family scutcheon. The lilies of France were removed with the disuse of the French title, in 1801, and the scutcheon of the House of Hanover on the accession of Queen Victoria in 1837. Since that time the British coat of arms in its full form has consisted of the shield with four fields, two occupied with the golden leopards of England, the other two occupied by the old arms of Scotland and Ireland respectively. Above the shield is a helmet, and still above this the crown with a golden crowned lion. Surrounding the shield is the Order of the Garter with its legend. Below the shield are two clusters of branches, made up of the English rose, the Scotch thistle, and the Irish shamrock intertwined, and the motto *Dieu et Mon Droit*. As supporters, there are dexter, a golden crowned lion, and sinister, a silver unicorn with a crown around his neck and a chain hanging from this.

France, after having used at various times the oriflamme, the lilies, the Napoleonic eagle, and other emblems, possesses, under the present republic, no authoritative or universally applicable coat of arms. By a decree passed in 1870, however, a seal was adopted consisting of a seated female figure holding a bundle of victor's rods. In 1896 a decorative emblem was authorized consisting of the initials 'R. F.' (*République française*) surrounded by a crown of laurel leaves, with French flags crossed at the back, oak and laurel branches below, the Order of the Legion of Honor and the fasces at the back. A common device, too, is a shield bearing the na-

tional colors in three vertical bars, with the fasces in the central space and the letters R and F on olive branches to right and left.

The arms of the German Empire consist of the great double-headed black eagle of the Empire, surmounted by the Imperial crown and bearing on its breast the Prussian coat of arms. This is a silver shield with a single-headed eagle holding in its claws the royal ball and sceptre, with the Hohenzollern arms on its breast. The silver shield is surrounded by the chain and pendant of the Order of the Black Eagle.

Russia and Austria-Hungary also use the double-headed eagle, in both cases both heads being crowned, and in both with an Imperial crown above. In the Russian arms the eagle bears on its breast a shield with Saint George; in the Austrian a shield with the arms of Hapsburg, Austria, and Lorraine.

The coat of arms of Spain consists of a shield on which the arms of Castile and Leon are quartered, a point below bearing the pomegranate of Granada, and a small central shield bearing the arms of Bourbon-Anjou.

The coat of arms of Italy is a shield with the silver cross on a red field, covered with a red ermine-lined baldaquin, surmounted by the Italian crown. The cross was granted to the counts of Savoy by the Knights Hospitalers in the fourteenth century as an acknowledgment of help given to them against the Turks.

Similarly, the coats of arms of other European countries represent in most cases the origin and fortunes of their royal families.

The newly formed nations of America found it necessary to adopt coats of arms deliberately instead of using the personal devices of their rulers. The Congress of the United States appointed a committee to prepare a coat of arms and a seal for the new nation on July 4, 1776, the very day of the Declaration of Independence. The devices reported by this and by several succeeding committees were not, however, satisfactory, and it was not till June 20, 1782, that the coat of arms was finally approved. Since that time it has not been changed. It consists of the American eagle with a shield upon its breast showing thirteen stripes, alternately silver and red, and thirteen white stars on a blue ground to indicate the original States, holding in its talons an olive branch and a sheaf of arrows, and in its beak a scroll with the motto *E Pluribus Unum*. It is surmounted by a group of stars appearing through a cloud, to indicate the emergence of a new nation in the world. Each State of the American Union has its own coat of arms, though none of them has adopted an individual flag, all using the national flag.

Most of the republics of Central and South America adopted coats of arms on the attainment of their independence, usually introducing into them some objects of local as well as symbolical significance. Mexico, for instance, in 1823, adopted as its national coat of arms a figure of an eagle tearing a snake in its beak, and poised upon a 'nopal' or cactus growing on a rock. The rock and the nopal are both connected with the old name of the city and province of Mexico, *Tenochtitlan*. This coat of arms was afterwards changed by Maximilian, but was restored on the downfall of his empire. The coat of arms of Peru contains a figure of the llama, the national beast of burden, and of the

tree from which the Peruvian bark or cinchona is taken. That of Guatemala shows the bird Quezal, the 'pito real,' or royal bird, of the old Spanish discoverers. The peaks of the Andes occur in several of the South-American national coats of arms. That of the Republic of Brazil, adopted in 1889, consists of a five-pointed star with a round shield placed upon it. On this shield are figured the stars of the Southern Cross, and it is surrounded by twenty silver stars, representing the States of the Republic. Below are a sword and branches of laurel and of the tobacco-plant, with an inscription. See Plates, NATIONAL COATS OF ARMS.

The terms and usages of heraldry vary somewhat in the different countries. In this article the rules of English heraldry have been followed. Information on the usages in other countries can be obtained from the books cited. For information on the details of heraldry, consult: the standard works of Guillim, *Display of Heraldry* (London, 1610; 6th ed. 1724); Edmondson, *Complete Body of Heraldry* (London, 1780); and Nisbet, *System of Heraldry* (London, 1722-43; 3d ed., London, 1816); and for a more discriminating view of the subject, Gourdon de Genouillac, *L'Art heraldique* (Paris, 1889); Hulme, *History, Principles, and Practice of Heraldry* (London and New York, 1892); Woodward and Burnet, *A Treatise on Heraldry, British and Foreign* (Edinburgh, 1891); Eve, *Decorative Heraldry* (London and New York, 1897).

HERALDS' COLLEGE, or COLLEGE OF ARMS. A collegiate body, founded by Edward IV. in 1464, and chartered by Richard III. in 1483. It consists of the heraldic officers of England. After various charters had confirmed its privileges, it was reincorporated by Philip and Mary, who bestowed on it Derby House, on the site of which in Doctors' Commons the present college was built by Sir Christopher Wren.

The presidency of the college is vested in the Earl-Marshal, an office now hereditary in the family of Howard, Duke of Norfolk; he nominates the three kings-at-arms, six heralds, and four pursuivants, who are the members of the collegiate chapter. Persons having an hereditary claim to arms, which has been disused for one or more generations, are empowered by the Herald's College to resume them on proof and registration of pedigree. A person who has no hereditary claim, and wishes a grant of arms, must memorialize the Earl-Marshal, and show that he is in condition to 'sustain the rank of gentry.' An important department of the college is the recording of pedigrees. Any pedigree showing the existing state or descent of a family may, if accompanied with sufficient evidence, be entered on the books of the college. The members have salaries, but derive their principal income from fees charged for assistance in tracing pedigrees and titles, and for the granting and registration of arms. Since a long time the college has lost all authority to enforce its regulations. In Scotland the corresponding functions belong to the Lyon Court (q.v.), and in Ireland to the Office-of-Arms. See HERALDRY.

HERAT, hēr-īt'. The capital of the province of the same name in Afghanistan (q.v.). It is situated in the western part of the country, on the River Heri-Rud, about 50 miles south of the Russian frontier, and the same distance east

of the Persian border (Map: Asia, Central, H 4). The town is surrounded by strong fortifications, having towers and gates, and with a strong citadel at the northern end. The streets are narrow and crooked and the buildings are unsightly. There is an ancient ruined mosque. The surrounding valley is of remarkable natural beauty and fertility. Fine fields of grain and attractive gardens adorn the landscape. The King's Garden was formerly famous. Herat exports carpets, blades, and rose-water. Its position on the route from Persia to India explains its commercial importance, while its proximity to the Russian border lends it to great strategic and political significance. The population, formerly much greater, is estimated at 45,000, and is very heterogeneous. Herat is supposed to have been founded by Alexander the Great. In the seventh century it came under the dominion of the Arabs. It was conquered by Timur in 1381, under whose reign it grew to be a centre of Persian learning and art. In 1510 it passed into the hands of Persia. The Afghans took it in 1749. During the civil wars in Afghanistan, Herat became independent, and remained so from 1823 to 1863, when it once more became a part of Afghanistan.

HÉRAULT, à'rô'. A maritime department in the south of France (q.v.), in Languedoc, bounded on the southeast by the Gulf of Lyons (Map: France, K 8). Area, 2393 square miles. Population, in 1896, 469,684; in 1901, 489,421. It is occupied in the north and northwest by the Lower Cévennes. The principal rivers are the Hérault (from which the department derives its name), the Orb, and the Lez. The coast-line is about 66 miles in length; and along the shore, from Agde to the Vidoule, are numerous étangs or marshy lakes, united by the Canal-des-étangs, and communicating with the sea. In the neighborhood of the étangs the climate is unhealthy, but elsewhere throughout the department it is usually fine. Hérault ranks among the foremost wine-growing departments of France. Woolen, silk, and cotton fabrics, leather, brandy, liquors, etc., are manufactured. Coal and copper mines as well as quarries of marbles, building-stone, granite, etc., are worked. Hérault supplies a great part of the salt used in France. Capital, Montpellier.

HÉRAULT DE SÉCHELLES, de sâ'shêl', MARIE JEAN (1760-94). A French revolutionist, born in Paris. An author and advocate, imbued with the teachings of Diderot, he was rather a philosopher than a revolutionist, and was at first but moderately attracted by the radical element in the Legislative Assembly, to which he was elected in 1791. But he soon took his stand with the extreme left, and supported Danton in the Revolution of August and September (1792). He was Deputy from the Department of Seine-et-Oise to the Convention of the same year, and voted for the King's death. As a member of the Committee of Public Safety, he aroused the enmity of Robespierre, who, under the pretext that he had had traitorous dealings with the Army of the Rhine, insisted upon his arrest and execution. The best of his writings were printed under the title *Voyage à Montbard* (last ed. 1890).

HERB (OF., Fr. *herbe*, from Lat. *herba*: probably connected with OLat. *forbea*, food, Gk. *φορβή*, *phorbê*, pasture, *φέρβειν*, *pherbein*, to feed). Any plant that contains no woody tissue, or, at

least, none above the ground. Herbaceous plants commonly die down to the ground at the close of the growing season. In some herbaceous plants, such as annuals, the entire plant dies during the resting period.

HERBARIUM (Lat., from *herba*, herb). A systematic collection of dried plants, representing the flora of one or more regions. An herbarium represents the best possible record of plants, and is indispensable as a basis for any systematic presentation of a flora. Of course, the study of living plants in their natural surroundings is the ideal method, and is employed as far as possible. But such a method is necessarily incomplete, and must be supplemented by the complete records of the herbarium. One of the essential features of an herbarium is that it contains the specimens, called 'types,' from which the original descriptions of species and genera were drawn. These types are kept for reference, so that there may be no uncertainty as to the plants described by different authors; and it may be said that, in a certain sense, the value of an herbarium is measured by the number of types and authentic specimens it contains. Large herbaria thus become centres of taxonomic work. Owing, however, to the great expense involved in maintaining them, extensive herbaria are not numerous; the local collections possessed by a large number of institutions and individuals are generally quite small.

In the United States there are three herbaria of first rank, and each is the background of continual publication. The oldest is the *Gray Herbarium*, which belongs to Harvard University. Its great value lies in the fact that it contains the vast majority of the older types of American plants, but its annual additions are also very large. The *Herbarium of the New York Botanical Garden*, formerly at Columbia University, was developed remarkably during the closing years of the nineteenth century. Its accumulation of material and wealth of types makes it indispensable in any taxonomic work. The *United States National Herbarium*, stored in the United States National Museum, has become a collection of national importance, since it contains a vast accumulation of material brought together by Government collectors, and also many of the most important collections of the early Government surveys. After these three great collections, those at the Missouri Botanical Garden (Saint Louis) and at the Field Columbian Museum (Chicago) are probably next in importance. Many of the larger universities also contain noteworthy collections. The three greatest herbaria in Europe deal more with the flora of the whole world than do the American herbaria. The greatest of all herbarium collections is that at the Royal Gardens at Kew, which has been enriched for many years by means of the numerous colonial enterprises of the British Empire. The *Herbarium of the Jardin des Plantes* at Paris is rich in older types, especially of American plants. The University of Berlin has built up a large herbarium, which has become one of first importance. Probably next in importance are the herbaria at Geneva, Vienna, and Saint Petersburg.

For directions as to the collection of plants and their preparation for the herbarium, consult Bailey, *Botanizing* (Providence, R. I., 1899).

HERBART, hĕr'bărt, JOHANN FRIEDRICH (1776-1841). A German philosopher. He was born at Oldenburg, May 4, 1776. He studied at Jena, where Fichte was just beginning to be an influential factor in the university life, and for a while he was ardent in his loyalty to Fichte's views; but after more reflection he found himself obliged to reject much of that system, and to form one of his own. After tutoring for several years in Switzerland, he qualified as docent in philosophy and pedagogy at Göttingen in 1802, and three years later was appointed professor extraordinarius. In 1809, at the instance of W. von Humboldt, then at the head of the Department of Public Instruction, he was called to a professorship of philosophy and pedagogy at Königsberg, to succeed Krug, who succeeded Kant. As in Göttingen, he conducted a seminar at Königsberg; but in 1833 he was recalled to Göttingen, where he continued in incessant pedagogical and philosophical activity until his death, August 14, 1841. His writings were collected and published by Hartenstein in 12 volumes (Leipzig, 1850), and reprinted in Hamburg (13 vols., 1883-93). Another edition is appearing at Langensalza. His pedagogical works have been published in two volumes at different times (1873, 1875, and 1880). Some of his letters were published in 1871 and in 1877. His chief works are: *Allgemeine Pädagogik* (1806); *Hauptpunkte der Metaphysik* (1806); *Allgemeine praktische Philosophie* (1808); *Lehrbuch zur Einleitung in die Philosophie* (1813); *Lehrbuch zur Psychologie* (1816; translated into English by M. K. Smith, 1891); *Psychologie als Wissenschaft* (1824); *Allgemeine Metaphysik* (1828-29). In addition to the one mentioned above, the following translations should be mentioned: *Application of Psychology to the Science of Education*, translated by Mulliner (New York, 1898); *Herbart's ABC of Sense-Perception, and Minor Pedagogical Works*, translated by Eckoff (ib., 1896); *The Science of Education*, translated by H. M. and E. Filkin (Boston, 1893); *Introduction to the Pedagogy of Herbart*, translated by Zimson (ib., 1894); *Outlines of Educational Doctrine*, translated by Lange, and annotated by De Garmo (New York, 1901).

His philosophy is a thorough-going atomism (q.v.), according to which the universe is constituted of monads or 'reals,' simple, unchangeable, and in their real nature unknowable. These 'reals' stand in accidental relations to each other, and it is the changes in these relations that constitute the process of change in the world of experience. The 'reals' disturb each other and provoke reaction in each other in self-defense. Such reactions are our ideas, which are called for by the effort of our unknowable souls to maintain themselves. These ideas in turn tend to preserve themselves, and conscious life is the behavior of these ideas toward each other in the way of conflict or of mutual support—conflict when they are totally or partially opposed; support when they are alike. When conflict occurs, the intensity of ideas is diminished; diminution of intensity beyond a certain point means the disappearance of ideas 'below the threshold of consciousness.' The relation between ideas is thus a mechanical relation and psychology is the mechanics of ideas. In the mechanical relation of ideas, those already in consciousness have an important part to play with regard to new ideas just appearing. The ideas already present are

called the apperceiving ideas, and the new ideas are said to be apperceived. The problem of education is to present such new ideas as can be most easily apperceived, i.e. incorporated with the old ideas to form knowledge. The central principle of all Herbart's reasoning is the abstract law of contradiction, interpreted metaphysically. That is, nothing can be ultimately real of which two contradictory predicates can be asserted. To predicate unity and multiplicity of an object is to predicate contradictions. Hence ultimate reality must be absolutely unitary and without multiplicity, hence also without change. Herbart's influence has been great both in philosophical and pedagogical lines. Among prominent Herbartians of recent times and of the present day may be mentioned M. A. Drobisch, O. Flügel, G. Hartenstein, M. Lazarus, H. Steinthal, L. Strümpell, W. F. Volkmann, T. Waitz, and R. Zimmermann. In America there is a Herbart Society, of which Prof. Charles De Garmo is the leading spirit, and which issues an important *Year-Book*. Herbartian bibliography is very extensive. For the life of Herbart, consult: Hartenstein, in the introduction to his *Herbart's kleinere philosophische Schriften und Abhandlungen* (Leipzig, 1842); Allihn, "Ueber das Leben und die Schriften J. F. Herbarts," in *Zeitschrift für exacte Philosophie* (Leipzig, 1860), which contains a bibliography; Hennig, *J. F. Herbart* (Leipzig, 1877). For an account or for criticism of his views, consult: Lotze, "Ueber Herbart's Ontologie," in *Zeitschrift für Philosophie* (Leipzig, 1843); Fechner, *Zur Kritik der Grundlagen von Herbart's Metaphysik* (ib., 1853); Kaftan, *Soll und Sein* (ib., 1872); Lipps, *Zur Herbart'schen Ontologie* (Bonn, 1874); Just, *Die Fortbildung der Kant'schen Ethik durch Herbart* (Eisenach, 1876); Wiggert, *Pestalozzi und Herbart* (Leipzig, 1891); De Garmo, *Herbart and the Herbartians* (New York, 1895); Adams, *The Herbartian Psychology Applied to Education* (Boston, 1898); also the various writings of the Herbartians mentioned above.

HERB BENNETT. An aromatic herb. See **GEUM**.

HERBECK, hĕr'bĕk, JOHANN VON (1831-77). An Austrian musician, born in Vienna. He was practically a self-educated musician, but by hard work rose rapidly from the position of chorister to that of professor in the Vienna Conservatory. In 1866 he was made chief Court Kapellmeister, and from 1871 to 1875 he was director of the Imperial Opera. He wrote many excellent part-songs and some instrumental music.

HERBELIN, ĕr'blĕn', JEANNE MATHILDE HABERT (1820-). A French painter of miniatures, born at Brunoy, Seine-et-Oise. She studied oil painting with her uncle, Belloc the artist, but was advised by Eugène Delacroix to confine herself to miniatures, and speedily reached the front rank in that branch of art, in which she created a new style. She exhibited ten miniatures in the Salon of 1848, and received her first-class medal at the Exhibition of 1855 for "Enfant tenant une rose," "Souvenir," and "Petite fille jouant avec un éventail," while one of her miniatures was requested for the Luxembourg Gallery, the first of its kind admitted there. Besides some ideal heads and genre studies, Madame Herbelin painted some notable miniature portraits, such as those of Guizot, Isabey, Robert Fleury, Rossi-

ni, E. Souvestre, Rosa Bonheur, and Eugène Delacroix.

HERBELOT, ĕr'blŏ', BARTHÉLEMY D' (1625-95). A celebrated French Orientalist, born in Paris. He studied also in Italy, and was likewise for a time secretary and interpreter of Oriental languages to the French King. Three years before his death he was appointed professor of Syriac in the Collège de France. His celebrated work, *Bibliothèque Orientale*, was published after his death by Galland (Paris, 1697), and afterwards with a supplement (Maestricht, 1776-81); but the best edition is that published at The Hague (4 vols., 1777-82). The work, which was not quite finished, contains extracts from a large number of Arabian, Persian, and Turkish authors, with abundant historical, biographical, and illustrative material relating to the peoples of the East.

HERBERAY DES ESSARTS, ĕr'bră' dă zĕs'săr', NICOLAS DE (?-1552). A French officer and translator. He was a Picard noble, and an officer in the royal artillery under Francis I., whom he accompanied to Madrid in 1525. Here he read, and, at the King's request, translated from the Spanish the romance of *Amadis of Gaul* (1540-48). His other works include: *L'amant maltraité de sa mye* (1539); *Le premier livre de la chronique de Dom Flores de Grèce, chevalier des Cignes* (1555); *L'horloge des princes de Guevara* (1555). He has been called the founder of the heroic romance in France.

HERBERT. An historic British family, dating from the Norman Conquest, which has been ennobled in so many of its branches, by ancient and renewed creations, that it has become a matter of difficulty to ascertain with certainty which is the parent stem. Herbert, Count of Vermandois, who afterwards filled the post of Chamberlain under William II., is mentioned in the roll of Battle Abbey, and received from his sovereign a grant of lands in Hampshire. His wife, Emma, daughter of Stephen, Count of Blois, was a granddaughter of the Conqueror, and his son, Herbert of Winchester, was Chamberlain and Treasurer of King Henry I. In the reign of Henry V., Sir William Herbert, of Raglan Castle, County Monmouth, received the honor of knighthood in reward of his valor in the French wars. His eldest son, a staunch adherent of the House of York, was created Earl of Pembroke by Edward IV. in 1469, but fell into the hands of the Lancastrians after the battle of Danes Moor, and was beheaded the following day, when the title became extinct. It was, however, revived in 1551, in the person of his illegitimate grandson, William Herbert, one of the most influential noblemen of his age, both as a statesman and as a soldier. The fourth Earl, Lord Chamberlain to Charles I., and chancellor of the University of Oxford, was the founder of Jesus College in that seat of learning, his representative descendant being hereditary visitor. The eighth Earl held several high offices under Queen Anne, including that of Lord High Admiral. From him the present representative, Sidney, fourteenth Earl of Pembroke and Montgomery (born 1853), is directly descended. The earls of Carnarvon, more than one of whom have gained celebrity in the field of literature, descend from the eighth Earl of Pembroke, mentioned above. The present earls of Powis are descended

from the same stock maternally, the only child and heiress of the last Earl of Powis of a previous creation having married the eldest son of Robert Clive, the founder of the British Indian Empire, in whose favor the title was renewed in 1804.

HERBERT, EDWARD, first Lord Herbert of Cherbury (1583-1648). Commonly reckoned as the first of the English deistical writers. He was born of a noble family at Eyton-on-Severn, near Wroxeter, March 3, 1583. He was sent to Oxford in his twelfth year, and by arrangement of his relatives at sixteen married an heiress, but kept on with his studies. The marriage was happy, but there appears to have been little affection between Herbert and his wife, who was four years older than himself. In 1600 he removed to London and attracted Queen Elizabeth's notice. On the accession of James I. he was made a knight and invested with various offices. He left home for travel in France in 1608, and from this time resided very much abroad. After a brief return to his native country he set out again for the Low Countries, where he joined the arms of Maurice of Orange; he again offered him his services in 1614. After a campaign he traveled through Germany and Italy on horseback, and went as far as Venice, Florence, and Rome. On his return he got into trouble by conducting a troop of Protestant soldiers from Languedoc into Piedmont to assist the Duke of Savoy against the Spaniards (1615). He soon returned to England, and proposed to devote himself to study and philosophical inquiry; but important diplomatic duties awaited him. He was sent to France as extraordinary ambassador (1618). His aim was to promote the alliance between France and England, and he was so far successful that he was appointed ordinary ambassador, and continued to reside in Paris. He tried, but without much success, the difficult task of negotiation between Louis XIII. and his Protestant subjects, and was abruptly recalled in 1624. He was elevated first to be a peer of Ireland, and then in 1630, five years after the accession of Charles I., to be a peer of England. When the Civil War broke out he appears to have acted with hesitation, at first siding with the Parliament and then joining the King. His hereditary seat, Montgomery Castle, was attacked and burned. He died in London, August 20, 1648. The result of his religious speculations is contained in his Latin treatises, *De Religione Laici*, and *Ad Sacerdotes de Religione Laici*, issued with his *De Causis Errorum* (London, 1645); and *De Religione Gentilium* (Amsterdam, 1663; trans., *The Ancient Religion of the Gentiles and Causes of Their Error Considered*, London, 1705). Herbert's position at the fountainhead of English Deism gives them a peculiar significance. His speculations are those of a philosophical dogmatist rather than of a critical inquirer. His arguments are abstract and deductive, and not analytical or negative. He offers solutions rather than starts difficulties or obtrudes negations. His other works of general interest are: his *Life and Reign of Henry VIII.* (reprinted 1880); his *Poems* (1881); and particularly his *Autobiography*, edited by Lee, with introduction and continuation (London, 1886).

HERBERT, GEORGE (1593-1633). An English poet, brother of Lord Herbert of Cherbury, born in Montgomery Castle, Wales. He was educated

at Westminster, and at Trinity College, Cambridge, graduating B.A. in 1612-13, and M.A. in 1616. In 1615 he was elected fellow, and in 1619 he was promoted to the office of public orator. He now made the acquaintance of Bacon; in the hope of preferment, he was induced to spend considerable time about the Court. On the death of James I. he studied divinity, and finally took holy orders. He married in 1629, and the next year received the rectory of Bemerton, Wiltshire. Here he lived a most saintly life. But in less than three years he died of consumption, and was buried beneath the altar of his church. While at Bemerton he wrote *The Temple, or Sacred Poems* (1633), which, though disfigured by conceits in the manner of the time, contains some of the finest sacred lyrics in our language. He also wrote a prose work, *The Country Parson* (1652), which lays down rules for the guidance of a clergyman's life, and may be considered a pendant to *The Temple*. A charming life of Herbert was written by Izaak Walton (*Life of George Herbert*, London, 1670). Consult, also: Shorthouse, reprint of *The Temple* (London, 1882); *Complete Works in Prose and Verse*, with Walton's *Life*, edited by Grosart (London, 1874); *Poems*, S. P. C. K. (ib., 1890), and *Life*, S. P. C. K. (ib., 1893).

HERBERT, HENRY HOWARD MOLYNEUX. See CARNARVON, fourth Earl of.

HERBERT, HENRY WILLIAM (1807-58). An American novelist, born in London. He studied at Eton from 1820 to 1825, graduated at Caius College, Cambridge, in 1830, emigrated to America in 1831, and for eight years taught Greek and Latin in a private school in New York City. He established in 1833 the *American Monthly Magazine*, which he edited till 1836, and contributed widely to newspapers and magazines. In 1834, under the pen-name of 'Frank Forester,' he began to write books on sports, and sketches of outdoor life, which formed a series of great usefulness and popularity. His more serious literary work included several carefully written novels, chiefly historical, and translations from the French of Eugène Sue and Dumas. The last years of his life were embittered by domestic troubles and the estrangement of personal friends, and he died by his own hand. The most important of his novels and works on history are: *Cromwell* (1837); *Marmaduke Wyvil* (1843); *The Brothers: A Tale of the Fronde* (1844); *The Roman Traitor* (1846); *The Miller of Martigne* (1847); *The Captains of the Old World* (1851); *The Cavaliers of England* (1852); *The Chevaliers of France* (1853); *The Puritans of New England* (1853); *The Captains of the Roman Republic* (1854); and *Memoirs of Henry VIII. of England and His Six Wives* (1858). Chief among the 'Frank Forester' series are: *My Shooting Box* (1846); *Field Sports of the United States and the British Provinces of America* (1848); *The Warwick Woodlands* (1849); *Frank Forester and His Friends* (1849); *Complete Manual for Young Sportsmen* (1852); *Sporting Scenes and Characters* (1857); *Horses and Horsemanship of the United States and British Provinces* (1859). His *Poems* were published in 1887. Consult: Picton, *Frank Forester's Life and Writings* (New York, 1881), and Judd, *Life and Writings of Frank Forester* (New York, 1882).

HERBERT, HILARY ABNER (1834—). An American Congressman and Secretary of the Navy. He was born at Laurensville, S. C.; was early taken by his parents to Greenville, Ala.; was educated at the University of Alabama and the University of Virginia, and adopted the profession of the law. In the Civil War he commanded the Eighth Alabama (Confederate) Regiment, and was disabled at the battle of the Wilderness in 1864. He was a member of Congress from 1877 to 1893, serving during several terms on the Committee on Naval Affairs, and hence was prominently connected with the reconstructions of the navy. From 1893 to 1897, during the second administration of President Cleveland, he was Secretary of the Navy, and subsequently practiced law in Washington. He edited *Why the Solid South? or, Reconstruction and Its Results* (1890).

HERBERT, IVOR JOHN CARADOC (1851—). An English soldier, born at Llanarth, Monmouthshire. At nineteen he became a grenadier guardsman, and he was made a captain four years afterwards. He distinguished himself in Egypt (1882), on the Nile expedition (1884-85), and was promoted to the rank of colonel in 1889. As major-general, Herbert was at the head of the militia in Canada for five years (1890-95), and afterwards was appointed assistant adjutant-general in England.

HERBERT, JOHN ROGERS (1800-90). An English painter, born at Maldon, Essex. He was a pupil of the Royal Academy, and exhibited there in 1830; then for some years did illustrating and subject pictures. Of these, "The Appointed Hour" (1834) attracted some attention, and after several successes he went abroad. In 1840 he became a Roman Catholic, and afterwards his subjects were chiefly religious. His best works are the frescoes in the Houses of Parliament: "King Lear Disinheriting Cordelia;" and a series of subjects called "Human Justice;" "Sir Thomas More and His Daughter;" and "Saint Gregory Teaching His Chant." He was one of the masters in the School of Design in Somerset House (1841), and a Royal Academician (1846).—His son **CYRIL WISEMAN** (1847-82) became a painter of note, despite his premature death.

HERBERT, MICHAEL HENRY (1857—). An English diplomat, the son of Sidney Herbert and Lady Herbert of Lea, known as an authoress, and brother of the Earl of Pembroke. He entered the diplomatic service in 1888, was appointed chargé d'affaires at Washington, and in 1892 was secretary of the British legation there. In 1893 he was made secretary of legation at The Hague, and thereafter held successively similar positions at Constantinople (1894-97), at Rome (1897-98), and at Paris (1898-1902). In the latter year he was appointed Ambassador from Great Britain at Washington as the successor of Lord Pauncefote.

HERBERT, SIDNEY, first Baron Herbert of Lea (1810-61). An English administrator, second son of the eleventh Earl of Pembroke. He was born at Richmond, Surrey; was educated at Harrow School and at Oriel College, Oxford, and entered the House of Commons in 1832 as member for South Wilts, which he represented until his elevation to the peerage in 1861. He began his political career as a Conservative, and was

Secretary of the Admiralty in Sir Robert Peel's Administration from 1841 to 1845, when he became Secretary for War. As a member of this Administration, it fell to him to oppose Cobden's motion for a select committee to inquire into the effect of the corn laws on farmers, and afterwards to argue in support of the free trade in corn. He went out of office with his party in 1846. In 1852 he was again Secretary for War, in the Aberdeen Ministry, and the sufferings of the army before Sebastopol were laid in a great degree at his door. He was for a few weeks Colonial Secretary in the first Administration of Lord Palmerston in 1855, and Secretary for War in his second Administration in 1859. Great improvements in the sanitary condition and education of the army, the amalgamation of the Indian with the royal army, and the organization of the volunteer force, signalized his army administration. He largely reformed the War Office, and was devoting himself with equal zeal and intelligence to his Ministerial duties, when, owing to failing health, he resigned his seat in the House of Commons, and in 1860 was called to the Upper House, under the title of Baron Herbert of Lea.

HERBERT, SIR THOMAS (1606-82). An English traveler and author, born at York, and educated at Oxford and possibly at Cambridge. When he was twenty-one he set out to Persia with Sir Dodmore Cotton, Ambassador to the Persian King. With letters of safe conduct from Court, Herbert traveled through Persia, and made important explorations on his way home. Siding with Parliament in the Civil War, he was commissioned to treat for the surrender of Oxford, and in 1647 was given charge of Charles, whose personality won him to the royal cause. Herbert was the King's constant and sole attendant during his last days, and accompanied him to his execution. He was created a baronet after the Restoration. Among his publications are narratives of his travels: *A Description of the Persian Monarchy* (1634), and *Some Yeares Travels into Divers Parts of Asia and Afrique* (1638; including the former work); and the Royalist *Threnodia Carolina* (1678; and, 1702, under the title *Memoirs of the Last Two Years of the Reign of that Unparalleled Prince of Very Blessed Memory, King Charles I.*).

HERBERT, VICTOR (1859—). An Irish-American bandmaster, orchestra conductor, and composer, born at Dublin, Ireland, and a grandson of the famous novelist, Samuel Lover. He was surrounded by musical influences from earliest childhood, and at seven years of age was studying music in Germany, in which country he received his musical education. Although trained in the entire range of music, he perfected himself on the 'cello, and secured his first important engagement as the first 'cellist of the Court Orchestra at Stuttgart, which, after an interval spent on tour, was followed in 1886 by a similar position with the Metropolitan Orchestra of New York. He afterwards played under Thomas, and later Seidl, acting under the latter in the double capacity of 'cellist and associate conductor. When the successor of Gilmore in the famous New York Twenty-second Regiment Band resigned, and a leader was required to keep up the high reputation of the organization, he was chosen conductor. He was soon after engaged to conduct the Pitts-

burg Orchestra. Meanwhile he had been equally busy with his pen, and had published several compositions, chiefly instrumental. Among his comic operas are: *Prince Ananias* (1894); *The Wizard of the Nile* (1895); *The Serenade* (1897); and *The Idol's Eye* (1897). He is also the composer of an oratorio, *The Captive*, written for the Worcester (Mass.) festival.

HERBICIDE (from Lat. *herba*, herb + *cædere*, to kill). A name applied to any substance used to destroy weeds. Of the various chemicals that have been successfully and inexpensively employed in weed destruction, dilute solution of carbolic acid, strong brine, copper-sulphate solutions, arsenic, sal soda, arsenate of soda, kerosene, etc., have been most extensively used upon walks, drives, courts, etc., in the destruction of dandelions, plantain, knotweed, ragweed, and various grasses. For best results, salt should be applied dry. At the rate of 3000 pounds of crude salt per acre, meadows can be freed from the orange hawkweed, a plant that resists all other methods of destruction. The interesting discovery has been made that some weeds, such as charlock, penny cress, wild radish, shepherd's purse, etc., may be destroyed without permanently injuring the crops among which they grow, by spraying the fields with a solution of copper sulphate (blue stone) at the rate of 40 gallons per acre. The most satisfactory strength of solution to use has been found to be one pound of copper sulphate to four gallons of water. The spraying should be made on a calm bright day, when the weeds have attained only three or four leaves. If the solution be well applied the weeds will be killed. Iron sulphate (copperas) may be substituted for the blue stone, but then a stronger solution is required, viz. one pound of the salt to a gallon of water. This treatment has been repeatedly tried in England, France, Germany, and the United States with great success. If rain falls soon after the spraying is done, or if the plants have been allowed to become too old, a second application should follow the first within a week or ten days. Young clover growing in the cereals will not be injured by the treatment.

HERBIVORA (Neo-Lat. nom. pl., from Lat. *herba*, herb + *vorare*, to eat). A term in the old classifications, variously defined and limited, which designated herbivorous as contrasted with carnivorous animals, but ordinarily referred to such as grazed. The term long ago ceased to have any exact significance in science.

HERBORT VON FRITZLAR. A German poet of the twelfth and thirteenth centuries, so called from his residence at Fritzlar in Hesse. He was somewhat read in the classics, and was probably in orders. He wrote the *Liet von Troie*, a poetic version of the Trojan War, and the oldest extant German work on that subject, based closely on the *Roman de Troie* of Benoit de Sainte More. The work is in the four-stressed rhyming distich. The language is decidedly Middle German, and mistranslations of the original are not infrequent. There are some worthy passages, such as the address of Achilles to the dead Hector. Perhaps Herbort von Fritzlar is to be identified with a Herbort who appears as the author of a drama, now lost, on Saint Otto.

HERB ROBERT. A common weed. See GERANIUM.

HERBS, CULINARY. Aromatic plants used in the preparation of viands. The plants popularly employed owe their flavoring properties to volatile oils which in most instances are derived from the leaves, either fresh or cured; in other cases, for example, dill and caraway, the seed is utilized. In Europe these plants are essential adjuncts of the cuisine, especially of France, where the ethereal flavors of such plants as fennel, basil, and balm are sought, and of Germany and England, where preference is given to more pronounced flavors, such as dill, sage, and mint. In America, few herbs are known beyond the confines of the larger cities, where the foreigners are slowly educating their neighbors in the uses of these plants. Uses they certainly have, in rendering certain inert salads and the too often tasteless 'made-over' dishes not merely palatable, but delicious.

The kinds most commonly employed in America are parsley, sage, thyme, marjoram, and savory (qq.v.). Each of these may be grown from seed, either in the garden or in boxes of good soil on a sunny window-sill. No special care is necessary, except to remove weeds and to keep the surface of the soil loose. When well established, the leaves may be gathered without injury to the plants; indeed, the yield may be increased by judicious removal of the tips of the shoots, or, in the case of parsley, of the individual leaves when they have attained the very dark green stage. The leaves should be gathered just when the flower-buds appear, and preferably immediately after the dew has disappeared in the morning, because the plants then contain the most oil. By spreading the leaves thinly upon trays in a heat not exceeding 120°, and occasionally turning them, they will soon be dry enough to pulverize, an operation generally performed by rubbing between the hands. The powder will keep best in air-tight jars, poorest in paper or pasteboard packages, because the paper absorbs the oil and permits its escape into the air. Herbs may also be preserved in alcohol or vinegar. When this method is employed a jar is filled with leaves and liquid enough poured over to cover them completely. After standing a few days the liquor will be ready for use. Dried herbs are generally used where the presence of specks is not objectionable, as in dressings, stews, soups, etc.; infusions in clear sauces, and the fresh herbs in salads. In general, sage is regarded as the proper flavoring ingredient in dressings with goose, duck, pork, and other rich meats; parsley, savory, fennel, balm, and marjoram, either singly or mixed, in dressings with turkey, chicken, veal, and similar delicate meats. Tarragon is perhaps most used in sauces with boiled fish, spearmint with spring lamb, dill with cucumber pickles. Individual taste, however, has much to do with the kind and quantity used and with what kinds of food.

HERBST, hërpst, EDUARD (1820-92). An Austrian politician, born in Vienna. He was elected a Deputy to the Bohemian Diet, and then, in accordance with the February patent of 1861, was elected by the Diet to the Lower House in the Austrian Reichsrat, where he became one of the most conspicuous leaders of the German Liberal or Constitutional Party. In 1867 he was appointed Minister of Justice in the Liberal Cabinet (Bürgerministerium) of Prince Carlos Auersperg. As such he introduced a number of im-

portant reforms, among them the abolition of imprisonment for debt; the introduction of the jury in libel suits against the press; the organization of the district courts; and, above all, the confessional ordinances of 1868. In 1870 his party lost its control of the Government, and he led the opposition in the Reichsrat in its attacks on the Ministries of Potocki and Hohenwart, until the fall of the latter in October, 1871, brought the German Constitutional Party once more into power, when he became a leader of the Government forces in the Lower House. In the latter years of his life, during the Taaffe régime, Herbst lost much of his former influence. Among his writings may be mentioned his *Handbuch des österreichischen Strafrechts* (7th ed. 1882-84).

HERCHER, hër'kër, RUDOLF (1821-78). A German Hellenist. He was born at Rudolstadt, and after studying at Jena, Leipzig, and Berlin, was appointed to a professorship at the Joachimsthal Gymnasium in Berlin (1861). In 1873 he was made a member of the Berlin Academy of Sciences. His works, which are distinguished by critical accuracy, include editions of *De Fluviis* (1851), which he proved had not been written by Plutarch; Arrian's *Scripta Minora* (1854, 2d ed. by Eberhard, 1885); *Scriptores Erotici Græci* (2 vols., 1858-59); *Ælian* (1858); and the *Oνειροκριτικά* of Artemidorus (1864); Plutarch's *Moralia* (vol. i. 1872); the *Epistolographi Græci* (1873); and Apollodorus's *Bibliotheca* (1874). His *Homerische Aufsätze* on the topography of Ithaca were collected by C. Robert (1881).

HERCULANEUM, hër'kû-lâ'nè-ùm (Lat., from Gk. Ἡράκλειον, *Hērakleion*, city of Hercules, from Ἡρακλῆς, *Hēraklēs*, Hercules). An ancient city of Italy, situated at the northwestern base of Mount Vesuvius, about five miles east of Naples. It was doubtless founded by Oscans, but Etruscans seem to have gained a foothold there. It subsequently was conquered, with all the rest of Campania, by the Samnites, and later it fell into the hands of the Romans. In A.D. 63 the city was seriously injured by a violent earthquake; and in 79 it was buried, along with Pompeii and Stabiae, by the memorable eruption of Vesuvius (q.v.). It now lies at a depth of from 30 to 120 feet below the surface, owing to successive eruptions of later days, and is filled up and covered with volcanic tufa, composed of *lapilli* and ashes, and consolidated to some extent by water, which is often thrown up in great quantities during volcanic eruptions. Above it, on the modern surface, are the two large villages Portici and Resina. The very existence of Pompeii had been forgotten, but the knowledge had never been lost of the burial-place of Herculaneum. Finally, in 1719, an Austrian general, Count Elbeuf, sank a shaft which fortunately struck the ancient theatre, from which centre some tunneling was done, and objects of interest discovered. But after a short time the Government stopped the work till 1738, when explorations were begun under royal authority. From that time excavations have been carried on intermittently, being more difficult than in Pompeii. For the greater part of the city lies deep under the modern villages, and work must be done by tunneling through a troublesome tufa, which needs constant support lest the vaults collapse, and with them the foundations of the houses above. Hence visitors can see only a

very small portion of this entombed city. The chief edifice shown is the theatre, which was very large, and was built but a short time before the fatal eruption. It has 16 rows of stone seats, and could accommodate about 3000 persons. A part of the Forum, with adjacent buildings, some private houses, two small temples, and a villa have also been discovered; and from these buildings many beautiful statues and remarkable paintings have been obtained. The art relics of Herculaneum far exceed in value and interest those found at Pompeii. Most remarkable was the discovery in the villa of nearly two thousand rolls of manuscript on papyrus, charred into a coal-like condition by their long burial under moist earth. Some of these have been deftly unrolled by a delicate process invented for the purpose, and their contents (philosophical treatises) deciphered. These treasures, together with such vases and domestic implements as have been found, have been conveyed to the museum at Naples. Latterly, the portion of Herculaneum toward the sea, which had been covered only by loose ashes, has been laid open, and ancient buildings may now be seen there. Consult: Ruggiero, *Storia degli scavi di Eucobano* (Naples, 1885); Comparetti and De Petra, *La villa ercolanese dei Pisoni* (Turin, 1883); Furchheim, *Bibliografia di Pompei, Ercolano e Stabia* (Naples, 1891).

HERCULANO, ar'kōō-lâ'no, ALEXANDRE DE CARVALHO E ARAUJO (1810-77). A Portuguese poet and historian, born in Lisbon. In 1828, to escape the despotism of Dom Miguel, he went to Paris, and two years afterwards to London. In 1832 he returned to Lisbon, joined the Liberal Party, and gained much fame as an editor of *Panorama*. His *Poesias* (1850), including *A voz do propheta* and *A harpa do crente*, the latter of religious and political importance, were followed by the historical novels: *Enrico, o Presbytero* (1847); *O monge de Cister* (1848); *O Bobo*; and *Lendas e narrativas* (1851). In 1845, as librarian at Ajuda, he began his historical work. The *Historia de Portugal* (1846-53) is an authority on Portuguese history to the end of the thirteenth century; equally important are: *Da origem e estabelecimento da inquisição em Portugal* (1854-55); *Questões publicas* (1873); and *Controversias e estudos historicos* (1876-84). As a member of the Lisbon Academy, Herculano edited *Portugalia Monumenta Historica*. Consult Pimentel, *Herculano e o seu tempo* (Lisbon, 1881).

HER'CULES (Gk. Ἡρακλῆς, *Hēraklēs*, also known at Thebes as Ἀλκαῖος, *Alkaios*, and frequently in literature called Ἀλκείδης, *Alkeidēs*, or Alcides; Lat. *Hercules*). The typical hero of Greek myth, and the subject of numberless legends. In general, these may be conveniently treated in three groups, centring about Thebes, Argos, and Mount Eta, near Thermopylæ, and corresponding to the birth, middle life, and death of the hero. Thebes seems to have been generally recognized as the birthplace of Hercules, and Amphitryon, the husband of Alcmena, is certainly a Bœotian hero; but when Argos had become the centre of his life it was necessary to connect his parents with that region, and so both Alcmena and Amphitryon become descendants of Perseus, and are represented as exiles from Tiryns, living at Thebes. According to the common story, during the absence of Amphitryon, Zeus came to Alc-

mene in her husband's form, and by him she became the mother of Hercules, while by Amphitryon she conceived his twin brother Iphicles. The jealous Hera, throughout his life the enemy of Hercules, sent two serpents to destroy the infants in their cradle; but the hero, who had been gifted by Zeus with superhuman strength, strangled them. Thebes is also the scene of the madness of Hercules, immortalized by Euripides in his play, *The Man Hercules*. In this fit he killed his children, and in some versions his wife, Megara, and was ordered by the Delphic oracle to expiate his crime by serving Eurystheus, King of Argos or Mycenæ. This feature seems much like an addition to bring the Theban hero into Argolis, and it is quite probable that the original Theban legend contained many exploits afterwards transferred to Peloponnesus. The killing of the lion of Mount Cithæron can scarcely be other than a variant of the first labor. At Argos the central feature is the servitude to Eurystheus, to which Hercules was bound even before his birth by a trick of Hera. To this servitude belongs a series of 'labors,' which were gradually fixed into a canon of twelve. The exact date when this was brought about is uncertain. It can scarcely be due to an early epic, for even in the fifth and fourth centuries there is no hard and fast line between the 'labors' and the other deeds, and the final classification appears first for us in the mythographers of Alexandria, who also arranged the *parerga*, or other deeds attributed to the hero in appropriate places in the cycle. Traces of an earlier cycle of ten labors are perhaps to be found in the story that, because in the second Hercules had the aid of Iolaus, and in the fifth concealed from Augeas that he was performing the command of Eurystheus, the latter refused to count these and required the performance of the eleventh and twelfth.

The first labor was to destroy the lion which haunted the forests of Nemea and Cleonæ and could not be wounded by the arrows of a mortal. Hercules boldly attacked him with his club, but in vain, and he was finally obliged to strangle him with his hands. From this time he wore the lion's skin as armor. The second was to destroy the Lernaean hydra with its many heads, which he accomplished with the assistance of his friend Iolaus. His third was to catch the Arcadian hind of Diana, famous for its swiftness, its golden horns, and its brazen feet. The fourth was to bring alive to Eurystheus a wild boar, which ravaged the neighborhood of Erymanthus. The fifth was to cleanse the stables of Augeas, King of Elis, where 3000 oxen had been confined for many years, a task which he accomplished in one day, by turning the river Alpheus or Peneus through the stables. His sixth was to destroy the carnivorous birds, with brazen wings, beaks, and claws, which ravaged the country near the Lake Stymphalus, in Arcadia. The seventh was to bring alive to Peloponnesus a bull, remarkable for his beauty and strength, which Poseidon had, upon his request, given to Minos, King of Crete, in order that he might sacrifice it. This, however, Minos afterwards refusing to do, Poseidon made the bull mad, and it laid waste the island. Hercules brought the bull on his shoulders to Eurystheus, who set it at liberty. It appears again as the Marathonian bull in the story of Theseus. The eighth labor was to obtain the mares of Diomedes, King of the Bistones

in Thrace, which fed upon human flesh. The ninth was to bring the girdle of Hippolyta, Queen of the Amazons. The tenth labor was to kill the triple-bodied monster Geryon and bring his herds to Argos. The eleventh was to obtain the golden apples from the garden of the Hesperides. Atlas, who knew where to find the apples, brought them to Hercules, who meanwhile supported the vault of heaven; but according to others, Hercules went himself and stole the apples, after slaying the dragon who guarded them. The last labor was to bring from the infernal regions the three-headed dog Cerberus. Hades promised him Cerberus on condition that he should not employ arms, but only force. When Hercules had brought the monster to Eurystheus, the latter, pale with fright, commanded him to be removed. Hercules set him at liberty, whereupon Cerberus immediately sank into the earth. Hercules was now free from his state of servitude.

Into the cycle of 'labors' are wrought many of the *parerga* performed by Hercules in his wanderings. Thus the battle with the centaurs, a favorite subject in archaic art, was localized at Pholoe in Arcadia, and connected with the chase of the Erymanthian boar. On his journey to Thrace for the horses of Diomedes he was entertained by Admetus, and, after wrestling with Death, restored to him from the grave his wife, Alcestis. The tenth and eleventh labors, with their long journeys, gave opportunity for many scenes. The hero voyages toward the western home of Geryon in a bowl given him by the Sun, and on his return through Italy kills the robber Cacus, who stole his cattle, and dedicates the *Ara Maxima* at Rome. While in search of the apples of the Hesperides, he wrestles with Nereus, the Old Man of the Sea, slays in Libya the giant Antæus, by his strength escapes from the Egyptian King, Busiris, who seeks to offer him as a sacrifice, and frees Prometheus from his captivity. He frees from Hades the captive Theseus. During the period of freedom from Eurystheus we find that Hercules made one of the Argonauts, and engaged in an expedition against Troy, because after freeing Hesione from a sea monster her father, Laomedon, had refused him his reward. In this period was also placed another fit of madness, in which he killed his friend Iphitus, and was in consequence required to serve the Lydian Queen, Omphale.

The legends that cluster about Mount Cæta are concerned with the death of the hero. He had won Deianira, daughter of Ceneus of Calydon, by overcoming his rival, the river god Achelous. With her he now repaired to Trachis. Having arrived at the river Evenus, he encountered the centaur Nessus. Hercules passed through on foot; but Nessus, under pretense of carrying Deianira over, attempted to offer her violence, whereupon Hercules slew him with an arrow dipped in the poison of the Lernaean hydra. Nessus, before expiring, instructed Deianira that a robe dipped in his blood would prove an infallible philter to regain her husband's love. The hero now made war against Eurytus, King of Echalía (who had defrauded him), slew him and his sons, and carried off his daughter Iole. Thence he went to Cenæon, in Eubœa, and erected an altar to Zeus Cenæos. In order to celebrate the rite with due solemnity, he sent Lichas to Trachis for a white garment. Deianira, being

jealous of Iole, anointed the robe with the philter she had received from Nessus. Hercules put it on, and immediately the poison penetrated his bones. Maddened by the terrible pain, he seized Lichas by the feet and flung him into the sea. He tore off the dress, but it stuck to his flesh, which was thus torn from his bones. In this condition Hercules was conveyed by sea to Trachis, and Deianira, being informed of what had occurred, destroyed herself. Hercules himself repaired to Mount Œta, where he erected a funeral pile, and, ascending it, commanded that it should be set on fire. The burning pile was suddenly surrounded by a dark cloud, in which, amid thunder and lightning, Hercules was carried up to heaven. There he became reconciled to Hera, and married Hebe.

Popular legend represented the great, patient, suffering hero as fond of good cheer and relaxation in his hours of rest, and thus in the comedy of Attica and Magna Græcia Hercules was frequently introduced as a jovial sensualist, whose intellectual powers are by no means equal to his physical.

In Greek art, from the earliest times Hercules is a favorite figure. His labors adorned the metopes of the Temple of Zeus at Olympia and the treasury of the Athenians at Delphi. His statues are numerous. Scopas seems to have represented him in youthful vigor, but in the Hellenistic period the type is that of a bearded man, of athletic build, often with the muscular development carried to excess, as in the Farnese Hercules of Glycon, which perhaps is based on a work of Lysippus.

As to the nature and origin of Hercules, there has naturally been the widest diversity of opinion. Some, following the later Greek identifications with the Phœnician Melqart, and the resemblances to the Babylonian hero Gilgames, have seen only a Semitic deity adopted by the Greeks. Others again have considered him a solar hero. It seems clear that the story of Hercules in its earliest features is pure Greek; the Oriental elements are, to judge from our sources, later accretions. Whether the hero or the god is the original form is, however, still matter for debate. E. Meyer (*Geschichte des Alterthums*, ii., Halle, 1894) has pointed out that Attica, Bœotia, and the Achaean colonies are the seat of the divine worship of Hercules, and insists that he is originally a nature deity, who, like many others, partakes of the changes of nature, now triumphant, now suffering, and that under the Dorian influence, and especially literary tradition, the god sank to the hero. On the other hand, U. von Wilamowitz-Möllendorff holds that in Hercules we have the perfect ideal of the Dorian man, who became a divinity to the tribes with whom the Dorians were in contact. Much can be said in favor of both views, and a positive decision between them is not as yet attainable; but it must be admitted that the degradation of a god to a hero seems common in the development of Greek mythology, while the reverse is by no means so clearly proved a process. Consult: Wilamowitz-Möllendorff, *Euripides's Herakles* (2d ed., Berlin, 1895); Furtwängler and Peters, in Roscher, *Lexikon der griech. u. röm. Mythologie* (Leipzig, 1884-97); and Dunbach, in Daremberg and Saglio, *Dictionnaire des antiquités* (Paris, 1892).

HERCULES, PILLARS OF (Gk., αἱ Ἡρακλέους στῆλαι, *hai Hērakleous stiēlai*, Lat., *Herculis Columnæ*). The name given by the ancients to the two rocks forming the entrance to the Mediterranean at the Strait of Gibraltar, Calpe (Gibraltar) in Europe and Abyla (Ceuta) in Africa. Their erection was generally ascribed by the Greeks to Hercules, on the occasion of his journey to the Kingdom of Geryon. According to one version of the story, they had once been united, but Hercules tore them asunder, to admit the flow of the ocean into the Mediterranean; another version represents him as causing them to unite temporarily, in order to form a bridge. The first author who mentions them is Pindar, who seems to connect them with Cadiz, and in later times there was much discussion as to their exact location, and especially as to whether they were to be identified with the promontories at the straits, or to be sought in islands, or were pillars erected by Hercules.

HERCULES AND STAG. An antique bronze sculpture in the Museo Nazionale, Palermo, Sicily, representing the lithe and youthful god grasping a stag by the horn and bearing it down to the earth. It was found at Pompeii.

HERCULES BEETLE. A scarabid beetle (*Dynastes Hercules*), remarkable not only for its great size (five inches long), but for the singular appearance of the male. An enormous

HERCULES BEETLE.
m, male; f, female.

horn projects from the head, and is opposed by a similar but smaller projection of the thorax, the whole resembling a pair of great but unequal pincers. It is a native of Brazil. Two species occur in the United States. *Dynastes tityus* is a large greenish-gray species of the Southern States; *Dynastes Granti*, of the far West, has a much larger thoracic horn than the former. Compare GOLIATH BEETLE.

HERCULES'S CLUB, ANGELICA TREE. See XANTHOXYLUM.

HERCULES'S CLUB GOURD. See BOTTLE GOURD.

HERCULES STRANGLING THE SERPENTS. A mythological painting by Sir Joshua

Reynolds (1788), and one of his best works. It represents the god, still a child, choking with miraculous strength two serpents which have attacked him; while Alcmene and her attendants rush to his rescue and Juno appears above him in a cloud. The painting, which hangs in the Hermitage Museum at Saint Petersburg, was ordered by Catharine II. of Russia, who saw in the subject a symbol of her country's early struggles for life.

HERCYNIAN FOREST (Lat. *hercynia silva*). A name variously applied by the ancient writers to portions of the central mountain system of Europe. Aristotle makes the Ister (or Danube) and the other great northern rivers take their rise in the Hercynian Forest. Cæsar, who estimates it at nine days' journey in breadth and sixty in length, comprehends under this name a great part of the mountain ranges in Germany north of the Danube; while some identify it with the Bohemian Forest, and others with the Thuringian Forest. Some geographers apply the term to the complex of mountain ranges, mountain groups, and plateaus which stretch from Westphalia across Middle Germany and along the northern borders of Austria to the Carpathians.

HERD, DAVID (1732-1810). A Scotch collector of national ballads. He was born in the Parish of Marykirk, Kincardine, where his father had a farm, but early left the country for the town and became a well-known figure among the literary men of Edinburgh. His claim to remembrance rests upon his *Ancient and Modern Scottish Songs, Heroic Ballads, etc.* (2 vols., 1776), of which a modern edition was published in Glasgow in 1869.

HERDER, hër'dër, BARTHOLOMÄUS (1774-1839). A German publisher, born at Rottweil, in Württemberg. In 1801 he opened a bookstore and printing-office in Meersburg, on Lake Constance, but soon afterwards removed to the city of Constance, and in 1810 to Freiburg, Baden, where he opened the Herdersche Universitätsbuchhandlung. He accompanied the Allies to Paris in 1814 as Imperial field printer in Metternich's suite, and on his return added to his printing business establishments for lithography, copper-engraving, and plastic art. The Catholic character of the firm was developed under his sons and successors, Karl Raphael Herder and Benjamin Herder, and it became one of the best-known publishing houses of this Church in Germany. In 1888 Hermann Herder, a son of Benjamin and grandson of the founder, inherited the business, which became known as the Herdersche Verlagshandlung. The firm also established an office at Saint Louis, Mo., U. S. A. Among the important works which the firm has published is *Wetzer und Welte's Kirchenlexikon oder Encyclopædie der katholischen Theologie* (12 vols., 1847-56; 2d ed. 1882-1901).

HERDER, JOHANN GOTTFRIED VON (1744-1803). An eminent German philosophical and critical writer, of the classical period, born at Mohrungen. He was the son of a schoolmaster and cantor. His frail health unfitted him for industrial life, and his first earnings were as copyist to Deacon Trescho, a voluminous but forgotten author. Here he was neither appreciated nor justly treated, but he gained a knowledge of books and an easy style. He had begun independent composition when he awakened the inter-

est of a Prussian surgeon, with whom he went to Königsberg, where he hoped to have an operation performed on an eye, and then to study medicine. But for the latter his nerves proved too weak, and he turned to theology, getting a small scholarship and eking out a livelihood by teaching. He soon won notice both as pedagogue and preacher, and became intimate with Kant, the philosopher, who, with Rousseau, was the guide of his future metaphysical speculations. In 1764 he accepted a call to the Cathedral School at Riga, where he maintained his reputation, and would have remained had he not become involved in a literary controversy with Klotz about Lessing, in the course of which he was led to protest that he had not written articles that universal opinion, supported by circumstantial evidence, held that he had. Thus he lost reputation, and resolved to recruit his health in the south of France in 1769. He returned to Germany in that year. He became tutor to the Prince of Holstein-Eutin, sharpened his critical genius in a fortnight with Lessing at Hamburg, found at Darmstadt his future congenial mate in Karoline Flachsland, and accepted a call to the pastorate of Bückeburg. He went thither in 1771, after a long stay in Strassburg for optical treatment, during which he was a helpful friend and critic of the young Goethe. He had printed the famous critical attacks on the artificial literary spirit of his time, *Fragmente über die neuere deutsche Litteratur* (1767) and the *Kritische Wälder* (1769), and a prize essay, *Ueber den Ursprung der Sprache* (1772). He now began to gather material for the *Ideen zur Philosophie der Geschichte der Menschheit*, his greatest work, though unfinished, published 1784-91 (translated by Churchill), for *Älteste Urkunde des Menschengeschlechts* (1774), an æsthetic study of Genesis, and for the studies in popular poetry (*Volkslieder*, 1778-79), the works that were to constitute his chief title to fame. In 1773 he married. In 1776 Goethe procured for him the posts of Court preacher and member of the Upper Consistory at Weimar, where he found the environment best suited to his delicately organized genius and labored effectively for Church reform, though he soon found himself in moral estrangement from Goethe and his associates. Many of Herder's important publications were completed in the period between 1778 and his journey to Italy in 1788. They consist of theological, æsthetic, philosophic, philologic, and political studies, of *Vom Geiste der Ebräischen Poesie* (1782), translated by Marsh (*The Spirit of Hebrew Poetry*, 1833), of a translation of *The Cid* (1805), and of *Stimmen der Völker* (Voices of the Peoples) (1778-80), in which he translated the popular songs of many nations with a felicity and sympathy that preserve in wonderful degree the local color and feeling. Herder's original work in æsthetics, philosophy, literature, and philology has powerfully influenced German thought. He was possibly best as an interpreter of others; for he had a truer perception of the relation of language to human nature and national character than any other of his day. He was thought, if not a systematic a most stimulating thinker, perhaps more a seer than a scholar, yet by the scope of his intuitional perceptions he abounded in suggestions that have borne fruit in the modern correlation of the sciences. Herder's *Works* are in 60 vols. (1827-30). The literary portion has been best reëdited by Suphan and

Redlich (9 vols., Berlin, 1884 et seq.). For Herder's biography, consult his widow's *Erinnerungen aus dem Leben Johanna Gottfried von Herders* (Stuttgart, 1830); his sons, *Lebensbild* (Erlangen, 1846-47); and his *Letters* (ib., 1846-48). There are *Lives* by Haym (Berlin, 1880-85); Kühnemann (Munich, 1894); and in English by Nevinson (London, 1884).

HERD'S GRASS. See REDTOP.

HÉRÉDIA, á'rá'dé'á, JOSÉ DE (1842—). A French poet, of Spanish parentage, born at Santiago de Cuba. He was the most talented disciple of Leconte de Lisle (q.v.). His sonnets are the supreme result of the cultivation of form that the French call 'Parnassian,' very picturesque and as impersonal as lyric poetry can be. Leconte de Lisle was not quite impassive in his pessimism, but in Hérédia's work one perceives of the author only the expansion of the heart toward beauty and heroism. The immediate response of the public to the fifty sonnets of *Les Trophées* (1893) was significant of the revival of stricter classical taste in a reaction against the fantastic license of the Symbolists and the followers of Baudelaire (q.v.). Hérédia's poems resemble Gautier's in polish. They show the reticences of the conscious artist, and a vague suggestion of the subjective. He is the most condensed, plastic, and precise stylist of modern France—rich in suggestions of color and melody, incomparable in the union of sonorosity and compression. His subjects reflect in the main the scenes and traditions of his youth at Havana rather than those of his later studies at the Ecole des Chartes. The heroic epoch of Spanish conquest is his most inspiring theme, and he uses it also in his sole picaresque prose romance, *La nonne Alferex* (1894), and in a translation of Bernal Diaz's *Chronicle*. But he is often superb in merely exotic description, as in the brilliancy of *Récif de corail* or the splendor of *Blason céleste*. Hérédia was elected a member of the French Academy in 1894. There is a translation of the sonnets into English blank verse in Frank Sewall's *The Trophies* (Boston, 1900).

HEREDIA, ā-rā'dé-ā, JOSÉ MARIA DE (1803-39). A Cuban poet, born in Santiago de Cuba. He completed his law studies at Havana in 1823, but was immediately thereafter exiled on account of the liberality of his political views. He published his first volume of poems in New York (1825), and their popularity with his countrymen all over the globe resulted in an invitation to Mexico, where he entered into the practice of his profession and was honored by important official positions. An enlarged edition of his poems was published in two volumes in 1832. They have been translated from the Spanish into the chief modern tongues, and critics of all nations have approved of them. Heredia wrote three dramas which were staged in Mexico (1826-29), and *Lecciones de historia universal* (1830-31), besides translating some famous French and Italian poems into Spanish verse.

HEREDIA Y CAMPUZANO, é kām-pōō-zā' nō, JOSÉ MARIA (1803-39). A Cuban lyric poet, born in Santiago de Cuba, December 31, 1803. His father and mother were from Santo Domingo. Very early Heredia was taken to Florida, then to Santo Domingo, and in 1812 to Venezuela. At the age of ten he began to study philosophy in Caracas, whence he went to Mexico. Thence he went to the University of Ha-

vana in 1817. Heredia had scarcely become a lawyer when he was arrested for conspiracy against Spain and banished from Cuba (1823). He now lived in the United States for two years, making a scanty livelihood by his poems and by giving lessons in Castilian. We next find him in Mexico, whither he had been called by Guadalupe Victoria. Heredia held in Mexico various offices both legal and educational. In 1827 he married a Mexican, Jaida Yáñez. After thirteen years of banishment Heredia sought and obtained permission to visit his mother and sisters at Matanzas. Three months later he had to leave them. Heredia died at Toluca, Mexico, May 12, 1839. Though he is infinitely less gifted than his young cousin, José Maria de Heredia (q.v.), this Cuban poet is well worth reading, because he is the first of the Cuban poets of the patriotic group. Heredia's Spanish is remarkably pure. His verses are often rhetorical, sometimes crude, and one is continually impressed by the weakness and the vanity of their author; nor is there ever any great power in Heredia's reasoning, which is often that of an hysterical nun, but his verses are often imaginative and they reflect the melancholy of exile. Consult: *The Obras poéticas de Don José Maria de Heredia*, ed. of Nestor Ponce de Leon (New York, 1875); *Poesias liricas con prólogo se Elias Zerdo* (Paris, 1893); and Hills, *Bardos Cubanos* (Boston, 1902).

HEREDITAMENT (ML. *hereditamentum*, from Lat. *hereditare*, to inherit, from *heres*, heir). In English law, a comprehensive term including everything that goes to the heir-at-law. Hereditaments are regularly classified as corporeal and incorporeal. A house or land held in freehold is a corporeal hereditament; while tithes, advowsons, profits *a prendre*, and even future estates in land are incorporeal, being dealt with, in our legal system, as impalpable rights enjoyed in corporeal things. The term most frequently appears in the phrase 'lands, tenements, and hereditaments,' technically used by Blackstone and other common-law writers to denote every species of real property. Hereditaments is the most comprehensive term of the three, as it includes not only lands, but incorporeal interests, such as those above referred to, and not only tenements, but such things as heirlooms (q.v.). On the other hand, it does not include interests in lands, such as leasehold estates and life estates, which do not descend to the heir. See HEIR; REAL PROPERTY.

HEREDITY (Fr. *hérédité*, from Lat. *hereditas*, inheritance, from *heres*, heir). The phenomenon of correlation in the deviations of blood relatives from the mean. No two individuals are alike; by marshaling in a series a large number of individuals of a species we shall find it possible to recognize a typical or middle condition of each organ or quality. From this typical condition called the mode, the organs or qualities of most individuals deviate to a certain extent. Thus, if stature be the quality in question, we shall find that adult males of the United States have a modal stature of, say, 67 inches. Then a person whose stature is 70 inches deviates 3 inches from the mode in a + direction. According to heredity, his close relatives will, on the average, deviate in this same direction, and will

deviate from the mode to an extent which can be predicted, or which we may hope some day to be able to predict. The subject will here be treated under the following heads: (1) The classes of heredity; (2) the mathematical laws of normal inheritance; (3) special cases of inheritance not following the normal law, and (4) the limits of inheritance.

(1) CLASSES OF HEREDITY. Heredity deals, as we have seen, with the qualities of organisms and their parts. Now there are, in the case of two parents and their offspring, four general methods of inheritance of qualities: (a) The qualities of the parents may blend in the offspring. This case of *blending heritage* is illustrated by human stature. Let us imagine the wholly supposable case of a family of children all of whose maternal ancestors for five generations back had been two inches taller than the mode of females, and all of whose paternal ancestors had been four inches taller than the mode of males; then the stature of the male offspring or of the female offspring would be found close to three inches above the mode of male or female stature, as the case might be. The tendencies in the two parents have precisely blended, and the offspring are intermediate. Another illustration of blending heritage is skin-color in man. The mulatto is a half tint, the quadroon a fourth tint, and so on. (b) The quality may be inherited from one parent wholly, and not at all from the other parent. This case is known as *alternative heritage*. This sort of inheritance is illustrated by human eye-color. Galton (*Natural Inheritance*, p. 139) says: "If one parent has a light eye-color and the other a dark eye-color, some of the children will, as a rule, be light and the rest dark; they will seldom be medium eye-colored, like the children of medium eye-colored parents." Cases of alternative heritage have also been described for plant hybrids. Alternative heritage is exhibited in the hair-color of some mammals. For when a white and yellow mouse are crossed, some of the offspring may be pure white (albinos), like the one parent, and the others may be yellow, like the other parent, with no sign of the yellow becoming lighter. (c) In one part of the body the quality may be exactly like that of one parent; in another part, exactly like that of the other parent; in other words, there may be a patchwork intermingling of parental qualities. This case is known as *particulate inheritance*. Particulate inheritance is common in hair-color of horses, dogs, mice, and other mammals. When we cross two plants in which the leaf-hairs differ, this sort of inheritance often occurs, so that the two kinds of hairs of typical form are scattered over the leaf. (d) *Reversion*. This is inheritance from a remote ancestor, or, perhaps, more truly, the absence of typical inheritance. Reversion is often illustrated when two domesticated races of very dissimilar color are crossed. The result may be offspring which resemble neither parent, but are like the ancestral, wild species. It is at present impossible to predict what kind of inheritance will be shown by the qualities of any new cross.

(2) MATHEMATICAL LAWS OF NORMAL INHERITANCE. Man, like most other animals, has two parents, four grandparents, eight great-grandparents, sixteen ancestors of the fourth generation, and, generally, $2n$ ancestors of the n th ancestral generation. We inherit not only from our parents, but also from our remote ancestors.

The law of inheritance in the case of blending heritage has been worked out by Galton as follows: To the total heritage the parents together contribute 50 per cent.; the four grandparents together, 25 per cent.; the third ancestral generation, $(\frac{1}{2})^3$ or 12.5 per cent.; and, generally, with the n th ancestral generation $\frac{1}{2}n$ per cent. of the total heritage. It is a corollary of this law that the offspring of an exceptional pair will, in the long run, be less exceptional than their parents, unless, which is extremely improbable, their ancestors for six or seven generations have all been as exceptional as the parents. It is because the vast population of one's ancestors is pretty sure to be mediocre that the sons of exceptional parents tend to be less exceptional than they. There is a regression of the progeny toward mediocrity. We can measure this regression (on the average), and say the deviation of the son's stature from the mean will be only $446 \div$ the deviation of the father's stature from the mean, or less than half. From the law of ancestral inheritance we may indeed calculate the relative relationship between two blood relatives in respect to any blending character. This has been done by Pearson in the following table:

Parent.....	.3000	First cousins.....	.0750
Grandparent.....	.1500	First cousins, once removed.....	.0344
Great-grandparent.....	.0750	Second cousins.....	.0172
Great-great-grandparent.....	.0375	Second cousins, once removed.....	.0082
Brothers.....	.4000	Third cousins.....	.0041
Uncles and nephew.....	.1500	Great-uncle and nephew	.0625

(3) SPECIAL CASES OF INHERITANCE NOT FOLLOWING THE NORMAL LAW. The normal law has so far been demonstrated only for cases of blending inheritance. For the other cases our knowledge is almost wholly qualitative. The normal condition of inheritance in these cases may be said to be equal inheritance of any quality from father and mother; or, in the case of alternative heritage, an equal proportion of offspring affected by the two parents. The first deviation from this law is the phenomenon of prepotency, or the excessive inheritance from one parent or one race. It often happens that a certain family characteristic crops out again and again, and in a larger percentage of cases than is called for by the normal law of inheritance. This is most marked when the parents belong to distinct races. Thus, when a common house mouse and a domesticated white mouse are crossed, the offspring are more like the house mouse in color than they are like the tame albinos. Ewart, in crossing horses, found that the male was strongly prepotent. The fact of prepotency is also familiar to plant-breeders who have tried to formulate some of its laws. Thus, it is asserted that the older species, or the more vigorous, is prepotent. 'Sports,' or considerable deviations from the typical condition, are apt to be prepotent. Bell has shown that deaf-mutism is a prepotent quality. The following case of inheritance of syndactylism in man is given by Smith and Norwell, in the *British Medical Journal* for July 7, 1894. Syndactylism, or the growing together of two or more fingers, is a rather rare abnormality. In the diagram ♂ stands for male, ♀ for female, N for normal, and S for syndactylie. Of two parents, the male precedes the female. When the law of normal inheritance calls for 20 per cent. of syndactylie individuals in the latest generations, observation gives 69 per cent.

given the name of germ plasm." This germ plasm exists in the nuclei of the reproductive cells.

The word 'continuity' expresses the hypothesis that heredity depends on the fact that a minute quantity of this germ plasm lies unchanged in the nucleus of the reproductive cells during the growth of the plant or animal, and afterwards grows and gives rise to the germ cells. A further elaboration of Weismann's views is not here necessary (see USE-INHERITANCE and WEISMANNISM), but to him we are mainly indebted for the view now generally held, that the germ plasm (chromatin) of the nuclear matter is the bearer of heredity.

The hypothesis seems supported by the experiments of Boveri on the eggs of the species of two genera of sea-urchins. By cross-fertilization of whole eggs or bits of eggs of sea-urchins of different genera having nuclei, larvæ are developed that share the larval forms of the parents of both genera. On the other hand, larvæ arising from the *enucleated* bits of eggs have inherited the characters of the male genus only. Hence he claims to have demonstrated the law that the nucleus alone is the bearer of heredity.

It may be observed that Hertwig, for the germ-plasm theory of Weismann, substituted the theory of the controlling inter-adjustments of the embryonic cells, and later of the tissues and organs.

HOMOCHRONOUS HEREDITY. A form of heredity called by Darwin "inheritance at corresponding periods of life," and by Haeckel "homochronous heredity." Darwin thus describes the phenomenon: "When the embryo leads an independent life, that is, becomes a larva, it has to be adapted to the surrounding conditions in its structure and instincts, independently of those of its parents; and the principle of inheritance at corresponding periods of life renders this possible." (*Variation of Animals and Plants Under Domestication*.) Again: "On this principle of inheritance at corresponding periods, we can understand how it is that most animals display from the germ to maturity such a marvelous succession of characters" (ib.).

Examples of this law are the complicated metamorphosis of certain free, but more especially the parasitic worms, notably the fluke-worms (see TREMATODA) and the cestodes (see CESTODA), the complicated metamorphoses of the echinoderms, of the mollusks, crustaceans, and of those insects with a complete metamorphosis, and more especially such insects as the Meloidæ, Rhipiphoridae, and Stylopidae, in which there is a hypermetamorphosis.

It is not altogether improbable, says Packard, that the phenomena of alternation of generations is primarily due to changes in surroundings, and hence of habits, resulting in new needs which were met by adaptation to the new surroundings, and that the different stages were fixed by homochronous heredity.

HEREFORD, hēr'e-ford. The capital of Herefordshire, England, a Parliamentary and municipal borough of great antiquity, and an episcopal see; on the Wye, 51 miles south of Shrewsbury (Map: England, D 4). The chief building is the cathedral, dating from 1079, and the fourth church built on the site; it was restored in 1856-63. The chapter-house contains the famous *Mapa Mundi*—map of the world—of the thirteenth century. Other edifices are the bishop's palace, originally a Norman hall; the Coningsby Hospital, 1610; the corn exchange, and the Doric shire hall. Hereford has an endowed grammar school of the fourteenth century. It owns profitable markets and real estate, gas, water, and electric-lighting plant; maintains a fire brigade, free library and museum, and the Castle green. Its industries and trade are chiefly agricultural. The see of Hereford was created in 673; the town was a fortified place in the reign of Athelstan, and numerous charters begin with King John. For its loyalty and sufferings during the Civil War, Charles I. bestowed the motto "Invictæ fidelitatis præmium." Population, in 1891, 20,300; in 1901, 21,400. Consult: Duncumb, *History and Antiquities of Hereford* (Hereford,

1804; new ed., London, 1882); Fisher, *Hereford Cathedral* (London, 1898).

HEREFORDSHIRE. An inland county in the west of England, bounded on the west by South Wales, and on the east by the counties of Worcester and Gloucester (Map: England, D 4). The surface of the county is hilly, with occasional valleys. Among the chief hill-ranges are the Black Mountains on the western, and the Malvern Hills on the eastern border. The Wye and its affluents, with the Lugg, the Arrow, and the Teme, are the principal rivers. Herefordshire is essentially an agricultural county, with four-fifths of its area of 840 square miles under cultivation. Population, in 1891, 115,949; in 1901, 114,400. Capital, Hereford.

Herefordshire formed a portion of the territory of the ancient Silures, and was conquered by the Romans about A.D. 73. During the heptarchy it was included in Mercia. From its position on the Welsh border—a portion of the county being included in the debatable land called the "Marches"—Herefordshire was long the scene of frequent contests.

HEREMANS, hĕr'e-mĕns, JACOB FRANS JAN (1825-84). A Dutch philologist, born at Antwerp. He studied at the Antwerp Athenæum, and in 1843 was appointed assistant librarian of the city. In 1864 he was appointed professor of the Dutch language and literature at the University of Ghent. He was a specialist also in Flemish literature, and wrote biographies of the Flemish poets Ledeganck (1847) and van Rijswijk (1850), and of the historian David (1868). His other books include: *Nederlandsche dichters-halle* (1858-64); *Hoffmann von Fallersleben en de Nederlandsche letterkunde* (1874); *Over den invloed van Noord-Nederland op de letterkunde in de zuidelijke provinciën gedurende het tijdperk 1815-30* (1874), all on literary topics; and *Nederlandsche spraakleer* (1846); *Nederlandsche metrie* (1862); and his Dutch-French dictionary (1865-69). He founded the *Nederlandsch Museum* in 1874.

HEREROLAND, hĕ-rĕ-rō-lĕnt, or **DAMARALAND.** A northern part of German Southwest Africa (q.v.), inhabited by the Herero or Ova-herero tribe (Map: Africa, F 6).

HERESY (OF. *heresie*, Fr. *hĕrésie*, from Lat. *hĕresis*, school of thought, from Gk. *αἵρεσις*, *hairesis*, choice, from *αἵρεῖν*, *hairein*, to take). The name given to religious opinion declared by ecclesiastical authority to be erroneous and contrary to the accepted standards of the Church. In the Septuagint the word is used of the various Jewish parties—Pharisees, Sadducees, and Essenes—and similarly in the Acts of the Apostles. Paul employs it to denote the party divisions into which the Corinthian Christians have fallen, and he rebukes them because they destroy the unity of Christ's flock. Once only in the New Testament (II. Peter ii. 1) has the word its later meaning of *wrong belief*. For some time the boundary line between right and wrong doctrine, orthodoxy and heresy, was not perfectly clear, but a distinction was soon rendered possible by the growth of ancient Catholic Christianity. Before the close of the second century the bishops had begun to test doctrinal soundness by the Rule of Faith (q.v.) and the Canon of Scripture as standards, the interpretation of which was held to rest with themselves. Thus judged, the Gnostics (q.v.)

are heretics to Irenæus (180) and Tertullian (c.200).

Beginning with Nicæa (325) the œcumenical councils gave united expression to the doctrinal belief of Christendom, so that the determination of what constituted heresy became much easier than before. With the adoption of Christianity as the State religion under Constantine, the civil Government was led to take cognizance of heresy, on the ground that it imperiled the public welfare. The first Imperial edicts to be mentioned in this connection are those of Constantine against the Donatists (q.v.), in 316. Under succeeding emperors similar decrees become frequent, and increasingly severe. Especially important are the edicts of Theodosius the Great, who in 381 set about enforcing orthodoxy throughout his whole empire. Saint Augustine lent his support to a policy of coercion, and sought to rest it upon the authority of Christ, who said: "Compel them to come in" (Luke xiv. 23). The first Christian to suffer death for his belief, at the hands of fellow Christians, was the Spaniard Priscillian (q.v.), who was charged with holding doctrines akin to those of the Manichæans (q.v.), and was executed at Treves, in 385, by order of the usurping Emperor Maximus. In the sixth century Justinian, the great codifier of Roman law, collected the Imperial edicts against heresy in the first book of his celebrated *Code*. The spirit which had already taken possession of the Christian Church is well illustrated by the saying of Pope Gelasius I. (492-496): "Toleration of heretics is more injurious than the worst devastation of the provinces by the barbarians."

Anti-heretical laws were more fully developed from the eleventh century onward, when the various sects of the Cathari (q.v.) began to infest Southern Europe. It was in connection with the Albigensian Crusade (see ALBIGENSES), in the thirteenth century, that the Dominican courts of inquisition were established. (See INQUISITION.) During this period the close alliance between Empire and Papacy made it possible for each to aid the other in detecting and punishing offenders. The penalties for heresy included loss of civil rights, banishment, and confiscation of property. In addition, the Church could inflict punishments of her own, such as excommunication. A clergyman, if convicted, could be deposed and degraded from office. Like treason, heresy was construed as a capital offense. But it was an established Catholic axiom that "the Church does not thirst for blood." According to mediæval usage, therefore, a heretic, declared guilty by the ecclesiastical courts, was handed over to 'the secular arm' for execution. The earliest recorded instance of the legal use of burning, as a form of inflicting the death penalty, occurs in Lombardy in 1224. This soon became the favorite method of executing obstinate offenders. The English law, *de hæretico comburendo*, was enacted in 1401, in which year the first burning in England took place. The last execution by this means in England was in 1612.

According to the canon law, 'formal heresy' (*hæresis formalis externa*) exists, in the case of a baptized Christian, when he consciously adopts and persistently maintains an opinion known to be contrary to the doctrinal standards of the Church. What is called 'material heresy' consists in falling into heretical opinion through

ignorance, and this is an offense of far less gravity. Previous to the Protestant Reformation the Church was in a better position to carry out a systematic policy of repression than it has been since. The legalizing of several different ecclesiastical bodies, the growth of toleration, and the final attainment of complete religious freedom in the United States, have effectually removed religious opinion from the jurisdiction of civil government. It remains solely a matter of ecclesiastical discipline. See DISCIPLINE, ECCLESIASTICAL.

Different churches differ widely in the extent to which they attempt to control the belief of their adherents. The most effectual system is that of the Roman Catholic Church, which, in its modern form, goes back to the establishment of the Congregation of the Holy Office in 1542. In general, Roman Catholics are forbidden all *communicatio in sacris* with heretics. For many years (from Urban V. in 1364 to Clement XIV. in 1769) the Papal bull, *In Cœna Domini*, which enumerated the heresies condemned by the Church, was publicly read in Rome on Maundy Thursday. More recently the Pope has sometimes felt compelled to warn the faithful against prevalent error, which, if adopted and persisted in, might become open heresy. Thus Pope Pius IX. published his celebrated *Syllabus of Errors* in 1864, condemning eighty current opinions as erroneous.

Some of the Protestant reformers held almost as stringent views respecting the repression of heresy as did their Catholic contemporaries. Calvin approved the execution of Servetus (q.v.), and Beza and Melancthon defended it. But most Protestants have gradually tended to rest satisfied with securing, by means of adequate tests, a reasonable degree of theological uniformity among the clergy, trusting the laity to conform their belief to that of their spiritual leaders. Heresy trials have occurred in several denominations in recent times, but their outcome does not encourage the hope that doctrinal agreement can be promoted by such means. The Protestant churches of to-day show an increasing aversion to the thought of trying men for their beliefs, and a desire to emphasize their fundamental principle of the right of private judgment, which was asserted at the Reformation.

BIBLIOGRAPHY. Arnold, *Unparteiliche Kirchen- und Ketzerhistorie* (Frankfort, 1699); Burton, *Heresies of the Apostolic Age* (London, 1829), which contains a bibliography; Hahn, *Geschichte der Ketzer im Mittelalter* (Stuttgart, 1846-50); Lea, *History of the Inquisition in the Middle Ages* (New York, 1888); Van Espen, *Jus Ecclesiasticum* (Cologne, 1702), especially on the legal aspects of heresy; Hinschius, *Kirchenrecht der Katholiken und Protestanten* (Berlin, 1869-97); White, *History of the Warfare of Science with Theology* (New York, 1896). See HERETIC.

HERETIC. A person holding an erroneous religious belief or one contrary to the standards of the Church. (See HERESY.) The most important of the individuals and sects commonly classed as heretical may be thus enumerated. The early orthodox writers represent Simon Magus (Acts viii.) as the father of heresies. After him, in the first two Christian centuries, come Menander, Cerinthus, the Ebionites, Nicolaitans, Nazarenes, and Elkesaites (Judaizing parties).

In the second century, the Gnostics, Saturnilus, Basilides, Valentinus, Ptolemæus, Marcus and Heraclæon; the antinomian sects of Ophites, Cainites, and Sethians, with whom we may class Carpocrates; the representatives of the ascetic tendency, Tatian and the Encratites; Marcion, and his followers, the Marcionites; Montanus and the Montanists; the Alogi, of Asia Minor (who rejected the Logos idea and the fourth Gospel); and among the earlier Monarchians, Theodotus of Byzantium, Theodotus the money-changer, Artemon, Praxeas, and Noëtus of Smyrna. In the third century, Sabellius, Paul of Samosata, Mani (from whom come the Manichæans), Novatian and his adherents. In the fourth century, the Arians (who opposed the Athanasian doctrine of the Trinity), the (schismatic) Donatists, who run over into the fifth century, the Macedonians, and the Apollinarians. In the fifth century, in the East, the Nestorians, Eutychemians, Monophysites, and Origenists (all of whom were heterodox in Christology); in the West, the Pelagians and Semi-Pelagians, all of whom were combated by Saint Augustine. The Semi-Pelagians run over into the sixth century. In the seventh century, the Monothelites (logical successors to the Monophysites). In the eighth, the Paulicians of Armenia, descended from an ancient Adoptianist type of Christianity, whose origin is perhaps to be sought in the teaching of Paul of Samosata. In the eleventh century we find the Euchites, inaccurately described as Manichæans. In the twelfth, the Bogomiles, Petrobrusians, Cathari, and Waldenses (the last two having a considerable period of activity). In the thirteenth century, the important and numerous Albigenses. In the fourteenth, the Friends of God and the Brethren of the Free Spirit, and (in England) Wiclif and the Lollards. In the fifteenth, Hus and the Hussites, Taborites, Calixtines, or Utraquists, Jerome of Prague, the Bohemian Brethren, and Savonarola.

From the Roman Catholic point of view, the Reformers were heretics. The great change in the ecclesiastical situation wrought in the sixteenth century, and the speedy legalizing of new Church organizations, has made the whole problem of heresy a different one since that time. It is, therefore, undesirable to proceed further with the list. See the various titles mentioned in this article, and, for bibliography, see HERESY.

HERETIC BAPTISM. One of the great questions in the Christian Church of the third century relating to the reception into the Church of those who had been baptized by heretics. Up to that time it would seem that the baptism of such persons had been accepted, and the rite had not been repeated. Clement of Alexandria (d. c.215), it is true, in passing calls 'heretic baptism not proper and true water,' but he does not say that it was invalid, and the universal practice was to consider it valid. But in the early part of the third century Agrippinus, Bishop of Carthage, took opposite ground, influenced perhaps by Tertullian, who says: "Heretics have no fellowship in our discipline. . . . Therefore their baptism is not one with ours . . . a baptism which, since they have it not duly, doubtless they have not at all." This Agrippinus presided over a synod held in Carthage between 218 and 222 which pronounced heretic baptism invalid, and the same declaration

was made by two Asia Minor synods held about this time. It then became the practice in Carthage and elsewhere to rebaptize those received into the Church from the heretical sects, on the ground that the baptism which they had received was no baptism.

But the Roman Church, and apparently the majority of the churches in the West, dissented from Agrippinus, considering that the use by heretics of the baptismal formula made their baptism valid; and accordingly, on the ground that baptism was not to be repeated, did not baptize those coming into the Church from heretical sects. In so acting these churches followed precedent, and instituted the practice since followed by the Roman Catholic Church throughout the world.

When Cyprian, the great Bishop of Carthage, came into his see (in the year 248-49) he accepted the view of the Carthaginian Church, and when it was criticised he called synods, in 255 and 256, which formulated this view and enjoined the corresponding practice of rebaptism of converts from the heretics upon the churches. Cyprian sent a report of the doings of the councils to Stephen, the Bishop of Rome from 254 to 257. This was a deliberate rebuke to the Church at Rome and those churches agreeing with her, and so Stephen wrote against Cyprian.

The position of Stephen found vigorous supporters and probably little opposition in the Western Church generally. Thus Augustine, Bishop of Hippo (d. 430), the final teacher of the Western Church, lays down the same doctrine, in writing against Petilian, the Donatist: "When the water of baptism is given to any one in the name of the Father, and of the Son, and of the Holy Spirit, it is neither ours nor yours, but His of whom it was said to John, 'Upon whom thou shalt see the Spirit descending, and remaining on Him, the same is He who baptizeth with the Holy Spirit.'"

But Cyprian's view was accepted and defended in many places, and universally by the Donatists, as was natural seeing that their leader and founder was Donatus, the Bishop of Carthage, in 313. So when Augustine entered in debate with the Donatists he devoted an entire treatise to the refutation of Cyprian's position (*De baptismo contra Donatistas*).

The Eastern Church has followed Cyprian rather than Stephen in denying validity to heretical baptism and insisting upon an orthodox interpretation of the baptismal formula. That this was early the case is shown by the remark of Cyril, Bishop of Jerusalem (d. 386): "We may not receive baptism twice or thrice . . . for there is only one baptism . . . heretics, however, are rebaptized since the first [so called] baptism was no baptism;" by the council in the *Apostolic Constitutions*, of uncertain date, but probably prior to the sixth century: "Be ye likewise contented with one baptism alone, that which is into the death of the Lord; not that which is conferred by wicked heretics, but that which is conferred by unblamable priests. . . . Those that receive polluted baptism from the ungodly will become partakers in their opinions;" and yet more strongly by the command in the *Apostolic Canons*, dating from the same period: "If a bishop or presbyter . . . does not baptize him who is polluted by the ungodly [i.e. has received heretical baptism], let him be de-

prived." Athanasius (d. 373) expressed himself to the same effect: "There are many other heresies too, which use the words [of the baptismal formula], but not in a right sense . . . nor with sound faith, and in consequence the water which they administer is unprofitable, as deficient in piety, so that he who is sprinkled by them is rather polluted by irreligion than redeemed." The voice of the Council of Nicæa (325) is of the same tenor: "With respect to the Paulianists, who wish to return to the Catholic Church, the rule which orders them to be rebaptized must be observed;" but the Council of Laodicea (somewhere between 343 and 381) distinguishes between heretics upon the ground of their position respecting the Trinity, enjoining rebaptism upon those who came into the Catholic Church from the Montanists (canon 8), but not upon those from the Novatians or Quartodecimans (canon 7).

Thus the West universally accepted the teaching of Stephen that where baptism was administered in the name of the Trinity it is valid; while the East qualified it by insisting that the person baptizing must be orthodox as to the Trinity, otherwise the baptism was invalid. The present teaching of Roman Catholics and Protestants is that of Bishop Stephen; while in the *Orthodox Confession of the Greek Church* direct mention is made of the necessity of an orthodox interpretation of the formula, and the same is implied in the *Longer Catechism of the Eastern Church*.

HEREWARD, hēr'e-wērd. An English outlaw who has passed into legend as the last champion of Saxon England against the Normans. He was a native of Lincolnshire, and appears in Domesday as the owner of lands in a number of places in that shire. In 1070 Hereward headed a revolt among the inhabitants of Peterborough and with the aid of a Danish fleet burned the town and plundered the abbey. He then retreated to the Isle of Ely, among the fens, where for more than a year he held out against the Normans. Here he was joined by a number of Saxon leaders, among them Morkere the former Earl of Mercia. He was finally driven from his refuge by William the Conqueror. Hereward's subsequent career is unknown, but it would seem that he made his peace with the King, who employed him in his wars in Normandy. The surname of Wake or Watchful dates from a much later period. Charles Kingsley has depicted Hereward as "the last of the English" in his novel, *Hereward the Wake*.

HERFORD, hēr'fōrt. A town in the Province of Westphalia, Prussia, situated on the Werre, 10 miles from Bielefeld (Map: Prussia, C 2). It is a town of great antiquity and contains an old Münsterkirche begun in the twelfth century, another church dating from the thirteenth century, a gymnasium founded in 1540, and a theatre. The chief manufactures of the town are linen, clothing, chocolate, and confectionery, cigars, tobacco, furniture, etc. The trade is important. Herford is supposed to owe its origin to the convent founded in 822, whose abbess enjoyed a princely rank. The convent was abolished in 1803. Population, in 1890, 19,255; in 1900, 25,109, mostly Protestants.

HERFORD, CHARLES HAROLD (1853—). An English scholar born at Manchester, and edu-

cated at Trinity College, Cambridge, and in Germany. He was appointed professor of English language and literature at University College, Aberystwyth, Wales, in 1887; lectured at Oxford in 1897, at Baltimore and Chicago in 1900, and elsewhere. In 1885 he founded the English Goethe Society. Ripe and painstaking scholarship appears in his contributions to the *Dictionary of National Biography*, in his *Studies in the Literary Relations of England and Germany in the Sixteenth Century* (1886), and *Age of Wordsworth* (1897). His interest in Scandinavian literature led him to several translations, among which are Ibsen's *Brand* in the original metres (1893), and *Love's Comedy* (1900). He also edited the "Eversley" Shakespeare in 1902.

HERGENRÖTHER, hĕr'gen-rĕ'tĕr, JOSEPH (1824-90). A Catholic theologian of Bavaria. He was born at Würzburg, and studied theology there and in Rome. He became a priest in 1848, instructor at Munich in 1855, and in 1852 professor of Church law and history at Würzburg. In 1868 Pius IX. made him a member of the canonical commission for the Vatican Council. He is best known for his *Anti-Janus* (1870), an answer to Döllinger's *Janus*, and the *Kritik der von Döllingerschen Erklärung vom 28. März 1871* (1871), in which he defended the doctrine of the Pope's infallibility. He was made a cardinal in 1879. His historical works are: *Der Kirchenstaat seit der Französischen Revolution* (1860); *Photius, Patriarch von Konstantinopel* (1867-69); *Katholische Kirche und Christlicher Staat in ihrer geschichtlichen Entwicklung und in Beziehung auf die Fragen der Gegenwart* (1872-76); *Handbuch der allgemeinen Kirchengeschichte* (last ed. 1884-86); *Kardinal Maury* (1878); *Abriss der Papstgeschichte* (1879); and *Leonis X., Pontificis Maximi, Regesta* (1884-91). Consult: Steiner, "Kardinal Hergenröther," in *Episkopat der Gegenwart* (Würzburg, 1876); and Stamminger, *Zum Gedächtnisse Kardinal Hergenröthers* (Freiburg, 1892).

HER HOR, hĕr hĕr, or SMENDES. An Egyptian King, of the twelfth century B.C., founder of the Twenty-first Dynasty, originally chief priest of Ammon. He built much at Karnak, and it was he who stored away the royal mummies discovered by Brugsch Bey in 1881.

HÉRICART-FERRAND, á'rĕ'kär' fá'rán', LOUIS ETIENNE FRANÇOIS, Vicomte de Thury (1776-1854). A French engineer and agriculturist, born in Paris, and educated there, at the School of Mines. From 1809 to 1830 he was inspector-general of quarries, and for the last seven years of this period was director of works. In agriculture he made a special study of irrigation. He was a Deputy in 1815-27, and in 1824 was elected to the Academy of Sciences. Besides contributions to the *Journal des Mines* (1799-1815), to the *Annales des Mines*, and to the *Annales de la Société d'Horticulture*, his principal works were: *Descriptions des catacombes de Paris* (1815); *Considérations sur les puits forés* (2d ed. 1829); and *Du desséchement des terres cultivables* (1831).

HÉRICHAULT, á'rĕ'kô' (DE RICAULT), CHARLES JOSEPH (1823—). A French historian and romancer, born at Boulogne-sur-Mer. He began his literary career by writing for the *Revue des Deux Mondes* and other journals, and for seven years (1883-90) he conducted one he had

himself founded, the *Revue de la Révolution*. His novels include: *La fille aux bleuets* (1860); *Un gentilhomme catholique* (1863); *La reine sauvage* (1869); *Les cousins de Normandie* (1874); *Le premier amour de lord Saint-Albans* (1879); *Le dernier amour de lord Saint-Albans* (1879); and *Aventures de deux Parisiennes pendant la Terreur* (1881); while the best of historical work is to be found in *Origine de l'épopée française et son histoire au moyen âge* (1860); *La France guerrière* (1867); *Histoire nationale des naufrages et aventures de mer* (1870); *Thermidor, Paris en 1794* (1872); *La Révolution, 1789-1882* (1882). He also edited the works of Gringoire, Clément Marot, and Charles d'Orléans.

HERING, hā'rīng, CONSTANTIN (1800-80). A German-American physician. He was born in Oschatz, Saxony; studied medicine and surgery at Leipzig, Würzburg, and Dresden, and soon afterwards became a convert to homeopathy. In 1833 he emigrated to America, and settled in Philadelphia, where he founded the first American homeopathic school, and from 1845 to 1860 was professor of the institutes of medicine and materia medica in that institution. He was the editor of several homeopathic magazines, and published a number of books, including: *Rise and Progress of Homœopathy* (1834); *Effects of Snake Poison* (1837); and *Guiding Symptoms and Analytical Therapeutics* (1875).

HERING, EWALD (1834—). A German psychologist and physiologist. He was born at Alt-Gersdorf in Saxony, on August 5, 1834; practiced medicine in Leipzig in 1860, and became docent in physiology at the university there in 1862. Three years later he was appointed professor of physiology at the medico-surgical Josephs-Akademie, Vienna. From 1870 to 1895 he occupied a similar position at the German University at Prague, and in 1895 he was called to Leipzig. Hering's publications are many of them of unusual scientific merit and importance. Best known are: *Beiträge zur Physiologie* (1861); *Die Lehre vom binocularen Sehen* (1868); *Ueber das Gedächtnis als eine allgemeine Funktion der organisierten Materie* (1870; Eng. trans., *On Memory as a General Function of Organized Matter*, 1897); *Grundzüge einer Theorie des Temperatursinnes* (1877); *Zur Lehre vom Lichtsinne* (1878); "Raumsinn des Auges—Augenbewegungen" (1879), "Temperatursinn" (1880), both in Hermann, *Handbuch der Physiologie; Ueber Newton's Gesetz der Farbenmischung* (1887); *Zur Theorie der Nerventhätigkeit* (1899).

Hering has won a high place among psychologists by his contributions to psychophysics. His name is especially associated with four features of this science, by (1) his investigations into visual space perception, wherein he argued for the nativistic or physiological theory against the 'empiristic' position of Helmholtz; (2) his treatise on memory as a general function of organized matter; (3) his attack upon Fechner's 'fundamental law of psychophysics,' otherwise known as 'Weber's law;' and (4) his theory of color vision, which stands out in sharp rivalry with that of Helmholtz. Nearly all subsequent theories may be regarded as improvements upon, or modifications of, these two theories. Hering's cardinal postulates are: (1) An independent brightness process (grays); (2) a paired ar-

rangement of the constituent processes (white-black, red-green, yellow-blue); and (3) an antagonistic relation between the colors of each pair. The advantages of this theory as an explanation of the psychological phenomena of vision have won for Hering the support of the great majority of psychologists.

HERING, RUDOLPH (1847—). An American engineer, born in Philadelphia. He graduated at the Polytechnic School in Dresden, Germany, and from 1868 on was employed in important engineering work, among other offices holding those of engineer in charge of the water-supply for Philadelphia and Chicago. In 1881 he prepared, for the National Board of Health, a comprehensive report on the sewerage of European cities.

HERINGSDORF, hä'rings-dörf. The principal German summer resort on the Baltic coast, situated on the island of Usedom in the Prussian Province of Pomerania, 40 miles from Stettin (Map: Germany, F 1). It is a picturesque place with numerous fine villas and hotels, and is visited by about 13,000 people in the season. Population, in 1900, 874.

HERIOT (AS. *heregeatu*, military apparel, from *here*, Goth. *harjis*, OHG. *heri*, Ger. *Heer*, OChurch Slav. *kara*, OPruss. *karjis*, OPers. *kāra*, army + *geatu*, equipment). In old English law, a customary tribute of goods and chattels, payable to the lord of the fee on the death of a freehold tenant. It may have had its origin in the practice of returning to the lord the martial equipment which he had furnished to his vassal. But in course of time it came to be regarded as a form of relief (q.v.), payable by the heir on succeeding to the inheritance, as a sort of inheritance tax or death duty. If a vassal fell in battle in the service of his lord, no heriot was demanded. As heriots were due only of tenants who held by knight's service, they disappeared with the abolition of military tenures. Nominally, however, the right still exists in England in connection with copyhold estates, but it is in practice obsolete. See **TRIBUTE**.

HERIOT, hēr'ŏt, GEORGE (1563-1624). A Scottish goldsmith and philanthropist, founder of Heriot's Hospital, Edinburgh. He was the son of a goldsmith of Edinburgh, and followed his father's business. In 1597 he was appointed goldsmith to Anne of Denmark, consort of James VI. of Scotland, and four years afterwards to the King, on whose accession, in 1603, to the English throne Heriot went to London, where as Court jeweler and banker he amassed a large fortune. Of this he left £23,625 to the town council of Edinburgh for the education of the children of decayed burgesses and freemen of that city. According to his will, the hospital or school which he wished to found was to be in imitation of Christ's Hospital, London. The school was opened in 1659; in 1885 it was reorganized for secondary and higher branches. In 1902 the funds yielded upward of £50,000, and besides supporting the original foundation, furnished many scholarships at the Heriot-Watt College, the university, and other schools of Edinburgh. Heriot figures as "Jingling Geordie" in Scott's *Fortunes of Nigel* (Edinburgh, 1822).

HERIOT, GEORGE (1766-1844). A Canadian official and author, born on the Isle of Jersey. In 1799 he was at Quebec, in the Ordnance Department. The following year he was appointed

Deputy Postmaster-General, and held the position for six years. He turned soldier during the War of 1812, was next in command to De Salaberry at the battle of Chateauguay, and in 1841 was made a major-general of militia. He represented Drummond County (1830-34), and wrote a *History of Canada* (2 vols., 1804), wherein he is largely indebted to Charlevoix, as well as *Travels Through the Canadas* (1807).

HERIOT, JOHN (1760-1833). A Scotch author, born at Haddington. He was educated at Edinburgh High School and University, but left without graduating, on account of lack of means, and went to London. Here he entered the marine service, was made a lieutenant at the age of eighteen, was in several of the naval engagements of the period, and was wounded in Rodney's famous fight with the French (April 17, 1780). When the war was over, Heriot was retired upon half pay, which he supplemented by making light literature out of his heavy experiences, such as *The Sorrows of the Heart* (1787), and *The Half-Pay Officer* (1789); but more important is his *Account of Gibraltar* (1792). After starting and editing two newspapers, he retired into Government positions, and from 1810 to 1816 lived in Barbadoes as deputy paymaster-general of the troops in the Windward and Leeward Islands. The last seventeen years of his life he spent in Chelsea Hospital, where he was comptroller.

HERI-RUD, hēr'ē-rōōd' (Lat. *Arius*). A river of Central Asia, rising in the Koh-i-Baba range of the Hindu Kush Mountains, 150 miles west of Kabul (Map: Afghanistan, H 4). It flows through Afghanistan, for more than 300 miles through a fertile and beautiful valley past Herat; then, bending suddenly to the north, it flows along the Persian boundary, and afterwards northwest through Turkestan, making a farther course of 400 miles, till it terminates in the swamp of Tejend. After entering Turkestan, the Heri-Rud assumes the name of Tejend. Its chief tributary is the Keshef from the west.

HERISAU, hār'ē-sou. A town of Switzerland, in the Canton of Appenzell, situated near the river Glatt, six miles southwest of Saint Gall (Map: Switzerland, D 1). The town is irregularly built, has a church-tower reputed to date from the seventh century, a public library, an arsenal, a new town house, and a hospital. The manufactures comprise muslin, cotton, and silk. In the vicinity are iron springs. Population, in 1900, 13,497. Herisau was known early in the ninth century, and was ruled by the abbots of Saint Gall till the middle of the fifteenth, when it entered the Swiss Confederation.

HERISSON, ār'ēsōn', MAURICE, Count (1840-98). A French officer and publicist, born in Paris. He entered the army, and took part in the Italian campaign and in the Chinese War, under General Montauban. In 1869 he was sent to America to make statistical studies. He returned to France at the outbreak of the Franco-Prussian War; was on the staff of General Schmitz, and later an ordinance officer under General Trochu, and was present at the interview between Bismarck and Jules Favre at Ferrières. In 1875 he was sent on an archaeological expedition to Tunis, and in 1891 was made head of the French militia in Congo. His main works are: *Etudes sur la*

Chine contemporaine (1864); *L'esprit chinois et l'esprit européen* (1869); *Journal d'un interprète en Chine* (1885); *Journal de la campagne d'Italie* (1889); and *Les responsabilités de l'année terrible* (1891).

HERISTALL, hēr'i-stál. A town in the Province of Liège, Belgium. See HERSTAL.

HERITABLE BOND, or HERITABLE SECURITY. In Scottish law, a bond or other obligation secured by a pledge or conveyance of heritable, i. e. real, property. In modern times it has taken on the form of the English and American mortgage of real property. See MORTGAGE.

HERITABLE JURISDICTIONS. A remarkable class of criminal jurisdictions held hereditarily from the Crown of Scotland. These jurisdictions amounted to upward of a hundred in number, and consisted of sheriffships, stewardries, constabularies, but principally of regalities and baileries, with some offices of distinction. One of the more important was the office of the Lord Justice-General, and the Lordship of Argyle and the Isles, both belonging to the family of Argyle. In virtue of their hereditary rights the possessors of these jurisdictions exercised an arbitrary power over vassals and others within the limits of their domain, and could punish them by fines, scourging, imprisonment, and even in some cases put them to death, without interference of the common law. As repugnant to social policy, and more particularly with the view of extinguishing the authority of Highland chiefs over their clans, these heritable jurisdictions were abolished by act of Parliament in 1747 (20 Geo. II., c. 43), the possessors receiving payment for the estimated value of their rights. The abolition of these jurisdictions was followed by the appointment of sheriffs and the placing of the administration of the law in Scotland upon a uniform and modern basis. Consult Hume, *Commentaries on the Law of Scotland Respecting Crimes* (Edinburgh, 1844).

HERJULFSON, hēr'yulf-son, BJARNI. The hero of an ancient Icelandic saga, according to which he was the first Norse discoverer of America. He was the son of Herjulf, one of the early settlers of Iceland. When he grew to manhood he became a sea-rover, and spent most of his time abroad, returning only to pass alternate winters at his father's house. During one of his absences Herjulf removed to Greenland with Eric the Red, and when Bjarni on his return to Iceland the following year (986) found his father gone, he determined to follow. Three days after he had left Iceland a storm arose and the ship drifted for some time at its mercy. When at last the storm abated, the crew hoisted sail and came to a land covered with trees. As this could not have been Greenland, Bjarni refused to go ashore; so they sailed away, leaving the land on their left. Three times more they made the land, and the third time they found Eric's settlement in Greenland. News of the discovery they had made of a well-wooded country to the southward came to the ears of Leif Ericson (q. v.), son of Eric, and incited him to make his famous voyage to Vinland. Consult Reeves, *The Finding of Wineland the Good* (London, 1890).

HERKIMER. A village and the county-seat of Herkimer County, N. Y., 81 miles west by north of Albany; on the Mohawk River, the Erie Canal, and the New York Central and Hudson

River Railroad (Map: New York, F 2). It has a free library of over 7000 volumes, and the Polts Mission Institute. The village is in a dairying region, and manufactures knit goods, paper, furniture, beds, mattresses, etc. The water-works and electric-light plant are owned by the municipality. Population, in 1900, 5555.

HERKIMER, NICHOLAS (1715?-77). An American soldier of the Revolutionary War. He was born probably in what is now Herkimer County, N. Y., where his father, J. J. Hercheimer, a German from the Rhenish Palatinate, was a patentee. Nicholas served as a lieutenant of militia in the French and Indian War, and was in command of Fort Herkimer in 1758, when the French attack on German Flats was made. In 1775 he was commissioned a colonel of militia, and was chairman of the Committee of Safety of Tryon County. In the following year he was appointed a brigadier-general of the New York militia, and operated against Sir John Johnson. After Ticonderoga fell into the hands of Burgoyne's advancing army on July 7, 1777, Colonel Saint Leger joined Sir John Johnson at Oswego, and with a mixed force of 1800 British regulars, Tories, and Iroquois Indians under Joseph Brant, advanced toward Fort Stanwix (q. v.). The fort was invested on August 3d, and two days later Herkimer, with a force of 800 hastily recruited militia and volunteers, marched to its relief. Apprised by his Indians of the advance of the relieving column, Saint Leger arranged an ambuscade in a swampy ravine at Oriskany. Into this Herkimer, who had been compelled to give up his original plan of attack, marched. The battle that ensued, perhaps the most obstinate and murderous of the entire Revolution, was indecisive. The Americans held the field and drove their opponents off, but lost a third of their force in dead and wounded, and were too weak to continue the advance. Saint Leger's force, on the other hand, was so crippled and disorganized as to render out of the question both the continuation of the siege and the advance southward. Early in the fight Herkimer had his horse shot under him and his leg shattered by a musket-ball; but, seated on his saddlebags underneath a tree, he continued calmly to smoke and shout out his commands until the fight was over. Ten days later he died, as a result of an unskillful operation. A monument 85 feet high was erected to his memory on the field of Oriskany in 1884.

HERKOMER, HUBERT (1849—). A genre and portrait painter and etcher of the English school. He was born at Waal, near Landsberg, Bavaria, May 26, 1849. His family emigrated to the United States in 1851, but returned to England in 1857. Herkomer's early life was a struggle with poverty and ill health. He evinced early talent for painting, and in 1865 he studied under Echtler in Munich. In 1866 he studied at South Kensington under Frederick Walker, whose influence is evident in his early works. In 1870 he removed to London, where he soon became famous as an illustrator for the *London Graphic*, as well as for his painting. He was an excellent water-colorist, and became a member of the Royal Society in 1871, but was not made an Academician until 1890. In 1873 he settled at Bushy, Hertfordshire, where in 1881 he established an art school, in which various branches

of art besides painting were practiced. In 1882 he visited America, painting a number of portraits and delivering lectures in New York and Boston; he came again in 1883, and in 1885 he opened a studio in Boston. From 1885 until 1895 he was Slade professor of fine arts, Oxford, succeeding John Ruskin. His lectures before the university were published under the title *Etching and Mezzotint in Engraving* (London, 1892). He has been the recipient of many honors in European countries, and has taken three gold medals.

Herkomer's work includes not only oil and water-color painting, but also excellent etchings. He has worked successfully in various branches of applied art, such as wood-carving, wrought-iron work, and architecture, and has also figured as a playwright, actor, magazine writer, musical composer, and singer. His paintings are excellent in drawing and good in color. The best known of them is the "Last Muster," which took the grand medal of honor at the Paris Exposition of 1878. It represents the veterans of Chelsea at prayer in their chapel. Among his other paintings are: "After the Toil of Day" (1873); "Eventide" (1878); "Life, Light, and Melody" (1879); "God's Shrine" (1880); "Der Bittgang" (Bavarian peasants praying for harvest); and "Pressing to the West" (1884), representing the arrival of emigrants at Castle Garden; "Gathering in the Charter House;" "The Magistracy of Landshut" (1893), which he presented to his native town. His portraits are marked by strong characterization and excellent technique. The best include: The "Lady in White," which took the medal of honor at the Berlin Exposition in 1886; the "Lady in Black" (an American girl); the artist's father, Lorenz Herkomer, in the series "Makers of My House;" Wagner (1878); Ruskin (1881); Browning; Tennyson; Archibald Forbes (1882); and Hans Richter (1883). Among his best-known water-colors are: "Im Walde;" "The Wood Cutter's Rest;" "The Poacher's Fate;" and "At the Well." Consult: The articles on "Herkomer," by Dafforne, in the *Art Journal* (1880); Courtney, *Art Annual* (1892).

HERKULESBAD, hēr'kōō-lās-bāt. See MEHÁDIA.

HERLIN, hēr'lén, FRIEDRICH (?-c.1499). A German painter, born in Rothenburg or Nördlingen. He was probably the pupil of Rogier van der Weyden the Elder. At any rate, he painted in the style of that master. There is an altarpiece by him, representing scenes from the life of the Virgin, in the Church of Saint James at Rothenburg; a "Madonna and Saints" in the town hall at Nördlingen; and a "Nativity" in the Church of Saint Blasius at Bopfinger.

HERM (Lat. *Hermes*, from Gk. Ἑρμῆς, connected with Skt. *Sāramēya*, dog of the lower world, from *Saraman*, messenger of Sudra, from *sar*, to run, to flow, to hasten). A pillar, generally surmounted with a head of Hermes or Mercury, erected commonly in many parts of ancient Greece, especially in Attica, where they were used as milestones. Hermes being the god of traffic, roads, and boundaries. Sometimes heads of other divinities, such as Athena and Eros, were combined with that of Hermes. The Romans used them rather for merely decorative purposes than with any religious significance.

Many examples are preserved in European museums.

HERMAN, HENRY (1832-94). An English dramatist and novelist, born in Alsace. He was educated at a military college, emigrated to America, and served in the Confederate Army during the Civil War, losing an eye as a result of a wound received in action. Afterwards he removed to London, and began to write for the stage. His first play, *Jeanie Dubarry*, was produced at the Charing Cross Theatre in May, 1875, and was followed the next year by *Slight Mistakes*, a farce. In November, 1882, was produced his first great success, *The Silver King*, written in collaboration with Henry Arthur Jones, with whom he also wrote *Breaking a Butterfly* (1884) (Ibsen's *Doll's House*) and *Chatterton* (1884). He then wrote *Claudian* with William Gorman Wills (1884), and *The Golden Band* (1887) with Freeman Wills. He also wrote: *For Old Virginia* (1891); *Eagle Joe* (1892); and *Fay o' Fire* (1885), a romantic opera, for which Edward Jones composed the music. Between 1887 and 1891 he wrote several novels in collaboration with David Christie Murray, such as: *One Traveler Returns* (1887); *A Dangerous Catspaw* (1889); *The Bishop's Bible* (1890); *He Fell Among Thieves* (1890); and *Paul Jones's Alias* (1891). He also wrote alone a large number of novels.

HERMAN, ar'mān', MARTIAL JOSEPH ARMAND (1749-95). A French revolutionist, born at Saint Pol. He became a lawyer and an ardent revolutionist, and in 1793, when he had laid aside all his earlier counsels of moderation and had become intimate with Robespierre, he was appointed president of the Revolutionary Tribunal, and tried Marie Antoinette, Danton, and many others who died in that year. As Minister of Justice (1794) he had, and used, fresh opportunity for horrible murders. Accused of being bribed by Robespierre in 1794, and of complicity with Fouquier-Tinville (1795), he was condemned on May 6th and guillotined the next day.

HERMANDAD, ar'mān-dāp'. THE (Sp., brotherhood). The name given to associations formed at various times by the principal cities of Castile, Leon, and Aragon for the defense of their liberties in times of trouble. These confederacies were sanctioned by the sovereigns as agents for suppressing the increasing power of the nobles, and for maintaining public security throughout the land with no cost to the Government. In Aragon the first Hermandad was established in the middle of the thirteenth century, and in Castile about thirty years later. In 1295 thirty-four cities of Castile and Leon formed a confederacy, and entered into a compact by which they pledged themselves to inflict summary punishment upon every noble who had either robbed or injured a member of their association and who refused to make just atonement for the wrong; or upon any one who should attempt, even by the order of the King, to levy an unjust tax. During the long period of anarchy, in which the Christian rulers of Spain were powerless to maintain order in their own dominions, the *Santa Hermandad*, or Holy Brotherhood, presented the only check against the unbounded license of the nobles. Isabella of Castile, seeing the beneficial effects which an extension of the

institution was capable of producing, obtained the sanction of the Cortes (1476) for its thorough reorganization and extension over the whole kingdom. A court was established in every community of thirty families, and an appeal from the local court went to the Supreme Council. A general junta met annually, and instructions were transmitted to the provincial juntas. The crimes reserved for the jurisdiction of the Hermandad were all acts of violence and theft committed on the high roads or in the open country, and the penalties attached to each misdemeanor were specified with the greatest precision in the codes of laws which were enacted at different times in the yearly assemblies of the deputies of the confederated cities. An annual contribution was assessed on every hundred householders or *vecinos* for the equipment and maintenance of the horsemen and *quadrilleros*, or officials of the Brotherhood, whose duty it was to arrest offenders and enforce the sentence of the law. Although the Hermandad was regarded with much disfavor by the aristocracy, it continued for some time to exercise its functions, until the country had been cleared of banditti and the ministers of justice enabled to discharge their duties without hindrance from lawless disturbers of the peace. In 1485 the association issued its code of laws, known as the *Quaderno de las leyes nuevas de la Hermandad*. In 1498, the objects of the Hermandad having been obtained and public order established on a firm basis, the functions of the Brotherhood were greatly reduced and most of its officials done away with; in the course of half a century the Hermandad became transformed into a mere police force. Consult: Mariana, *Historia de España* (Valencia, 1783-96); Prescott, *History of Ferdinand and Isabella* (Boston, 1838). See SPAIN.

HERMANFRID, hër'mán-frèt (?-531). The last King of the Thuringians, son of Basinus. He ruled at first with his two brothers, Baderich and Berthar, but, urged on by his ambitious wife, Amalberga, killed Berthar and joined with Theoderich I., King of the Franks, against Baderich, who was defeated and dethroned in 516. Hermanfrid now refused to give up half of his kingdom, as he had promised, to Theoderich. The latter joined Clotaire I., his brother, and the Saxons, in a grand alliance against Thuringia, and dethroned Hermanfrid in 531. One story says that he was killed by his own armor-bearer. Amalberga went to Italy with her children, the bulk of Thuringia was joined to the kingdom of the Franks, and the Saxons took the northern part. The story of Hermanfrid has been dramatized by Wetzel and by Schlönbach.

HERMANN. A town and the county-seat of Gasconade County, Mo., 81 miles west of Saint Louis; on the Missouri River and on the Missouri Pacific Railroad (Map: Missouri, E 3). It is the centre of extensive vine-growing interests, and manufactures wine, in which there is an important trade, beer, flour, foundry products, etc. The picturesque scenery of the vicinity attracts many excursionists during the summer. Population, in 1890, 1410; in 1900, 1575.

HERMANN, hër'mán. The leader of the Cherusci in their celebrated victory over the Roman legions of Varus (A.D. 9). See ARMINIUS.

HERMANN, Count of WIED (1477-1552). Archbishop and Elector of Cologne, born at Wied.

He was elected Archbishop of Cologne in 1515, and supported the claims of Charles V., whom he crowned at Aix-la-Chapelle in 1520. The next year, at the Diet of Worms, he strongly opposed heresy, and endeavored to have Luther declared an outlaw, in spite of the fact that he himself was striving to bring about a reform, though within the Church. In 1542 he became an advocate of the new teachings, and in consequence was outlawed by the Emperor and banned by the Pope. The Emperor then secured the election of Adolf of Shaumburg to the Archbishopric, and Hermann withdrew to his Earldom of Wied, where he died a few years later. Consult Varrentrapp, *Hermann von Wied und sein Reformationsversuch in Köln* (Leipzig, 1878).

HERMANN, FRIEDRICH BENEDIKT WILHELM VON (1795-1868). A German political economist. He was born in Bavaria, and studied at the universities of Erlangen and Würzburg. His attention was early directed to mathematics and political economy. In 1823 he became privat-docent at the University of Erlangen; in 1825 he was called to the professorship of mathematics at the Gymnasium of Nuremberg; and in 1827 he became professor extraordinary of *Kameralwissenschaften* in the University of Munich. His great work, *Staatwirtschaftliche Untersuchungen*, which appeared in 1832, ranks as one of the most important contributions to German economics. In 1835 he was made member of the Royal Bavarian Academy of Science. He was inspector of technical instruction in Bavaria; in 1845 was appointed one of the Councilors to the Minister of the Interior; and in 1848 sat as a member for Munich in the National Assembly at Frankfurt, where he was one of the founders of the so-called 'Great-German Party,' which opposed the rise of the hegemony of Prussia; in 1850 he assumed charge of the Bureau of Statistics, and in 1855 he became Councilor of State. He published a large number of pamphlets and papers on political, economic, and industrial subjects, and the annual reports which he published as head of the Bureau of Statistics entitle him to the rank of one of the founders of the science of statistics.

HERMANN, GOTTFRIED (1772-1848). A German philologist. He was born at Leipzig, November 28, 1772; studied there and at Jena, and was made in 1798 professor extraordinary of philosophy at Leipzig. In 1803 he was professor of eloquence, becoming in addition professor of poetry in 1809, and in this position he remained till his death, December 31, 1848. The first department which he began to cultivate on original principles was metre, of which he attempted to develop a philosophical theory from the categories of Kant; and on this subject he wrote, besides his *Handbuch der Metrik* (1798), several Latin treatises, among which his *Epitome Doctrinæ Metricæ* (1818) reached a third edition in 1852. Of wider importance, however, was the new method which he introduced into the treatment of Greek grammar. The principles of this method are not only explicitly developed in his *De Emendenda Ratione Græcæ Grammaticæ* (1891), but are practically illustrated in his numerous editions of the ancient classics. Hermann's power of dealing with chronological, topographical, and personal questions is shown in his *Opuscula* (7 vols., Leipzig, 1827-30), which also

contain some poems. Consult: Jahn, *Gottfried Hermann, eine Gedächtnisrede* (Leipzig, 1849); Köchly, *Gottfried Hermann* (Heidelberg, 1874); Bursian, *Geschichte der klassischen Philologie in Deutschland* (Munich, 1883).

HERMANN, KARL FRIEDRICH (1804-55). A German classical scholar. He was born at Frankfurt-on-the-Main, and was educated at Heidelberg and Leipzig. In 1832 he was appointed professor of classical philology at the University of Marburg, and in 1842 succeeded O. Müller as professor of philology and archæology at the University of Göttingen, where he remained until his death. His principal works were his *Lehrbuch der griechischen Antiquitäten* (6th ed. 1882-92), a standard work on Greek antiquities; *Geschichte und System der Platonischen Philosophie* (1839); *Kulturgeschichte der Griechen und Römer* (1857-58); and text revisions of Plato (6 vols., 1851-52); Juvenal's *Satires* (1854); and Persius (1854). Consult Lechner, *Zur Erinnerung an Karl Friedrich Hermann* (Berlin, 1864).

HERMANN, ROBERT (1869-). A Swiss composer, born at Bern. He studied music at the Frankfurt Conservatory in 1891, and with Humperdinek (1893-94). In 1895 the Berlin Philharmonic Orchestra gave his *Symphony in C*, and since that time his compositions have met with increasing favor in Germany. His works include pieces for violin and piano, songs, a concert overture in D minor, quintets, trios, etc.

HERMANNSTADT, hër'mân-stât, Hung. **NAGY-SZEBEN**, nõd'y'-së'bën (Lat. *Cibinium*). An important town of Hungary, formerly the capital of Transylvania, beautifully situated on the Cibin, or Zibin (Hung. *Szeben*), an affluent of the Aluta, about 70 miles west-northwest of Kronstadt (Map: Hungary, J 4). Hermannstadt is the seat of a Greek archbishop and of a Lutheran superior consistory, possesses many fine schools, a library of 40,000 volumes, and a number of fine churches. There are extensive barracks. Tanning, wax-bleaching, and the making of cloth, combs, paper, and gunpowder are among the chief industries. Population, in 1890, 21,500; in 1900, 26,077, of whom two-thirds are Germans and the rest Magyars and Rumanians. Hermannstadt is the principal town in the so-called Saxon Land, and is supposed to have been founded by German colonists in the twelfth century.

HERMANN UND DOROTHEA, õont dõ'rõ-tã'ã. An idyllic poem by Goethe (1797). The plot was suggested by the appearance in Weimar and Eisenach of French emigrants who had been driven from Würzburg by the Bishop. This reminded Goethe of the historic expulsion, in 1731, of several hundred Protestants from his territory by the Archbishop of Salzburg, and on this the poem was based. The scene is laid in a small German town in 1796. Hermann, the son of an innkeeper of the town, meets Dorothea among the exiles and falls in love with her. The opposition of his father is overcome, and after clearing up the misconception of Dorothea, who at first understands that Hermann is seeking her as a servant for his father's household, Hermann wins her love. The poem is in nine cantos and contains 2000 hexameter verses. Goethe acknowledged indebtedness to Voss's *Luise* for the idea of his

poem, which, however, surpasses Voss's work in all particulars.

HERMANN VON FRITZLAR, fõn frits'lãr. A German mystic of the fourteenth century. Of his life we know merely that he came from Fritzlar, in Hesse, and that he traveled through Europe, visiting the tombs of the saints. It is surmised that he was a rich layman. He wrote *Die Blume der Schauung*, a speculative work now lost, and a mystical *Heiligenleben*, preserved in a manuscript written under his own supervision. This valuable document for the reconstruction of German mysticism in the fourteenth century is edited by Pfeiffer, in his *Deutsche Mystiker*.

HERMANN VON REICHENAU, ri'ke-nou, HERMANN DER LAHME, or HERMANNUS CONTRACTUS (1013-54). A German poet and mathematician. He was the son of the Swabian Count Wólverad. From childhood his limbs were painfully contracted, whence the name by which he is generally known. He attended a monastic school at Reichenau, and at the age of thirty joined the brotherhood. He was an earnest and a successful teacher, and drew about him a zealous body of pupils from various places. He wrote a treatise on the abacus (published by Treutlein in the *Boncompagni Bulletino*, vol. x., Rome, 1877); and did much to extend the knowledge of the column computation. Unlike Gerbert (see SYLVESTER II.), however, he seems to have had no knowledge of the Hindu numerals. He also wrote on a number-game, 'Rhitmomachia,' and on the use of the astrolabe (q.v.). He is best known, however, for his *Chronicon*, a work on history down to the year of Hermann's death. It was continued by Berthold (edited by Pertz, vol. v. of *Monumenta Germaniæ Historica*, 1844; and translated by Nobbe, 1892). Among his poems are: *De Octo Vitiis Principalibus* (ed. by Dümmler, in *Zeitschrift für deutsches Altertum*, vol. xiii.), and the Latin hymns, *Salve Regina* and *Alma Redemptoris Mater*. Consult Hansjakob, *Hermann der Lahme von der Reichenau* (Mainz, 1875).

HERMANN VON SALZA, zãl'tsã (?-1239). A grand master of the Teutonic Order, probably descended from the lords of Salza, in Thuringia. He became grand master in 1210, and raised the Order to an enviable position both in the East and in Europe. He made his headquarters in Venice, though his duties kept him continually traveling in Egypt, Palestine, Italy, and Germany, and several times he acted as arbitrator in the frequent quarrels between the Pope and the Hohenstaufen Emperor Frederick II. Carlyle says of him: "He is reckoned the first great Hochmeister . . . fourth in the series of masters; perhaps the greatest to be found there at all, though many were considerable." Consult: Carlyle, *History of Frederick the Great*, vol. i. (London, 1858-65); Koch, *Hermann von Salza, Meister des Deutschen Ordens* (Leipzig, 1885).

HERMANRICH, hër'mân-rîk (c.269-375). King of the Ostrogoths, variously called Hermanrich, Ermanarich, Ermanrich, and in myth Ermanrich. He was the founder of a great Ostrogothic power about the middle of the fourth century, when he conquered many Slavie and Finnish tribes, so that the saga makes him rule from the Black Sea to the Baltic. This story makes him

order that Swanhilde, wife of a defeated prince, be torn asunder by horses, for which Hermanrich is slain by her three brothers. According to another tradition he is said to have put an end to his life, at the age of more than a hundred years, when he saw that he was about to be attacked by the King of the Huns, Balamir.

HERMAPH'RODITE (Lat. *hermaphroditus*, from Gk. Ἑρμαφρόδιτος, son of Hermes and Aphrodite, from Ἑρμῆς, *Hermēs*, Hermes + Ἀφροδίτη, *Aphrodite*, Aphrodite). An obsolete term in botany, formerly used to designate those flowers that contain both stamens and pistils, these organs then being regarded as sexual.

HERMAPH'RODITE BRIG. See BRIG.

HERMAPH'RODITISM. See SEX.

HER'MAPHRODI'TUS. The son of Hermes and Aphrodite, born on Mount Ida, where he was brought up by naiads. Going in his fifteenth year to Caria, he rejected the love of Salmacis, the nymph of a fountain in which he bathed. Salmacis prayed to the gods to unite her to the boy forever, and a being resulted half male and half female. The origin of the dual conception is probably to be found in the Cyprian Aphroditus, worshiped in connection with Aphrodite. The form in which Hermaphroditus is represented in art was fixed by Polyclitus. It became a favorite subject for sculpture in the late Greek and Græco-Roman period.

HER'MAS, SHEPHERD OF (Lat., from Gk. Ἑρμάς). The title of a work (in Greek), written by a Christian of the second century, who lived in Rome; it is included among the works of the Apostolic Fathers (q.v.). Hermas was a well-to-do freedman, and a brother of Pius, Bishop of Rome about the middle of the second century. He was an earnest, simple-minded Christian, with little education or culture, but typical, no doubt, of many in the Church of his day. Some later writers, like Jerome, confuse him with the Hermas mentioned in Rom. xvi. 14, which is not surprising in view of the fact that he refers to persons and events of the Apostolic age as if they were contemporary. Parts of *The Shepherd* may have been written near the beginning of the second century, but other parts are obviously later, and the work as a whole should probably be dated not long before A.D. 140.

The book takes its name from one of its principal characters, an old man in shepherd's garb, who appears at the close of the first part, and thereafter attends Hermas as a sort of guardian, committing to his charge certain divine commands. The general theme is repentance and the duty of moral strenuousness. The book is divided into (1) five 'Visions,' which form the introduction; (2) twelve 'Mandates,' or commandments respecting the Christian life, and (3) ten 'Similitudes,' or parables, which picture among other things the progress of the Church. The whole forms an important source for our knowledge of second-century Christianity in Rome. Here and there it shows close resemblances to the Epistle of James. Visions and revelations play such an important part in the book that it is properly classed among early Christian apocalypses. A few recent critics hold that it was originally a Jewish book which received Christian revision and enlargement.

For some time after it was written opinion

was divided as to whether *The Shepherd* deserved to be classed among the 'Scriptures,' that is, among what we call the canonical books of the New Testament. Irenæus cites from it as 'Scripture,' and Clement of Alexandria and Origen esteemed it highly. It was often read in public worship. Tertullian, on the other hand, speaks slightly of its moral teaching. In the fourth century it was still held in honor, as Eusebius and Jerome testify, but there was no longer any doubt that it stood outside the sacred canon.

The Greek text, with English translation, has been published by Lightfoot, *Apostolic Fathers*, edited by Harmon (London, 1893). An English translation is given in volume i. of the American edition of *Ante-Nicene Fathers*, edited by Roberts and Donaldson (Buffalo, 1886). In general consult: Cruttwell, *Literary History of Early Christianity*, vol. ii. (London, 1893); Krüger, *History of Early Christian Literature* (New York, 1897); Taylor, *The Shepherd of Hermas* (New York, 1901).

HERMENEGILD, hēr'me-ne-gild (c.560-c.610). Son of Leovigild, King of the Visigoths, and centre of a Catholic legend. In 580 he rebelled against his father to induce him to become a Catholic, says the story, although there is no evidence that Hermenegild was a Catholic apart from the fact that he married Ingunthis, daughter of Sigibert and Brunhilde, who was orthodox. The son was defeated by his father and driven into exile. The legend makes him martyred by his father, whose second wife was an Arian. He was canonized by Pope Sixtus.

HER'MENEUT'ICS. See EXEGESIS.

HERMENGYLD, hēr'mën-gild. The constable's wife, in Chaucer's *Man of Law's Tale*. Constance is falsely accused of her murder.

HERMES, hēr'mēz. See MERCURY.

HERMES, hēr'mēs, GEORG (1775-1831). A German Roman Catholic theologian and philosopher, born in Dreyerwalde, Westphalia. His student life was passed in Münster, where he afterwards taught at the gymnasium (1798-1807), and lectured with marked success at the Academy (1807-19). In 1799 he was ordained to the priesthood. In 1819 he was called to the University of Bonn, where he spent the remainder of his life. As a professor of theology Hermes achieved the distinction of being the founder of a 'school,' known after him as the Hermesians. It was not long before all his colleagues at Bonn recognized him as their leader. It is said that his influence was sufficient to prevent the appointment of Möhler and Döllinger to professorships there. In Breslau, too, he gained many adherents. Spiegel, Archbishop of Cologne, was an active and powerful supporter of the new movement, and until his death (1836) the Hermesians were in high favor throughout the provinces of the lower Rhine. There seems to have been no doubt of their orthodoxy or of their loyalty to Catholicism, and so long as Hermes lived hardly a sign of opposition appeared. He died in 1831, at peace with the Church, and generally recognized as one of the foremost leaders of German Catholicism.

Four years later (1835), to the astonishment of the Hermesian party, Pope Gregory XVI. issued a brief, condemning Hermes's teaching and prohibiting his writings. The brief declared that

many complaints had reached the ears of the Pontiff, and that after careful examination Hermes's works had been found erroneous, scandalous, and injurious to faith. The sections especially objectionable related to the nature of faith and of divine revelation, the authority of Scripture and tradition, the necessity of grace, the evidence of God's existence, and the idea that through reason men could gain a knowledge of supernatural truth. Such teaching was declared to lead toward skepticism and indifference.

Since the year 1832 the party had had an organ, the *Zeitschrift für Philosophie und katholische Theologie*. In its columns and elsewhere defenses at once began to appear. The Hermesians declared that the Pope had been misinformed by persons who were ignorant of philosophy and theology alike. It was freely admitted that the doctrines specified in the Papal brief were heterodox, but it was alleged that these were not the doctrines of Hermes; that neither he nor his school had ever held or taught them. At this point the similarity of their defense to that adopted long before by the Jansenists (q.v.) should be noticed. So confident were they that the Pope was wrong that two of the Bonn professors (Braun and Elvenich) undertook a mission to Rome to persuade him to withdraw the brief. They found, however, that their hopes were baseless, and they were forced to return without having accomplished anything. About 1838 philosophical criticism began to add its strength to the opposition which had already developed in other quarters, and the decline of Hermesianism was rapid. The two Bonn professors, Braun and Achterfeldt, who had been most active in defense of Hermes's memory, retired in 1844. They were not subjected, however, to any ecclesiastical censure. Before the middle of the century the whole movement had become a matter of history.

Hermes's writings are few. Their titles are: *Ueber die Wahrheit des Christentums*, which appeared in 1805; *Einleitung in die christkatholische Theologie*, in two parts (1819 and 1829); *Christkatholische Dogmatik* (1834) published posthumously under the editorship of Achterfeldt. In general consult: Niedner, *Philosophie Hermesii Explicatio* (Leipzig, 1838); Braun and Elvenich, *Acta Romana* (Hanover, 1838); Werner, *Geschichte der katholischen Theologie* (Munich, 1866); Lichtenberger, *History of German Theology in the Nineteenth Century* (Edinburgh, 1889).

HERMES, hēr'mēz, or **MERCURY REPOSING**. A life-size bronze statue found at Herculaneum, now in the Museo Nazionale at Naples. It represents the youthful messenger of the gods seated and leaning forward with limbs relaxed. The attitude is life-like, and the statue is one of the most famous extant representations of the god.

HERMES CARRYING THE INFANT BACCHUS. A masterpiece of Praxiteles, found in 1877 at Olympia, and now preserved in the museum there. The figure of the god is the most perfect example extant of the Greek conception of youthful masculine beauty. Hermes stands leaning his left arm, draped with a cloak, on a tree-stump, and holding the infant god of wine. His right arm is missing, but evidently the raised hand held some object for the babe's amusement.

HER/MESI/ANAX ('Ερμηςιάναξ). A Greek elegiac poet, who lived in the time of Alexander the Great, and was a native of Colophon, in Asia Minor. His chief work was *Λέοντρον*, an elegiac poem in three books, addressed to his mistress, Leontium. The fragment of ninety-eight lines of the third book preserved by Athenæus (lib. xiii.) describes, in a somewhat disconnected though not ungraceful style, the love-stories of the poets and sages from Orpheus down to Philetas. Consult the editions by Bailey (London, 1839); by G. Hermann in his *Opuscula* (Leipzig, 1828); and by Bergk, in his *Anthologia Lyrica* (2d ed., Leipzig, 1868); also Bergk, *De Hermesianactis Elegia* (Marburg, 1845); and Susemihl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit* (Leipzig, 1892).

HERME/SIANISM. See HERMES, GEORG.

HERMES OF ANDROS. A statue in the National Museum at Athens, wrongly so called. It does not represent the god, but is a portrait statue belonging to a tomb, and is considered the best example of this class of statues. It dates from the fourth century B.C.

HERMES, OR A PHILOSOPHICAL INQUIRY CONCERNING UNIVERSAL GRAMMAR. A technical work by James Harris, much influenced by Aristotle. It was published in 1751, and was translated by Thurot in 1796 by order of the French Directory.

HERMES TRIS/MEGISTUS. See HERMETIC.

HERMETIC (ML. *Hermeticus*, relating to Hermes, from *Hermes*, Gk. 'Ερμης, Hermes). The ancient Egyptians considered the god Dhouti, or Thoth, identified by the Greeks with their god Hermes, as the patron of literature, and the scribe of the gods. Therefore, several magical and religious texts, partly embodied in the *Book of the Dead* (q.v.), were reputed to have been written by this god with his own hands. As such writings could claim the most direct inspiration, the word Hermetic was applied, in Greek times, to writings of the highest degree of sanctity, and served in a general way to designate all inspired books. Clemens of Alexandria states that the Egyptian priests had to study forty-two (i.e. the number of assessors of Osiris) sacred or Hermetic books, divided into six subjects: sacred law, ritual, science, astrology, hymnology, and medicine. It is questionable if such a canon existed throughout Egypt. The claim that the great medical papyrus discovered by Ebers was one of these Hermetic books has not been substantiated. In early Christian times it was customary to ascribe a certain type of magical and gnostic writings in Greek to Hermes Trismegistus, who lost his divine personality more and more, and came to be regarded as a great magician. These pseudographs often claimed to have been translated from the Egyptian, although they bear a thoroughly Greek character and mostly exhibit un-Egyptian ideas of Jewish, Neo-Platonic, etc., origin. They may, however, have been written in Egypt. The most noticeable product among them is *Hermes Trismegistus* (most recent edition by Parthey, Berlin, 1854). These writings exercised a strong influence upon the various secret sciences; hence the term Hermetic became very popular in alchemy and astrology, and some mediæval writings claim the title of Hermetic books. Hermetic

medicine meant the most mysterious and powerful medicine, and the expression 'hermetic sealing,' for the most complete, air-tight closure, has survived to our own day. Consult Dufresnoy, *Histoire de la philosophie hermétique* (Paris, 1742); Baumgarten-Crusius, *De Librorum Hermeticorum Origine atque Indole* (Jena, 1827); Hilger, *De Hermetis Trismegisti Poëmandro* (Leipzig, 1855); Ménard, *Hermès Trismegiste* (Paris, 1866); Pietschmann, *Hermes Trismegistus* (Leipzig, 1875).

HERMIA, hēr'mi-ā. An Athenian lady in Shakespeare's *Midsummer Night's Dream*. She is the daughter of Egeus, and is enamored of Lysander.

HERMI'AS (Lat., from Gk. 'Ερμίας, *Hermias*, or 'Ερμείας, *Hermēias*). A slave of Eubulus, tyrant of Atarneus, in Mysia, Asia Minor, whom he subsequently succeeded on the throne (B.C. 347). At Athens he made the acquaintance of Plato and Aristotle. The latter spent some years at the Court of Hermias, but fled when Artaxerxes III., captured the tyrant and put him to death. The philosopher, who was married to one of the relatives of Hermias, erected a statue in his honor.

HERMINJARD, ar'mé'nyär', AIMÉ LOUIS (1817—). A Swiss author, born at Vevey, Vaud. He was a teacher, and practiced his profession in Russia, Germany, and France, before going to Geneva, where he became a friend of Amiël. His great work, the *Correspondance des reformateurs dans les pays de langue française*, began to appear in 1866 (vol. ix., covering the period 1543-44, in 1897).

HERMIONE, hēr-mi'ō-nē. (1) The beautiful daughter of Menelaus and Helen, married against her will to Neoptolemus (Pyrrhus), the son of Achilles, in performance of a promise made by her father. According to late tradition, she was carried off by Neoptolemus, who was killed by Orestes, to whom she had already been promised. (2) The much-injured wife of Leontes, the madly jealous King of Sicily, in Shakespeare's *Winter's Tale*. The character is taken from Bellaria, in Greene's *Pandosto*. (3) The scornful love of Pyrrhus and loving mother of Astyanax, in Racine's *Andromaque*. After Andromache has persuaded Orestes to murder Pyrrhus, in the act of ascending the altar with Hermione, the latter becomes Regent of Epirus.

HERMI'ONES, or **HERMIN'ONES**. One of the three great divisions of the German peoples, so named from their mythical progenitor Irminus. They were the oldest, best, and most-powerful of the West-Germanic stock, and their eastern boundary was the Vistula and the Carpathians. Among the nations to whom the name Hermiones applied were the Suevi, the Hermunduri, the Lombardi, the Vandali, the Heruli, and the Quadi. Their early home was about the basin of the Elbe and the Main. Consult Stubbs, *Constitutional History of England*, ch. 1, 6th ed. (Oxford, 1897).

HERMIP'PUS OF SMYRNA (Gk. 'Ερμιππος, *Hermippus*). A Greek philosopher who lived about B.C. 200. A disciple of Callimachus of Alexandria, he was called ὁ Καλλιμάχειαος, the Callimachean. He was the author of *Bioi*, a work containing the biographies of all the Greek philosophers, historians, and poets. Though it is

repeatedly referred to by later writers, only fragments have been preserved. Consult Müller, *Historicorum Græcorum Fragmenta* (Paris, 1868-83).

HERMIT (from OF. *hermite*, *ermite*, from Lat. *eremita*, from Gk. ἐρημίτης, *erēmītēs*, hermit, from ἐρημία, *erēmia*, desert, from ἐρήμος, *erēmos*, quiet; connected with Gk. ἡρέμα, *erema*, quietly, Goth. *rimis*, quiet, Skt. *ram*, to rest): One of the names given in the early ages, and still more in the later Church, to a class of solitary ascetics, who, with a view to more complete freedom from the cares, temptations, and business of the world, withdrew from the ordinary intercourse of life and took up their abode in natural caverns or rudely formed huts in deserts, forests, mountains, and other solitary places. The hermits of the Middle Ages, like the primitive anchorites, often lived in complete solitude; but a much more common, and, in its influence on the Church, more important form of the institute was that of a community of hermits, each possessing his separate hermitage, but all meeting at stated times for mass, prayer, religious instruction, and other common exercises. The various hermits of this class are regarded as constituting religious orders, and although never attaining to the popularity which distinguished the Franciscans, Dominicans, and other active orders, they have formed, nevertheless, a numerous and not unimportant element in the spiritual life of the Roman Catholic Church. It would be impossible to enumerate the many small associations of this kind. For some of the more important, see AUGUSTINIANS; CELESTINES; HIERONYMITES; PAULITES.

HERMITAGE, THE. (1) A celebrated palace and museum at Saint Petersburg (q.v.). (2) A garden on the side of a hill overlooking Moscow, Russia, which has become a noted fashionable resort. (3) The name given to Rousseau's retreat in the valley of Montmorency, France. It was built for the philosopher by Madame d'Épinay, and was occupied by him from 1751 to 1757. *La nouvelle Héloïse*, *Le discours sur l'inégalité des conditions*, and a part of the *Dictionary of Music* were written here. In 1813 Grétry died in this place. (4) An old house near Nashville, Tenn., where Andrew Jackson resided for a great part of his life, and near which he was buried. The mansion is now owned by the State.

HERMIT CRAB. One of a large group of small crabs (q.v.) of the family Paguridæ, having the abdominal or tail segments much more largely developed than in true crabs, but undefended by hard plates, and not forming an organ for swimming. The soft and tender tail requires a protective covering, which the instinct of the hermit crabs leads them to find in some coiled shell of a suitable size. On the slightest alarm the hermit crab retires backward into the shell, guarding the aperture of it with one claw, which is much larger than the other, the hard points of the feet also projecting a little. The whole structure of the animal is adapted to such a habitation. The part which in the lobster becomes a finlike expansion at the end of the abdomen, becomes in the hermit crab an appendage for firmly holding in the shell; and so well does the hermit crab hold that it may be pulled to pieces, but cannot be pulled out. Some species have suckers to render the hold more perfect. They

often remain in a single shell for a long time, so that colonies of Hydractinia and other hydroids grow over a large part of it. Often sea-anemones attach themselves to the shells in which hermit crabs live, and thus get the benefit of free and rapid transportation. (See COMMENSALISM.) A Chinese species is said to carry an anemone on its claw, so that when withdrawn into its shell the anemone forms an effectual stopper to the opening. Increase of size, however, renders it necessary for hermit crabs to relinquish their shells and seek new ones from time to time, and when thus engaged they are very interesting animals to watch. They try on shell after shell before finding one that suits them, and they are constantly quarreling savagely over their houses; yet in fact they are great cowards. Hermit crabs are very interesting inmates of the aquarium, but their locomotive habits and their voracity make them unsuitable for an aquarium stocked with valuable animals. They feed on mollusks and other crustaceans, and all the animal garbage of the seashore.

The most common American species (*Pagurus longicarpus*) is an interesting object to every visitor of the seashore, and may be found in abundance wherever little pools are left by the tide on a rocky or shelving coast, from Massachusetts Bay to South Carolina.

This species never reaches a large size, and is usually under an inch in length. It is very gregarious, and large numbers are usually found together. A closely related larger species is *Eupagurus pollicaris*, which is found in shallow water from Massachusetts to Florida, inhabiting the shells of *Natica* and other gastropods. The common European species, *Eupagurus Bernhardus*, is also found in somewhat deeper water off the northeastern coast of America. In the tropics some interesting forms occur, including one or two of large size. One of the most interesting is the Diogenes crab (*Cænobita Diogenes*), which is several inches long when fully extended. It lives on land, and is found in the driest places, as active as other forms are in the sea. Allied to the hermit crabs are the palm or robber crabs (*Birgus latro*) of the East Indies, which live in holes in the ground at the foot of cocoanut palms, on the fruit of which they feed. They do not carry a shell with them. See LAND-CRAB.

While the shallow-water hermit crabs are symmetrical behind the thorax, in certain deep-sea forms the abdomen is symmetrical, showing that the ancestors of the ordinary hermit crabs were all symmetrical. *Polycheles Agassizii* of the West Indian seas lives in straight tubes of compacted sand, the abdomen being symmetrical. This also is the case with *Xylopagurus rectus*, living in open tubes of wood or bamboo stem. *Tylaspis anomala*, inhabiting the South Pacific at a depth of 2375 fathoms, has a shortened but symmetrical abdomen, with distinct segments and symmetrical legs. Another form (*Chenopagurus*) takes refuge in a sheet or blanket formed by the cænosome of a colony of polyps. It also is symmetrical. The polyp (*Zoanthus*) is tucked by the crab under its telson by one end and pulled over its back by the other, and the two animals, crab and polyp, seem incapable of independent existence. (See COMMENSALISM.) Hermit crabs have rarely been found in a fossil state, and then only their claws are found preserved. These

have been obtained in the Eocene rocks of Hungary.

Consult: Emerton, *Life on the Seashore* (Salem, 1880); Verrill, *Invertebrates of Vineyard Sound* (Washington, 1874); Arnold, *Sea Beach at Ebb Tide* (New York, 1901); Milne-Edwards et Bouvier, "Description des crustacés de la famille des Pagurieux pendant l'Expedition de la Blake" (*Memoirs Museum of Comparative Zoology*, Cambridge, 1893).

HERMITE, ar'mêt', CHARLES (1822-1901). One of the best-known French mathematicians of the nineteenth century. He was born at Dieuze, Meurthe, and received his early education in the Lycée Louis-le-Grand. He entered the Ecole Polytechnique in 1842, but left at the end of the year, in order to devote his attention exclusively to mathematics. From 1848 to 1876 he was connected with the Ecole Polytechnique in various capacities, and from 1862 to 1873 was maître de conférences in the Ecole Normale Supérieure. From 1876 until his death he gave his time to the university, where he held the chair of higher algebra (1869-97). He was a member of the Academy of Sciences, and a grand officer of the Legion of Honor (1892). His work was chiefly along the line of theory of functions, in which subject he was for many years the leader in France. His first great work, the one which secured for him his election to the Academy of Sciences, was *Sur la théorie de la transformation des fonctions abéliennes* (*Comptes rendus*, 1855). At about the same time begin his discoveries in the new theory of algebraic forms and in the theory of numbers. His most remarkable memoirs, twenty-six in number, *Sur quelques applications de la théorie des fonctions elliptiques*, appeared in the *Comptes rendus* (1877-82). His memoir, *Sur l'équation du 5ème degré* (1866), may be said to have finally settled the great question of the solubility of the quintic equation to the entire satisfaction of the mathematical world. His memoir *Sur la fonction exponentielle* (1874), in which he proved the incommensurability of e , paved the way for Lindemann's proof (1882) of the incommensurability of π . Hermite was a very prolific writer. A substantially complete list of his memoirs may be found in the *Catalogue of Scientific Papers of the Royal Society of London*, vols. iii. and vii. Besides his memoirs, which contain his most valuable contributions, he published a *Cours d'analyse de l'Ecole Polytechnique* (1873; 2d ed. 1894), and assisted Serret in editing Lacroix's calculus (9th ed., Paris, 1881, 2 vols.). Consult articles by Mittag-Leffler and Picard in *Acta Mathematica*, vols. xxiii., xxiv. (Stockholm, 1901-02).

HERMIT HUMMING-BIRD. A name given to a group of humming-birds which agree in having the beaks much curved, and the edge of the mandibles not serrated. The 'true' hermits are of the genus *Phaëthornis*, whose sixteen species are found from Mexico to Southern Brazil, mostly in the hot lowlands. The 'sickle-billed' hermits of the genus *Eutoxeres* have the beak greatly bent downward, sometimes describing a full half-circle. The whole group keep themselves secluded in dense forest, whence the name. See HUMMING-BIRD.

HERMIT KINGDOM. A popular name given to Korea (q.v.).

HERMIT THRUSH. See THRUSH.

HERMOCRATES (Lat., from Gk. Ἑρμοκράτης, *Hermokratēs*) (c.460-407 B.C.). A Syracusan politician and statesman, son of Hermon. His great work was the union of the Siceliots (424), which made possible Syracuse's success when attacked by the great fleet from Athens (415). He was at the head of the aristocratic party, and was opposed by the demagogue Athenagoras. In B.C. 412 he went with a large Syracusan fleet to join the Spartans off the western coast of Asia Minor. Here he was very successful for a time, but lost the battle of Cyzicus, and for this was removed from command and exiled. He then fought against Carthage, and died in his attempt to reinstate himself in Syracuse. His daughter was married to Dionysius in 405.

HERMODACTYL (from Gk. ἑρμωδάκτυλος, *hermodaktylos*, hermodactyl, from Ἑρμῆς, *Hermēs*, Hermes + δάκτυλος, *daktylos*, finger). The name of a medicine that had a high repute among the later Greek and the Arabian physicians as a remedy for gout and rheumatism. It is mentioned by Alexander of Tralles, who flourished A.D. 560; by Paulus Ægineta, who lived a century later; by Avicenna, Serapion, and others. By some of the old writers it was termed *anima articulorum*, or *the soul of the joints*. It is impossible now to speak with certainty of the nature of hermodactyl. Corms, probably of several species of colchicum, are still sold in Greece and in the East under the name of hermodactyls. Different botanists and pharmacologists have referred the corms to *Colchicum illyricum*, *Colchicum autumnale*, *Colchicum variegatum*, *Colchicum bulbocodioides*, etc. See COLCHICUM.

HERMOGENES, hēr-mōj'ē-nēs (Lat., from Gk. Ἑρμογένης). A Greek rhetorician, who flourished about A.D. 170, born at Tarsus. His ability as a lecturer won him the favorable notice of the Emperor Marcus Aurelius, who appointed him a public teacher of oratory when he was only seventeen years of age. Between the ages of eighteen and twenty he published his famous *Rhetoric* (Τέχνη Ῥητορική,) which was for centuries regarded as a standard and became the subject of extensive commentaries. At the age of twenty-five his faculties gave way, and he spent the remainder of his life in a state of intellectual impotency. A large part of the *Rhetoric* has survived, and was published by Walz, *Rhetores Græci* (Stuttgart, 1832-36), and by Spengel (Leipzig, 1853-56).

HERMON. A lofty mountain of Syria, the southern end of the Anti-Lebanon Range, from which it is separated, however, by a deep ravine (Map: Turkey in Asia, B 1). It rises to the height of 9166 feet above the level of the sea. Its crown is divided into three distinct peaks, the western one a little lower than the northern and the southern, which are of the same height. These peaks are always covered with ice and snow, and can be seen as far south as the Sea of Galilee. The lower part of the mountain is clothed with forests and a specially rich vegetation, due to the numerous rivulets caused by the melting snow. Hermon was a sacred mountain, and is therefore encircled with ruins of ancient temples, most of which were consecrated to the Baal-worship. It is often referred to in Hebrew poetry. It is also held by tradition to have been the Mount of Transfiguration. It is now called Jebel-esh-Sheikh ('the mountain of the

old man'), or Jebel-eth-Thel ('the snow mountain').

HERMON'THIS (Lat., from Gk. Ἑρμωνθίς). A city of ancient Egypt on the left bank of the Nile, a little above Thebes. Its Egyptian name was On, and, to distinguish it from other places of the same name, it was called On of the South or On of the god Mont. The local deity was the hawk-headed god Mont (q.v.), and hence the city bore the sacred name of *Per-Mont* (house of Mont), of which the Greek *Hermonthis* is a corruption. It was a very ancient town, but was eclipsed by the rise of its neighbor Thebes. With the decline of Thebes on rose again in importance, and finally, as Hermonthis, became the capital of the district. According to Strabo, Apollo (i.e. Horus) and Zeus (i.e. Mont) were worshiped here, and a sacred bull, called by the Greeks Bacis, was also revered. Of the magnificent buildings which adorned the place in ancient times only scanty ruins now remain. The site is occupied by the modern town of Erment, which contains extensive sugar-refineries.

HERMOPOLIS, or HERMUPOLIS (Gk. Ἑρμόπολις, city of Hermes). The capital of the Greek nomarchy of the Cyclades, situated on the eastern coast of the island of Syra (Map: Greece, F 4). It consists of the old mediæval town and the newer portion constructed since the Revolution of 1821. The town is lighted by gas, and has a number of educational institutions, including two gymnasia and a theatre. The chief industry is ship-building. Commercially Hermonthis is one of the most important cities of Greece, being one of the chief centres in the trade with the Levant, although its commercial importance has somewhat decreased since the rise of Piræus. Hermonthis is the seat of a number of consular agents, of a Greek archbishop and a Roman Catholic bishop. Population, in 1896, 18,760.

HERMOPOLIS, or HERMUPOLIS MAGNA. An ancient city of Middle Egypt, on the left bank of the Nile, between the river and the Bahr-Yūsuf ('Joseph's Canal'), opposite Antinöe, not far south of the site of the modern Bani Nassan (q.v.). The Copts called it Shmūn, and the hieroglyphics Khmunu. The village which is on its site bears the name of Ashmunein. The Greek name Hermonthis is derived from the ibis-formed or ibis-headed local god Thoth or Dhouti, who was identified with the Greek Hermes (q.v.). The city was once very important, but the only remarkable ruin, the portico of a beautiful temple, dating from Ptolemaic times, was destroyed in the middle of the last century. Recently another temple has been discovered there. Another Hermonthis, Hermonthis Parva, is the modern Damanhur in the Delta.

HERMOSILLO, ar'mō-sē'lyō. Capital of the State of Sonora, Mexico, situated on the Rio de Sonora, in a fertile valley 90 miles by rail north from Guaymas (Map: Mexico, C 3). It has a cathedral, a library, and a mint, and is an important trading centre for agricultural products. Population, in 1900, 17,618.

HERNANDEZ DE CORDOVA, ar-nān'dāth dā kōr'dō-vā, FRANCISCO. See CORDOVA.

HERNANDEZ DE OVIEDO Y VALDES, dā ō've-ā'dō ē vāl-dās', GONZALO. See OVIEDO Y VALDES.

HERNANI, OU L'HONNEUR CASTILLAN, ar'ná'né', oó ló'nér' ká'sté'yán' (Fr., Hernani, or Castilian honor). A romantic five-act tragedy in verse, by Victor Hugo. At its first performance in 1830 at the Théâtre Français, the presence of Hugo's partisans in bizarre costumes gave rise to the 'Battle of Hernani,' a series of personal encounters between the adherents of the Classical and the Romantic schools of French playwrights. The play rests on the love of three suitors, Don Carlos, Ruy Gomez, and the bandit Hernani, for Doña Sol. Hernani, on whose head a reward is set, is surprised with Doña Sol by Ruy Gomez, who shelters him from the pursuit of the King on condition that at the blast of a horn Hernani shall give himself up. In the dénouement Hernani is about to wed Doña Sol, when the horn sounds and the lovers kill themselves. The plot is highly improbable and without historical truth, but is redeemed by great richness of imagery and poetic feeling.

HERNDON, hēr'n'don, WILLIAM HENRY (1818-91). An American lawyer, born in Greensburg, Ky. When he was two years old his parents removed to Illinois. In 1836 he entered Illinois College, but was removed by his father in consequence of the abolition sentiments of the faculty. He studied law, and was admitted to the bar in 1844, when he formed a partnership with Abraham Lincoln, which was dissolved only by the latter's death. In 1855 he was Mayor of Springfield, Ill. In connection with Jesse W. Weik, who assisted in putting into literary form the material he (Herndon) had collected, he published *Herndon's Lincoln: The True Story of a Great Life* (new ed. 1891), which is of especial value for the account it gives of Lincoln's early life and personal habits.

HERNE. A town of Westphalia, Prussia, Germany, 11 miles northeast of Essen by rail. It is the centre of great industrial activity, with coal-mines and manufactures of machinery and gunpowder. It was incorporated in 1897. Population, in 1900, 27,863.

HERNE, JAMES A. (1840-1901). An American actor and playwright. He was born in Troy, N. Y., where after a brief experience 'on the road' he made his appearance, in 1859, with a stock company in *Uncle Tom's Cabin*. Afterwards he played in Baltimore and Washington, and then went to California. He had become a popular actor, both East and West, before he produced his first play, *Hearts of Oak*, in 1878. This was very successful, but his subsequent productions, such as *Drifting Apart* and *Margaret Fleming*, were less fortunate, till in the season of 1892-93 his *Shore Acres* at the Boston Museum made its author famous. It is a rural comedy in which he, as 'Uncle Nat' Berry, presented a character full of honest humor and touching pathos, and the play kept the boards almost without a break for six years. In 1899 he produced *The Rev. Griffith Davenport*, and the following year *Sag Harbor*. Consult Strang, *Famous Actors of the Day in America* (Boston, 1900).

HERNE THE HUNTER. A character in popular tradition, who, it was believed, walked at midnight by an ancient oak in Windsor Forest. In Shakespeare's *Merry Wives of Windsor* (iv., 4), he is described as a spirit, with huge horns on his head, who disturbs the revels of the fairies. He also plays a part in Harrison Ains-

worth's romance entitled *Windsor Castle*. Herne's oak, said to have been 650 years old, was blown down in 1863. A young oak was planted on the spot by Queen Victoria.

HERNIA (Lat., rupture). A protrusion, through an abnormal or accidental opening, of any organ from its natural cavity. Although hernia may occur in many parts of the body, the word is usually restricted to signify protrusion of the abdominal viscera. The abdominal viscera are subject to violent pressure from the diaphragm and the muscles of the abdomen. This pressure forces them outward and downward against the walls of the belly; and if at any point these walls are not sufficiently strong to resist this pressure, some portion of the viscera is driven through them, and a hernial tumor is formed. Certain parts of the abdominal walls, especially the inguinal and crural rings, and the umbilicus, being weaker than others, hernia most frequently occurs at these points. In some instances hernia is congenital, as from abnormal deficiency of the walls; in other cases it may arise at any period of life as a result of violent bodily exertion, such as straining in lifting, jumping, etc. Sex, age, and occupation seem to have a marked influence on predisposition to hernia. Men are far more liable (in about the proportion of four to one) to this disease than women, though they are less so to those forms of the affection known as femoral and umbilical hernia.

A hernia is almost always composed of a sac and its contents. The sac is a portion of the peritoneum (q.v.) corresponding to the aperture at which the hernia protrudes. It is pushed forward by the protruding viscus, and forms a pouch. The contents vary greatly, but generally consist of a portion of the small intestine (particularly of the ileum), forming the variety of hernia known as *enterocoele*. Omentum is often found in hernial sacs, together with intestine. Besides the viscera, the sac always contains a certain quantity of fluid secreted by its interior. Hernia is divisible (1) into reducible, or returnable into the abdomen, irreducible, and strangulated; and (2) according to its situation, into inguinal, crural, femoral, umbilical, etc. The treatment of *reducible hernia* may be palliative or radical. The palliative treatment consists in the application of a truss (q.v.) to retain the protrusion within the cavity of the abdomen. Each particular kind of hernia requires its special form of truss; and before applying it, the hernia must be reduced by placing the patient on his back, relaxing the muscles by bending the thigh upon the abdomen, and pressing the tumor back in the proper direction. The truss should then be put on, and should be worn during the day. The means that have been contrived to effect a radical cure are too purely surgical for description in these pages. Below the age of puberty, and if the hernia is recent, a radical cure is sometimes effected by wearing the truss for two or three years. In *irreducible hernia* the protruded viscera cannot be returned into the abdomen, but there is no impediment to the passage of their contents or to their circulation. In these cases the patient is often liable to dragging pains in the abdomen and to attacks of vomiting. The treatment consists in avoidance of violent exercise and of constipation, and in wearing a support for the protection of the tumor. Hernia

is said to be *strangulated* when a portion of intestine or omentum that is protruded is so tightly constricted that it not only cannot be returned into the abdomen, but has its circulation arrested. This form is highly dangerous, because, if relief is not speedily afforded, the strangulated part becomes gangrenous. The causes of strangulation are various, but the condition most commonly arises from a sudden violent effort, by which a fresh portion of intestine is driven into a pre-existing hernia, which it distends to such a degree as to produce this complication. The most prominent early symptoms are flatulence, colicky pains, etc. They are succeeded by vomiting first of the contents of the stomach, then of mucus and bile, and lastly of fecal matters, owing to inverted peristaltic action. If relief is not obtained, the inflammation that commences in the sac extends to the peritoneum, and the ordinary signs of peritonitis appear. After a variable time comes gangrene or mortification of the part, and the patient speedily sinks. When reduction is impossible, prompt surgical intervention is necessary. The hernia is cut down upon and freed from constricting bands with the knife. Where gangrene has set in in the intestine the diseased portion must be cut away and the ends of the intestine reunited.

HERNICI, ĕr-nĕ'chĕ. An old Italian people of Latium. Of Sabine connection, they dwelt in the Appenines between the Trerus and Lake Fucinus. They held out long against the Romans, with whom they at length formed an equal alliance in B.C. 486, but to whom they had to yield in B.C. 306. They received in B.C. 241 the rights of Roman citizens. To the north were the Marsi and the Æqui, while the Volsci were on the south. Their capital was Anagnia.

HERNÖSAND, hĕr'nĕ-sĕnd. The capital of the Lĕn of Wester Norrland, Sweden, situated on the island of Hernö, in the Gulf of Bothnia, about two miles south of the mouth of the Angerman River (Map: Sweden, H 5). It is connected by bridges with the mainland. It has a school of navigation and other educational institutions. Its harbor is good, and it has regular steamship communication with the other coast towns. It was founded in 1584 by John III., became a bishop's see in 1772, and capital of the lĕn in 1778. Population, in 1901, 7890.

HERO (Lat., from Gk. Ἡρώ). A priestess of Aphrodite at Sestos. At a festival of Aphrodite she was seen and loved by Leander, a youth of Abydos. She returned his love, and received him in her tower on the Hellespont, which he swam nightly, being guided by her lamp. Venturing the passage on a stormy night, he was drowned and the body washed ashore at the tower, whence Hero at once cast herself that she might be united with her lover in death. The story developed in the romantic poetry of the Alexandrian period, and has come down to us in a form of Musæus and in Ovid. It is represented on some late works of art and on Roman coins of Abydos and Sestos. It is also the subject of poems by Marlowe and Schiller, and a drama, *Des Mœres und der Liebe Wellen*, by Grillparzer.

HERO. A Greek mathematician and physicist. See HERO OF ALEXANDRIA.

HERO. The quiet daughter of Leonato and cousin of the gay Beatrice in Shakespeare's *Much*

Ado About Nothing. Don John causes her waiting woman to impersonate her in a moonlight interview with him, and thus causes her lover to reject her at the altar, but on the discovery of the deception the marriage is carried out. The story of the slander to which she is subjected is generally omitted in modern productions.

HERO, or HERON, OF ALEXANDRIA.

The leading Greek mathematician and physicist of his time. Not only are the dates of his birth and death unknown, but there is great uncertainty as to the century in which he lived. The most recent investigation of the evidence, by Schmidt (1899, work cited below, Bd. 1, p. ix.), leads to the conclusion that he may have lived in the first century A.D., but other writers, who, it must be said, have not considered the question so fully, have usually placed him in the first or even the second century B.C. There is much confusion concerning the works of Hero of Alexandria, there having been no less than eighteen Greek writers of this name. It is, however, fairly certain that he wrote at least thirteen books on mathematics and physics. He seems to have been an Egyptian, and it is certain that his style is not that of a Greek. He contributed little to pure mathematics, his chief work on this subject being the extension of the ancient mathematics so as to allow the consideration of the fourth power of lines. Thus, in his geodesy, *γεωδαισία*, contained in his *Μερικά*, upon which subject he was the only Greek writer, he gives the well-known formula for finding the area of a triangle with sides, *a, b, c*, and semiperimeter *s*, $\sqrt{s(s-a)(s-b)(s-c)}$ a formula known by his name. (The proof is given, possibly an interpolation, in his *Περὶ διόπτρας*.) He seems also to have had some idea of trigonometry, and in his geometry is to be found the first definite use of a trigonometric formula. He asserts in substance, using modern symbols, that if *A* represents the area of a regular *n*-gon of side *s*, and if *c* be the numerical coefficient by which *s*² must be multiplied to produce *A*, i.e. so

that $A = cs^2$ then must $c = \frac{n}{4} \cot \frac{180^\circ}{n}$. He pro-

ceeds to compute *c* for the values *n*=3, 4, . . . 12, with considerable accuracy, but his method is unknown. He could also solve the complete quadratic equation $ax^2 + bx = c$, where *a, b, c*, are positive, but not the general form. Hero is credited with a number of mechanical inventions, including a contrivance for utilizing the force of steam and a fountain which bears his name. Consult: Martin, "Recherches sur la vie et les ouvrages d'Heron d'Alexandrie," in vol. iv. of *Mémoires présentées par divers savants à l'Académie d'Inscriptions* (Série I., Paris, 1854); Hultsch, *Heronis Alexandrini Geometricorum et Stereometricorum Reliquiæ* (Berlin, 1864); Schmidt, *Heronis Alexandrini Opera quæ Super-sunt Omnia* (Leipzig, 1899—).

HEROD, hĕr'od (Gk. Ἡρόδης, *Hērōdēs*). The family name of a group of rulers in Palestine, derived from that of its most famous member, Herod the Great. The family had its origin in Antipater, an Idumean of honorable stock, whom Alexander Jannæus (B.C. 104-78) made governor of Idumea. The fact that the Idumeans had been subjugated to John Hyrcanus in B.C. 128, and compelled to embrace Judaism, is the only basis for the claim that the members of the

Herodian line were Jews. In his power and influence, and apparently in his official position in Idumea, Antipater was succeeded by his son of the same name (q.v.). The latter, with the sagacity which had become characteristic of the family, made the declining fortunes of the Asmonean rule and the rising fortunes of Rome serve his political interests until the real control of the country of the Jews rested in his hand—a control which he strengthened by appointing his two sons Phasaël and Herod governors, respectively in Jerusalem and in Galilee. (1) **HEROD THE GREAT.** Son of Antipater and Cypros, an Arabian woman; reigned from B.C. 37 to 4. Upon the assassination of Antipater (B.C. 43) there followed a period of intrigue and warfare on the part of the Asmonean Antigonus and the Parthians against the Herodian rule, which resulted in the death of Phasaël and the escape of Herod to Rome. There in B.C. 39 he was made King of Judea by Antony, Octavius, and the Senate. It was not, however, until B.C. 37 that he succeeded in putting down the forces opposing him. The first years of his reign (B.C. 37-25) were troublous, owing to the hostility of the Sadducean and Pharisaic parties, and the enmity of the surviving members of the Asmonean house, who secured an ally in Cleopatra of Egypt. Herod ultimately prevailed, partly through murder and confiscation of property, partly through political cleverness and trickery, but mainly through the fall of Antony and Cleopatra before the forces of Octavius. The following years (B.C. 25-13) were prosperous. Herod was free to rule and to indulge his passion for building, the results of which showed themselves in the rehabilitation of such places as Strato's Fortress, and such cities as Samaria, Capharsaba, and Anthedon, renamed by him respectively Cæsarea (q.v.), Sebaste, Antipatris, and Agrippæum. At Jerusalem, Jericho, and Cæsarea he erected theatres, amphitheatres, and hippodromes for the Grecian games established in honor of Augustus. He rebuilt the temple in Jerusalem with the most lavish expenditure of wealth and careful regard for the religious scruples of the people. This munificence was extended even beyond his domains to cities in Syria, Asia Minor, and Greece. Herod also gratified his Hellenizing tastes by inviting and attaching to his Court Greek writers and teachers. With all this he was loyal to the people over whom he ruled, not only bestowing upon them substantial benefits at home, but securing for them large favors in some parts of the Diaspora and significant privileges from Rome. The last years of his reign (B.C. 13-4) were full of misery, occasioned by the ceaseless and complicated political intrigues within his household, which rendered him morbidly suspicious and inflamed his murderous passions to the worst. It was shortly before his death that Jesus was born. On his last visit to Rome Herod obtained consent of Augustus to dispose of his kingdom as he saw fit. A few hours before his death he made a will, in which he gave Judea, including Samaria and Idumea, to Archelaus, with the title of king; Galilee and Perea to Antipas, with the title of tetrarch; and Gaulanitis, Auranitis, Trachonitis, Batanea, and Panias to Philip, with the title of tetrarch. This will was practically confirmed by Augustus, and in spite of disturbances and disorders on the part of the people, who desired to be rid of the Herodian yoke, was ultimately put into

effect.—(2) **ARCHELAUS**, ethnarch of Judea, Idumea, and Samaria. Son of Herod the Great and Malthace, a Samaritan woman; ruled from B.C. 4 to A.D. 6. Though given title of king by his father's will, Augustus withheld this from him, substituting that of ethnarch. He was the worst of Herod's surviving sons. Of his reign we have no details; but Josephus describes it as violent and tyrannical. After nine years the Jews made such complaints against Archelaus that Augustus banished him to Vienne in Gaul. This accords with the statement of Matthew ii. 22, that Joseph on his return from Egypt with Mary and the Child Jesus, "When he heard that Archelaus was reigning over Judea in the room of his father Herod, was afraid to go thither, and . . . withdrew into the parts of Galilee."—(3) **ANTIPAS** (Herod Antipas), tetrarch of Galilee. Son of Herod the Great and the Samaritan Malthace, younger brother of Archelaus; ruled from B.C. 4 to A.D. 37. Though not much is known of his rule, he seems to have been able to govern his country and to have possessed the family passion for building. In Galilee he remade Sepphoris, afterwards called Dio-Cæsarea, and in Perea, Betharamphtha, which he named Livias after the wife of Augustus, and in addition reared the magnificent capital which he named Tiberias, for the reigning Emperor. He seems to have had his father's craftiness, though he apparently lacked his diplomacy, as he certainly did his ability in war. The discarding of his first wife, daughter of the Arabian King Aretas, for Herodias, wife of his half-brother Herod Philip (Mark vi. 17; Matt. xiv. 3), not the tetrach Philip, brought on a war with Aretas in which Antipas was routed. Later, through the persuasion of Herodias, he went to Rome and demanded of Caligula that he be favored, as Agrippa I. had just been, with the title of king. He was confronted, however, by charges from Agrippa himself, was deposed, and banished by the Emperor to Lugdunum (Lyons) in Gaul. This Antipas is the 'Herod' most frequently mentioned in the New Testament (Matt. xiv. 1; Luke iii. 1; xiii. 31; Acts xiii. 1 et al.). It was he who imprisoned and beheaded John the Baptist (Mark vi. 14-29), and to whom Jesus was sent by Pilate (Luke xxiii. 7-15).—(4) **PHILIP.** Son of Herod the Great and Cleopatra, a woman of Jerusalem; ruled from B.C. 4 to A.D. 34. The country over which he ruled was north and east of the Sea of Galilee, consequently outside of strictly Jewish territory and inhabited by a predominantly non-Jewish population. It was owing to this fact that Philip was able to carry out a Hellenizing and Roman policy among his people. He had the family passion for building, and founded on the site of Paneas a city which he named Cæsarea, known as Cæsarea Philippi (q.v.), to distinguish it from the larger city on the coast. He also rebuilt Bethsaida, which he called Julias, in honor of the daughter of Augustus. Of his rule nothing is known beyond what may be inferred from Josephus's characterization of the man, as "a person of moderation and quietness" in the conduct of his life and government. He seems to have possessed none of the Herodian ambition, cruelty, or lust. He was married to Salome, the daughter of Herodias, and died without issue.—(5) **AGRIPPA** (Herod Agrippa). Son of Aristobulus, Herod the Great's son by Mariamne, granddaughter of Hyrcanus, and Bernice, daughter of Salome;

Herod's sister, and Castobar; ruled from A.D. 37 to 44. His earlier years were spent in Rome, where he fell into spendthrift habits that finally compelled his retirement to Palestine. In the last years of Tiberius's reign he returned to Rome, and succeeded in securing the appointment by the Emperor to the care of his grandson. He had been friendly with Caligula in his early life, and shortly after the latter's accession received from him the tetrarchies of Philip and Lysanias (viz. Abilene) with the title of king, while the Senate added the honorary rank of prætor. In A.D. 40 he obtained the fortified tetrarchy of Antipas; and in the next year, when Claudius came to the throne, he was given by the Emperor, along with the honor of the consular rank, the additional territory of Judea and Samaria, thus finally securing the whole region over which his grandfather had ruled. The next three years constitute the real period of his rule. For the sake of peace he followed a pro-Jewish policy, which showed itself in a personal piety of almost Pharisaic legalism and an official furtherance of the interests of the Jews, which brought them to regard him as a brother and alienated from him the regard of the Roman element in his population and of the Roman troops in his domains. This Jewish favoritism, no doubt, was the cause of his persecution of the Christians (Acts xii. 1-19). The account of his death given by Josephus (*Antiq.* xviii. 6, 7) is in substantial agreement with that in Acts xii. 20-23.—(6) AGRIPPA II. (Herod Agrippa). Son of Agrippa I. and Cypros; ruled from A.D. 50 to about 100. Because of his extreme youth at the time of his father's death, Claudius was persuaded not to give him the succession. The whole of Palestine thus passed under direct Roman rule. In A.D. 50, however, two years after the death of his uncle Herod of Chalcis, he received the kingdom which had thus been vacated. This he surrendered in A.D. 53, receiving in return the former tetrarchy of Philip, together with that of Lysanias and the domains of Varus. In A.D. 56 Nero added to this the cities of Tiberias and Julias in Galilee and Tarichea in Perea, with surrounding lands and villages. Like all his family, he gave himself to building, improving his capital, Cæsarea Philippi, which he renamed Neronias, and architecturally adorning Berytus (Beirut) in Phœnicia. Unlike his father, he gave no special care to the interests of the Jews—manifesting, in fact, a general indifference to the religious questions of his time, though it was in his rule that the Temple at Jerusalem was finished. He tried to combine Hellenism and Judaism, and placed the effigies of the emperors on his coins. He strove to dissuade the Jews from their war with Rome, and manifested his loyalty to the Emperor even after his Galilean cities had deserted him. In return for this, after the war his territory was extended northward, while in A.D. 75 he had conferred upon him the prætorian rank. He left no children; in fact, it is doubtful whether he ever married. As far as record can be obtained, he died in the third year of Trajan's reign, A.D. 100. His rule was a feeble one. It was before this Agrippa and his sister Bernice that Paul was brought by Festus in Cæsarea, on the eve of his deportation to Rome, as narrated in Acts xxv. 13-xxvi. 32.

HEROD AGRIPPA. See HEROD.

HERODAS. See HERONDAS.

HEROD'ES AT'TICUS. See ATTICUS HERODES.

HERODIAN (Gk. Ἡρωδιανός, *Hērōdianos*). A Greek historian of the third century A.D. He was a Syrian by birth, but held office under the Roman Government, so that he writes with a practical knowledge of the events which he describes. His history covers the years A.D. 180-238, i.e. from the death of Marcus Aurelius to the accession of Gordianus III. The work was highly valued by later historians, especially the Scriptores Historiæ Augustæ and Johannes Antiochenus, who take long passages from it, and try to imitate its style. The history was first made known to the Western world in the translation of Politianus (1493). The first critical edition was published by Bekker (1826); the best is that of Mendelssohn (Leipzig, 1883). There is an English translation by Hart (London, 1749). Consult Peter, *Die geschichtliche Litteratur über die römische Kaiserzeit*, ii. (Leipzig, 1897).

HERODIANS (Gk. Ἡρωδιανοί, *Hērōdianoi*, adherents of Herod, from Ἡρώδης, *Hērōdēs*, Herod). A party among the Jews, twice mentioned in the New Testament, and both times in connection with the Pharisees: (1) Mark iii. 6, on the occasion of Jesus' healing of the man with the withered hand in the Capernaum synagogue; (2) Mark xii. 13 (cf. Matt. xxii. 16), on the occasion of placing before Jesus the question about tribute to Cæsar. They were evidently not a religious sect, as the Pharisees and the Sadducees; nor the mere Court and family followers of the Herods, but rather a political party, whose object was the reestablishment of the Herodian kingdom in the spirit of its traditional policy—the union of Judaism with Hellenism. (See HEROD.) Their connection with the Pharisees, consequently, was not due to any sympathy of ideas with them, but to the instinctive conviction that in the spiritual mission of Jesus lay a danger common to them both. They were not necessarily pro-Roman in their feelings; though, in the nature of things, they would be more kindly disposed to the spirit of the pagan government than to that of the old theocracy, as represented by the Pharisees, or of the new Messianism involved in the religion of Jesus. It is probable that they had more in common with the religiously indifferent Sadducees than with any other Jewish party. Upon such a supposition there may be some bearing in the significant interchange of 'Sadducees' and 'Herod' in Jesus' warnings to His disciples as given in the parallels, Mark viii. 15 and Matt. xvi. 6.

HERODIANUS, ÆLIUS. A Greek grammarian of the second half of the second century A.D., son of Apollonius Dyscolus. He was born at Alexandria, but afterwards removed to Rome, and there gained the favor of the Emperor Marcus Aurelius, to whom he dedicated his chief work, *Καθολικὴ Προσῳδία*, called also *Μεγάλῃ Προσῳδία*, a treatise on prosody, syntax, and etymology, in about twenty books. Though he is highly praised by later grammarians, including Priscian, who calls him *maximus auctor artis grammaticæ*, only his treatise on monosyllabic words, *Περὶ Μονήρων Λέξεως*, has been preserved complete. Fragments, however, have been preserved in the citations of other grammarians, and have been edited by Lentz in his *Herodiani Technici Reliquiæ* (3 vols., Leipzig, 1876). Consult: Lehrs, *Herodiani Scripta Tria* (Königs-

berg, 1848); Hilgard, *Excerpta ex Libris Herodiani* (Leipzig, 1887); and Stephen, *De Herodiani Technici Dialectologia* (Strassburg, 1889).

HERODIAS. Daughter of Aristobulus (second son of Herod the Great and Mariamne, granddaughter of Hyrcanus) and Bernice, daughter of Salome, Herod's sister. She was twice married, first to her half-uncle, Herod, called in the Gospels Philip (Mark vi. 17; Matt. xiv. 3), the issue of which marriage was a daughter, Salome, who afterwards became the wife of Philip, another half-uncle of her mother. Doubtless, through the real attachment of love, Herodias left her husband for his half-brother, Antipas—a marriage which, because of its illegality according to the Mosaic law, brought upon the latter the outspoken denunciation of John the Baptist, and so led to that prophet's imprisonment and final execution (Mark vi. 17-29; Matt. xiv. 3-12). It was quite possibly the daughter of this second marriage, bearing her mother's name, who danced before Antipas on the occasion of the festival and allured him to the reckless oath that gave Herodias opportunity to accomplish the death of John. The better reading of Mark vi. 22, "his daughter Herodias," is too plain to be otherwise interpreted; while the term by which she is described, "a little maid," would scarcely apply to a girl as old as Salome must have been at that time. It was Herodias's ambition that led her to urge Antipas to his fatal journey to Rome for the securing of the royal title, though her loyal affection for him made her share his exile. See HEROD.

HERODOTUS (Lat., from Gk. Ἡρόδοτος) (c.484-c.424 B.C.). A Greek historian. He was the son of Lyxes and Rheo or Dryo, and was born about 484 B.C. at Halicarnassus, an originally Doric colony in Southwestern Asia Minor, at that time ruled by a Queen Artemisia under the sway of the Persians. His uncle, Panyasis, was an epic poet; and it was perhaps through him that Herodotus acquired the comprehensive acquaintance with early Greek literature, especially poetry, which is so conspicuous in his writings. His family was a prominent one, and the uncle was put to death about the year 457 for conspiring against the tyrant Lygdamis. Herodotus went into exile, and is said to have made his temporary home in the island of Samos, an ally of Athens and member of the Confederacy of Delos or the Athenian Empire. Between the years 467 and 464 he is believed to have traveled extensively on the shores of the Black Sea, in Thrace, Scythia, Asia Minor, and the Persian Empire, including Egypt. The precise extent, direction, and starting-points of his travels are matters of inference from his writings and of controversy among scholars. He saw in Egypt the skulls lying on the field of a battle fought in 460. He visited Scythia before the year 454. His travels in Greece, and possibly in Southern Italy, fall much later. Halicarnassus having risen against Lygdamis and joined the Athenian Empire, Herodotus, according to one tradition a leader in the uprising, returned and resumed his citizenship. He was, however, soon attracted to Athens, then, about 447, at the height of the age of Pericles, the centre and focus of Hellenic culture. There, or, as a fanciful later tradition has it, at Olympia, he gave 'author's readings' from his unfinished histories, and won the admiration of the greatest minds of Greece, the personal friendship of the poet

Sophocles, and, so the story goes, the more substantial reward of ten talents voted by the people. A well-invented story relates that the boy Thucydides, present at one of these readings, burst into tears from stress of emulous emotion, and that the historian complimented the boy's father on this indication of a generous nature. In the year 444 Herodotus, with many other brilliant men, joined the colony which Pericles was founding at Thurii in Southern Italy. His subsequent life is a blank. It was probably devoted to the completion and the final publication of his history. An allusion to the Propylæa, or entrance to the Acropolis, is supposed to prove that he visited Athens so late as 430. Nothing in his histories implies that he survived the year 424. Tradition placed his tomb at Thurii.

Herodotus was called the father of history by Cicero. This means, if anything, that he was the first to compose an artistic and dramatically unified history, although there were historians before him, the so-called logographers, or story-tellers, who continued in prose the work of the garrulous later epic. (See LOGOGRAPHER.) The only one explicitly named by Herodotus is Hecataeus of Miletus, who traveled in Egypt, is mentioned as a prominent adviser of the Ionians during the Ionic revolt, and is thought by some critics to have been the source of much matter that Herodotus gives out as his own. But Herodotus was the first to grasp firmly a great central international theme, and to work up, in due and artistic subordination to it, a vast mass of legendary, local, antiquarian, geographical, and ethnological lore, derived partly from predecessors, but widely supplemented by his own travels and *inquiry* (the original meaning of *history*). This theme was the invasion of Greece by Xerxes, of which his boyhood had perhaps caught the last echoes in the tales told by his town-folk of the wondrous exploits of Artemisia at Salamis. He apprehended it as the culmination of the eternal conflict between the East and the West which he conceived as beginning with the Trojan War, and of which we have not yet seen the end. It shaped itself to his imagination in a large, dramatic, and religiously edifying way. Its prologue is the evolution of the free States of Greece, and, in antithesis to them, the history and panorama of the barbarian world of ancient monarchies and outlying peoples. Its dramatic culmination is the overthrow of the myriads of Xerxes by the few thousand Greeks at Salamis, Plataea, and Mycale. Its moral is the lesson of the nemesis that waits upon Hybris—upon the insolence of those who, drunk with power, forget the limits of mortality. "For God abases the mighty ones of earth, and suffers none to think proud thoughts save Himself." There are many theories (none of them verifiable) of the order of composition of the different parts of the history, of the digressions, in which it abounds, and of the retouches by which its allusions were brought down to date. But in the final result the general design is so clear both to Herodotus and to the reader, that, despite the bewildering prodigality of anecdote, digression, retrospect, and description, we never lose our sense of a majestic architectural unity, or fail to feel that we are progressing steadily toward a predetermined goal. The nine books named after the muses, into which later grammarians aptly divided the work, fall into natural groups of symmetry or antithesis

when viewed in connection with the whole. The first three books deal with centuries of time, and the vast barbarian world: (1) The overthrow of the Lydian kingdom of Cræsus, and, in retrospect, the establishment of the Persian monarchy as the heir of the immemorial empires of the East. (2) Egypt in retrospect and description in connection with the Persian Conquest. (3) The consolidation of the Persian Empire under Cambyses and Darius. The last three books are concerned with ten, or, more strictly, three years of conflict on Greek soil, books vii., viii., and ix. being marked respectively by the battles of Thermopylæ, Salamis, and Plataea. The three intervening books at once link and divide the extremes, and trace the progress of Persia and the interlacing of Greek and Persian interests to the point where the struggle became inevitable. (4) The campaigns of Persia, in Scythia and Libya, with vast geographical and ethnological digressions. (5) The subjugation of the north coast of the Ægean—Thrace and Macedon. The beginnings of revolt among the Ionic cities, with anecdotal digressions on Athens and Sparta that prepare us for the rôle to be assumed by those cities. (6) The revolt of the Ionians aided by Athens and Eretria; its suppression; the avenging mission of Mardonius against Eretria and Athens; his defeat at Marathon.

Herodotus, though an artistic, is not a critical historian. A critical history was possible in that age only to a Thucydides describing on the testimony of documents and eye-witnesses a contemporary war between Greeks. The Greeks of the generation of the Persian Wars were too busy making history to write it, and the tradition of the great struggle was already transfigured by legend and local patriotism when he took it up. Nor could he deal scientifically with the dim legends and inextricably crossed traditions of the East which he gathered on the frontiers of the Greek and barbarian worlds. Fortunately, he did not make the attempt. Ignorant of the languages, unable to decipher the records, if he had applied to the tales told him by dragomans, minor priests, commercial travelers, and Greek mercenaries either his own standards of credibility or ours, he would have deprived us not only of many a delightful story, but of much invaluable information. "It is my business to relate what is told me," he declares, "but I am under no obligation to believe it." He does not believe that the Phœnicians got the noonday sun on their right hand in circumnavigating Africa—but he tells us the story. And, wasting no time on vain critical discussions or pretentious philosophies of history, he contrives to tell us more fascinating stories and interesting facts to the page than any other writer in the world. In view of this and his evident good faith, genial simplicity, and earnest piety, we may disregard the critics who impugn his honesty because his account of a crocodile would amuse a naturalist, and his description of Babylon would not satisfy a Baedeker.

The charm of his seemingly simple, artfully artless, naïve, Ionic style has been celebrated by all critics, ancient and modern. Andrew Lang's entertaining parody in his *Letters to Dead Authors*, gives, by exaggeration, a good idea of it to the English reader. Macaulay's essay "On History" contains a picturesque rhetorical characterization.

BIBLIOGRAPHY. De Quincey wrote on what he called the "Philosophy of Herodotus," and his essay on "Style" has a fine digression on Herodotus at Olympia. The chief translation is the classical work of Rawlinson in four volumes with elaborate notes and introduction (London, 1858, often reprinted). The translation of G. C. Macaulay (London, 1890) is well spoken of. Stein's annotated German edition (Berlin, 1901 et seq.) is read chiefly by students. Sayce, *Herodotus*, i.-iii. (London, 1883) deserves attention for his introduction, notes, and appendices. Macan, *Herodotus*, iv., v., vi., with appendices (London, 1892), is rich in historic criticism. Hauvette, *Hérodote: historien des guerres médiques* (Paris, 1894), is an excellent monograph. The volume on Herodotus in *Blackwood's Ancient Classics* is readable. Consult also: Kirchhoff, *Ueber die Abfassungszeit des Herodotischen Geschichtswerks* (Berlin, 1878); and Bauer, *Herodots Biographie* (Vienna, 1878).

HEROES, hē'rōz (Lat. *heros*, from Gk. ἦρος, connected with Lat. *servare*, Skt. *sar*, Av. *har*, to protect). In the older portions of the Homeric poems the heroes are warriors; in the *Odyssey* the word has extended its meaning, and denotes any distinguished character of the stories of the past. In the later time a third meaning prevails, and the 'heroes' are the semi-divine objects of worship. To such heroes the later noble families, or even whole communities, traced their origin, and it seems probable that the original use of the word was to denote the souls of the blessed ancestors. These 'heroes' were commonly regarded as sprung from the union of a god and a mortal. Their cult ritual was like that of the gods, but naturally had closest resemblance to that of the chthonic divinities. Their worship was widespread, and it seems very clear that in the large majority of cases those worshiped in historic times as heroes were originally gods, who had been superseded by the growth of the great personal gods. It was natural that eminent men, who had seemed to possess somewhat of the divine essence, should receive reverence as supernatural beings after death. Such are the cases of Brasidas, Themistocles, and in later times some of the founders of philosophical schools, as Epicurus. From this it seems to have been easy to worship the living, as in the case of Alexander and some of his successors, who were honored as 'savior gods' (θεοὶ σωτῆρες). In Thrace the conception of the heroized dead as heavenly horsemen is common, but the word 'hero' has become the name of a mighty god, to whom dedications are frequent. For the best brief account of the growth and character of the hero-worship in Greece, consult: Usener, *Götternamen* (Bonn, 1896); more elaborate, but in their discussion less satisfactory, Rohde, *Psyche* (2d ed., Freiburg, 1898); Deneken, in Roscher, *Lexikon der griechischen und römischen Mythologie* (Leipzig, 1886-90), with full collection of authorities; and Furtwängler, *Sammlung Sabouroff*, vol. i. (Berlin, 1883).

HEROIDES, hē-rō'i-dēz. An early work of Ovid, a collection of twenty fictitious love-letters sent by noble women of the olden time to their estranged husbands or lovers. The theme in all is the same, but their romantic nature and dramatic setting have placed them among the most popular of Ovid's works. The last six

of the epistles are believed to be the work of imitators.

HER/OIN. A derivative of morphine. It is a white, crystalline, neutral, slightly bitter powder. It is only slightly soluble in water, but freely so when a dilute acid is added. The use of the drug in medicine practically dates from 1898, and there is still a diversity of opinion as to its action and value. Its analgesic effect is inferior to that of morphine or codeine, but it may be used as a substitute when these are not well tolerated. It seems to be chiefly of value in allaying cough. For the relief of dyspnoea it is sometimes effectual, having given good results in cases due to asthma, cardiac dilatation, aneurism of the aorta, and uræmia. It has been claimed that heroin is to the respiratory system what digitalis is to the heart. The dose should always be small, and it should be used with the same caution as other derivatives of opium. A single dose of two and one-half grains has been followed by great exhaustion, trembling, diminished temperature, a thready pulse of 140, contraction of the pupil, and impaired vision. Recovery followed the administration of caffeine.

HÉROLD, á'rô', LOUIS JOSEPH FERDINAND (1791-1833). A French dramatic composer, born in Paris. Although his father was a musician, he discouraged his son's musical ambitions, and it was only after his father's death (1802) that the boy was able to follow his natural bent. In 1806 he entered the Paris Conservatory, winning first prize for piano-playing in 1810, and the Prix de Rome in 1812 with his cantata *Mlle. de la Vallière*. After studying in Rome for three years he went to Naples, producing there, in 1815, his first opera, *La gioventù di Enrico Quinto*. His next three or four operas, given in Paris, were successful, but, owing to poor libretti, were followed by a series of failures which for a time discouraged the composer. In 1828 Hérold was elected a member of the Legion of Honor. His best works, *Marie* (1826), *Zampa* (1831), and *Le pré aux clercs* (1832), are compositions of genuine merit, and still hold the boards in France and Germany. Consult Jouvin, *Héroid, sa vie et ses œuvres* (Paris, 1868).

HERON (OF. *hairon*, *heron*, Fr. *héron*, Prov. *aigron*, *heron*, from OHG. *heigr*, *heron*, AS. *higora*; connected with AS. *heagra*, OS. *hrecira*, MHG. *reiger*, Ger. *Reiher*, *heron*, Skt. *krakana*, *krakara*, partridge, and Lat. *crociro*, Gk. *κρίειν* *krizein*, to screech, Goth. *hrops*, cry, OHG. *hruom*, *ruom*; Ger. *Ruhm*, fame, AS. *hroc*, Eng. *rook*). A bird of the genus *Ardea* (and allied genera), of the family Ardeidae and suborder Herodii. This family includes also bitterns and night-herons. In it the bill is long, compressed, and sharp; the tail short, the legs and the toes long and slender, the wings long. Those peculiar patches of soft, oily feathers called 'powder-down' tracts are always present—three pairs in the true herons, one on the breast, one on the rump, and one under the thighs. In the herons—in which genus are included the species commonly designated egrets (q.v.), which differ only in unimportant particulars of plumage—the bill is slender but strong, forming a compressed and lengthened cone; the plumage is beautiful, but seldom exhibits very gay colors, white, brown, black, and slate-color, finely blended, being generally predominant. Al-

though the sexes usually are alike in color, few birds show greater variety of plumage than the herons, for the breeding plumage is much finer than that of the remainder of the year, and the young are usually very different from the adults. Furthermore, a number of species are dichromatic; that is, some specimens show one type of coloration and other specimens another type, absolutely without regard to age, season, or sex. (See DICHROMATISM.) In the herons, one of the color phases is generally pure white; the other phase is more or less colored, and is always remarkably different. (For the use of the plumage of certain herons as an ornament of costume and in millinery, which has led to their extinction in some regions, see ATGRET.) The body is small in proportion to the length of the neck and limbs; the neck is long, and, except in flight, is usually held curved. In flight the heron carries the neck, head, and long bill in a straight line before the body, and the long legs in like manner stretched out behind. Herons feed mostly on fish, frogs, and other aquatic animals, and may be seen, particularly very early in the morning and late in the evening, standing patiently motionless in some shallow water, at the margin of a lake or stream, or on the seashore, waiting till prey come within reach. In default of their ordinary food, however, herons sometimes prey on young birds, reptiles, and the smaller mammalia. They usually go forth singly in quest of prey, but are mostly gregarious in their nidification. The nests are usually built in trees, of coarse sticks with little lining. The eggs are three or four, in color blue or bluish green, without spots. See Colored Plate of EGGS OF WATER AND GAME BIRDS.

Herons are widely distributed over the globe, but are especially abundant in the tropics and warm temperate zones. Some seventy-five species are known, of which about a dozen occur in the United States.

The great blue heron (*Ardea herodias*) is about four feet in length from the point of the bill to the end of the tail, and nearly six feet across the wings. It is of a delicate gray color on the upper parts, except the quill-feathers, which are black, and the tail, which is deep slate-color. This common heron generally builds its nest in a high tree, and many nests are sometimes to be seen in a single tree. In northern parts of the continent the heron is known only as a summer bird of passage, but it remains in the Southern United States all the year. Its geographical range extends over most parts of the New World north of the equator. Herons were formerly in great esteem for the table, although now disregarded. The common heron (*Ardea cinerea*) of Europe is very similar to the great blue heron, but has the tibiae white instead of chestnut. It is famous as the game which was most eagerly sought in falconry. Other well-known American herons are the little green heron (*Ardea virescens*), which is only about a foot and a half long, the prevailing colors dark green and brown, abundant throughout the United States and a little beyond, both north and south; the night-heron (*Nycticorax nycticorax*, var. *nervius*), a mere variety of the European night-heron, found throughout the United States and Canada. (See NIGHT-HERON.) The white heron (*Ardea egretta*) and the snowy heron (*Ardea candidissima*) are southern species, always pure

white, the former about 60 per cent. larger than the latter; and the reddish egret (*Ardea rufa*), the little blue heron (*Ardea cœrulea*), and the great white heron (*Ardea occidentalis*), all of which are dichromatic; the last is the largest American heron, and is about 4½ feet long and 8 feet in extent. The largest known species is the giant heron of Africa (*Ardea Goliath*), which slightly exceeds these figures. Among other herons of the Old World may be mentioned the following: The purple heron (*Ardea purpura*), which is of large size, purplish-blue plumage, and wide distribution (see Colored Plate of WADING BIRDS); the great white heron, or great egret (*Ardea alba*), is most common in Turkey and eastward. It is an extremely beautiful bird, with perfectly white plumage, much of it loose and flowing. The little egret (*Ardea garzetta*) has also white flowing plumage. Consult: Newton, *Dictionary of Birds* (London and New York, 1896); Sclater and Hudson, *Argentine Ornithology* (London, 1888); and American ornithologies.

HERON. See HERO OF ALEXANDRIA.

HERON, MATILDA (1830-77). An American actress. She was born near Londonderry, in Ireland, and was brought to the United States by her parents in childhood. She first appeared in Philadelphia in 1851 as Bianca in *Fazio*. Her chief parts were Camille in *La Dame aux Camélias*, and Ulah in *De Soto*. She played in all the principal American cities and visited London in 1861. She was married to Robert Stoepel, a musician, in 1857, but was divorced in 1869. In the latter part of her life she taught elocution in New York City.

HERON/DAS, or HERO/DAS (Lat., from Gk. Ἡρόνδας, or Ἡρόδας). A Greek poet of the third century B.C., born, probably, in the island of Cos. Of his mimes or mimiambi, as they are sometimes called, nothing was known before 1890 except a few fragments. In that year, however, an Egyptian papyrus was found which contains seven comparatively complete poems and parts of two others. These are all written in the metre called the choliambus, or lame iambic trimeter. Unlike the works of the earlier iambographers, such as Archilochus and Hipponax, the poems of Herondas are not personal in their satire. They may be described as *genre* pieces descriptive of certain phases of life in the early Alexandrian time, and as such they are extremely interesting. The realism of these pictures is very striking. In them the Alexandrian age lives again in all its hurry and flurry, all its outward brilliancy and spiritual poverty. First publication by Kenyon, *Classical Texts from Papyri in the British Museum* (London, 1891). The latest edition is by Crusius (Leipzig, 1898).

HEROOP/OLIS. See SUCCOII.

HEROPH/ILUS (Lat., from Gk. Ἡρόφιλος (c.300 B.C.). A famous surgeon of antiquity, born at Chalcædon in Bithynia. He studied medicine under Praxagoras, one of the followers of Hippocrates, and afterwards went to Alexandria in Egypt, where he became famous, and was one of the founders of the medical school in that city. His followers later spread to Pergamum, Laodicea, and elsewhere. Herophilus's greatest services were performed in the field of anatomy.

He discovered the nerves and made important observations in connection with the eye. Several names which he gave to different parts of the body are still in use, one such, *ocular Herophili*, recording his own name. He is said to have practiced vivisection upon condemned criminals. His writings were numerous, but we have only fragments thereof.

HERO'S FOUNTAIN (named from its inventor, Hero of Alexandria). A pneumatic apparatus, in which a vertical jet of water is produced by the pressure of condensed air. A simple form of the apparatus constructed of glass tubes is shown in the annexed figure. The column of water in the left-hand tube compresses the air in the lower vessel; this causes an increase of pressure on the surface of the water in the upper cistern, and causes it to gush out at the jet.

HEROSTRATUS (Lat., from Gk. Ἡρόστρατος). An Ephesian, who, from a desire for future fame, set fire, in B.C. 356, on the very night on which Alexander the Great was born, to the magnificent Temple of Diana at Ephesus; only the walls and a few columns were left standing. Herostratus expiated the deed by a painful death, and the Ephesians passed a decree that his name should never be mentioned. It was revealed by Theopompus.

HER/PES (Lat., from Gk. ἕρπης, *herpēs*, from ἔρπειν, *herpein*, Lat. *serpere*, Skt. *sarp*, to creep). A cutaneous eruption, characterized by spreading or creeping from place to place. The term was formerly applied to several different diseases, including eczema, psoriasis, lichen, and seborrhœa, as well as zona, to which it properly belongs. Zona, or herpes zoster, is a cutaneous disease of trophic origin, occurring as a sequence of various lesions of the nervous system; it is a dermatosis of nervous origin—a fact established by pathologists. The disease is of an acute, inflammatory nature, characterized by a set of vesicles as large as a split pea, occurring in clusters and following the course of a peripheral nerve. The course of the affection is from ten to fourteen days in each locality to which it spreads, each irregular cluster of vesicles going through the process of increase, maturation, and decline, each vesicle drying into a scab. The inflamed areas are exquisitely tender to the touch, sometimes itching at the same time. Soothing and cooling applications should be made, avoiding ointments whose base is grease. Galvanism is of benefit. Appropriate internal treatment for the nerve condition must be employed. Herpes zoster is popularly called 'shingles.'

HER/PETOL/OGY (from Gk. ἕρπετον, *herpeton*, reptile, from ἔρπειν, *herpein*, to creep + *-λογία*, *-logia*, account, from λέγειν, *legein*, to say). That branch of natural history which treats of reptiles and formerly included the amphibia. Now, however, the term is restricted to the Reptilia proper, which includes lizards, snakes, turtles, crocodiles, alligators, and various extinct aquatic and terrestrial reptiles. The first

HERO'S FOUNTAIN.

attempt at a systematic arrangement of reptiles was made by Ray (1693), but he did not clearly comprehend their relationships, nor did he give the group a name. Linnæus (1735-68) classed tortoises, lizards, and serpents as amphibia, and recognized two sub-groups, (1) those with and (2) those without feet. He included in this class those forms which we to-day call amphibia, and later he added branchiostegous fishes. Of course, such an arbitrary classification, without any morphological foundation, was soon replaced by others. Linnæus recognized 213 species and 10 genera. Cuvier (1817-29) practically adopted the classification of Brongniart (1799), in which four orders were recognized: (1) Chelonia; (2) Sauria (lizards and crocodiles); (3) Ophidia (serpents and provisionally the cæcilians); and (4) Batrachia, the latter corresponding to our present Amphibia minus the cæcilians. The splendid additions to our knowledge of their anatomical structure, made by such men as Johannes Müller in Germany, Owen and Huxley in England, and Cope in America, and an increased knowledge of the embryological development of some puzzling forms, has greatly added to the accuracy of our classification both of the Reptilia and the Amphibia. The light which has been shed on the relationship of the groups by paleontological researches of the past century particularly has also been of inestimable value in the establishment of our present classification, for which see REPTILE.

HERPETON (Gk. *ἑρπετόν*, reptile). An extremely rare snake of Southeastern Asia. It belongs to a family (Homolopsidæ) of colubrine viviparous water-snakes, which prey upon fish and crustaceans, and often moor themselves by curling the prehensile tail about some waterside branch or root. This species (*Herpeton tentaculatum*) is peculiar in having two forward-pointing appendages covered with scales on the snout, supposed to be organs of touch. Compare LANGAHA.

HERRERA, ár-rá'rá, FERNANDO DE (1534-97). A Spanish poet, born at Seville, the head of the so-called Seville school of lyric poetry in the sixteenth century. When advanced in life he took orders. He was master of the Greek, Roman, and Italian literatures, and was a man of prodigious learning. As a poet he ranked so high in the opinion of his contemporaries that they bestowed upon him the appellation of the 'divine.' Like his acknowledged master, Garcilaso de la Vega, he sings chiefly in the foreign Italian strains, and is particularly successful in the *canción* and the *soneto*. His masterpiece is the *canción* (or ode) *Por la victoria de Lepanto*. Many of his erotic poems are remarkable for tender feeling, and his odes frequently display a lofty enthusiasm; but the expression is sometimes cast in too classical a mold, and consequently wears a certain air of artificiality. Herrera himself prepared for publication a volume of his verse, *Algunas obras* (Seville, 1582), to which additions were made in an edition by Pacheco (1619). The poems are to be found also in Ramón Fernandez, *Poesías castellanas* (1808), and in the *Biblioteca de autores españoles*, xxxii. (Madrid, 1872); selections in Ford, *A Spanish Anthology* (New York, 1901). His chief historical work is the *Relación de la guerra de Chipre y batalla de Lepanto* (1572), and he

translated from the Latin of Stapleton a life of Sir Thomas More. In 1580 he published an annotated edition of the poems of Garcilaso. Consult: *Fernando de Herrera, Controversia sobre anotaciones á las obras de Garcilaso de la Vega: Poesías inéditas* (Seville, 1870); Morel-Fatio, *L'hymne sur Lépante* (Paris, 1893); Lasso de la Vega, *Historia de la escuela poética sevillana* (Madrid, 1876); Bourciez, in the *Annales de la Faculté des lettres de Bordeaux* (Bordeaux, 1891).

HERRERA, FRANCISCO DE (1576-1656), called El Viejo (the elder). A Spanish painter of the school of Seville. He was the first to emancipate himself from the Italian manner then dominant in Spain, and to assume the vigorous naturalistic style afterwards adopted by Velasquez (q.v.). He may therefore be regarded as the founder of the new national school of Spain. Herrera was born at Seville in 1576, and studied painting with Luis Fernandez, who painted in the Italian manner. He soon emancipated himself from this master, and founded a school of his own; but his unbearable temper drove away his pupils, among whom was Velasquez, and even his own sons. A carver in bronze, Herrera was accused of counterfeiting money, and in order to avoid arrest he took sanctuary in the Jesuit College at Seville. While there he painted the "Triumph of Saint Hermengild," now in the Museum of Seville—a picture of such merit that when it was seen by Philip IV. on his visit to the city he pardoned the artist. After his release Herrera became more unbearable than ever. His wife left him; his elder son, called El Rubio, died of consumption; and his younger, Herrera el Mozo, robbing his father of his money, fled to Italy. In 1650 the father went to Madrid, where he died in 1656.

His subjects are generally sombre and tragic, and are mostly of a religious nature, although he sometimes painted genre. They contain all the qualities of a great artist; a design grandiose but correct and true to nature, especially in the nudes; a harmonious color, laid on in great masses. He painted both in oils and al fresco, but most of his fresco-work has disappeared. His principal works are at Seville. Among them are the "Last Judgment," in the Church of San Bernardo; four great pictures in the archiepiscopal palace, representing the "Fall of Manna," "Moses Smiting Water from the Rocks," the "Marriage at Cana," and the "Miracle of the Loaves and Fishes;" "Saint Peter," in the Cathedral; and "Saint Basil," in the Museum; "Saint Augustus and Saint Jerome," in the Montpensier Collection, Seville. The Louvre has two excellent examples, "Saint Basil Dictating His Doctrine," and the "Israelites Gathering Manna in the Desert;" the Museum of Dresden, a "Saint Matthew." The frescoes with which he ornamented the façade of the convent of La Merced, at Seville, have perished, as have also those at Madrid. Luckily the artist himself etched a number of the latter, showing great skill in this branch of art, as is further evident from his print, "Saint Peter."

His son, FRANCISCO HERRERA (1622-85), called El Mozo (the younger), after he had fled to Italy, painted pictures of various subjects, especially of fish, the latter with such success that he was called "Il Spagnuolo degli Pesci." In 1656, after his father's death, he returned to Seville. In 1660 he was one of the founders of the academy there, but on account of his jealousy of Murillo (q.v.),

who was made president, while Herrera was vice-president, he went to Madrid in 1661. He became Court painter to Philip IV., and master of the royal works under Charles II. In this office he figured as an architect, assisting in the renovation of the Cathedral of Saragossa. His work as a painter was brilliant, but manneristic. His works include the "Four Doctors of the Church Adoring the Host," Museum of Seville; the "Immaculate Conception," and "Saint Hermengild," now in the Prado Museum; and the frescoes of the Chapel of Our Lady of Atocha, "The Ascension of Mary," his chief work. Consult: Bermudes, *Diccionario de los mas illustros profesores* (Madrid, 1800); Stirling Maxwell, *Annals of the Artists of Spain* (London, 1848).

HERRERA, JOSÉ JOAQUIN DE (1792-1854). A Mexican general, born at Jalapa. He rebelled with Iturbide (1821), but opposed him when he was made Emperor. Herrera was Minister of War; President of the Supreme Court; was President for three months and a half in 1845; was Santa Anna's lieutenant in the war with the United States of America; and was President again (1848-51).

HERRESHOFF, hēr'rēs-hōf, JOHN B. (1841—). An American naval architect, born in Bristol, R. I., and a brother of Nathaniel Herreshoff. He is a descendant of John Brown who headed the attack on the *Gaspée*, and early showed both inventive ability and love of the sea. Although he became blind at fifteen, he built up and managed the business of the Herreshoff Manufacturing Company, which succeeded Edward Burgess as designer of the defenders of the *America* cup, and many stories are told of his wonderful grasp of detail and of his perfect freedom of movement in shop and on board ship.

HERRESHOFF, NATHANIEL GREENE (1848—). An American naval architect, born at Bristol, R. I. He was educated at the Massachusetts Institute of Technology, and made a special technical study of engineering in the Corliss Works at Providence, R. I., where he assisted in the construction of the large engine which furnished motive power for all machinery at the Philadelphia Exposition of 1876. He became superintendent of the Herreshoff Manufacturing Company, boat-builders, at Bristol, R. I., and designed numerous torpedo-boats and yachts. Among the high-speed torpedo-boats designed by him for the United States Government were the *Lightning* and the *Cushing*. His reputation in connection with racing yachts dates mainly from the triumphs of the *Gloriana* in 1891. The great success of the three craft built for contests in defense of the *America's* cup, the *Vigilant*, *Defender*, and *Columbia*, placed him among the foremost of his profession. He introduced many innovations in the architecture of racing yachts, and invented a coil boiler for use on steam vessels built by the Herreshoff Company.

HER'Rick, EDWARD CLAUDIUS (1811-62). An American meteorologist, born in New Haven, Conn. He was librarian at Yale College from 1843 to 1858, and treasurer from 1852 until his death. He made noteworthy contributions to the knowledge of meteorology, meteoric showers, the Aurora Borealis, and the zodiacal light. He was likewise an entomologist of distinction, and devoted nine years to the study of the Hessian fly

and its parasites. His reputation is one of the treasures of Yale College.

HERRICK, ROBERT (1591-1674). An English poet, born in London. He was educated at Cambridge, and in 1629 was presented to the Vicarage of Dean Prior, Devonshire. Ejected from his parish by the Long Parliament in 1647, he repaired to London. In 1648 appeared a collection of his poems, in two parts, bound together, bearing the titles *Hesperides* and *Noble Numbers*. Some of these poems, however, had been finding their way into print ever since 1635. On the restoration of Charles II. he was reinstated in his old living, where he died. His poems, which are mostly lyrical, are graceful and melodious, and show much fine fancy. They vary in subject from amatory verses, pagan in tone, to pieces of deep religious feeling. Such songs as "Cherry Ripe" and "Gather Ye Rosebuds While Ye May," are universally known. They and scores of others are exquisite in sentiment and admirable in form. Though duly appreciated in his own time, Herrick was neglected for more than a hundred years after his death. Rediscovered in the nineteenth century, he has steadily grown in favor. There are editions of his poems by Hazlitt (London, 1869), Grosart (ib., 1876), Palgrave (selections, ib., 1877), Pollard, with critical essay by Swinburne (ib., 1891), and an essay by Gosse in *Seventeenth Century Studies* (ib., 1883).

HERRIG, hēr'rik, HANS (1845-92). A German poet and dramatist, born in Brunswick. He studied law at Berlin and Göttingen, and at first was employed in the Berlin city court, but after 1872 devoted himself entirely to literature, was editor of the *Deutsches Tageblatt* from 1881 to 1888, and wrote many plays that attained wide popularity. His *Festspiel*, written for the Luther Jubilee in 1883, was especially successful. His dramas, which are more distinguished for elegance and force of diction than for positive dramatic skill, comprise: *Alexander der Grosse* (1872); *Kaiser Friedrich der Rotbart* (1873); *Jerusalem* (1874); *Der Kurprinz* (1876); *Konradin* (1881); *Harald der Wiking* (1881), which was set to music by Andreas Hallen; *Drei Operndichtungen* (1881); *Nero* (1883); *Columbus* (1887); and *Christnacht* (1887). His other writings are: *Die Schweine* (1876); *Mären und Geschichten* (1879); *Der dicke König* (1885); *Die Meiningen, ihre Gastspiele und deren Bedeutung für das deutsche Theater* (1879); *Luxustheater und Volksbühne* (1886); *Ueber christliche Volksschauspiele* (1891); and *Das Kaiserbuch* (1891).

HERRING (AS. *hæring*, OHG. *harinc*, Ger. *Hering*, herring, from AS. *here*, OHG. *hari*, *heri*, Ger. *Heer*, army; in allusion to the shoals in which the fish moves). A fish of the family Clupeidæ, belonging to the genus *Clupea*, very closely related to the shads and sardines. Herring are soft-rayed fishes, with a compressed body and rather large cycloid scales. The head is naked, and the caudal fin is forked. They occur in all the northern seas, and make periodic migrations from the deeper waters to the shore for the purposes of spawning. In the more northern regions this occurs during the spring and early summer; in the more southern regions, in July to December. The average yield of eggs is about 30,000 to the fish, with a maximum of about 55,000. They are laid in shallow waters and are

1. COMMON HERRING (*Clupea harengus*).
2. MENHADEN (*Brevoortia tyrannus*).
3. MUD or HICKORY SHAD (*Dorosoma cepedianum*).
4. ALEWIFE (*Pomolobus aestivus*).
5. PILCHARD (*Clupea pilchardus*).

slightly glutinous, sticking in clumps to rocks, etc., on the bottom. The young herring probably remain on the shallow spawning beds all the year. At this period of spawning they swim in great schools, and are taken in vast numbers for commercial purposes. The herring fisheries are very extensive both in Europe and America. The estimated annual catch is 3,000,000,000, weighing one-half that many pounds. They are largely smoked, salted, and canned. The young in certain regions are canned as sardines. Fresh herring are much used as bait for cod and other fishes taken by line. See FISHERIES.

Herring live on minute crustaceans and larval forms of a great variety of animals, which they strain out of the water, and are themselves preyed upon to an enormous extent by cod, haddock, sharks, and other fishes, and by sea-birds.

The common herring (*Clupea harengus*) frequents both sides of the Atlantic southward to the thirty-seventh parallel. It attains a maximum length of about 17 inches, the usual average being about 12 inches. The California herring (*Clupea Pallasii*) strongly resembles the Atlantic one in form and habit, and is about equally abundant and an important food-fish. There are other less valuable species, belonging to this or a related genus. Thus the various species of alewife (q.v.) are known as 'herrings,' with distinguishing adjectives. The 'lake' or 'Michigan herring,' however, is an entirely unrelated form, being a salmonoid (see CISCO), although greatly resembling the common herring in form and general appearance. Consult, for an extensive natural history of the herring family, Goode, *Fishery Industries*, Section I. (Washington, 1884). See Plate of HERRING AND SHAD.

HERRING, JOHN FREDERICK (1795-1865). An English animal painter, born in Surrey. He was for many years a coachman, and during this time and afterwards devoted himself to painting pictures of horses. His racing and coaching pictures have often been lithographed. The "York Stage," the "Mail Coach," and the "Mail Change" are spirited representations of methods of traveling in the early days of the last century. He also did a series of portraits of the Derby and St. Leger winners. His genre picture, "A Frugal Meal," is in the National Gallery, London.

HERRING-GULL. See GULL.

HERRING-HOG. A porpoise; especially, in New England, the common small harbor porpoise, also called 'puffing pig.' See PORPOISE.

HERRINGS, BATTLE OF THE. See FASTOLF, SIR JOHN.

HERRMANN, ALEXANDER (1844-96). An American prestidigitateur, born in Paris. After public performances in various European cities from 1856, he appeared in 1861 in the United States, and in the same year was naturalized. He traveled professionally all over the world, even to the Far East, the home of the sleight-of-hand art, where he was received with amazement. In 1874 he made his first transcontinental tour of the United States. As a master of pure sleight-of-hand, and as a performer who united the entertaining with the mystifying, he has perhaps never been surpassed.

HERRMANN, hēr'mān, or **HEERMANS, hār'māns**, or **HARMAN, hār'mān**, AUGUSTINE (1605-86). An American colonist, active chiefly

in the affairs of New Netherlands, and afterwards in those of Maryland. He was born in Prague, Bohemia, and after receiving an excellent training in modern languages and mercantile life, entered the service of the Dutch West India Company. It is said that he came to Virginia in 1629, and that he was the original founder of the tobacco trade of that colony. Having settled in New Amsterdam in 1643, he began to take an important share in the civic life of the Dutch settlements, and was of much service in regulating the relations of New Netherlands with Rhode Island and Maryland. Having been sent to Maryland in 1659 to uphold the rights of New Netherlands as against the claim of Lord Baltimore to the Delaware River, he presented the case of his colony with great force, and the State of Delaware is believed to have owed its existence to the arguments established on that occasion. He later obtained from Lord Baltimore a charter to found Cecil town and county in Maryland, and induced some New Amsterdam people to go there with him. Having made a valuable map of Maryland and Virginia, he received land grants amounting in all to 30,000 acres, with manorial privileges. He was given the title of Lord of Bohemia Manor, became a member of the Governor's Council, a justice of Baltimore County, and in 1678 was made a commissioner to treat with the Indians. His descendants were lords of Bohemia Manor until 1735.

HERRMANN, hēr'mān, ERNST ADOLF (1812-84). A German historian, born at Kämmerwalde. He studied at Dorpat, and at Berlin under Ranke, and then lived in Dorpat (1837-39) and in Dresden. In 1847 he became docent at Jena, then professor of history there, and afterwards (1857) at Marburg. His work was mostly on the history of Russia; especially important was his completion of Strahl's *Geschichte des russischen Staates* (1846-66). Among his other writings are: *Beiträge zur Geschichte des russischen Reichs* (1843); *Die österreichisch-preussische Allianz vom 7. Februar 1792 und die zweite Teilung Polens* (1861), which was an attack on Sybel; and *Peter der Grosse und der Zarowitzsch Alezei* (1880).

HERRNHUT, hērnhoot. A small town in the Kingdom of Saxony, situated on the southern slope of the Hutberg, 11 miles from Zittau (Map: Germany, F 3). It is noted throughout Germany as the central seat of the Moravian Brotherhood. The town has manufactures of linen, furniture, etc., the products of Herrnhut being famous all over Germany. The community was founded in 1722 by a colony of persecuted Moravians, some of whom were descended from the old Bohemian and Moravian Brethren. In coming into Saxony they were sheltered and protected by the pious Count Zinzendorf, to whom Herrnhut belonged. Population, in 1900, 1242, including 830 Moravians.

HERRON, FRANCIS JAY (1837—). An American soldier. He was born in Pittsburg, Pa.; graduated at the Western University of Pennsylvania in 1853, and after 1856 engaged in business in Iowa. He served in Iowa volunteer regiments in the Civil War, becoming brigadier-general of volunteers in July, 1862, for a time commanding the Army of the Frontier, and being made major-general of volunteers in November, 1862. At Vicksburg he commanded the left wing

of the investing forces, and at the close of the war received the surrender of the Confederate forces west of the Mississippi. He resigned in 1865, entered on the practice of law in New Orleans, was United States marshal of the District of Louisiana from 1867 to 1869, and was Secretary of State of Louisiana in 1872-73. He subsequently practiced law in New York City.

HERRON, GEORGE DAVIS (1862—). An American clergyman and writer, born in Montezuma, Md., and educated at Ripon College, Wisconsin. He held Congregational pastorates at Lake City, Minn., and Burlington, Iowa, and in 1893 became professor of applied Christianity in Iowa College. Opposition to his teachings led him to resign in 1900, and he then initiated a social crusade in Chicago and New York, founded the *Social Crusader*, and lectured upon "The Economics of the Kingdom of Heaven" and similar topics, chiefly advocating a transformation of the present economic order into conformity with the Christian principle of the brotherhood of men. He aroused great controversy throughout religious circles generally in 1901 by his separation from his wife, his second marriage, and his published theories regarding a free marriage relation. At a meeting of the Iowa Congregational Council he was deposed from membership. His principal writings are: *The Larger Christ* (1891); *The Call of the Cross* (1892); *A Plea for the Gospel* (1892); *The New Redemption* (1893); *The Christian Society* (1894); *The Christian State* (1895); *Between Cæsar and Jesus* (1899).

HERSCHEL, hēr'shel, CAROLINE LUCRETIA (1750-1848). A German-English astronomer, sister of Sir William Herschel. She lived in Hanover till 1772, when she came to England to live with her brother at Bath. When he turned astronomer, she became his constant helper, and on his being appointed private astronomer to George III. acted as his assistant in the famous observatory at Slough, receiving a small salary from the King. She found time for a series of independent observations with a small Newtonian telescope made for her by her brother. Her special occupation was to scan the heavens for comets, seven of which she discovered, in regard to five of which she has the credit of priority of discovery; and several remarkable nebulae and clusters of stars included in her brother's catalogues were described from her original observations. In 1798 she published *A Catalogue of Stars taken from Mr. Flamsteed's Observations*, etc. This work was published at the expense of the Royal Society, and contained 561 stars omitted in the British catalogue. She lived with her brother during the whole of his career, and on his death, in 1822, returned to her native country. In 1828 the Royal Society conferred on her their gold medal for completing the catalogue of nebulae and clusters of stars observed by her brother. She was afterwards chosen an honorary member of the Royal Society. Consult: Mary C. Herschel, *Memoir and Correspondence of Caroline Herschel* (London, 1876); Clerke, *The Herschels and Modern Astronomy* (London, 1895).

HERSCHEL, Sir JOHN FREDERICK WILLIAM (1792-1871). An eminent English astronomer, the only son of the astronomer William Herschel. He was born at Slough, near Windsor, March 7, 1792, and was educated at Saint John's College,

Cambridge. His first publication was *A Collection of Examples of the Application of the Calculus of Finite Differences* (1820). In 1822 he applied himself especially to astronomy, using his father's methods and instruments in observing the heavens. For a time he worked with Sir James South in reëxamining the nebulae and clusters of stars described in his father's catalogues. The results of the reëxamination were given in 1833 to the Royal Society in the form of a catalogue. The catalogue contained observations on 525 nebulae and clusters of stars not noticed by his father, and on a great number of double stars—in all, between 3000 and 4000. His "Treatise on Sound" appeared in the *Encyclopædia Metropolitana* in 1830, and his "Treatise on the Theory of Light" in the same work in 1831, in which year also appeared in Lardner's *Cyclopædia* his "Preliminary Discourse on the Study of Natural Philosophy." In 1836 appeared his "Treatise on Astronomy," in Lardner's *Cyclopædia*. At this time Herschel was at the Cape of Good Hope, where he arrived in January, 1834, with the intention of completing the survey of the sidereal heavens by examining the Southern Hemisphere as he had done the Northern. Here he established his observatory at a place called Feldhausen, six miles from Table Bay. On March 5, 1834, he commenced his observations, which were embodied in his *Results of Astronomical Observations Made During 1834-38 at the Cape of Good Hope; Being a Completion of a Telescopic Survey of the Whole Surface of the Visible Heavens, Commenced in 1825* (1847). On his return to England, in 1838, honors were showered on him. He got the Royal Society's gold medal in 1826; he now was made a D.C.L. of Oxford, was created a baronet, succeeded the Duke of Sussex as president of the Royal Society, and in 1848 he became president of the Royal Astronomical Society. In 1849 he published his *Outlines of Astronomy*. In 1850 he was appointed master of the mint. This office, on account of ill health, he resigned in 1855. Consult Clerke, *The Herschels and Modern Astronomy* (London, 1895). For a list of his contributions, consult the Royal Society's great catalogue.

HERSCHEL, Sir WILLIAM (1738-1822). An eminent English astronomer. He was born at Hanover, Germany, November 15, 1738. The son of a musician, he was educated specially as a professional musician. In 1757 he went to England, where he became a teacher of music in the town of Leeds, from which he went to Halifax as organist, and subsequently (1766) in the same capacity to Bath. Here he would seem to have first turned his attention to astronomy. Wanting a telescope, and unable to afford a reflector, he made one for himself—a Newtonian, of five feet focal length—and with this applied himself to study the heavens. In 1781 he made his first discovery, a new planet, which at first he took for a comet. It was detected by an exhaustive process of surveying the heavens, which Herschel was the first to follow, taking the stars in regular series, and examining them in all their groups through the same instrument. The result of his discovery was his appointment to be private astronomer to George III., with a salary of £200 a year. He then went to live at Slough, near Windsor, where, assisted by his sister Caro-

line (q.v.), he continued his researches. He was knighted by George III., and made a D.C.L. by the University of Oxford; he became rich, partly through his wife's jointure, and partly through selling mirrors for reflecting telescopes. He died at Slough, August 25, 1822.

Herschel contributed sixty-nine papers to the *Philosophical Transactions* between the years 1780 and 1815, and to the first volume of *Memoirs of the Astronomical Society* he contributed a paper, "On the Places of 145 New Double Stars." He greatly added to our knowledge of the solar system; he discovered Uranus and six satellites, and two satellites of Saturn. Besides this, he determined the period of rotation of Saturn and that of Venus, the existence of the motions of binary stars, the first revelation of systems besides our own. He threw new light on the Milky Way and the constitution of nebulae, and, in fact, was the first to give the human mind any conception of the immensity of the universe. When in 1780 he began his researches, less than 150 nebulae were known, but as a result of his observations the number increased to nearly 2500, and through him the nebulae acquired a new importance in the universe. He advanced, in the earlier period of his researches, the theory that the nebulae were clusters of stars, the component stars being too faint, on account of their immense distance, to be seen separately. For the explanation of some of the nebulae, among them the nebulae of Orion, he, however, reverted to the old theory, that the nebulae were masses composed of a shining fluid of a nature unknown to us. His catalogue of double stars, nebulae, etc., and tables of the comparative brightness of stars, and his researches in regard to light and heat, would of themselves entitle him to the first rank as an astronomer and physicist. He erected a monster reflecting telescope, as it was then considered, of 40 feet focal length and 4-foot apertures. It was begun in 1785 and finished in 1789, on August 28th of which year he, by means of it, detected the sixth satellite of Saturn, and on the 17th of September a seventh. Consult Holden, *Sir William Herschel: His Life and Works* (New York, 1881).

HERSCHELL, FARRER, Lord (1837-99). An English lawyer and politician. After completing his education at Bonn and University College, London, he entered at the bar in 1860, and in twelve years was Queen's counsel. He was recorder of Carlisle in 1873-80, member of Parliament for Durham (1874-85), Solicitor-General under Gladstone (1880), and was knighted the same year. He was raised to the peerage six years later and made Lord Chancellor. He was president of the royal commission to inquire into the proceedings of the Metropolitan Board of Works (1888), and once more Lord Chancellor in 1892. He died in Washington, D. C., while serving as chairman of the Anglo-American Joint High Commission.

HERSENT, ar'sän', LOUIS (1777-1860). A French historical painter, born in Paris. He studied under Regnault and David, and won the Prix de Rome in 1797. In 1817 he attracted some attention by his "Daphnis et Chloë." His best picture, "L'abdicacion de Gustave Wasa" (1819), painted shortly afterwards, was destroyed. Several of his works are at Versailles. After 1824 he painted principally portraits, such

as those of the Duc d'Angoulême, Louis Philippe, and Queen Amélie. Hersent is an excellent representative of the classic school of David.

HERSFELD, hër'sfêlt. An ancient town in the Prussian Province of Hesse-Nassau, situated on the Fulda, 23 miles by rail from Fulda (Map: Prussia, C 3). It still retains a portion of its old fortifications, and contains an old church dating from the thirteenth century; the ruins of a collegiate church, originally built in the eleventh and twelfth centuries, and destroyed by the French in 1761; the remains of the Benedictine Abbey of Hersfeld; and an old Rathaus. There are manufactures of cloth, cotton goods, and leather. The Abbey of Hersfeld, founded in 770, by Lullus, Archbishop of Mainz, enjoyed great renown through the Middle Ages. Population, in 1890, 6758; in 1900, 7908.

HERSTAL, hër'stäl, or **HERISTALL**. A manufacturing and mining place in the Province of Liège, Belgium, extending along the left bank of the Meuse for about three miles immediately below the city of Liège, of which it may be considered a suburb (Map: Belgium, D 4). It has extensive metal-works and coal-mines in the vicinity; its population is made up chiefly of the workmen employed in the mills and mines. Some ruins still exist of the Castle of Herstal, the birthplace of Pepin le Gros (father of Charles Martel, and great-grandfather of Charlemagne), from which he has his title of Pepin of Herstal. Population, in 1890, 13,877; in 1900, 18,195.

HERTEL, hër'tel, ALBERT (1843-). A German painter, born in Berlin. He studied at the Berlin Academy, where he became professor in 1875, and of which he was elected a member in 1901. His landscapes are notable for style and fine coloring; among them are: "The Via Flaminia" (1872); "Olive Harvest in Capri" (1872); "After the Storm on the Coast of Genoa" (1878) and "Northern Coast Scene with Fishermen Returning" (1883), both in the National Gallery, Berlin; "Road Between Rapallo and Santa Margherita" (1892, bought by Emperor William II.); and "View in the Roman Campagna" (1896). He also painted decorative subjects.

HERTEL DE ROUVILLE, är'têl' de rōv'vêl', FRANCIS (1643-1722). A Canadian soldier, born in Three Rivers, Maurice County, Quebec. As a woodsman and Indian fighter he was widely known for valor and resourcefulness. Captured by the Iroquois in 1681, he bore various tortures with such fortitude that, instead of being put to death, he was adopted by the tribe. After a time, however, he escaped from the Indians and rejoined his comrades. Acting as one of Frontenac's lieutenants in 1690, he ravaged settlements in the lower part of Maine, escaped by adroitness from the greatly superior force of the English colonists, and united with the band attacking Falmouth, now Portland, where his strategy aided in the speedy capture of the village. Louis XIV. promised to reward him with letters of nobility, which he did not receive, however, until twenty-six years afterwards.

HERTER, ALBERT (1871-). An American figure painter, born in New York City. He studied at the Art Students' League there and at Corman's, and under J. P. Laurens in Paris. Afterwards he traveled in Japan, and was influ-

enced by Japanese art. His work has fine decorative qualities, and his color is rich and well handled. He received honorable mention at the Salon of 1890, and a bronze medal at the Paris Exposition of 1900.

HERTER, ERNST GUSTAV (1846—). A German sculptor, born in Berlin. He studied at the Berlin Academy, and as a pupil of August Fischer, Bläser, and Albert Wolff, was elected a member of the Academy in 1885, and obtained a professorship there in 1889. His work is careful in execution, but often formal and undistinctive. Among examples of it may be cited such imitations of the antique as "Alexander the Great Studying" (1876) and "The Wounded Achilles" (1879), both in the National Gallery at Berlin; "Moses Breaking the Tables of the Law" (1881); a statue of Helmholtz in the grounds of the Berlin University (1899); a fountain commemorative of Heine in New York; a statue of William I. at Holtzenau (1900); and various decorations for public structures.

HERTFORD. The capital of Hertfordshire, England, a municipal borough and market-town on the Lea, 26 miles north of London by rail (Map: England, F 5). The fourteenth-century Church of All Saints, destroyed by fire in 1891, has been replaced by a fine Perpendicular edifice; the shire hall and corn exchange are the chief of several important public buildings. The town has a preparatory branch of Christ's Hospital, a grammar school, and several charity schools. It owns the water-supply, markets, and a free public library, and school of art. Its industries and trade are chiefly agricultural. The old castle, of which traces remain, was built about 905. The present castle is of the time of James I., and was the temporary home of Haileybury College when its present buildings were being erected, two miles to the southeast. Domesday Book records Hertford as a borough, and it received its charter in 1544 from Queen Mary. Population, in 1891, 9000; in 1901, 9300.

HERTFORD, MARQUIS OF. See SEYMOUR, WILLIAM.

HERTFORDSHIRE, or HERTS. An inland county of England, bounded on the east by Essex, on the south by Middlesex, on the west by Buckingham and Bedford, and on the north by Cambridge (Map: England, F 5). Area, 635 square miles. Population, in 1891, 220,162; in 1901, 250,350. The surface presents a pleasing succession of finely wooded hill and fertile valley. The chief elevations are those of the chalk downs, a branch of the Chiltern Hills, which skirt the north of the county. The principal rivers are the Lee and the Colne, both affluents of the Thames. Agriculture is the chief industry, over three-fourths of the total area being cultivated. Immense quantities of hay and straw are sold, and throughout the county there are numerous gardens and orchards, the fruit of which is sent to the London market. Great quantities of malt are made in the county. Ware is the chief seat of the malting trade in the kingdom. Paper and straw-plait are extensively manufactured in the west and south. Capital, Hertford.

HERTHA, hēr'tá, HER'THUS, or ÆR'THA (Goth. *airþa*, OHG. *erda*, Ger. *Erde*, AS. *eorþe*, Eng. *earth*; connected with OHG. *erō*, earth, Gk. *ἔραζε*, *eraze*, on the earth, and perhaps with Lat.

arvum, field, *arare*, Gk. *ἀροῦν*, *aroun*, OChurch Slav. *orati*, Goth. *arjan*, OHG. *erian*, to plow). A deity of the ancient Germans. Tacitus states that she was worshiped with great solemnity by the Suevi, and that her temple stood in an island of the ocean, where her service was performed by a single priest. On great occasions which were regulated by this priest, the covered chariot of the goddess was drawn forth from the sanctuary by sacred cows and led in triumph throughout the country. Those districts through which the chariot passed were held to be peculiarly favored, peace was always proclaimed, and the occasion celebrated by universal merrymaking, until the priest declared that it was the will of the goddess to return to her shrine. Her image was then washed in a sacred spring, and all who witnessed the ceremony of the ablation were drowned. The island of Rügen was long thought to be identical with the sacred island of Hertha, but the same honor has been claimed for Helgoland and Zetland.

HERTOGENBOSCH, hēr-tō'gen-bōs', or HERZOGENBOSCH. The capital of the Dutch Province of North Brabant. See BOTS-LE-DUC.

HERTWIG, hērt'vīk, OSKAR (1849—). A German embryologist, born at Friedberg. He studied medicine in Jena under Haeckel and Gegenbaur, and at Zurich and Bonn. In 1878 he was made professor at Jena, and in 1888 professor of anatomy in Berlin. He studied with Haeckel and with his brother, Richard Hertwig, at Lesina on the Adriatic in 1871, in Corsica and Villefranche in 1875, and afterwards with his brother in Messina and Naples. He is one of the most influential embryologists of his time. The following are the most important of his publications: *Beiträge zur Kenntnis der Bildung, Befruchtung und Theilung des tierischen Eies* (1876), an epoch-making work, in that in it is established the fact that fertilization consists of the conjugation of the two equivalent sexual cells; *Studien zur Blättertheorie* (with R. Hertwig, 1879-83); *Die Cöломtheorie; Versuch einer Erklärung des mittleren Keimblattes* (with R. Hertwig, 1881); *Entwicklung des mittleren Keimblattes der Wirbelthiere* (with R. Hertwig, 1883); *Das Problem der Befruchtung und der Isotropie des Eies, eine Theorie des Vererbung* (1884); *Vergleich der Ei- und Samenbildung bei Nematoden* (1890); *Lehrbuch der Entwicklungsgeschichte des Menschen und der Wirbelthiere* (1886), translated into English by Edward L. Mark as *Textbook of Embryology* (1892); *Die Zelle und die Gewebe* (1892 and 1898); *Urmund und Spina Bifida* (1892); *Ueber den Werth der ersten Furchungszellen für die Organbildung des Embryos* (1893); and *Zeit und Streiffragen der Biologie* (1894).

HERTWIG, RICHARD (1850—). A German zoölogist, born at Friedberg. He studied medicine in Jena under Haeckel and Gegenbaur, and also in Zurich and Bonn. In 1874 he became privat-docent, and in 1881 professor extraordinarius in Jena. He was made professor of zoölogy in 1881 at Königsberg, and in 1885 at Munich. He studied with his brother, Oskar Hertwig, and with Haeckel on the Adriatic at Lesina in 1871 and in Corsica and Villefranche in 1875, and later with his brother in Messina and Naples. His publications include: *Zur Histologie der Radiolarien* (1876); *Studien zur Blätter-*

theorie (with O. Hertwig, 1879-83); *Die Cölomtheorie, Versuch einer Erklärung des mittleren Keimblattes* (with O. Hertwig, 1881); *Die Aktinien der Challenger Expedition* (1882); *Ueber Kernstruktur und ihre Bedeutung für Zellteilung und Befruchtung* (1888); *Ueber die Konjugation der Infusorien* (1889); *Ueber Befruchtung und Konjugation* (1892); *Lehrbuch der Zoologie* (1893); *Kerntheilung, Richtungskörperbildung und Befruchtung von Actinosphærium Eichhorni* (1898).

HERTZ, hërts, HEINRICH (1857-94). A German physicist, born at Hamburg. He studied at first to become a civil engineer, but forsook this profession for the study of mathematics and pure science, which he pursued at Munich and Berlin, becoming Helmholtz's assistant at the latter university in 1880. In 1883 Hertz became privat-docent at Kiel, and two years later was called to the Polytechnic Institute at Karlsruhe as professor of physics. His earlier experiments with electro-magnetic waves were performed during his occupancy of this professorship, and made for Hertz such a reputation that he was in 1889 called to the important chair of physics at Bonn, previously occupied by Clausius. To Hertz is due the realization and detection of the electro-magnetic waves which Maxwell had discovered in his theoretical consideration of the nature of electricity. Hertz found that waves produced by the spark of an electrical machine could be received by a circular loop of wire, and was able to show the reflection, refraction, diffraction, and polarization of the waves. The first paper describing these wonderful discoveries was published in 1887 and the series continued for several years in *Wiedermann's Annalen*. In 1890 was published *Ueber die Beziehungen zwischen Licht und Electricität*, while his *Gesammelte Werke* were published in Leipzig the year after his death. English translations entitled *Electric Waves*, by D. E. Jones, with a preface by Lord Kelvin (1893), and *Miscellaneous Papers*, by D. E. Jones and G. A. Schott, with an introduction by Philipp Lenard (1896), have been published. Consult "Biographical Sketch," in *Popular Science Monthly* (New York, 1894), reprinted in *Smithsonian Report* (Washington, 1894).

HERTZ, HENRIK (1798-1870). A Danish dramatist, born in Copenhagen. He continued the literary impulse of the generation of Oehlenschläger, Heilberg, and, more immediately, Baggesen. A Jew, early orphaned, afterwards Christianized and brought up in a literary atmosphere for the law, he abandoned this gradually for the drama (*Buchardt and His Family*, 1827; *Love and Policy*; *Cupid's Strokes of Genius*, 1830), and for satiric criticism in Baggesen's vein (*Letters of a Ghost*; *Poetic Epistles from Paradise*, 1830), with cutting attacks on the early work of Hans Andersen, that created a deep impression. Continuing dramatic work, Hertz fell into the romantic movement in *Svend Dyring's House* (1838), and gained cosmopolitan recognition for *King René's Daughter* (1845), a charming bit of Provençal chivalric romance from the last "Court of Love," beautiful even in its translations (Englished by Theodore Martin). A tragedy, *Ninon* (1848), is also noteworthy. He was also an editor and poet. His *Dramas* are collected in eighteen volumes (1854-73), his *Poems* in four (1851-62).

HERTZ, MARTIN JULIUS (1818-95). A German classical scholar. He was born at Hamburg, and after studying at Berlin and Bonn, was appointed professor ordinary of classical philology at Greifswald in 1855. He was called to a similar chair at Breslau in 1862, and remained there until 1893, when he retired. He is celebrated chiefly for his text edition (2 vols., 1853; 2d ed. 1886), and critical edition (2 vols., 1883-85) of Aulus Gellius. Of his other works, the best known are his *Karl Lachmann. Eine Biographie* (1851); his critical edition of Priscian's *Institutiones Grammaticæ* in Keil's *Grammatici Latini*, vols. ii. and iii. (1855-59); and his recensions of Livy (4 vols., 1857-63) and of Horace (1892).

HERTZ, WILHELM (1835-1902). A German poet, born in Stuttgart. His university studies were prosecuted at Tübingen, and during residence there he was encouraged in Germanic researches by Uhland, and wrote the major portion of his *Gedichte* (1859). In 1858 he became a member of the literary group at Munich that numbered Lingg, Heyse, and Geibel, to whose *Dichterbuch* (1862) he was an original contributor. From 1869 until his death he was professor of German language and literature in the Munich Technical Institute. His poetic talent was genuine, and of much refinement. His intention was directed notably to rendering into the modern language the Middle High German poets, of whose thought and spirit he was a skillful interpreter. In thus continuing the work of familiarizing the mediæval literature, inaugurated by Simrock, he translated the *Tristan* (1877; 3d ed. 1901) and Wolfram von Eschenbach's *Parzival* (1898). The epic *Lancelot und Ginevra* (1860; done into English by Bruce, London, 1865), and the collection *Gesammelte Dichtungen* (1900) comprise his chief original verse. He wrote also a number of important volumes in literary research—*Der Werrwolf* (1862); *Deutsche Sage im Elsass* (1872); *Aristoteles in den Alexanderdichtungen des Mittelalters* (1890); and others.

HERTZBERG, hërts'bërk, EWALD FRIEDRICH, Count (1725-95). A Prussian statesman and historian, born at Lottin, near Neustettin. He occupied various positions under the Prussian Government during the reigns of Frederick the Great and Frederick William II. He was one of the guiding spirits in the diplomacy of the Seven Years' War, and signed the treaty of Hubertsburg (February 15, 1763). He wrote a number of works of historical character, of which the most famous is his *Mémoire raisonné* (1756), based on dispatches between the Courts of Vienna and Dresden, in which he justifies the Prussian invasion of Saxony.

HERTZBERG, GUSTAV FRIEDRICH (1826—). A German historian and archaeologist. He was born at Halle, and from 1843 to 1848 studied in the university there and at Leipzig. He became privat-docent of history at Halle in 1851, and taught also in a gymnasium until 1855. In 1858 he became editor of the *Preussisches Wochenblatt*. In 1860 he was appointed professor of history at Halle. Among his writings are: *Alkibiades, der Staatsmann und Feldherr* (1853); *Das Leben des Königs Agesilaos II. von Sparta* (1856); *Geschichte Griechenlands unter der Herrschaft der Römer* (1866-75); *Geschichte der Perserkriege*

nach den Quellen erzählt (1877); *Geschichte Griechenlands vom Absterben des antiken Lebens bis zur Gegenwart* (1876-79); *Rom und König Pyrrhos* (1871); *Die Feldzüge der Römer in Deutschland* (1872); *Geschichte von Hellas und Rom* (1879-80); *Geschichte des römischen Kaiserreichs* (1880-82); *Geschichte der Byzantiner und des Osmanischen Reichs* (1882-84); *Geschichte der Stadt Halle* (1889-93); and *Kurze Uebersicht über die Geschichte der Universität Halle* (1894).

HERTZKA, hërts'ká, THEODOR (1845—). An Austrian political economist, born at Pest. He studied at Vienna and at Pest, was editor of the economics section of the *Neue Freie Presse* of Vienna from 1872 to 1879, and in the latter year established the *Wiener Allgemeine Zeitung*, which he edited until 1886. His earlier volumes, such as *Die Gesetze der Handels- und Socialpolitik* (1880), recommend for Austria free trade and a gold-standard currency. In his *Gesetze der sozialen Entwicklung* (1886), he promulgated ideas of social reform which he extended in *Freiland, ein soziales Zukunftsbild* (1890, 10th ed. 1896), the description of a communistic Utopia located in Central Africa. His summons to the formation of such a colony resulted in the organization of nearly a thousand unions for the realization of that object, general direction of the enterprise being assigned to a central committee. An attempt toward the execution of the plans was made in 1893, but failed. The *Reise nach Freiland* (1893; Nos. 3051-62 of Reclam's *Universalbibliothek*) was an amplification by Hertzka of the previous volume.

HERULI, hë-rōō'lé, or **ERULI**. A savage, undisciplined, and warlike tribe of Germanic stock that appears frequently in history from the third to the sixth century A.D. We first hear of them as settled north of the Black Sea at about the middle of the third century, and joining in the marauding expeditions of the Goths on the eastern confines of the Roman Empire. In the following century they were subjugated by Hermanrich, King of the Ostrogoths, and later still allied themselves with the Huns, and fought in the battles of Attila. (See **ATTILA**.) By this time their main body had moved to the west, and was settled in the middle basin of the Danube in close proximity to the Gepidæ, with whom they formed a sort of loose alliance. They joined in large numbers the army of Odoacer and helped to overthrow the Western Empire in 476. Their Danubian kingdom was destroyed by the Lombards in the sixth century, and the race was dispersed, soon disappearing from view. Most of them had been converted to Christianity under the Emperor Justinian. Consult: Aschbach, *Geschichte der Heruler und Gepiden* (Frankfurt, 1835); and Hodgkin, *Italy and Her Invaders* (Oxford, 1880-99).

HERVAS Y PANDURO, är-väs' é pán-dōō-rō, LORENZO (1735-1809). A Jesuit priest and celebrated philologist, born at Cuenca, Spain. He entered the Society of Jesus at Madrid; studied in the Jesuit College at Alcalá de Henares, devoting himself especially to linguistics and architecture; taught in the Royal College in Madrid, and at Murcia in the college of his Order. Soon after he went to America as a missionary, but in 1767, by the expulsion of his society, he was driven to Rome, where he studied mathematics, physics, and afterwards lin-

guistics. In 1799 he returned to Barcelona and after a few months there to his native town. But in 1803 or 1804 he again went to Rome, and Pius VII. made him librarian of the Quirinal, where hard work hastened his death. He may be called the founder of comparative philology in Spain and Italy, because of his *Catálogo de las lenguas conocidas*; the *Vocabulario poliglota*; an *Ensayo práctico de las lenguas*; and *Origen, formación, mecanismo, y armonía de los idiomas*. He wrote both in Italian and Spanish. His most famous work was *Idea del Universo* (1778-87), a huge treatise on cosmography. He wrote: *La escuela española de sordo-mudos ó arte para enseñarles á escribir y hablar el idioma español* (1795), which was followed by other educational works for deaf-mutes; *Descripción de los archivos de la corona de Aragón en Barcelona*, etc. (1801); and the following unedited works: *Historia de la escritura*; *Paleografía universal*; *Moral de Confucio*; and *Historia de las primeras colonias de América*.

HERVÉ, är'vâ', AIMÉ MARIE EDOUARD (1835-99). A French journalist, born at Saint Denis, Réunion Island. He was successively editor of the *Courrier du Dimanche* (1863); *Le Temps* (1864); *L'Époque* (1865); after which the Government censorship silenced him in France till, in 1867, he, with J. J. Weiss, founded *Le Journal de Paris*. On Weiss's withdrawal he edited that paper alone until 1873, when he founded *Soleil*, which he conducted with great ability. He was elected to the Academy in 1886. Hervé was a supporter of a liberal constitutional monarchy, and wrote in this connection a history of liberal ideas in England, *Une page d'histoire contemporaine* (1869).

HERVÉ (properly FLORIMOND RONGER) (1825-92). A French musical composer, librettist, and comedian. He was born at Houdain, near Arras, went to Paris when a child, studied vocal and instrumental music under Saint-Roch, and was for eight years organist of Saint-Eustache. He made his début as a composer with a light opera, *Don Quichotte* (1848), and in 1851 was made leader of the Palais-Royal orchestra. Three years afterwards he assumed the direction of the Folies-concertantes on the Temple Boulevard, and became literally man of all work, as he wrote the score and the words, delivered both, led the orchestra, painted and shifted scenery. His first great success was in his original rôle of *Le compositeur toqué*, and he produced a number of light operas, such as *L'œil crevé* (1867) and *Le petit Faust* (1869), performances not lacking in melody, imagination, and originality. Hervé was the originator of French opera bouffe, but his work was afterwards overshadowed by that of Offenbach.

HERVÉ, RIEL. The hero of Browning's poem of the same name (1867). He was a Breton sailor, who, in 1692, guided the French fleet safely into the port of Saint-Malo after the battle of La Hague, and asked only a day's holiday as a reward.

HERVEY, hër'vî, ELEANOR LOUISE MONTAGU (1811—). An English poet, wife of Thomas Kibble Hervey, the poet. When but fourteen years of age, she began writing verses and tales for the different annuals and 'keepsakes' of her time, but her most ambitious attempt was a dramatic poem in six acts called *The Landgrave*

(1839). She also published an autobiographical novel and a complete edition of her husband's poems (1866).

HERVEY, JAMES (1714-58). A clergyman of the Church of England. He was born at Hardington, near Northampton, February 26, 1714, educated at Northampton grammar school and Oxford, where he came under the influence of John Wesley, and for some time manifested inclination toward his theological opinions; but ultimately he adopted a thoroughly Calvinistic creed, and resolved to retain his connection with the Established Church. In 1743 he became curate to his father at Weston Favell, near Hardington, and succeeded him in 1752. His works have slight literary or theological value, but rapidly became popular. His earliest work, *Meditations and Contemplations* (1745-47), comprising *Meditations Among the Tombs, Reflections in a Flower Garden, A Descant on Creation, and Contemplation on the Night and Starry Heavens*, passed through fourteen editions in as many years. *Theron and Aspasio* (1755), which was equally well received, called forth some adverse criticism, even from the Calvinists, on account of tendencies which were considered to lead to Antinomianism, and was strongly objected to by Wesley. His *Works* appeared in six volumes (Edinburgh, 1769, later edition, 1834). He died at Weston Favell, December 25, 1758.

HERVEY, JOHN, Lord Hervey of Ickworth (1696-1743). An English politician, the eldest son of John, first Earl of Bristol. He was educated at Cambridge and afterwards traveled abroad. After his return to England he frequented the Court of the Prince of Wales at Richmond, and in 1720 married Mary Lepell, maid of honor to the Princess. He entered the House of Commons in 1727 as member for Bury Saint Edmunds, and at first opposed Walpole, though he was brought over by a pension, the office of vice-chamberlain (1730), and a seat in the House of Lords (1733). In 1740 he replaced Lord Godolphin as Lord Privy Seal, and held this office until Walpole's fall from power in 1742.

Hervey was an intimate friend of the Queen, and had a good deal of influence at Court. He was a man of doubtful morals, and no religion, but intellectually by no means justified Pope's bitter epithets of Lord 'Fanny,' 'Sporus,' and 'Narcissus.' The wordy quarrel between Hervey and the poet was probably concerning Lady Mary Wortley Montagu, to whom the former was friendly for many years. During his political career Hervey wrote a number of vigorous controversial pamphlets. His *Memoirs* were not published until 1848. They are ably written, in a cynical style throughout, and contain valuable information about the inner Court life of his time.

HERVEY-SAINT-DENYS, ār'vā' sǎn' de-né', MARIE JEAN LÉON, Marquis d' (1823-92). A French historian and Orientalist, born in Paris. He studied Eastern languages in the College of France, and in 1867 was sent as commissioner-general to China, the country in whose literature and history he became a specialist. In 1874 he was made professor of Chinese in the College of France, and four years afterwards was elected a member of the Académie des Inscriptions et Belles-Lettres. His first publications were translations from the Spanish; but after

the publication of his *Recherches sur l'agriculture des Chinois* (1851), he rendered invaluable aid to students of Chinese literature by his translations of the native prose and poetry, ending with six novels translated from the Chinese in 1892.

HERVIEU, ār'vyé', PAUL ERNEST (1857—). A French author, born at Neuilly-sur-Seine. He studied at the Lycée Condorcet, was admitted to the bar in 1877, and in 1879 became connected with the secretary's office of the presidency of the Council. In 1881 he was appointed secretary to the French Legation in Mexico, from which post he resigned in the same year. His first literary work was done, with some success, as a contributor to numerous periodicals, under the pseudonym 'Eliacin.' He afterwards collected a series of essays, first published in the *Gaulois*, as *La bête humaine* (1884). His books, involved in manner, but frequently praised for their skillful character-drawing, include: *Les yeux verts et les yeux bleux* (1886); *L'inconnu* (1887); *Deux plaisanteries* (1888); *L'exorcisée* (1891); *Peints par eux-mêmes* (1893); *L'armature* (1895); *Le petit duc* (1896); and *Amitié* (1900). Among the best known of his dramas are: *Les tenailles* (1894); *La loi de l'homme* (1897); and *La course de flambeau* (1900). In 1900 he was elected to the French Academy.

HERVIEUX, ār'vyé', AUGUSTE LÉOPOLD (1831—). A French advocate and author. He was born at Elbeuf; was educated at the Lyceum of Rouen, and studied law in Paris, where he afterwards had some important cases. He was elected municipal councilor for the Saint Vincent De Paul District in 1884, and retired to private life in 1890. His writings are mainly upon literary subjects, such as: *Premiers essais poétiques* (1853); *Mémoires d'une femme du monde* (1860); *Poésies complètes* (1866); *Théâtre complet* (1867); *Les déclassés* (1882); *Les fabulistes latins depuis le siècle d'Auguste jusqu'à la fin du moyen âge* (1883-90); *Harmonies intimes* (1889); *Étapes amoureuses d'un sonnetiste* (1889); *Des péculs du fils de famille dans la législation romaine* (1890). Between 1860 and 1870 he wrote under the nom-de-plume 'Saint-Amand.'

HERVILLY, ār'vè'yé', MARIE ERNEST D' (1839—). A French poet, romancer, and playwright, born in Paris. He was educated for civil engineering, but left his railroad appointment and his overseeing of bridges and highways to go into journalism. Thence he emerged as a poet with such work as *La lanterne en vers de couleur* (1868), and *Bêtes à Paris* (1886), while he made his name as a novelist with *Mesdames les parisiennes* (1875) and *La dame d'Entremont* (1884), after which he wrote acceptably for young people—*Jack-le-Gal et ses contes* (1891), for example. He wrote also a number of one-act comedies in verse that have met with favorable receptions, such as: *Le magister* at the Théâtre Français, *Le bibelot* at the Palais-Royal, in 1877, and *Molière en prison* at the Odéon, 1886.

HERWARTH VON BITTENFELD, hēr-värt fōn bīt'ten-fēlt, KARL EBERHARD (1796-1884). A Prussian general. He was born at Grosswerther in Prussia, and entered the army in 1811. He gained his first laurels in the War of Liberation, especially in the battle of Leipzig. In 1848 he commanded the First Regiment of

the Guards. During the war with Denmark in 1864 he acquired fame through his daring crossing of the Sound and capture of the Isle of Alsén. In the campaign of 1866 he was in command of the right wing of the army which advanced into Bohemia. He bore the brunt of the fighting at Hühnerwasser and Münchengrätz, and contributed materially to the victory of Sadowa. On the outbreak of the war of 1870 he was appointed Governor of the Rhenish Provinces, and in the next year he was raised to the rank of general-field-marshal.

HERWEGH, hēr'vāk, GEORG (1817-75). A German poet. He was born at Stuttgart; was educated there and at Maulbronn, forsook theology, which he had begun to study, for literature, and returned to Stuttgart, where he coöperated in Lewald's *Europa*. In 1841 he was living in Switzerland and published *Gedichte eines Lebendigen* (last ed. 1896), political poetry full of the unrest, the dissatisfaction with the existing conditions, and the uncertainty as to what should take its place, that marked the period. These fervent effusions became immensely popular, so that when, after a short trip to Paris, Herwegh journeyed through Germany in 1842, he was greeted with enthusiasm everywhere. King Friedrich Wilhelm IV. gave him an audience, and assured him that he liked nothing better than an energetic opposition. But the young man overstepped all the bounds of conventionality in a letter to the King, and was hurried out of Prussia. At Zürich he found no pleasant reception, and he took up his abode in Paris, and wrote a second volume of *Gedichte eines Lebendigen* (1844). In this his republican tendencies were more plain than ever, but his inspiration seemed weaker. He translated all of Lamartine into German (1843-44). After the Revolution of February, 1848, Herwegh made several attempts to carry out his republican ideas by invading Baden at the head of a legion of German and French workmen, but was defeated by the Württemberg troops, and escaped only through the bravery of his wife. Thereafter he lived in retirement in Paris, and later in Zürich and at Lichtenthal, near Baden-Baden. The most important work of his later years was the translation of many of Shakespeare's plays. Consult Marcel Herwegh, *Briefe von und an Georg Herwegh* (Zurich, 1896).

HERZ, hërts, HENRI (1806-88). A French pianist, born in Vienna. He studied music under Hünten at Coblenz and at the Paris Conservatory, where he won first prize for piano-playing. He made a number of tours which were highly successful; in Germany, with the violinist Lafont (1831); in London, appearing with Moscheles and Cramer (1834); in the United States, Mexico, and the West Indies (1845-51). From 1842 to 1874 he was professor of piano-playing at the Paris Conservatory. He founded a piano factory, and in 1855 his instruments received first prize at the Paris Exhibition. Herz's compositions were confessedly written to catch the popular fancy, and, though they succeeded, have little permanent value. His best works were *Études*, and exercises for the piano. He published *Mes voyages en Amérique* (1866), a series of letters describing his American tour.

HERZ, HENRIETTE (1764-1847). A German woman, distinguished for her rare beauty and

cultivation, as well as by her relations to many of the most distinguished men of her time. She was born in Berlin, the daughter of a Jewish physician, Benjamin de Lamos, and at fifteen years of age became the wife of Markus Herz, a rich and elderly physician. Her home became the centre of the literary life of Berlin, and such men as the Humboldts, Friedrich and August Wilhelm Schlegel, Fichte, Varnhagen von Ense and his wife Rachel, Schleiermacher, and Börne were her intimate friends. She was left a widow in 1803, and became a Christian in 1817. Consult Fürst, *Henriette Herz: Ihr Leben und ihre Erinnerungen* (Berlin, 1850).

HERZEGOVINA, hër'tsâ-gô-vě'nâ. The smaller of the two Ottoman provinces occupied by Austria-Hungary, in accordance with the treaty of 1878 (Map: Austria-Hungary, F 5). It forms part of Bosnia in the wider sense. It is bounded by Bosnia proper on the north, by Montenegro on the east, and Dalmatia on the southwest. Its area is 3530 square miles. In the formation of its surface it resembles Bosnia (q.v.). It is generally somewhat barren, and is mountainous, having a number of peaks exceeding 7000 feet in height, the highest being the Maglić on the eastern boundary, which rises about 7850 feet above the sea. The eastern part is especially barren and rocky, in contrast with the part adjoining Bosnia and Dalmatia, which is fertile, and invites the cultivation of the vine, tobacco, and southern fruits. In this latter district is found the largest river, the Narenta, whose valley forms the characteristic feature of the region. Administratively Herzegovina is a dependency of Bosnia, and forms (within reduced limits) the district of Mostar. There are no official figures for the population, but its number may be set down at approximately 200,000. The great bulk of the inhabitants are Slavs. The capital is Mostar (q.v.), which is connected by rail with Serajevo, the Bosnian capital.

Herzegovina was originally a part of Dalmatia and was occupied by a Slavic population in the seventh century. The most important of the mediæval principalities of the region was that of Zaclum or Chulm, which in the fourteenth century was annexed to Bosnia. Regaining its independence, Herzegovina was erected into a dukedom by the Emperor Frederick III. in 1440. (Hence the name Herzegovina, from Ger. *Herzog*, Slav. *herceg*, duke.) About 1463 the country became tributary to the Turks, and twenty years later was completely subject to them, remaining for more than two centuries afterwards a battlefield between Christians and Mohammedans. In 1875 a serious insurrection, arising from the Turkish oppression of its Christian inhabitants, broke out in Herzegovina, which rapidly spread into Bosnia, and was supported by Montenegro and Servia. This ultimately led to the war of 1877-78 between Russia and Turkey. The Berlin Congress of 1878 determined that Herzegovina, like Bosnia, should be occupied by Austria-Hungary. The Mohammedan inhabitants rose against the Austrian army of occupation, and were subdued only after a desperate resistance. The introduction of a new recruiting law was the occasion for an insurrection in 1881-82. The Austro-Hungarian Government has done much to promote the welfare of the region. See BOSNIA.

HERZEN, hërts'en, ALEXANDER IVANOVITCH (1812-70). A Russian publicist and author, born

at Moscow. He was the illegitimate child of a rich nobleman, Ivan Alexeyevitch Yakovlyeff. He received the fashionable French education of the time, and while at school became a great admirer of the contemporary French socialists. Arrested in 1834 with his comrades, he was sent to Perm and then to Viatka, where he held a position in the Governor's office. Transferred to Vladimir, he married, bringing his bride secretly from Moscow. In 1840 he was allowed to return to Moscow. A close study of Hegel, whose teachings were then in the ascendancy, brought him to conclusions quite opposite to those of most of his friends. Under the influence of the doctrines of Proudhon, Cabet, and Louis Blanc, he became a rabid Westerner as distinguished from the Slavophiles. He resigned his Government position in 1842, and left Russia in 1847, after having published, under the pseudonym of 'Iskander,' two works on philosophy as well as several novels. He settled in Paris, was in full sympathy with the events of 1848, although not actively engaged in them, and later was on intimate terms with Proudhon, Garibaldi, as well as with many revolutionists in France, Italy, and Switzerland, and carried on a systematic agitation against the absolutist Government of Russia. Forced by the police to leave Paris, he was naturalized in Switzerland, and, founding a free press in London, published after 1857 his weekly *Kolokol* ("The Bell"). From 1864 to 1867 he published it at Geneva, and moved to Paris in 1869, where he soon died of pneumonia. His literary activity began as early as 1830. His works are strikingly brilliant, characterized by depth of thought and artistic form. His best-known novel, *Who Is to Blame?* deals with the questions of freedom of feelings, family relations, and woman's position in wedlock. The dominant idea is that it is futile to seek happiness by locking one's self up within the narrow family interests away from society and the world. A great admirer of Western civilization, he was completely disappointed in it when viewing it at close range, and was disgusted with the mercantilism of the *bourgeoisie*, but saw a bright future for the working classes, and expected much from the regenerative power of Russia, with her communistic village system of the *mir*. These ideas he embodied in his *Vom andern Ufer* (1850); published in Russian, 1855; in French, 1870); and in his *Letters from France and Italy*, in which he gives a keen analysis of the causes that brought on the revolutionary events of the time. He was a free-thinker in the broadest sense of the word, hence his negative attitude toward all parties and creeds. His influence was overwhelming, the greatest secrets of the State and the Imperial household immediately finding their way into his paper, a copy of which was very often placed in the Emperor's room. But his popularity was undermined by his advocacy of the Polish rebellion, he having for a long time stubbornly refused to lend any assistance, until finally persuaded by his friend Bakunin (q.v.). The circulation of the *Kolokol*, from over 3000 fell to about 500, and Herzen finally stopped its publication. Besides the works mentioned, the following are among his best: *Dilettantism in Science* (1842); *Letters on the Study of Nature* (1845-46); *From the Memoirs of Doctor Krupoff* (1847); *Recollections of My Travels* (1848); *On the Develop-*

ment of Revolutionary Ideas in Russia (1851); *Baptized Property* (1853), or "Serfism"; *Prison and Exile* (1854); *My Exile* (1855); *Interrupted Tales* (1856); *France or England* (1858); *The Old World and Russia*; and *The New Phase of Russian Literature* (1864). His collected works in Russian were published in ten volumes at Geneva (1875-85). *Who Is to Blame?* was published at Saint Petersburg in 1891, his correspondence with his friends in the *Monthly Russian Thought* in 1890. In French his works appeared as follows: *Mémoires*, vols. i-iii. (Paris, 1860-62); *Récits et nouvelles* (ib., 1873). The *Kolokol* appeared at Brussels in 1863-65, under the title *Cloche*. For a biography, consult: Eckhardt, in *Jungrossisch und Allivländisch* (Leipzig, 1871); and Sperber, *Die sozialpolitischen Ideen A. Herzens* (Leipzig, 1894).

HERZLIEB, hërts'leb, MINNA (1789-1865). A friend of Goethe, who addressed to her several of his sonnets, and in his *Wahlverwandschaften* is supposed to have represented her under the name *Ottilie*. Consult Gädertz, *Goethes Minchen* (Bremen, 1888).

HERZOG, hër'tsög, EDUARD (1841—). First bishop of the Old-Catholic Church of Switzerland. He was born at Schongau, Switzerland, August 1, 1841. He studied theology at Tübingen and Freiburg; was ordained priest in the Roman Catholic Church, 1867, and was professor of exegesis in the theological seminary at Lucerne (1868-72). He joined the Old Catholic organization (1872), and was pastor of Old Catholic churches at Krefeld, Germany (1873), and at Olten, Switzerland (1874), and professor of New Testament exegesis in the Old Catholic faculty at the University of Bern. He was called to be bishop by the national synod in 1876. He has written many polemical and controversial articles.

HERZOG, ERNST VON (1834—). A German classical philologist, born at Esslingen. He was appointed a professor in the University of Tübingen in 1867. His publications relate chiefly to the constitutional history of Athens and Rome. The most important among them are: *Gallia Narbonensis Historia* (Leipzig, 1864); *Geschichte und System der römischen Staatsverfassung* (ib., 1884-91); *Zur Verwaltungsgeschichte des attischen Staats* (Tübingen, 1897).

HERZOG, HANS (1819-94). A Swiss general, born at Aarau, and educated there. His enforced military service in 1839 interested him in the art of war; he volunteered in the Württemberg artillery in 1846; and in 1860 was appointed by the Federal Council chief of the Swiss artillery. He introduced new arms for both infantry and artillery. At the beginning of the Franco-Prussian War he was put in command of nearly forty thousand men to guard the Swiss frontier, and vigorously opposed the disbanding of more than half this force in August, 1870. At the beginning of 1871 he commanded at the French frontier, and entered into a convention with General Clinchant at Verrières by which Bourbaki's army was allowed to cross into Swiss territory on laying down its arms. His experiences of this year made him more eager than ever in his attempts to better the condition of the army in his old post of chief of artillery. He died at Aarau. Consult Bluntschli, *Karl Johann Herzog* (Zurich, 1895).

HERZOG, JOHANN JAKOB (1805-82). A religious editor and scholar. He was born at Basel, September 12, 1805. He studied at Basel and Berlin, and filled the position of professor of historical theology at Lausanne, Halle, and Erlangen. He retired in 1877, and died at Erlangen, September 30, 1882. He was a voluminous writer, and published a sketch of Calvin (1843), a life of *Æcolampadius* (1843), works on the Waldenses (1848 and 1853), and *Abriss der gesamten Kirchengeschichte* (1876-87; 2d ed. by Koffmann, 1890-92). His greatest work was the religious encyclopædia known as *Real-Encyclopædie für protestantische Theologie und Kirche* (22 vols., Gotha, 1853-68; 3d ed. by A. Hauck, 1896 et seq.; 12th vol. 1902), of which he was editor and to which he contributed 529 articles.

HERZOG, KARL JOSEPH BENJAMIN (1827-1902). A German statesman, born at Brieg and educated at Breslau. He was assistant in the ministerial Department of Commerce (1859) and representative of the North German Federation at the Paris Exposition (1867); in 1871 he was a member of the commission on the government of Alsace and Lorraine, and later (1876) became Assistant Secretary of State in the department for these provinces, and (1879) Secretary of State in their first Ministry, from which he resigned a year later because of his opposition to the policy of Von Manteuffel. He traveled in America (1881-82), and wrote *Reisebriefe aus Amerika* (1884).

HERZOGENBERG, hër-tso'gen-bërk, HEINRICH VON (1843-). An Austrian musician, born at Gratz. He studied at the Vienna Conservatory (1862-64), and in 1874, at Leipzig, founded the Bach-Verein in conjunction with Spitta, Holstein, and Volkland. In 1875 he succeeded the latter as its director. He was professor of composition at the Berlin 'Hochschule für Musik' (1885-92); and also a member of the Akademie, and president of the 'Meisterschule' for composition. His compositions include: The oratorio, *Die Geburt Christi*; a symphonic poem, *Odysseus*; two symphonies; and many psalms for chorus and orchestra, and instrumental pieces.

HERZOG ERNST, hër'tsôg êrnst. A poem of the twelfth century of Bavarian origin, but of unknown authorship. Its subject is the exploits of Ernst of Swabia in the Orient during his banishment.

HESEKIEL, hâ-zâ'kê-ël, GEORG LUDWIG (1819-74). A German novelist, born at Halle, the son of Friedrich Hesekei, a religious poet, and educated at Halle, Jena, and Berlin. He was editor of *Die Rosen* at Altenburg (1846), of the *Patriotischer Hausfreund* at Zeitz (1848), of the *Berlin Kreuzzeitung* (1849), and of the *Berliner Revue* (1855); but he is best known for his poems and novels, which are marked by a distinctly conservative and monarchial patriotism. Among the former are: *Gedichte eines Royalisten* (1841); *Zwischen Sumpf und Sand* (1863); *Aus dem Dänenkrieg* (1864); *Neue Gedichte* (1866); and *Gegen die Franzosen* (1870). His novels include: *Das liebe Dorel* (1851); *Vor Jena* (1859); *Von Jena nach Königsberg* (1860); *Stille vor dem Sturm* (1862); *Unter dem Eisenzahn* (1864); *Refugiert und emigriert* (1869); *Graf d'Anethan d'Entraques* (3d ed. 1861); *Von Turgot bis Babeuf* (2d ed. 1873); and *Lilienbanner und*

Tricolore (1859). He also wrote *Das Buch vom Grafen Bismarck* (3d ed. 1873).

HESEKIEL, LUDOVICA (1847-89). A German novelist, daughter of the above, born at Altenburg. She early entered journalism, and in literature devoted herself to historical fiction and to biography. She married Wilhelm Johnsen, pastor at Neustadt, in 1887. Among her novels the most important are: *Eine brandenburgische Hofjungfer* (1868); *Von Brandenburg zu Bismarck* (1873); *Unterm Sparrenschild* (3d ed. 1893); *Deutsche Träumer* (2d ed. 1897); *Prinz Wilhelm* (2d ed. 1897); *Jesus meine Zuversicht* (3d ed. 1894); *Des Kaisers Gast* (3d ed. 1894); and *Andernach und Clairveaux* (1889). She also wrote the sketches *Barackenleben* (1872), and the biographies, *Elisabeth Luise* (1881), *Agnes Fürstin Reuss jüngerer Linie* (1887), and *Augusta-Kaiserin-Königin* (1890).

HE'SIOD (Gk. Ἡσίοδος, *Hēsiodos*). After Homer, the earliest Greek poet whose works have survived. The date at which he lived is uncertain. Herodotus regarded him as contemporary with Homer, and dated both of these at 400 years before his own day, i.e. in the middle of the ninth century B.C. Ephorus thought him older than Homer; the Parian Marble (q.v.) also takes this view and makes him thirty years the elder; but the Alexandrians, Eratosthenes, and Aristarchus, held that the treatment of the myths and the geographical knowledge shown in Hesiod's works proved him to be younger. Modern criticism has shown clearly that the Hesiodic works exhibit a knowledge of the *Iliad* and *Odyssey* in their present Ionic dialect, and in very much their present form; on the other hand, it is certain that Hesiod's *Works and Days* were known to Simonides and Archilochus, so that we may safely place Hesiod in the second half of the eighth century, or perhaps about B.C. 700.

Our knowledge of his life is derived almost solely from his poems; the ancient scholars had no better source of information. From notices in his *Works and Days*, and other scattered sources, we learn that his father, under stress of poverty, came to Bœotia as an emigrant from Cyme, an Æolian town in Asia Minor, and settled in the petty village of Asera beneath Mount Helicon. Here probably Hesiod was born. In his youth he watched the sheep on Helicon. At his father's death his brother Perses succeeded in cheating him of his proper inheritance by corrupting the judges; but later, this unjust brother was reduced to such poverty that he was forced to appeal for aid to Hesiod. Under the impulse of his homely muse, Hesiod, like other early bards, became a wandering singer, visiting not simply the cities of his native Bœotia, but also traveling to the west past Delphi, until he reached Naupactus in Ozolian Locris. Tradition says that the Delphic oracle had warned him that he was destined to die in the shrine of the Nemean Zeus; but the poet in the course of his travels came to Cneon in Locris, quite unaware that here also was a temple of the god whose sacred precinct he was to avoid. In this town he is reported to have met his death at the hands of two brothers who without foundation suspected him of wronging their sister. The tradition may well have this truth, that Hesiod died in Locris. At Naupactus a school of Hesiodic poetry developed, one product of which was the

genealogical poem *Ναυπάρκεια*, fragments of which are embodied in the Scholia to Apollonius Rhodius. In later times a grave of Hesiod was to be seen in the market-place at Orchomenus, to which tradition said the poet's bones had been removed at the command of the Delphic Oracle.

Hesiod was the founder of Greek didactic poetry, as Homer of epic song. The following works are extant under his name: *Works and Days* (*Ἔργα καὶ Ἡμέραι*) in 828 verses, which the Bœotian tradition on Helicon regarded as his only genuine work. The first part of its name (*Works*) comes from the directions for various kinds of labor which it contains; the second (*Days*) is due to the calendar it gives, showing the days of the month on which certain tasks should be performed. The poem in its present form no doubt contains some later additions, but scholars are not agreed as to the extent of these interpolations. The *Theogony* (*Θεογονία*) in 1022 verses is an attempt to bring Greek mythology into an ordered system, and to incorporate into the ranks of the older divinities the new gods from abroad, which were not known to the Homeric poems. In it theosophic and cosmogonic speculations are combined with ancient hymns and accounts of cults. Under the epic form Hesiod gives a history of the creation and of the generations of the gods; the close of the poem contains a list of the daughters of Zeus, who bore sons to mortals. We have to regret the loss of the *Catalogue of Women* (*Γυναικῶν Κατάλογος*), which gave a list of the mortal women who had become the mothers of heroes, and some account of these heroes' exploits. The poem was divided into five books, of which probably the last two bore the special title *Ἡοῖαι* from the fact that each division began with *ἡ οἴη*, 'or such a woman.' The extant *Shield of Hercules* (*Ἄσπίς Ἡρακλέους*) in 480 verses borrowed its introduction from the fourth book of the preceding work. The greater part of the poem is occupied with an account of the shield of Hercules, which is an inferior imitation of the description of Achilles's shield in the *Iliad*. There were a number of other Hesiodic poems in antiquity; of these only scanty fragments are left. The *Contest Between Homer and Hesiod* (*Ὀμήρου καὶ Ἡσίοδου Ἄγων*) usually printed with Hesiod's works is a product of the time of Hadrian.

Hesiod exhibits none of the splendid imagination and vivid power of Homer; his verses are filled with sayings and homely precepts; they offer a calendar and a mythology for the common people. But the form is the same as that of the Homeric poems and the dialect on the whole shows little divergence. Hesiod was, however, highly prized for his moral precepts, and the poems played an important part in Greek education. Their influence, especially that of the *Works and Days*, was not confined to Bœotia and Locris, where a Hesiodic school developed, but extended to Ionia, and can be seen in the development of iambic poetry. The poems formed the subject of learned comment from the Alexandrian Age to the Byzantine period. The best editions are by Lennep (Amsterdam, 1843); Schönmann (Berlin, 1869); Flach (Berlin, 1874); Göttling-Flach (Leipzig, 1878); Rzach (Leipzig, 1884); Sittl (Athens, 1890). There are translations of the *Works and Days* by Chapman (London, 1858); of the entire poems by Elton (2d ed., London, 1832), and by Banks (London, 1892).

Consult also: Fick, *Hesiod's Gedichte* (Göttingen, 1887); Grote's *Greece*, vols. i. and ii. passim (5th ed., London, 1888); and the histories of Greek literature.

HESPE'RIA (Lat., from Gk. Ἑσπερία, from ἑσπέρα, *hespera*, ἑσπερος, *hesperos*, west, Lat. *vesper*, evening; probably connected ultimately with OHG. *westan*, Ger. *Westen*, Eng. *west*, and with Gk. ἄστυ, *asty*, city, Skt. *vāstu*, house, from *vas*, to dwell). The land of the west, a term applied by the ancient Greek poets to Italy, and by the Roman writers sometimes to Italy and sometimes to the Iberian Peninsula.

HESPERIDES, hēs-pēr'i-dēz (Lat., from Gk. Ἑσπερίδες, *Hesperides*, from ἑσπέρα, *hespera*, evening). In the earliest version, the daughters of Night, who on an island far beyond the western ocean guard with the dragon Ladon the golden apples, symbol of love and fruitfulness, which Gæa produced as a wedding gift for Zeus and Hera. The number and names varied, but the common version seems to have known three, Ægle, Erythea, and Hesperethusa. Later genealogists represented them as daughters of Atlas, who was also localized in the far West. With the aid of Atlas Hercules secured three of the apples for Eurystheus, but they were restored by Athena.

HESPERIDES. The title of the collection of Robert Herrick's poems published in 1648. It contains his most charming lyrics and the larger part of his work, filling two volumes of the fine edition by Grosart (1876).

HESPERIS. See DAME'S-VIOLET.

HESPERORNIS, hēs-pēr-ōr'nīs (Neo-Lat., from Gk. ἑσπερος, *hesperos*, west + ὄρνις, *ornis*, bird). A primitive, flightless, toothed sea-bird, found fossil in the Middle Cretaceous shales of western Kansas, and, excepting Archæopteryx, the oldest bird known. The first skeleton was discovered in 1871 by Prof. O. C. Marsh, near the Smoky Hill River, in marine deposits of yellow chalk and calcareous shales, and was named *Hesperornis regalis*. Several other species have since become known; and Enaliornis, of the Upper Greensand of Cambridge, England, appears to be a closely allied form. It was a large, well-feathered water-bird, having the general habits

THE HESPERORNIS.

After a drawing by Joseph Gleeson, representing an ideal figure, in the attitude of swimming; based upon skeletons in the National Museum.

of a loon, perhaps, ranging the open sea, and scrambling upon land only for breeding. Its food was mainly fishes, which it pursued by swimming and diving, for it had no wings. There is reason to believe that this winglessness was

due to degeneracy from fully winged ancestors. Hesperornis was more than five feet in length, and if its ancestors were equally bulky their wings were quite too large to use under water, but would be folded close against the body when the bird dived or swam. This constant disuse, as the race became more and more exclusively aquatic, would permit the wings to dwindle. By the time the wings were small enough to be of use as paddles under water, as modern auks use theirs, the muscles had become too feeble to move them in so dense a medium, and so degeneration continued until only a remnant of humerus remained. Correlative with this was a constant growth and strengthening of the legs, which became of great size (though the bones remained hollow, like those of an aerial bird) and so twisted as to turn edgewise when the foot was brought forward after each stroke, thus offering least resistance to the water. The original skeleton set up by Marsh, and depicted in his *Odonotornithes*, stood erect like a penguin. When an attempt was made at the National Museum to mount another skeleton in a swimming attitude, it was discovered that this position required an altogether novel arrangement of the legs, such as is shown in the accompanying sketch of a restoration based by Lucas (see above) upon this skeleton. It ap-

slender jaws, armed with sharp recurved teeth resembling those of reptiles. They were set in a common alveolar groove (halcodont dentition)—

COMPARISON OF SKULLS AND BRAINS.

1. Skull and brain-cavity of *Hesperornis regalis*, from above. 2. Skull and brain-cavity of modern loon. 3. Cast of brain-cavity of a young alligator; ol, olfactory lobes; c, cerebral hemispheres; op, optic lobes; cb, cerebellum; f, foveoli; m, medulla. (After Marsh.)

SKULL AND TOOTHED BEAK OF HESPERORNIS REGALIS.

pears that the legs of this bird must have stood out almost at right angles, and have acted like a pair of oars.

To this most powerful apparatus for swimming and chase was added the best of means for

a fact which differentiates Hesperornis from the higher Ichthyornis and its relatives, whose teeth were implanted in separate sockets (thecodont). (See ODONTORNITHES.) In the upper jaw the teeth were confined to the maxillary bone alone, but in the lower jaw they extended to the tip of the ramus. As this lower jaw was united in front only by a cartilage, as a serpent's, and had on each side a joint which admitted of some elbow-like motion, the power of swallowing was very extensive. The skull, though shaped like that of a loon, had many struthious characters, and the brain was distinctly reptilian in form, and only about one-third as large as that of a modern loon. The skeleton as a whole closely

BONES OF THE TAIL.

seizing and holding the agile, slippery, and often bone-incased prey, in the form of a long neck, capable of rapid flexure and thrust, and long

approximates that of modern birds. The vertebrae resemble those of a loon. The shoulder-girdle, in its original structure, as well as in its degeneracy, and the sternum, which has no keel, are ostrich-like; and it is in the pelvic arch more than elsewhere that traces of reptilian ancestry are evident. The tail contained 12 vertebrae—more than are or have been possessed by any other known bird since Archæopteryx; and they were solid, firmly locked together and winged, so that the outline of the caudal skeleton is spatulate. This, with the evidently strong musculature, would give great power, similar to that of a beaver's tail, and doubtless the organ was an important aid in swimming, by a sculling motion, as well as in steering and controlling progress.

Whether it bore quill-feathers in pairs, as did the long tail of Archæopteryx, is not known. The legs and feet resemble those of a grebe on a large scale, and it is fair to suppose that they were externally lobed in a similar way. The feathers on the legs, at least, as is known from impressions in the rocks, were soft and rather scanty.

Hesperornis survived for a long period, during which the interior of North America was a shallow sea, stretching from the Alleghanies to the Rocky Mountains, broken by little except the island summits of the Ozark Hills. Professor Marsh says that apparently there was an absence of enemies in the air to be feared by this great diver, since it was more than a match for the huge but toothless pterodactyls, which hovered over the waters in great numbers. The warm sea teemed with fishes and other food; but it also teemed with great swimming lizards (mososaurs), turtles a dozen feet in length, and large predaceous fishes. As the gradual rise of the land toward the close of the Cretaceous epoch more and more inclosed the sea and modified conditions, the struggle for life became too hard for many of its denizens, and Hesperornis was among those which early succumbed. With it disappeared forever a primitive type of bird life, for this branch of the avine stock seems to have terminated without leaving any descendants.

BIBLIOGRAPHY. The fullest descriptions and illustrations of Hesperornis are contained in Marsh, *Odontornithes: A Monograph of the Extinct Toothed Birds of North America* (Washington, 1880). Consult, also: Cope, *Cretaceous Vertebrates of the West* (Washington, 1877); Williston, various papers in the *Annual Reports of the University Geological Survey of Kansas* (Lawrence); Lucas, *Animals of the Past* (New York, 1901); Newton, *Dictionary of Birds* (New York, 1896). See BIRD; FOSSIL; ICHTHYORNIS; ODONTORNITHES.

HESPERUS (Lat., from Gk. Ἑσπερος). The name given by the Greeks to the evening star Venus. He is the son of Astræus, or Cephalos, and Eos, and the father of the Hesperides. As the morning star he is called Phosphorus (Lucifer).

HESPERUS. A surname given to the Green Knight, Sir Pertolope, in the legend of King Arthur. With his three brothers he guarded the approaches of Castle Perilous. In Tennyson's *Idylls of the King* he is called the 'Evening Star,' but his famous combat takes place at dawn.

HESS, HEINRICH, Freiherr von (1788-1870). An Austrian general, born in Vienna. He entered the army in 1805, distinguished himself at Wagram, and served in the campaigns of 1813 and 1814. In 1815 he was employed in the War Department, but soon returned to active service, and in 1821 was in the army of occupation in Piedmont. Transferred to the General Staff in 1831, he served in Lombardy, where he greatly improved the organization of the army. Hess was promoted to the rank of brigadier-general in 1834, and to be field-marshal-lieutenant in 1842. In 1849 his ability as quartermaster-general was recognized by Radetzky, as contributing largely to the success of the campaign in Italy. During operations in the East (1854-55), Hess commanded the observation corps in Galicia and Transylvania. In 1859 he was sent to Italy,

and was involved in the Emperor's defeat at Solferino, but for his part in the truce of Villafranca was made field-marshal. Two years afterwards he was named a member of the House of Lords for life.

HESS, HEINRICH VON (1798-1863). A German painter, born at Düsseldorf. He studied with his father, Karl Ernst Christoph Hess (1755-1828), an engraver, born at Darmstadt. He attracted attention at an early age, and was sent to Italy in 1821 to complete his studies. In 1828 he was made professor at the Munich Academy, and in 1849 director of all the galleries in the city. The frescoes in the Basilica of Saint Boniface, twenty-two scenes from the life of that saint, in the execution of which he was assisted by Koch and Schraudolph, and those in the Church of All Saints (both in Munich), are probably his best works. He also produced other notable frescoes and many cartoons for windows. His oil paintings include: "Saint Luke," "Christmas Eve," and "Faith, Hope, and Charity." One of his best portraits is that of Thorwaldsen.

HESS, JOHANN (1490-1547). A German preacher of the Reformation, born at Nuremberg, and educated at Leipzig and Wittenberg. He returned to Wittenberg (1520), after acting as secretary to the Bishop of Breslau and traveling in Italy, where he came under the influence of the humanists. Strongly influenced by Luther and Melancthon, he went back to Breslau, and did much for the spread of the Reformation there. Consult Köstlin, "Johann Hess, der Breslauer Reformator," in the *Zeitschrift des Vereins für Geschichte und Altertum Schlesiens*, vols. vi., xii. (Breslau, 1893-99).

HESS, HESSE, JOHANN JAKOB (1741-1828). A Swiss theologian, born at Zurich, where he became deacon (1777) and (1795) superintendent of the churches in the canton. He wrote original studies on the life of Christ: *Geschichte der drei letzten Lebensjahre Jesu* (1768-73); *Jugendgeschichte Jesu* (1773); and, including these, *Lebensgeschichte Jesu* (8th ed. 1822-23). Consult: Escher, *Johann Jakob Hess* (Zurich, 1837), and Zimmermann, *Die Zürcher Kirche von der Reformation bis zum dritten Reformationsjubiläum* (Zurich, 1877-78).

HESS, KARL ADOLF (1769-1849). A German animal painter and etcher, born in Dresden. He was a pupil of Kloss, traveled in Hungary, Russia, and Turkey, and afterwards became professor at the Vienna Academy. He is noted for his pictures of horses, and his drawings and sketches of those subjects are also prized.

HESS, PETER VON (1792-1871). A German battle painter, born at Düsseldorf. He was the son of Karl Ernst Christoph von Hess, the engraver, and the brother of Heinrich von Hess. He studied under his father, and then in the Munich Academy, and was with the German Army in the campaign of 1813-15. His first large picture was the "Battle of Arcis-sur-Aube" (1817). Afterwards he was appointed painter to the Bavarian Court. In 1839 he went to Russia, and painted two pictures from scenes in the War of 1812 for the Emperor Nicholas. His other works include some genre pictures; a series of oil sketches for the Munich 'Hofgarten,' representing Greek stories; "The Entrance of King Otho into Nauplia;" "Saint Leonard's Festival

in Bavaria;" "Plundering Cossacks;" "A Market-ing Scene;" and a "Surprise;" all minutely painted and of good color.—His brother KARL (1801-74), born at Düsseldorf, was an animal, landscape, and genre painter. Notable works by him are: "On Lake Starnberg" (1835); "A Tyrolese Landscape" and "Cattle in a Pasture" (1822), both in the National Gallery, Berlin. He was also an engraver.

HESS, RICHARD (1835—). A noted German forester. He was born at Gotha, studied at Aschaffenburg and at Göttingen, and at the age of twenty-three entered the forestry service at Gotha. In 1868 he was appointed director of the Academic Institute of Forestry at the University of Giessen, where he also occupied a chair as one of the professors. His chief book is *Der Forstschutz* (Leipzig, 1876-78; 3d ed., 2 vols., 1896-99). Among his numerous other writings may be mentioned: *Grundriss zu Vorlesungen über Forstbenutzung und Forsttechnologie* (2d ed. Berlin, 1901); *Der akademische Forstgarten bei Giessen als Demonstrations- und Versuchsfeld* (2d ed. Giessen, 1890); *Die Eigenschaften und das forstliche Verhalten der wichtigsten in Deutschland vorkommenden Holzarten* (2d ed. Berlin, 1895); *Encyklopädie und Methodologie der Forstwissenschaft* (Nordlingen, 1885-92).

HESSE, hēs (Ger. *Hessen*). A former land-graviate of Germany. The region was occupied in early times by the *Catti* or *Chatti* (German *Katten*). Their first appearance in history is in A.D. 15, when Germanicus destroyed their principal settlement, Mattium, the site of the present villages of Grosse and Klein Maden, near Gudensberg, in the Prussian district of Cassel. In the course of time the Catti became merged in the Frankish tribes, who, when they migrated into Gaul, left Hesse uninhabited, whereupon the Saxons took possession. The Carolingians ruled the country by means of counts, and the power soon became hereditary in one family, the head of this family being elected in 911 King of Germany as Conrad I. After his death and that of his brother Eberhard, the country fell into many divisions, until in 1137 Count Louis I. of Thuringia married the daughter of Count Geiss IV. of Gudensberg, who belonged to the most powerful family in Hesse, and soon thereafter the Hessian nobles accepted Louis as their overlord; but the Thuringian line of landgraves died out in 1247, with Heinrich Raspe, the opponent of Frederick II. In 1263, after a long contest, Sophia, niece of Heinrich Raspe, obtained full possession of Hesse, and from her son and successor, Henry I., surnamed the Child (died 1308), all the various branches of the Hessian family still trace their descent. His descendants added many valuable territories to their old patrimony. After the possessions of the house had been for a time divided, William II., in 1500, was in complete control of all Hessian territories, to which he added Homburg, and in 1509 his five-year-old son, Philip the Magnanimous, succeeded him. He was declared of age in 1518, and thereafter played a very prominent rôle in German affairs, and to some extent in Europe, being a leader in the German Reformation. (See PHILIP THE MAGNANIMOUS and LUTHER.) Philip, on his death, in 1567, divided his territory among his four sons. The eldest, William IV., obtained

half of the Hessian domains, with Cassel for his residence; Louis, a fourth part, with Marburg; Philip, an eighth part, with Rheinfels; and George, an eighth part, with Darmstadt. The death of Philip and Louis left all the Hessian dominions in the two main lines of Hesse-Cassel and Hesse-Darmstadt. See HESSE (grand duchy); HESSE-CASSEL.

HESSE. A grand duchy of Germany, the eighth German State in size, lying between latitudes 49° 24' and 50° 50' N. and longitudes 7° 51' and 9° 39' E., consisting of two main divisions and eleven small exclaves. The northern main division, called the Province of Upper Hesse (*Oberhessen*), lies in the Prussian Province of Hesse-Nassau, and the southern between Prussia, Bavaria, Baden, and the Bavarian Palatinate (Map: Germany, C 4). Area, 2965 square miles. The Rhine traverses for about 55 miles the southern division of the duchy, which consists of the provinces of Rhine-Hesse and Starkenburg. Five of the exclaves border on, or are included by, Baden and Württemberg. The remainder of the exclaves are within Prussian territory.

PHYSICAL FEATURES AND CLIMATE. The surface consists of level, hilly, and mountainous sections. Upper Hesse is mountainous, and is identified with the basaltic Vogelsberg, situated in the east, and rising to a height of about 2500 feet. From this group radiate spurs and outliers west and north through the province, leaving in the south the Wetterau, an extensive, undulating, and arable tract of Upper Hesse. Into the southwestern part of the province extends the northern end of the Taunus, about 2000 feet high. The eastern half of Starkenburg is also mountainous, being occupied by the Odenwald Range, with four peaks reaching about 2300 feet—Krähberg, Hardberg, etc. The western part is in the Rhine valley proper, and in the north lies the low region bordering on the Main. Rhine-Hesse is mostly in the Rhine plain. The western part of this province consists of a rolling country of hills. The Hardt Mountains enter on the southwest, but their highest point (the Eichelberg) has an altitude of only about 1050 feet. The Rhine and the Main form the north border of the southern division of Hesse. The whole grand duchy, except the Vogelsberg district, belongs to the Rhine basin. The Neckar barely reaches Hesse on the south. Other Rhine tributaries from the right are the Lahn, the Weschnitz, and the Modau. On the left the Rhine receives the Selz and Nahe. To the Weser basin section of Upper Hesse belong the Fulda and the Schwalm.

The climate differs somewhat in the two main divisions of the duchy, being rather raw and cold in most of the northern part, while the southern division (except the Odenwald) and the Wetterau have the mild climate of Southern Germany. The mean annual temperature in Darmstadt is 49° F.—in summer 65°, in winter 29.7°; average rainfall, 33 inches. There are several mineral springs and salt-water baths in Hesse; namely, at Salzhausen, Bad Nauheim, etc.

INDUSTRIES. The principal industry is agriculture, the soil being for the most part well adapted for farming. The land is divided into small holdings, as shown by the fact that out of the 133,840 holdings in the year 1895, over

59,000 contained less than 2½ acres each, and only about 9400 holdings contained over 25 acres each. Over 64 per cent. of the area is under cultivation. There is 31 per cent. in forest, more than one-third of which is State property. The forests constitute an important source of income-producing wealth. About one-half of the total area is arable, and one-eighth is in meadows and pastures. Rye, barley, wheat, and oats are cultivated. Hay and potatoes are produced in large quantities, and fruit is extensively grown. The cultivation of the vine, together with the production of fine wines, is a very important industry, not only in Rhine-Hesse, but on the slopes of the Odenwald. There were about 82,500 acres in sugar-beets and turnips in 1900. Agriculture is promoted actively by a Government board of agriculture at Darmstadt, by numerous associations, and excellent agricultural schools which instruct in all branches of farming, fruit-growing, etc. Fishing and hunting yield well commercially. Stock-raising as a separate industry can hardly be said to exist. In 1900 there were 59,091 horses, 330,679 cattle, 82,360 sheep, 124,790 goats, and 312,899 hogs.

The mining region of Hesse is found chiefly in the northern part, and produces coal, iron, and salt. In 1900 the mined minerals amounted to \$474,000, and salt \$125,000. The total of these products, together with those of the smelting-works and foundries, was about \$2,525,000, the persons engaged numbering 3737. Peat is an important output, and Hainstadt-am-Main exports famous clays. The manufacturing industries are generally in a prosperous condition. Hesse is known for its manufactures of leather and leather goods. Other chief manufacturing products are tobacco and cigars, metal articles, paper, sugar, chemicals, spirits, etc. There were five sugar-factories in 1901. The province has many handicraft schools and courts of trade.

COMMERCE AND TRANSPORTATION. The trade of Hesse is of considerable importance, and is favored by many organizations and industrial banks, as well as by the central position of the grand duchy and the excellent transportation facilities. The exports consist mainly of agricultural and manufactured products; the chief imports are raw and half-finished materials. The river commerce is extensive, including much Belgian and Dutch trade. There are over 700 miles of railway, nearly all owned by Hesse, Prussia, and Baden.

GOVERNMENT AND FINANCE. The government is that of a hereditary constitutional monarchy. The Grand Duke is very largely dependent on the civil list, which amounts to about \$300,000. The Constitution was adopted in 1820, and has been repeatedly modified. The executive power lies in a responsible Ministry of three members, who are the heads of the departments of the Interior, Justice, and Finance. The Minister of the Interior is president of the Ministry, and is the Minister of Foreign Affairs and of the Ducal House. The legislative power is represented by two Chambers. The Upper Chamber is composed of all the princes of the reigning house, the heads of several noble families, the Roman Catholic bishop, a Protestant church dignitary, the chancellor of the University of Giessen, the representatives of the landed nobility, and not over twelve life members nominated by the Grand Duke. The Lower Chamber consists of ten

members elected by the large municipalities and forty members returned by the small towns and rural communities. The members of the Lower Chamber are elected indirectly for six years. The Chambers meet each year. The three provinces are divided into eighteen circles. The provinces and circles have local councils elected by a restricted suffrage. The duchy is represented by three members in the German Bundesrat, and returns nine members to the Reichstag. The budget for 1901-02 was estimated at about \$20,000,000. The chief items of revenue are from public domains, lottery, Imperial customs, and direct taxes. The chief articles of expenditure are for the Department of the Interior, lottery, service of the debt, and contributions of the Empire. The public debt amounted in 1901 to about \$74,000,000, nearly all incurred for railways.

POPULATION AND RELIGION. The population was 992,833 in 1890 and 1,119,893 in 1900, showing an increase of nearly 13 per cent. for the decade. Hesse ranks seventh as to population among the German States. Number of inhabitants per square mile, 377.7. Emigrants are few. Darmstadt (q.v.) is the capital; the largest city, Mainz; other large towns are Offenbach and Worms. Over 65 per cent. of the inhabitants are Protestants. The Grand Duke is Protestant, and is the head of the Evangelical Church (embracing the Lutheran and the Reformed). It is governed by a synod and a consistory. The seat of the Roman Catholic bishop is at Mainz. The State contributes to both the leading faiths. This item was \$120,000 in 1900.

EDUCATIONAL AND OTHER INSTITUTIONS. Education is free, compulsory, and maintained partly by the Government and partly by the communes. Secondary education was represented in 1900-01 by 29 gymnasia and 'real' schools, 5 high schools for girls, and 48 private schools. Advanced elementary schools—high schools and middle schools—numbered 34, and there were 902 'continuation schools' (*Fortbildungsschulen*), for scholars leaving the elementary schools. Higher education is supplied by the University of Giessen, and also by the Technical School of Darmstadt. The latter has about 1500 students. Both institutions are supported in part by the State. There are, in addition, not only the industrial schools, but numerous special institutions, as, for instance, a merchants' school and an ivory-carving school. The important libraries and museums number three each. Hesse has a State fire-insurance company, and institutions or pensions or insurance funds for all classes of needy, ill, or otherwise unfortunate persons, including indigent ladies of the nobility. In this respect Hesse is one of the most highly organized commonwealths in the world.

HISTORY. (See preceding article.) The line of Hesse-Darmstadt, the second main branch of the House of Hesse, is derived from George I., the fourth son of Philip the Magnanimous, Landgrave of Hesse, who, on the death of his father in 1567, obtained the Principality of Katzenelnbogen, with the town of Darmstadt for his residence, and received in 1583, on the death of his brother Philip without heirs, a third of the patrimony of the latter. (See HESSE-CASSEL.) At his death, in 1596, he was succeeded in the greater part of his possessions by his eldest son, Louis V. (1596-1626), while another son,

Frederick, became the founder of the Hesse-Homburg line. Louis V. acquired a portion of Upper Hesse, and is noted as the founder of the University of Giessen (1607). His son, George II. (1626-61), and grandson, Louis VI. (1661-78) did much to promote learning and the arts. Under Ernest Louis (1678-1739) the country was laid waste by the French armies. The finances became disorganized, and Louis VIII., who succeeded and ruled until 1768, did little to mend them. Louis IX. (1768-90) was a wise and able ruler, a patron of art and letters. As a result of the French Revolutionary wars, under Louis X. (1790-1830), Hesse-Darmstadt changed its boundaries materially, on the whole to its gain. Louis X. joined the Confederation of the Rhine in 1806, and assumed the title of Grand Duke as such (Louis I.). At the Congress of Vienna (1814-15) he was obliged to make large cessions of territory to Prussia and Bavaria, receiving, however, by way of indemnification, a large district on the Rhine, including the towns of Worms and Mainz, in right of which he assumed the traditional title of Rhenish Grand Duke. At this time Hesse-Darmstadt became a member of the German Confederation. In 1820 Louis promulgated a constitution establishing a parliamentary form of government. He instituted various reforms and joined the Zollverein (q.v.) in 1828. The reactionary policy of Louis II. (1830-48) evoked a strong opposition in the Landtag, but the Grand Duke finally succeeded in subordinating the Chambers to his will. The February Revolution of 1848 in France, however, lent renewed strength to the Liberal Party. In answer to the popular demand for constitutional reform, the heir to the throne was named co-regent with the King; Gagern, the great leader and apostle of German unity, was made Minister of the Interior; and a far-reaching programme of reform adopted, many features of which were carried out only to be abrogated in the reaction which followed the revolutionary wave of 1848-49. Louis III. succeeded his father in 1848. His chief adviser, Dalwigk, was a bitter enemy of Prussia, and in 1866 Hesse-Darmstadt sided with Austria against the former. The Grand Duke made a vain appeal to Napoleon III., of whom he was a personal friend, for assistance. The Hessians were defeated at Laufach, July 13th, and Prussian troops occupied the grand duchy. The Grand Duke was forced to cede some territory, including the recently acquired Hesse-Homburg, to pay a heavy war indemnity, to receive a garrison in Mainz, and to enter into an offensive and defensive alliance with Prussia. The Hessian troops played a conspicuous part in the war against France, and Hesse-Darmstadt became a part of the new German Empire. Louis IV. (1877-92) did much to restore the finances and increase the prosperity of the duchy. He was succeeded by his son, Ernest Louis.

HESSE, hēs'se, ADOLPH FRIEDRICH (1809-63). A German organist and musical composer, born at Breslau. He displayed such marked ability while studying piano, organ, and composition there, that the city fathers gave him financial assistance to continue his musical education at Weimar, where he was a pupil of Hummel, and also came under the influence of Rinck and Spohr. For the last thirty-two years of his life he was organist of Saint Bernard's Church, Breslau, directed the symphony concerts of the town, and made occasional professional tours to Paris, London, and elsewhere. Of his large variety of compositions, the most important are for the organ, and a complete edition of them was edited by Dr. Steggall.

HESSE, ës, ALEXANDRE (1806-79). A French historical painter, born in Paris. He was the pupil of his uncle, Auguste Hesse (1795-1869), an historical and religious painter of some note. He succeeded Ingres in the Institute (1867). His pictures are Venetian in coloring, and well composed. One of the more notable works is "Pisani's Triumph" (1847), in the Luxembourg.

HESSE, hēs'se, OTTO (1811-74). A German mathematician. He was born in Königsberg, and studied and taught there from 1840 to 1856. After that he held professorships of mathematics, successively, at Halle, Heidelberg, and in the Polytechnic School at Munich. He was a disciple of Jacobi, and contributed chiefly to geometry and the theory of determinants. His important mathematical works include: *Vorlesungen über die analytische Geometrie des Raumes* (1861; 3d ed. 1876); *Vorlesungen aus der analytischen Geometrie der geraden Linie, des Punktes und des Kreises* (1865; 3d ed. 1881); *Vier Vorlesungen aus der analytischen Geometrie* (1866; completed in 1874); *Die Determinanten, elementar behandelt* (1871); *Die vier Species* (1872). A list of his memoirs may be found in the *Catalogue of Scientific Papers of the Royal Society of London*, vols. iii. and vii. The name of Hesse is connected with an important determinant form known as the Hessian, or Hessian covariant, which is of great value in the study of curved lines and surfaces. (See **DETERMINANTS**.) An edition of his works was published by the Bavarian Academy of Sciences (München, 1897). Consult Noether, "Otto Hesse," in the *Zeitschrift für Mathematik und Physik*, vol. xx. (Leipzig, 1875).

HESSE-CASSEL, or ELECTORAL HESSE (Ger. *Hessen-Kassel*, hēs'sen kās'el). A former landgraviate, later electorate, of Germany, forming at present the District of Cassel (q.v.) in the Prussian Province of Hesse-Nassau.

HISTORY. The House of Hesse-Cassel, representing the elder line of the House of Hesse, was founded by William IV., the Wise, the eldest of the four sons of Philip the Magnanimous (1509-67). (See **HESSE**.) William, who ruled as Landgrave from 1567 to 1592, was a good administrator, and left a well-consolidated little principality to his son Maurice, who resigned the government in 1627 to his son, William V., and died in retirement five years later.

William (1627-37) fought on the side of Sweden during the Thirty Years' War, for which he was put under the ban of the Empire. His two brothers, Hermann and Ernest, founded the lines of Hesse-Rothenburg and Hesse-Rheinfels. In 1637, on the death of William V., Amelia Elizabeth, his widow, assumed the regency for their young son, William VI., and ruled with vigor and ability. In the Peace of Westphalia (1648) the greater part of Schaumburg and the Principality of Hersfeld were acquired. William VI. died in 1663, and was succeeded by his sons, William VII. (1663-70) and Charles I. (1670-1730). The latter inaugurated the practice, continued by his successors, of hiring out Hessian soldiers to fight in the service of foreign princes, by which the finances of the State were considerably augmented at the expense of the welfare of the people. On the death of Charles, his son Frederick I., who in 1720 had become King of Sweden, in right of his wife, the Princess Ulrike Eleonore, sister of Charles XII., resigned the government of his Hessian territories to his brother William VIII., who succeeded him as Landgrave in 1751, and ruled until 1760. He fought under the British and Hanoverian flag in the Seven Years' War, and gained considerable military renown for himself and his troops. Frederick II. (1760-85) kept up a splendid court on the subsidies received from the British Government for the services of the Hessians who fought against the Americans in the War of Independence, and expended much of his treasures in the patronage of art and in the erection of public edifices. Frederick, who had become a convert to the Roman Church, was succeeded by William IX. (1785-1821), who reigned as William I. after his elevation to the rank of Elector in 1803. This prince frequently shifted sides during the French wars. In 1806, at the time of Prussia's struggle against Napoleon, he remained neutral, but Napoleon, nevertheless, seized his electorate, which was incorporated in the newly formed Kingdom of Westphalia (1807). In 1813, after the defeat of Napoleon at Leipzig, William returned to his dominions and began to restore the old order of things as far as he could, while he sought to recover the State lands that had been sold during his exile, and appealed so strongly for indemnification that he obtained various important concessions at the Congress of Vienna, although he failed to secure the title of King. In accordance with a promise which he had made on his restoration, he summoned a body of jurists to construct a constitution; but no sooner was the draft completed than he refused to abide by it. His death, in 1821, was regarded as a fortunate event. But his son and successor, William II. (1821-47), by his narrow policy, increased the rapidly growing disorders of the State, while his prodigality toward his mistress, the Countess of Reichenbach, rendered him peculiarly unpopular with his subjects. In 1831 William was compelled to promulgate a constitution. At the same time his son, Frederick William, was appointed co-regent. The history of the sixteen years' regency of Prince Frederick William exhibited a retrogressive policy, pursued at first under the guidance of Hassenpflug (q.v.), which left Hesse far behind other German States in material prosperity. The death of the old ruler occurred at Frankfort in 1847. The revolutionary movement of 1848 extorted from Frederick William I. (1847-66)

many liberal promises of reform, some of which were redeemed; but in 1850, after revoking many of his pledges, he summoned again the obnoxious reactionist Hassenpflug to govern the country. The Elector and his Minister resorted to the most arbitrary measures to force the excited people to submission, and Hassenpflug persuaded the sovereign that his personal safety would be endangered if he remained longer among his subjects, and Prince and Minister fled from Cassel to Wilhelmsbad. Hassenpflug appealed for federal intervention, and Austrian and Bavarian troops entered the country. The friends of liberal government looked to Prussia for support. On November 2, 1850, a Prussian army entered Hesse-Cassel; but the Prussian King was timid, and the war was principally limited to angry protocols. External force was now applied to quell all opposition to the despotic sway of Frederick William, who in 1852 returned to Cassel. A new constitution was promulgated, which in no way satisfied the people, whose conduct throughout the trying crisis had been marked by forbearance and moderation. But the policy of the Government remained unchanged. Not until 1862, after much agitation and powerful pressure from Prussia, was the Prince forced to accede to the Constitution of 1831. After this concession, however, he still ruled in such a way as to paralyze the political activities of the country. In the Seven Years' War of 1866 Hesse-Cassel sided with Austria. A Prussian army entered the principality, June 16, 1866, and Frederick William was taken prisoner and conveyed to Stettin, where he remained till September 17th. Three days later Hesse-Cassel was incorporated with Prussia. The deposed Prince died January 6, 1875, leaving no direct heir.

HESE-DARMSTADT. See HESSE.

HESE-HOMBURG, hóm'bōrk (Ger. *Hessen-Homburg*). Formerly a landgraviate, containing about 106 square miles, composed of the District of Homburg vor der Höhe on the right of the Rhine, and that of Meisenheim on the left. It has belonged to Prussia since 1866, and is now a part of Hesse-Nassau and of the Rhine Province. The landgraviate was an integral part of Hesse-Darmstadt till it was transferred in accordance with the disposition made by the Landgrave George I. (died 1596) to that Prince's youngest son, Frederick I., in 1622. It constituted a part of Hesse-Darmstadt from 1806 till the Congress of Vienna (1815), when its independence was restored and its territory augmented by the addition of Meisenheim. The opening of the springs and baths at Homburg in 1833 proved an unexpected source of wealth to the State, and after the addition of gambling saloons, the establishment constituted a very important branch of the revenue. Attempts were more than once made by the Diet to put down the gambling-tables; but whenever the pressure of Federal intervention was removed, gambling was always

resumed with fresh spirit, and the system continued till 1872. In March, 1866, on the death, without heirs, of the last landgrave Ferdinand, who had succeeded his brother Gustavus Augustus, in 1848, the landgraviate fell to Hesse-Darmstadt, but remained united with that duchy only a few months, being ceded to Prussia on September 3, 1866.

HESSE-NASSAU, nās'sou (Ger. *Hessen-Nassau*). A province of Prussia, the southwestern part of the kingdom, lying between the Rhine and the Weser, and composed chiefly of the larger portions of Hesse-Cassel, Nassau, and Hesse-Homburg. It also contains the city of Frankfurt (q.v.) (Map: Germany, C 3). The main body of the province is bordered by the Rhine Province, Westphalia, Waldeck, Hanover, and Prussian Saxony, Saxe-Weimar-Eisenach, Bavaria, and Hesse, and incloses the Hessian Province of Upper Hesse. Among the several exclaves that belong to Hesse-Nassau are the countship of Schaumburg and the Thuringian district in which Schmalkalden is situated. Area, 6000 square miles.

TOPOGRAPHY. The province is generally an elevated region. In the south are the rich valleys of the Main and Rhine; in the north lies the Weser Valley; but as a whole the province belongs to the mountain region of Middle Germany, and consists of high, rolling districts broken by peaks and rather prominent spurs and outliers. In the east are the Kaufunger Wald and portions of the Rhöngebirge, Vogelsberg, and Spessart. The Westerwald is in the west, and the important Taunus range in the extreme southwest. The western part of the province is traversed by the Lahn, an affluent of the Rhine. In the northeast are the Fulda and the Werra, which unite to form the Weser. The climate is mild and generally even.

INDUSTRIES. The principal occupations are agriculture and its allied industries. Of the total area, about 40 per cent. is under crops and gardens, about the same proportion is in forests, and the remainder is chiefly in meadow and pasture. Most of the land is distributed into small holdings. According to the industrial census of 1895 there were 212,349 holdings ranging from less than 5 acres to 50 acres, and 4743 holdings of over 50 acres each. The chief agricultural products are rye, wheat, potatoes, flax, oats, and hay (including clover and alfalfa). Tobacco and beans are cultivated to a considerable extent. Among the well-known wines of the province are the Johannisberger, Hochheim, and Rüdesheim. The forests are among the most extensive of Prussia, and belong mostly to the State and the communities. The trees are conifers, oaks, and beeches. The commercial yield of the forest is large. They abound in game, and the streams are rich in fish. Live-stock raising is not carried on extensively as a separate industry. In 1900 there were 85,170 horses, 587,802 cattle, 304,499 sheep, 556,233 swine, and 171,959 goats.

The mineral deposits are important, principally iron and coal. Of the former about 400,000 tons are obtained annually; of the latter, over 600,000 tons. Hesse-Nassau is one of the leading iron producers among the Prussian provinces. There are some deposits of zinc, lead, and copper. Good clay is found. The mineral springs and health resorts of the province are both numerous and famous, including those of Homburg, Wiesbaden,

Ems, Schwalbach, and Selters. Several of the waters, especially the Selters, are exported extensively to all parts of the civilized world.

The manufacturing industries, with some exceptions, are on a small scale. The industrial census of 1895 gives the total number of establishments at 128,888, employing 344,602 hands. This number includes 58,664 establishments employing no help, and 42,865 establishments employing from one to five hands each. The chief manufactured products are cotton and woolen goods, tobacco, cigars, and sugar. Also worthy of mention are the exports of marble, dressed stone, and burnt clay, and wooden wares, leather, and jewelry. There were 347 distilleries in operation in 1901. The province has important fairs and markets, especially horse markets, and the trade and manufacturing interests are furthered by means of numerous chambers of commerce. The banks of Frankfurt, the financial centre of this part of Germany, are celebrated for their strength and the extensive scope of their undertakings. The transportation facilities are fully adequate to the needs of the province. The railways are mostly controlled by the State. The splendid roads and natural waterways aid very materially in the distribution of products. The commerce is concentrated largely in Frankfurt, Cassel, and Wiesbaden. Other important business towns are Hanau and Fulda.

GOVERNMENT AND EDUCATION. Administrative Hesse-Nassau is divided into the two districts of Cassel and Wiesbaden, subdivided into 24 and 18 circles, respectively. The former district is about twice the size of the latter, but has less population, Frankfurt being included in the latter. Cassel (q.v.) is the capital. The province is represented in the Prussian Landtag by 26 Deputies in the Lower Chamber and by 21 members in the House of Lords. The highest educational institution is the University of Marburg, founded in 1527. There are an agricultural school at Weilburg, a farmers' association at Cassel, and an agriculture and forestry association at Wiesbaden. There are also several unions for bee and bird raising and gardening.

POPULATION. The population was 1,664,426 in 1890, and 1,897,310 in 1900, showing an increase of 14 per cent. for the decade. Population per square mile, 313.1. Emigrants, in 1900, 605. About 70 per cent. of the inhabitants are Protestant. For the history of Hesse-Nassau, see HESSE-CASSEL; HESSE-HOMBURG; NASSAU.

HESSE-WARTEGG, vär'tég, ERNST VON (1851—). An Austrian traveler, born in Vienna. His travels covered most of the habitable globe. He married Minnie Hauck, the opera singer, in 1881. He wrote, among many books of travel: *Prairiefahrten* (1878); *Tausend und ein Tag im Occident* (1896); *Chicago* (1892); *Curiosa aus der neuen Welt* (1893); *Korea* (1895); *China und Japan* (2d ed. 1900); *Schan-tung und Deutsch-China* (1898); *Siam* (1899); and *Samoa, Bismarckarchipel und Neuguinea* (1902).

HESHSIUS, TILEMANN (1527-88). A German Lutheran theologian, born at Wesel, and educated at Wittenberg, Oxford, and Paris. From his post as lecturer of New Testament exegesis in Wittenberg, he went to Goslar (1553), then to Rostock (1556), to Heidelberg as professor of theology (1558), and then preached at Bremen, and (1560) at Magdeburg. But

here, too, his love of strife and his extreme orthodox, and his absolute opposition to Crypto-Calvinism or to any form of Lutheranism less rugged than his own, brought him into trouble. He had to leave Magdeburg, and, driven from one town to another, settled at Neuburg in 1565 as Court preacher. From there he went to Jena, but in 1573 left Brunswick and became Bishop of Samland at Königsberg. Four years later he was forced to retire from this office, and became professor at Helmstedt. Heshsius wrote: *Von Amt und Gewalt der Pfarrerherren* (last ed., by Schütz, 1854); *De Cera Ecclesia et ejus Auctoritate* (1572); *Antidotum contra Dogma M. Flaccii, quod Peccatum Originis Sit Substantia* (1572); and *Assertatio Testamenti Christi* (1574). Consult: Wilkens, *Tilemann Heshsius* (Leipzig, 1860); and Helmolt, *Tilemann Heshsus und seine sieben Exilia* (Leipzig, 1859).

HESSIAN FLY. A dipterous insect (*Cecidomyia destructor*), which, from the damage which the larva does to wheat in North America, and also to some extent in Europe, has become one of the most widely known of insects. It is dark in color, nearly black, with dusky wings and pale brown legs. While distinctively a wheat insect, it will breed also in barley and rye. Over a large part of the wheat area of the United States there are two principal broods, namely, a spring brood and a fall brood. There are, however, supplemental broods both in spring and fall, particularly in the southern wheat areas; but in the extreme northern area of the spring wheat belt there may be only a single generation. Each generation is represented by four distinct states, namely, egg, larva or 'maggot,' pupa or 'flaxseed,' and the mature winged insect. The eggs are very minute and slender, white in color, and are usually deposited in irregular rows of three to five or more on the upper surface of the leaf. Sometimes they are thrust beneath the sheaf of the leaf on the lower joints. The whitish maggots hatch and crawl down to the base of the sheath, developing on the substance of the stalk, causing a distortion or enlargement of the stalk at the point of attack. In a few weeks the larva contracts into a flaxseed-like object, which is the puparium. With the spring brood the insect remains in the flaxseed state during midsummer, giving out the perfect insect usually in September. With the fall brood, the insect passes the winter in the flaxseed state at the base of the winter wheat.

The best remedies are the late planting of winter wheat or the early planting of a narrow strip in which the flies will lay their eggs and which may afterwards be plowed under, the bulk of the crop being planted late. The copious and prompt use of fertilizers enables the wheat to tiller sufficiently to yield a partial crop even when badly attacked. The burning of the stubble, the destruction of volunteer wheat, and the growth of resistant varieties are all recommended.

Osborn, *The Hessian Fly in the United States* (Department of Agriculture, Washington, 1898); *The Hessian Fly in Wheat* (Pennsylvania Department of Agriculture, Harrisburg, 1890); Luggler, *The Hessian Fly* (Minnesota Agricultural Experimental Station, Saint Paul, 1899); Webster, *Bulletin 107* (Ohio Agricultural Experimental Station, Columbus, 1898).

HES'TIA. See VESTA.

HES'TON AND ISLE'WORTH. A suburban municipality of London, England, on the Thames, 12 miles southwest of Saint Paul's (Map: London, E 4). Market gardening is carried on, and it is a favorite residential place of London merchants. Population, in 1891, 26,000; in 1901, 30,800.

HESYCHASTS, hēs'ī-kāsts (from Gk. ἡσυχαστής, *hēsychastēs*, quietist, from ἡσυχάζειν, *hēsychazein*, to be quiet, from ἡσυχος, *hēsychos*, quiet). Mystics of the Greek Church, and particularly the monks of Mount Athos (q.v.). In all probability mysticism never entirely died out among the Oriental monastic bodies; but the mystics attracted an unusual share of attention, not only at home but in the Western Church, in the earlier half of the fourteenth century. A Basilian monk, named Barlaam (q.v.); in the course of a visit to the monasteries of Greece, observed several practices and doctrines which he considered reprehensible. The monks of Mount Athos especially provoked his reprobation and ridicule. Believing that in the soul lay a hidden divine light, which it was the office of contemplation to evoke, they withdrew at stated times to a retired place, seated themselves on the earth, and fixed their eyes steadfastly on the navel (whence the sobriquet by which they were known, ὀμφαλόφυχοι, navel-souls); and they averred that, after the allotted time of contemplation, a kind of heavenly light beamed forth upon them from the soul (whose seat, they held, was in that region), and filled them with ecstasy and supernatural delight. They declared that this light was the glory of God Himself, and they connected it in some unexplained way with the light which appeared at the transfiguration of the Lord. Barlaam denounced these notions as fanatical and superstitious. On the other hand, they were explained and defended by Gregory Palamas, the Archbishop of Thessalonica; and in order to settle the controversy, a council was held in Constantinople in 1341 which terminated in the triumph of Palamas and the monks. The controversy afterwards turned upon the nature of the light supposed to emanate from the soul in this state of contemplation. Other councils were called, one of which, in 1351, again pronounced in favor of the monks, through the influence, it was said, of the Court and of John Cantacuzenus, who was a patron of the Hesyachasts. But the public voice was hostile to the sect, and on the retirement of their patron Cantacuzenus, who, in 1355, became a monk, they fell into obscurity. Consult: Stein, *Studien über die Hesyachasten des XIV. Jahrhunderts* (Vienna, 1874); Holl, *Enthusiasmus und Bussgewalt bei dem griechischen Mönchtum* (Leipzig, 1898).

HESYCHIUS, hē-sīk'ī-ūs (Lat., from Gk. Ἠσύχιος). A Greek grammarian of Alexandria, probably belonging to the fifth century A.D. He was the author of a Greek lexicon taken partly from earlier works of a similar character, with the addition of new words and examples from the writings of poets, orators, historians, and physicians. Its value is very great, as it helps us to the correct readings in many texts, and contains no little information concerning the Greek dialects. The best edition is that of Schmidt (4 vols., Jena, 1858-68).

HESYCHIUS. According to Jerome, publisher of an edition of the New Testament, and also a revision of the Septuagint. He is generally identified with a Hesychius said by Eusebius to have been Bishop of Alexandria, and to have died a martyr during the Galerian persecution, about 311.

HESYCHIUS OF MILETUS (fl. probably c.550 A.D.). A Greek chronicler, surnamed The Illustrious (ὁ Ἰλλούστριος). We hear of three works of his: (1) A universal history in six books, beginning with the Assyrian King Belus, and coming down to the reign of the Byzantine Emperor Anastasius (518), of which a part of the sixth book, covering the history of Constantinople from the earliest times to the reign of Constantine (324), has been preserved under the title Πάτρια Κωνσταντινουπόλεως. (2) A history of the reign of Justin (518-527) and the earlier years of Justinian (527-565), now lost. (3) A biographical dictionary of Greek writers (Ὀνοματολόγος ἢ πῖναξ τῶν ἐν παιδείᾳ ὀνομαστῶν), which was extensively excerpted by Photius and Suidas (qq.v.). The fragments of his works are collected by Müller, *Fragmenta Historicorum Græcorum*, iv. (Paris, 1841-70). An attempt to 'recover' Hesychius from Suidas and other excerpts has been made by Flach, *Hesychii Milesii Onomatologi quæ Supersunt* (Leipzig, 1882).

HETÆRÆ (Neo-Lat., from Gk. *ἑταῖρα*, *hetaira*, fem. of *ἑταῖρος*, *hetairo*s, comrade, companion; connected with *ἕτης*, *hetes*, kinsman). In ancient Greek society women of more or less unconventional life. They were apt to be slaves or foreigners, and, skillful in dance or music, gave private or public entertainments. As, under the Athenian law, only a citizen's daughter could marry a citizen, many of these women, often of otherwise excellent character, were constrained, if they desired companionship, to accept concubinage. Some—for example, Aspasia, the instructor of Socrates and the friend of Pericles—were highly accomplished, and exerted great and wholesome influence upon State policy. Others, like Leontium, Phryne, Thais, and Theodota, while possessed of personal grace and charm, and more or less intellectual distinction, were more properly courtesans. The various words for women of irregular life should be sharply distinguished. *Hetæra*, like *concubina*, implies fidelity to a single man, and such relation may well have been a true marriage. *Meretrix*, *pornē*, and *scortum* signify a quite different thing—the harlot or prostitute. There was still another class represented by the words *pallakē*, *pallakis*, and *pelle*x, signifying a mistress kept by a man already married. In the New Attic comedy the *hetæra* are a conspicuous feature of the plot, and the *Letters* of Alciphron find in this their source, as do also Lucian's *Conversations of Hetæra*.

HETÆRIA PHILIKE, *hēt'ā-rē'ā fē-lē'kē* (Gk. *ἑταῖρα φιλική*). A secret society of Greek sympathizers, founded in 1814, to liberate Greece from Turkish rule. Under the leadership of Prince Alexander Ypsilanti it brought about the Greek War of Independence in 1821.

HETCHEL. See HECKLE.

HETEROCELA (Neo-Lat. nom. pl., from Gk. *ἕτερος*, *heteros*, other + *κοῖλος*, *koi*los, hollow). One of the two orders of calcareous sponges, including those in which the endoderm is

composed of flagellate collared cells. In the other order, Homocela, collared cells are restricted to flagellate chambers, and flattened cells compose the remainder of the endoderm. See SPONGE.

HETEROCYST (from Gk. *ἕτερος*, *heteros*, other + *κύστις*, *kystis*, bag). A term applied to certain cells, empty or with watery contents, found in the filaments of blue-green algæ. See ALGÆ and CYANOPHYCÆÆ.

HETEROGAMY (from Gk. *ἕτερος*, *heteros*, other + *γάμος*, *gamos*, marriage). A condition in plants, contrasted with isogamy (q.v.), in which the pairing sex-cells (gametes) are differentiated into sperms and eggs. Most plants are heterogamous in this sense. The term is also used when two kinds of flowers exist on the same plant; as, for example, in certain Compositæ, where the development of stamens and pistils differs in the disk and the ray flowers. See FERTILIZATION.

HETEROGENESIS (Neo-Lat., from Gk. *ἕτερος*, *heteros*, other + *γένεσις*, *genesis*, generation, from *γίγνεσθαι*, *gignesthai*, Skt. *jan*, to be born). A term bearing various meanings and relations. (1) The equivalent of abiogenesis or spontaneous generation. (See BROGENESIS.) (2) A mode of reproduction in which the parent produces offspring unlike itself, as opposed to *homogenesis*, or the production of offspring like the parent or parents. See ALTERNATION OF GENERATIONS.

HETEROGONY. See PARTHENOGENESIS.

HETEROPHORIA (Neo-Lat., from Gk. *ἕτερος*, *heteros*, other + *-φορία*, *-phoria*, carriage, from *φέρειν*, *pherein*, to carry), or INSUFFICIENCY. A condition in which the eyes are only prevented from deviating by constant muscular effort. Exophoria is the term applied to the tendency of an eye to look outward while the other is fixed upon an object; esophoria, to the tendency to deviate inward. The trouble is due to relative weakness of an eye-muscle, the result of some error of refraction or in persons generally run down. In severe cases there are headache, pain in the eyes, occasional double vision, blurring of point, and irritability of the eyelids. The difficulty is treated by attention to the general health and correction of errors of refraction by eyeglasses. Exercise of the weak eye-muscles is also employed.

HETEROPHYLLY (from Gk. *ἕτερος*, *heteros*, other + *φύλλον*, *phyllon*, leaf). That condition in which there are two or more forms of leaf on the same plant, a condition particularly well shown in amphibious plants in which the water leaf is finely divided, but the air leaf is entire and compact. See LEAF.

HETEROPODA (Neo-Lat. nom. pl., from Gk. *ἕτερος*, *heteros*, other + *πούς*, *pous*, foot). A suborder of small pelagic pectinibranchiate Gastropoda (q.v.). They swarm at night at the surface of the ocean and swim rapidly about with their backs downward and their ventral surfaces uppermost. Their bodies are small, delicate, and often transparent, with well-demarcated heads, and well-developed sense, circulatory, breathing, and reproductive organs. The foot is compressed to form peculiar blade-like swimming organs. Most heteropods are naked, but some genera, among them *Atlanta*, *Carinaria*,

and *Oxygyrus*, have delicate involute shells. These resemble in some respects those of certain fossil Bellerophonids of Paleozoic age, and the resemblance has led many authors to include the Bellerophonitidae with the Heteropoda in spite of their larger size, and heavier and thicker shells. See BELLEROPHON; GASTROPODA.

HETEROPTERA (from Gk. *ἕτερος*, *heteros*, other + *πτερόν*, *pteron*, wing). A suborder of the Hemiptera, including the 'true' bugs, characterized by dissimilarity in the wings. The proximal half of the anterior pair of wings is thickened, much like those of beetles. The suborder includes a number of aquatic forms, some of which occur out at sea hundreds of miles from land. The water-boatman (*Corixa undulata*), with a pair of oar-like legs, the large water-bug or 'electric-light bug' (*Belostoma Americanum*), and the long-legged water-striders are, perhaps, the best known of the aquatic forms. The bedbug, redbug, chinch-bug, squash-bug, and stink-bugs (q.v.) are other familiar and important Heteroptera. See HEMIPTERA; HOMOPTERA.

HETEROSPORY (from Gk. *ἕτερος*, *heteros*, other + *σπός*, *sporos*, seed). The production, by plants, of two kinds of sexless spores. Heterospory is one of the most important phenomena in connection with the evolution of the plant kingdom, since through it the seed has appeared, and since a clear conception of flowering plants is impossible without some knowledge of the beginnings of heterospory. The phenomenon appears first, and in its simplest form, among certain of the fern-plants (Pteridophytes), and is universal among the seed-plants (spermatophytes). To understand the significance of heterospory it will be necessary to read the article on ALTERNATION OF GENERATIONS, since this deals with the two kinds of spores produced by the sexless generation (sporophyte).

'microspores.' More important than the fact of difference in size, however, is the other fact that the microspores produce sexual plants which bear only male organs, and the megaspores sexual plants which bear only female organs. There is a very definite relation between the amount of nutrition and the appearance of the female organs, so that the larger and hence better-nourished spore is expected to produce a female plant. In consequence of heterospory, therefore, the sexual plants become distinctly male and female. The unfortunate thing is that the sexual character has often been applied to the microspores and the megaspores, which are simply the sexless spores of a sporophyte, which necessarily produce gametophytes.

HETEROSPORY.

Microsporangium of a club-moss containing numerous microspores.

HETEROSPORY.

Megasporangium of a club-moss containing four megaspores.

In ordinary ferns the spores are alike, and in germination each one produces a sexual plant (gametophyte), which bears both the male and the female sex organs. Such a condition is called 'homospory' (q.v.) or 'isospory,' which means in each case 'spores similar.' Very gradually the spores begin to differ in size, until presently some become very much larger than others. The large spores are called 'megaspores' and the small ones

When spores become thus differentiated in size and in product, the spore-cases (sporangia) are also differentiated, so that certain sporangia produce only microspores, and others produce only megaspores. The former were naturally called 'microsporangia' and the latter 'megasporengia.' These sporangia are ordinarily produced upon leaf-like structures, and later the leaves bearing sporangia, become differentiated in the same way, so that certain leaves bear only microsporangia and other leaves only megasporengia. Naturally the former were called 'microsporophylls' and the latter 'megasporophylls.' These names are used in connection with those fern-plants which are heterosporous, as the water-ferns, the little club-mosses (*Selaginella*), and the quillworts (*Isoetes*). Among the seed-plants (flowering plants), however, the corresponding structures already possessed names long in use, and not to be discarded. It is important, however, to know the structures among the seed-plants that correspond to those among the heterosporous fern-plants. It is found that the stamen (q.v.) of a flowering plant is a microsporophyll, that its pollen-sacs are microsporangia, and that the pollen-grain is a microspore. The interesting conclusion is reached, therefore, that the pollen-grain is a sexless spore, a conclusion quite contrary to the general impression that it is a male cell, and that the stamen is a male organ. It is found that the carpel (q.v.) of a flowering plant, which organizes the ovary, style, and stigma, is a megasporophyll; that the ovules are megasporengia; and that the so-called embryo-sac is a single large unshed megaspore. It follows, therefore, that the ovule is by no

means the egg or ovule structure which its name would imply, but the spore-case (sporangium) of a sexless plant.

An important further fact in connection with heterospory is that upon its development the sexual plants (gametophytes) become very much reduced in size, for the most part not escaping from within the spores which produce them. As a consequence, the male plant or generation in a flowering plant is contained entirely within the pollen-grain; and the female plant or generation is completely inclosed within the ovule. For further development of the subject in connection with the evolution of the seed, see SEED.

HET'MAN. See ATAMAN.

HETTINGER, hêt'ting-ër, FRANZ (1819-90). A German Catholic theologian, born at Aschaffenburg, and educated at Würzburg and at the German College in Rome. In 1847 he returned to Würzburg as assistant in the theological seminary, and nine years afterwards he became professor in the university. Hettinger wrote: *Apologie des Christentums* (8th ed. 1899-1900); *Lehrbuch der Fundamentaltheologie* (2d ed. 1888); *Timotheus. Briefe an einen jungen Theologen*; and many studies on Dante, of which the most important is *Die göttliche Komödie nach ihrem wesentlichen Inhalt und Charakter dargestellt* (2d ed. 1889). Consult the biography by Kaufmann (Frankfurt, 1891).

HETTNER, hêt'nër, ALFRED (1859—). A German geographer, son of Hermann Hettner. He was born at Dresden, studied at Halle, Bonn, and Strassburg, and was professor of geography at Leipzig, Tübingen, and Heidelberg. He made two expeditions to South America—to Colombia (1882) and to Peru and Bolivia (1888)—and in 1895 became an editor of the *Geographische Zeitschrift*, for which he wrote on anthropology and geographical methodology. He published: *Gebirgsbau und Oberflächengestalt der Sächsischen Schweiz* (1887); *Reisen in der columbianischen Anden* (1888); *Die Cordillere von Bogota* (1892); and the text in Spamer's *Atlas* (1896, 2d ed. 1900).

HETTNER, HERMANN THEODOR (1821-82). A German literary and art critic, born at Leisnersdorf (Silesia). He had traveled extensively and become known through various volumes on literary and critical subjects before he was made professor of æsthetics at the University of Jena (1851). Afterwards he became director of the cabinet of antiquities in Dresden (1855), and professor of the history of art in the Academy of Fine Arts. In 1868 he was appointed director of the Historical Museum. His most important work is *Litteraturgeschichte des achtzehnten Jahrhunderts* (1856-70; parts 1 and 2, 5th ed. 1894; part 3, 4th ed. 1893-94). He also wrote *Die romantische Schule in ihrem innern Zusammenhange mit Goethe und Schiller* (1850); *Griechische Reiseskizzen* (1853); *Das königliche Museum der Gipsabgüsse zu Dresden* (4th ed. 1881); and *Italienische Studien: Zur Geschichte der Renaissance* (1879).

HET'TON. A town in the County of Durham, England, five and one-half miles northeast of Durham (Map: England, D 3). The mining of extensive coal deposits in the vicinity constitutes its principal industry. Population, in 1891, 12,700; in 1901, 13,670.

HETZEL, â'tsèl', PIERRE JULES (1814-86). A French publisher and littérateur, born at Chartres. From 1835 he was associated with Paulin, the French publisher, and afterwards took part in politics as a Republican. After the Revolution of 1848 he was chief of a department in the Ministry of Foreign Affairs and Secretary-General of the Provisional Government. After the coup d'état he was exiled and lived in Brussels until the amnesty of 1859. During the time he published a series of French classics. Upon his return to France he published, among other volumes, the romances of Jules Verne. He had founded, with M. J. Macé, a *Magasin d'éducation et de récréation* (1854), which was very successful, and his best claim to general interest, although his stories for children have always been popular. Under the pseudonym of P. J. Stahl he wrote *Les nouvelles et seules aventures de Tom Pouce* (1843); *L'esprit des femmes, et les femmes d'esprit* (1855); and other volumes.

HETZER, hêts'ër, LUDWIG. See HÄTZER, LUDWIG.

HEUBERGER, hoi'bèrk-ër, RICHARD (1850—). An Austrian composer, born at Gratz. By profession a civil engineer, he did not take up music seriously until 1876. Two years later he became conductor of the Vienna Singakademie. He composed much instrumental music, and the operas *Abenteuer einer Neujahrsnacht* (1886); *Manuel Venegas* (1889), which was rewritten as the grand opera *Mirjam, oder das Matifest* (1894); and several ballets and operettas.

HEUBNER, hoib'nër, OTTO (1843—). A German physician, born at Mühltröf, son of the revolutionist Otto Leonhard Heubner (1812-93). The son studied at Leipzig and Vienna, was long connected with the former university, and in 1894 went to Berlin as professor and manager of the clinic for children. Among his writings are: *Dieluetische Erkrankung der Hirnarterien* (1874); *Die experimentelle Diphtherie* (1883, which received the prize offered by the Empress Augusta); *Klinische Studien über die Behandlung der Diphtherie mit dem Behring'schen Heilserum* (1895); and *Syphilis im Kindesalter* (1896).

HEUCHERA, hū'kè-rá. See ALUM ROOT.

HEUGLIN, hoi'glîn, THEODOR VON (1824-76). A German traveler and ornithologist, born at Hirschlanden, Württemberg. From 1850 to 1865 he spent most of his time in Africa. While attached to the Austrian consulate at Khartum, he visited Dongola and Abyssinia, and afterwards described his travels in a volume entitled *Reisen in Nordostafrika* (1857). Next he visited the White Nile, the Sudan, and the west coast of the Red Sea, and in 1861 set out with a party for the interior of Africa to determine the fate of the explorer Eduard Vogel. After other expeditions he returned to Europe with rare collections, and published several valuable scientific works, including: *Ornithologie Nordostafrikas* (1869-75), and *Reise in das Gebiet der westlichen Zuflüsse des weissen Nil* (1869). Journeys which he made in 1870 and 1871 to Spitzenberg and Nova Zembla he described in *Reisen nach dem Nordpolarmeere* (1872-74).

HEUMANN, hoi'mán, CHRISTOPH AUGUST (1681-1764). A German scholar. He was born at Allstedt, studied at Jena, and in 1717 became

head of the academy at Göttingen. He contributed largely to the growth of this school and to its change to a university. In the university he was made professor of the history of literature (1734), and of theology (1745). His great works, *Acta Philosophorum* (last ed. 1717-24), and *Conspectus Respublicæ Literariæ* (last ed. 1791-97), by the use of the analytical system, founded modern German literary history. He also translated, with a commentary, the New Testament (1750-63). Consult the life by Casius (Cassel, 1768).

HEUMANN VON TEUTSCHENBRUNN, fôn toit'shen-brûn, JOHANN (1711-60). A German jurist and writer on diplomacy, born at Muggendorf in Bavaria, and educated at Altdorf, where in 1740 he became professor. The first jurist to approach the study of diplomacy in a scientific manner, he wrote: *Commentarii de Re Diplomatica Imperatorum ac Regum Germaniæ* (1745-53); *Exercitationes Juris Universi* (1749-57); *Initia Juris Politicæ Germaniæ* (1757); and *Geist der Gesetze der Deutschen* (1761).

HEUN, hoin, KARL GOTTLIEB SAMUEL (1771-1854). A German novelist, known under the pseudonym H. Clauren, born at Dobrilugk, and educated at Leipzig and Göttingen. He became in 1792 secretary in the departments of Mining and Foundries in Westphalia, but he left the Prussian service in 1801 to become manager of an estate near Posen. Ten years later he returned to Berlin, received a place in a bureau of the Chancellor Hardenberg, and in 1820 became editor of the *Preussische Staatszeitung*. Heun is best known by the first line of a poem on the War of Liberation, *Der König rief, und alle, alle kamen*, which has become proverbial. His novels, realistic but full of false sentiment and of doubtful morality, are no longer read in Germany. They include: *Erzählungen* (1819-20); *Die graue Stube*, and *Mimili* (1824); and *Scherz und Ernst* (1820-28). Heun also wrote some dramas, which were collected, *Lustspiele* (2d ed. 1827). A collection of all his works appeared at Leipzig in twenty-five volumes (1851).

HEVEA, hê'vê-â. A genus of about ten species of trees, natives of tropical South America, of the natural order Euphorbiaceæ, characterized by trifoliate leaves, loose panicles or corollaless flowers, and a trivalved capsular fruit. The species, especially *Hevea Braziliensis*, furnish the highest grade of South American india-rubber. The seeds are eaten by birds, but are considered poisonous to man and other animals unless boiled, a process which makes them edible.

HEVELIUS, HEVEL, hâ'vêl, or **HEWELKE**, hâ-vêl'ke, JOHANNES (1611-87). One of the most celebrated astronomers of the seventeenth century. He was born and died at Danzig. In 1641 he erected an observatory in his own house, furnished it with large telescopes constructed by himself, and devoted himself to astronomical observations. He was the first astronomer, with the exception of Gassendi, to observe a transit of Mercury (Gassendi's observation was made in 1631, that of Hevelius in 1661); and it is now generally conceded that he ranks next to Flamsteed among the astronomers of his day. Toward the end of his life he opposed the notion of using telescopic sights for astronomical instruments of precision, believing that the old method of observing through pin-holes, etc., was superior. Halley

(q.v.) was at one time sent to Danzig by the Royal Society of London to examine into this question, and the controversy was decided against him. Hevelius's observatory and library perished by fire in 1679. His extant works include the following: *Selenographia, seu Descriptio Lunæ* (1647); *De Natura Saturni* (1656); *Cometographia* (1668); *Machina Cœlestis* (1673); *Prodromus Astronomiæ* (1690). His letters were published in 1683. Consult Seidemann, *Johannes Hevelius* (Zittau, 1864).

HEVESI, hê'vê-shê, LUDWIG (1843—). A German-Hungarian journalist and humorist, sometimes writing under the pseudonym of *Onkel Tom*. He was born at Heves, studied classical philology and medicine at Vienna, and entered journalism in 1865. In the following year he became one of the editors of the *Pester Lloyd*; then helped launch the Hungarian journal *Borsszem Jankó*; from 1871 to 1874 edited the Vienna juvenile *Kleine Leute*; and in 1875 became the art and dramatic critic of the *Fremdenblatt*. He writes mainly in German. His works include the humorous sketches of travel and collections of stories; *Sie sollen ihn nicht haben* (1871); *Des Schneidergesellen Andreas Jelky Abenteuer in vier Weltteilen* (1875); *Auf der Sonnensite* (1886); *Buch der Laune* (1890); *Ein englischer September* (1891); *Regenbogen* (1892); *Von Kalau bis Säkkingen* (1893); *Glückliche Reisen* (1895); *Die Althofleute* (1897); *Blaue Fernen, neue Reisebilder* (1897); *Das bunte Buch. Humoresken* (1898); *Wiener Totentanz* (1899); *Der zerbrochene Franz nebst andern Humoresken* (1900); and *MacEck's sonderbare Reisen* (1901); the biographies, *Zerlino Gabillon* (1894) and *Wilhelm Junker* (1896); and in Hungarian, *Karcsképek* (1876), descriptive of life in Budapest.

HEWES, hûz, JOSEPH (1730-79). A signer of the Declaration of Independence, born at Kingston, N. J. He was educated at Princeton, and then went to Philadelphia, where he engaged in business. About 1760 he settled in Edenton, N. C., and was soon afterwards elected to the Legislative Assembly. In 1774 he was elected to the Continental Congress, of which, with the exception of a brief period when he declined to serve, he continued a member until his death, signing the Declaration of Independence in 1776.

HEWIT, hû'it, AUGUSTINE FRANCIS (1820-97). An American Roman Catholic clergyman, superior of the Paulist Fathers. He was born in Connecticut, the son of Nathaniel Hewit, and was baptized as Nathaniel Augustus. He graduated at Amherst in 1839; entered the Congregational ministry in 1842, but a year later joined the Episcopal Church. In 1846 he was received into the Roman Catholic Church, and in 1850 entered the Redemptorists. He joined Fathers Hecker, Walworth, and other members of that Order in founding, in 1858, the Congregation of Saint Paul the Apostle, and was made professor of theology, philosophy, and Holy Scriptures in their seminary. On the death of Father Hecker he became superior of the Paulists. He edited the *Catholic World* (1869-74), and was a regular contributor to the *American Catholic Quarterly Review*. Among his works are: *Reasons for Submitting to the Catholic Church* (1846); *Problems of the Age* (1868); and *The King's Highway, or the Catholic Church the Way of Salvation* (1874)

He received the degree of D.D. from Amherst College in 1874.

HEWITSON, WILLIAM CHAPMAN (1806-78). An English naturalist, born at Newcastle-upon-Tyne. He practiced land-surveying until a bequest from a deceased relative gave him the means and the leisure to study the natural sciences. He gave great attention first to the Coleoptera and Lepidoptera of Great Britain, then to the study of birds' eggs, and devoted the last years of his life to the diurnal Lepidoptera of the world, gradually forming a large and valuable collection which he left to the natural history section of the British Museum. His library was bequeathed to the Natural History Museum of Newcastle. He contributed many papers on entomology and ornithology to scientific journals, and published: *British Oölogy* (1833-42); *Colored Illustrations of the Eggs of British Birds* (1846); *The Genera of Diurnal Lepidoptera* (1846), with E. Doubleday; *Illustrations of Diurnal Lepidoptera* (1863-78); *Illustrations of New Species of Exotic Butterflies* (1851-76); *Descriptions of One Hundred New Species of Hesperidæ* (1867); *Descriptions of Some New Species of Lycanidæ* (1868); *Equatorial Lepidoptera* (1869-70); *Bolivian Butterflies* (1874).

HEWITT, HŪ'IT, ABRAM STEVENS (1822-1903). An American manufacturer and public man, born at Haverstraw, N. Y., and educated at Columbia College, where he was acting professor of mathematics in 1843. He studied law and was admitted to the bar in 1844, but defective eyesight prevented him from practicing, and he engaged in the manufacture of iron with Edward Cooper, the son of Peter Cooper, and a college classmate, who later became his brother-in-law. In 1862 Mr. Hewitt learned in England the process for making gun-barrel iron, and upon his retirement in 1876 as president of the American Institute of Mining Engineers, he delivered a widely read address upon *A Century of Mining and Metallurgy in the United States*. He served in Congress in 1871-79 and 1881-86, was chairman of the National Democratic Committee which directed the Tilden campaign in 1876, and was a Democratic member of the House committee which, in 1877, conferred with a similar committee from the Senate in regard to the choice of an electoral commission to settle the disputed Presidential election. In 1886 he was elected Mayor of New York City, defeating Henry George and Theodore Roosevelt. He was an earnest worker for good government and labored with much success for municipal reform. After his administration of two years he remained closely identified with municipal movements, and for his services in furthering the rapid-transit plan in New York City he was awarded a gold medal by the New York Chamber of Commerce in 1901. As a public benefactor he gave great aid to numerous institutions, and the present educational prominence of Cooper Union, founded by his father-in-law in New York City, is due largely to his services as trustee and secretary. He was chosen chairman of the trustees of the Carnegie Institution at its organization in 1901.

HEWITT, JOHN NAPOLEON BRINTON (1859—). An American ethnologist and linguist. He was born on the Tuscarora reservation, near Niagara Falls, N. Y.; with some Tuscarora blood in his veins, he learned the language of that

tribe while a child. He was educated in the public schools of Wilson and Lockport, and was successively farmer and journalist till 1879, where he was employed by the department of American ethnology in the Smithsonian Institution, where he devoted himself to Indian ethnology and the language of the Tuscaroras and Iroquois.

HEWLETT, MAURICE HENRY (1861—). An English novelist, born in London, and educated there. He was called to the bar in 1891, and in 1896 was made Keeper of the Land Revenue Records and Enrolments. Though he had written much previously, he gained his reputation in 1898 with a beautiful romance entitled *The Forest Lovers*. His other books include: *Earthwork Out of Tuscany* (1895); *The Masque of Dead Florentines* (1895); *Songs and Meditations* (1897); *Pan and the Young Shepherd* (1898); *Little Novels of Italy* (1899); *Richard Yea-and-Nay* (1900); and *New Canterbury Tales* (1901). In his first romance and in the short stories that followed, Mr. Hewlett has of all his contemporaries best interpreted the more elusive phases of mediæval thought and sentiment. He can write with great charm an historical romance having few or no historical characters, depending upon his truth to life upon his intimate acquaintance with the period he seeks to produce. Nothing of their kind can be better than the short stories called "Madonna of the Peach-Tree" and "The Duchess of Nona," in *Little Novels of Italy*. Some of the stories of the *New Canterbury Tales* are also exquisite in sentiment and execution.

HEXACHORD, hēks'á-kōrd (from Gk. ἕξ, *hex*, six + χορδή, *chorde*, chord). A name given by the ancient Greeks, in their music, to the great sixth. In modern music, hexachord denotes the six diatonic degrees of which Guido formed his scale, better known by the six syllables, ut, re, mi, fa, sol, la, to which the scale was sung. See GAMUT.

HEXACORALLA (Neo-Lat., from Gk. ἕξ, *hex*, six + κοράλλιον, *korallion*, coral). A subclass of zoantharian corals so named by Haeckel because the radiating septal walls of the polyps are arranged in series of six or multiples of six. Recent researches have shown that the Hexacoralla constitute an artificial group. See CORAL.

HEXACTINEL/LIDA (Neo-Lat. nom. pl., from Gk. ἕξ, *hex*, six + ἀκτίς, *aktis*, ray). One of the two orders of siliceous sponges (see SPONGE), comprising those with six-rayed siliceous spicules; they live at considerable depths and include the glass sponge (Euplectella) and other hyaline forms. The other order is Desmospongiae, including "Silicispongiae devoid of six-rayed spicules." The group is an ancient one, present in geological formations from the Ordovician down to present times. Remains attributed to this group occur in Precambrian rocks at Saint John, N. B.

HEXAGON (Lat. *hexagonum*, from Gk. ἑξάγωνον, from ἕξ, *hex*, six, + γωνία, *gōnia*, angle). A geometric figure of six sides. When the sides and angles are respectively equal, the hexagon is said to be regular. If a regular hexagon is inscribed in a circle, each side is equal to the radius of the circle, and by joining the angular points to the centre of the circle six equilateral triangles are formed. Hence the perimeter of the circle may be divided into six equal parts

by laying off in succession six chords, each equal to the radius. See POLYGON.

HEX'AGRAM (from Gk. ἑξαγράμματος, *hexagrammatos*, consisting of six letters, from ἕξ, *hex*, six + γράμμα, *gramma*, letter), **MYSTIC**. In 1639 Pascal, at the age of sixteen, published the proof of the proposition that the three pairs of opposite sides of a hexagon or *hexagramma mysticum*, as he termed it, inscribed in a conic, intersect in three collinear points. This is a fundamental proposition of modern geometry, and its reciprocal is Brianchon's theorem. See CONCURRENCE.

HEX'AH'E'DRON (from Gk. ἕξ, *hex*, six + ἕδρα, *hedra*, base). A solid geometric figure of six faces. A regular hexahedron is called a cube. See CUBE; POLYHEDRON.

HEX'AM, LIZZIE. The heroine of the subplot in Dickens's *Our Mutual Friend*. She educates her ungrateful younger brother, frees her father's name from the stigma of murder, and is finally married to Eugene Wrayburn.

HEXAM'ETER (Lat., from Gk. ἕξ, *hex*, six + μέτρον, *metron*, measure). The name of a verse composed of six feet or measures. The name hexameter usually refers to the dactylic hexameter, the heroic or epic verse of the Greeks and Romans, the best examples of which are Homer's *Odyssey* and *Iliad* or Vergil's *Aeneid*. The last part of every verse must be either a spondee (two long syllables, as in *anno*) or a trochee (a long and a short syllable, as in *qualis*), and the penultimate must be a dactyl (a long and two short syllables, as in *τῆγμῖνῆ*). The rest may be either dactyls or spondees. Thus constructed the verse is called dactylic. Homer offers a regular dactylic hexameter in the verse:

δεινὴ | δὲ κλαγ | γῆ γέυε' | ἀργυρε | οἴω βι | οἴω.

Vergil gives this example:

Tityrē | tū pātū | hāō rēcū | bāns sūb | tēgmīnē | fāgī.

The dactylic hexameter has often been employed in modern poetry, especially in English and in German. Thus, in Longfellow's *Evangeline*, we read these lines:

This is the | forest prim|eval. The | murmuring | pines
and the | hemlocks
Bearded with | moss and with | garments green, indis|tinct
in the | twilight
Stand like | Druids of | old with | voices sad and pro|phetic,
Stand like | harpers | hoar with | beards that | rest on
their | bosoms.

And Klopstock's *Messias* begins with the line:
Sing', un|sterbliche | Seele, der | sündigen | Menschheit Er | lösung.

The last line of the Spenserian stanza consists of an iambic hexameter. Thus:

And often knockt his brest, as one that did repent.

HEX'APLA (Gk. ἑξαπλά, sixfold). The name given to the work compiled by Origen for the purpose of restoring the purity of the Septuagint text of the Bible and bringing it into closer agreement with the original Hebrew. (See BIBLE, heading *Versions*.) It consisted of a six-column text: (a) the Hebrew text; (b) the same text transliterated into Greek characters; and the Greek translations of (c) Aquila; (d) Symmachus; (e) the Septuagint; (f) Theodotion. In case of a number of books, Origen added comparisons with three other Greek translations. The omissions in the Septuagint were generally supplied from Theodotion and marked by an asterisk,

while additions in the Septuagint, as compared with the Hebrew text, were indicated by an obelisk. In consequence, however, of the neglect of these distinguishing signs in manuscripts of the Hexapla, great confusion arose, so that it has been well nigh impossible to recover the original Septuagint text. The Hexapla, as a whole, has long been lost; several editions of those fragments which it has been possible to recover, have been printed; that by the Benedictine Montfaucon (2 vols., Paris, 1713), which retains, so far as it was retained in the manuscripts, the arrangement and even the asterisks and obelisks of Origen, long enjoyed high favor, but is now superseded by the admirable edition of Frederick Field (2 vols., Oxford, 1867-75), with additions and supplements by Pitra in *Analecta Sacra Spicilegio Solesmensi*, vol. iii. (Paris, 1883). See ORIGEN.

HEXAP'ODA (Neo-Lat. nom. pl., from Gk. ἕξάπους, having six feet, from ἕξ, *hex*, six + πούς, *pous*, foot). The name of a class of arthropods, the insects, equivalent to Insecta (q.v.).

HEXATEUCH (from Gk. ἕξ *hex*, six + τεῦχος, *teuchos*, implement, book). A term used to denote the first six books of the Bible, viz.: Genesis, Exodus, Leviticus, Numbers, Deuteronomy, and Joshua. While *Pentateuch* (q.v.) as a title of the five books ascribed to Moses, and *Octateuch* as a designation of these with Joshua, Judges, and Ruth, go back to antiquity, *Hexateuch* is a modern term that has come into vogue chiefly through Kuenen and Wellhausen. It represents a critical view, according to which the Book of Joshua was compiled from the same sources as the Pentateuch, and once formed with it a separate work. This opinion presupposes the conviction that the Pentateuch is not the work of Moses, but a later compilation from sources of different age, which sources also appear in the Book of Joshua. The existence of such sources is thought to be proved by duplicate accounts of the same events and marked differences of representation, which differences do not occur indiscriminately, but appear in well-defined sections and in combination, a given point of view and certain marked characteristics of language and style invariably being found together. The following sources are now generally recognized: (1) A prophetic narrative, itself a combination of two distinct sources, one using Jehovah (Yahweh) as the divine name and hence commonly called J, the other using Elohim as the name of God and hence called E, the combination being designated as JE. It presents a succession of more or less closely connected narratives, beginning with the creation and extending to the conquest of Canaan. (2) A priestly document (P), covering the same period, but distinguished by the combination of narrative with legal ordinances. It is often called the 'Priests' Code,' although the name strictly belongs only to the legislative portions (i.e. certain of the laws in Exodus and those of Leviticus and Numbers). (3) The code of laws known as the 'Book of the Covenant' (C; Ex. xxi-xxiii). (4) Another code, the 'Law of Holiness' (H; Lev. xvii-xxvi.). (5) The Book of Deuteronomy (D; also containing certain codes). The work of combination is commonly referred to a 'redactor' designated by R. These sources are in turn generally considered as composite, or at

least to have undergone successive revisions before being combined into the Hexateuch as we have it. There is difference of opinion concerning the minutiae of the analysis, the age of the documents, and their relation to each other, and the process or processes by which they have reached their final form. But scholars do not now question the existence of such sources; and they are in substantial accord as to what they are in the main, as indicated above. That the Pentateuch contains post-Mosaic material was seen by some writers as early as the second century, such as Ptolemy the Gnostic, and the author of the Clementine Recognitions. It was shrewdly intimated by Ibn Ezra (died 1167). Through Carlstadt (1520), Du Maes (1574), Pereira (1594), Bonfrère (1625), Hobbes (1651), Peyrère (1655), Spinoza (1670), Simon (1678), and Le Clerc (1685), the facts showing a later authorship of the Pentateuch were brought out. In 1753 Astruc published his epoch-making conjectures as to the documents possibly used by Moses in the compilation of Genesis. He had correctly observed that sections in which Elohim was used as the divine name differed in vocabulary, style, and thought from sections in which the name Yahweh was used, and concluded that they belonged to different documents, though some fragments could not be ascribed to either of these. Before the end of the century Eichhorn (1780) and Ilgen (1798) had further developed the documentary theory, the latter distinguishing between two sources using the name Elohim and leaving it an open question whether there was more than one writer using the name Yahweh, while Geddes (1792-1800) had framed a theory based on the existence of unrelated fragments recognized by Astruc. This theory was introduced in Germany by Vater (1802), and found an exponent in De Wette (1806), whose view that the divine names represented not so much different authors as different ages or schools of religious thought was destined to exercise a wider influence. He also suggested that an earlier epic was supplemented in later times. This led to the supplementary theory championed by Ewald and Tuch (1830). While De Wette himself and Gesenius (1815) still regarded the bulk of the legislation in Exodus and Leviticus as earlier than Deuteronomy, which they placed in the Exile, George (1835) and Vatke (1835) were led partly by a careful analysis of customs and ideas, partly by applying Hegelian principles of historic development, to the conviction that this priestly legislation was later than Deuteronomy, thus anticipating the position now generally held. The reaction led by Ewald against a too mechanical construction of history according to philosophical categories, and in the direction of a stronger emphasis upon personality, brought Hexateuchal criticism back to the documentary theory, while delaying for a time the recognition of Israel's historic development divined by the disciples of De Wette and by Reuss. This scholar in 1850 expressed his conviction that the priestly legislation was later than Deuteronomy, but without a definite conception of the Pentateuchal documents. Hupfeld in 1853 carefully defined the main sources of Genesis, making the necessary distinction between the two writers using the name Elohim. A correct characterization of Deuteronomy was given by Riehm (1854). A clear idea of the Priests'

Code could only be obtained after the historical criticism of Reimarus (whose *Wolfenbüttel Fragments* were published by Lessing in 1777) had been resumed by Colenso (1860) and Nöldeke (1869). Before Nöldeke's work had appeared it was still possible for Graf (1866) to give to the legislative portions a post-exilic date, while leaving the closely allied matter in the pre-Deuteronomic period. This error was corrected by Kuenen (1866). The position reached by Reuss, Graf, and Kuenen was ably defended by Wellhausen (1876). His comparison between the regulations as to sanctuaries, festivals, priestly functions, and revenues in the different codes and between these and the historic and prophetic books was especially convincing. Budde (1883) observed that there was an earlier stratum within the Yahwistic documents which did not know of a deluge. The history of Israel was written from the new standpoint by Stade (1886). Dillmann embodied the results of documentary analysis in his learned commentaries on the books of the Hexateuch (1886-92), though he was unwilling to accept the priority of Deuteronomy except as regards some late additions to the Priests' Code. During the last decade most scholars have come to recognize the essentially post-exilic origin of the Priests' Code. The Book of the Covenant is considered the oldest of the codes and perhaps of the sources. It probably dates from early in the ninth century, B.C. It is generally held that the earlier Elohist narratives originated in North Israel before the fall of Samaria in B.C. 722. The Yahwistic narratives show a marked preference for Judean heroes, sanctuaries, and traditions; hence many scholars assign them to the Kingdom of Judah before the reign of Josiah; others think they originated in the northern kingdom, but have been worked over in Judah. It is agreed that both the Elohist and the Yahwistic documents received various additions from time to time. They were combined in the seventh century B.C. The difference of opinion as to their relative age has lost much of its positiveness and importance by the fact that, in case of duplicates, the originality is seen to be sometimes on one side and sometimes on the other, and by the shifting of interest from the writers, who, after all, were chiefly collectors of stories, to the narrators who gave them a form and told them at the sanctuaries. It is especially Gunkel (1902) who has called attention to these aspects of the question. While Steuernagel has not won general recognition for his analysis of the Deuteronomic Code, it is commonly maintained that our present book has gone through at least two redactions, and this scholar has made it probable that the work introduced by Josiah as the law of Israel (see JOSHUA) had itself been compiled from smaller codes embodying decisions by elders, priestly oracles, and acknowledged rules of conduct. The code of Holiness is thought to belong to the time of Ezekiel (c.560 B.C.), and the combination of Deuteronomy and JE probably took place at about the same time. Most uncertainty still prevails in regard to the Priests' Code. While some scholars consider this code as having been introduced by Ezra and afterwards united with Deuteronomy and the earlier code-books (c.400 B.C.), others look upon the Code of Ezra as a compilation containing both the priestly documents and the previously existing ones. The

general opinion is that the Priests' Code grew up in Babylon. Eduard Meyer regards Ezra as its author. But the unity of this book has long been questioned. Popper (1862) showed that Ex. xxxv.-xl. and Lev. viii.-x. are by a different hand from that which wrote Ex. xxv.-xxxi. Klostermann (1877) indicated a separate authorship for the Holiness Code (Lev. xvii.-xxvi.). Baentsch (1901) and Berthelot (1901) agree in regarding Lev. i.-vii. and Lev. xi.-xv. as independent minor codes. Graf (1871) and Maybaum (1880) suggested that the priestly writer was only a supplementer of the earlier text. Klostermann (1893) considered this writer as the editor of the Pentateuch. Schmidt (1902) also thinks that the so-called Priestly Document never existed as a separate code, but consists of a collection of laws, illustrative stories, annotations, and comments added to the already existing books by the priesthood in Jerusalem, chiefly during the Persian period. As the Book of Joshua has been subjected to a thorough priestly redaction, while the books of Judges, Samuel, and Kings have only been edited by men writing in the spirit of Deuteronomy, the question naturally arises why Joshua should have fared differently from the rest of the 'former prophets.' The answer generally given is that the Priestly Document ended with the conquest of Canaan, and that the Book of Joshua was cut off from the once existing Hexateuch. But Eduard Meyer is probably right in holding that there never was any Hexateuch, but that the Law, Joshua, Judges, Samuel, and Kings once formed one great historic work. This seems to have been essentially a Deuteronomistic work. The additions made in priestly circles affected some facts more than others. As the section dealing with events up to the death of Moses came to be regarded as 'the Law,' the rest formed a class by themselves. The division of the Law into five parts probably does not go back to the time when the Book of Joshua formed a part of the great work. The term Hexateuch is therefore likely to disappear, while the observations that led to its use are seen to be accurate, and the theory framed to account for them is recognized as essentially sound.

BIBLIOGRAPHY. Consult the later commentaries on the books of the Hexateuch; the introductions to the Old Testament of Bleek-Wellhausen, Cornill, Driver, König, and Wildeboer; the Hebrew histories of Kittel and Piepenbring, which include discussions of literary sources; the article "Hexateuch" by Cheyne in the *Encyclopædia Biblica*; id.; by Wood, in the *Hastings Dictionary of the Bible*; Westphal, *Les sources du Pentateuch* (Paris, 1888-1892); Kuenen, *The Hexateuch* (Eng. trans., London, 1886); Wellhausen, *Die Composition des Hexateuch* (Berlin, 1889); Robertson Smith, *The Old Testament in the Jewish Church* (2d ed., Edinburgh, 1892); Addis, *Documents of the Hexateuch* (London, 1892-98); Holzinger, *Einleitung in den Hexateuch* (Freiburg, 1893); Klostermann, *Beiträge zur Entstehungs-geschichte des Pentateuchs* (Leipzig, 1894); Battersley-Carpenter, *The Hexateuch* (London, 1900); Kautzsch, *Die heilige Schrift des Alten Testaments* (Freiburg, 1896; Eng. trans., New York, 1899), a clear and concise survey of the sacred literature of the Hebrews. For arguments in support of the traditional view, consult Green, *Moses and the*

Prophets (New York, 1883); id., *The Hebrew Feasts* (ib., 1886); and the series of articles by Harper and Green in *Hebraica*, vols. v.-viii. (1886-92). See the articles upon the books of the Hexateuch; also ELOHIST AND YAHWIST; EZRA; EZEKIEL; PENTATEUCH.

HEXHAM. A market-town in Northumberland, England, on the Tyne, 20 miles west of Newcastle (Map: England, D 2). It has interesting remains of a splendid twelfth-century abbey church, erected on the site of a structure built by Saint Wilfrid about 675, the crypt of which was recently discovered. Hexham is the see of a Roman Catholic diocese. Coal and barytes are mined in the vicinity. The town was the scene of a Lancastrian defeat in 1464. Population, in 1891, 5900; in 1901, 7100. Consult: Raine, *The Priory of Hexham, Its Chroniclers, Endowments, and Annals*, Surtees Society (London, 1864-65); Hewitt, *Hexham and Its Antiquities* (Hexham, 1879).

HEY, HI, JULIUS (1832—). A German singing-teacher, important for his efforts to further Wagner's views on vocal training. He was born at Irmelshausen, and studied music under F. Schmitt and F. Lachner. He was introduced to Wagner by King Louis II., and, in connection with the Munich School of Music, attempted a revolution of the national system of singing. His attempts failed, and on Wagner's death, in 1883, he retired from public to complete his great work on singing, *Deutscher Gesangsunterricht* (1886). Although unsuccessful in his efforts to overturn the existing methods of voice culture, Hey exercised a powerful influence on the contemporary schools of singing.

HEY, WILHELM (1790-1854). A German fabulist. He was born at Leina, was educated at Jena, and successively became pastor at Töttelstädt (1818), Court preacher at Gotha, and superintendent at Ichtershausen. His more famous works, issued anonymously, *Fünfzig Fabeln für Kinder* (1833), and *Noch fünfzig Fabeln* (1837), were followed by poems called *Erzählungen aus dem Leben Jesu* (1848). Consult Hansen, *Wilhelm Hey* (Gotha, 1886).

HEYDEBRAND UND DER LASA, hi'de-bránt unt der lä'zä, TASSILO VON (1818-99). A German authority on chess, born at Potsdam. He was for a time German Ambassador to Copenhagen. The possessor of one of the largest libraries on chess in the world, he wrote the *Handbuch des Schachspiels*, which appeared under the name of Bilguer, and *Leitfaden für Schachspieler* (5th ed. 1880). With Frank he edited the old Portuguese work on the game by Damiano (1857).

HEYDEMANN, hi'de-mán, HEINRICH (1842-89). A German archaeologist. He was born at Greifswald, and studied at Tübingen, Bonn, Greifswald, and Berlin. His specialty, the study of vases, took him to Italy and Greece, and in 1869 he became instructor in archeology at the University of Berlin. Five years afterwards he went to Halle as professor of archeology. Most of his writing was for the journals, *Annali dell' Instituto*, *Archäologische Zeitung*, and *Zeitschrift für bildende Kunst*. Among his other works are: *Ilupersis* (1866); *Griechische Vasenbilder* (1870); *Die Vasensammlungen des Museo Nazionale zu Neapel* (1872); *Terrakotten*

aus dem Museo Nazionale zu Neapel (1882); *Dionysos' Geburt und Kindheit* (1885); *Pariser Antiken* (1887).

HEYDEN, hī'den, ADOLF (1838—). A German architect, born at Krefeld, pupil of Schlüter, in Berlin, where he worked at first independently, but after 1868 was associated with Walter Kyllmann in the erection of important structures there and in other cities of Germany. He also executed a great deal of decorative work, and strongly influenced the development of industrial art by his numerous designs in this branch.

HEYDEN, AUGUST VON (1827-97). A German historical painter, born at Breslau, the son of Friedrich von Heyden, the poet. He studied mining in Breslau and Berlin, and had already become director of the various mining interests of the Duke of Ujest before taking up painting in 1859 at the Berlin Academy under Eduard Holbein. He then entered the studio of Steffeck and finished his studies under Gleyre and Couture in Paris, where his "Saint Barbara, Patron Saint of Miners," was awarded the gold medal in the Salon of 1863. Of several historical and numerous ideal compositions, the more important are: "The Meeting of Luther and Georg von Frundsberg at the Diet of Worms, 1521" (1866, Germanic Museum, Nuremberg); "The French Ambassadors Suing for the Hand of Princess Clémence" (1869); "Morning Festival" (1870, National Gallery, Berlin); "Ride of the Valkyries" (1872, owned by the German Emperor); and "The Rescue of Wittich" (1880, Karlsruhe Gallery). Besides two large mural paintings for the Hall of Assizes at Posen, representing episodes from local history, he executed decorative work in the city hall, the National Gallery, and other public buildings in Berlin, where he was professor of the history of costume from 1882 to 1893. He published: *Blätter für Kostümkunde* (2d ed. 1876-90); *Die Tracht der europäischen Kulturvölker* (1889); the miners' fairy tales, *Aus der Taufe* (1878), and *Die Perlen* (1881), illustrated by himself; *Aus eigenem Rechte der Kunst* (1894); and *Jury und Kunstausstellungen* (1894).

HEYDEN, FRIEDRICH AUGUST VON (1789-1851). A German poet, born at Nerfken, near Heilsberg, in East Prussia, and educated at Königsberg, Berlin, and Göttingen. He wrote some dramas, which are now forgotten, but was successful as a writer of poetic tales, the best known of which are: *Die Gallione* (1825); *Reginald* (1831); *Das Wort der Frau* (1843, 23d ed. 1881); *Der Schuster von Isphan* (1850); and *Die Königsbraut* (1851).

HEYDEN, JAN VAN DER (1637-1712). A Dutch landscape and architectural painter, born at Gorkum. His subjects are the exteriors of buildings, for which Adrian van der Velde, Egdon van der Neer, and Lingelbach supplied the figures. He was a thorough master of perspective and combined an extraordinary degree of finish with great breadth of general treatment and warm, harmonious color. Characteristic works by him are: three street scenes, in the Amsterdam Museum; another street scene in The Hague Gallery; three fine examples in the Louvre (one of them a view of the Amsterdam Town Hall); a street in Cologne, and a view of Cologne

Cathedral in the National Gallery, London. His pictures are always of small dimensions.

HEYDEN, OTTO (1820-97). A German historical and portrait painter, born at Ducherow, Pomerania. He was a pupil of Wach and Kloeber at the Berlin Academy (from 1843), then of Cogniet in Paris (1847-48), and later continued his studies independently in Italy (1850-54). Although the bulk of his work is devoted to the delineation of national history, he also painted religious subjects, genre scenes, and landscapes, besides many portraits. From his sojourn in Italy dates "Job and His Friends" (Stettin Museum), followed after his return by "Foundation of Greifswald University, 1455" (1856, in the Aula of the University); "Duke Boguslav X. on His Pilgrimage to Jerusalem Attacked by Pirates, 1497" (Stettin Museum); "Field Marshal Schwerin in the Battle of Prague" (Royal Palace, Berlin). The Austro-Prussian War, in which he took part in the suite of Crown Prince Frederick William, brought "The Battlefield of Königgrätz" (1868, National Gallery, Berlin), and three episodes in the battle of Sadowa, all owned by the German Emperor, and several reminiscences of the Franco-German War of 1870-71, in which he also accompanied the army. "Emperor William I. Visiting the Wounded," in the National Gallery of Versailles, is especially noteworthy. A visit to the East in 1869 resulted in several genre and landscape scenes from the Nile, and for the Dankeskirche in Berlin he executed the mural paintings of "The Last Supper," "The Adoration of the Magi," and "The Resurrection" (1883).

HEYDRICH, hī'drīk, HEINRICH MORITZ (1825-85). A German poet, born at Dresden and educated at Leipzig and at Berlin. His principal works are: The tragedies, *Tiberius Gracchus*, and *Leonore von Portugal* (1861); the farce *Prinz Lieschen* (1861); and a collection of poems, *Sonnenschein auf dunklem Pfade* (1869).

HEYDT, hit, AUGUST, Freiherr von der (1801-74). A Prussian administrator. He was born at Elberfeld, where with his two brothers he carried on the banking business founded by his father. Elected a Deputy in 1847 and a member of the National Assembly in 1848, in the latter year he became Minister of Trade. Three years afterwards he was made director of the Prussian Bank. His Cabinet post he held through the period of reaction, as his politics were not extreme. In 1862 he became Minister of Finance in the Hohenlohe-Itzenplitz Cabinet, and attempted to please both sides in the growing conflict between Crown and Legislature. He retired on Bismarck's assumption of control later in the year, but was recalled in 1866 to face the question of raising funds for the war with Austria, clashed with the Diet, but held his place until 1869.

HEYDUK, hī'duk, ADOLF (1835—). A Czech poet, born at Richenburg, and educated at Brünn and Prague. Since 1860 he has been professor in the Realschule at Pisek. He wrote a valuable sketch of Slavic and German mythology (1863), and the popular poems, mostly lyric, but many in the epic of idyllic manner: *Lesní květy* (1875); *Dřevorubce* (1882); *Cymbal a husle* (1876); which deals with the Slovaks; *Pisně* (1885);

Zaváté listy (1886); *Na vlnach* (1890); and *Bahatř* (1894).

HEYER, hi'ér, GUSTAV (1826-83). A distinguished German forester, son of Karl Justus Heyer (q.v.). He was born at Giessen, and studied at the University of Giessen, where at the age of twenty-seven he became professor of forestry. In 1868 he was appointed director of the Academy of Forestry at Münden, a post which he resigned in 1878, to accept a professor's chair in the University of Munich. From 1856 to 1878 he edited the *Allgemeine Forst und Jagdzeitung*. Among his many works on forestry may be mentioned: *Lehrbuch der forstlichen Bodenkunde und Klimatologie* (Erlangen, 1856); *Anleitung zur Waldwertrechnung* (Leipzig, 1895; 4th ed. 1892); *Handbuch der forstlichen Statik* (Leipzig, 1871).

HEYER, KARL JUSTUS (1797-1856). A noted German forester. He was born at Bessungen near Darmstadt, studied at Giessen and at Tharand, and at the age of twenty-one took active part in practical forestry, especially in the vicinity of Darmstadt, where he was then lecturing on forestry. In 1835 he was appointed instructor in the school of forestry at the University of Giessen, where, after having been also practical forester for Count Erbach-Fürstenau for four years, commencing in 1831, he became professor of forestry in 1835, a post he held until his death. During his incumbency he made many interesting contributions to the subject of forestry, in recognition of which a monument was erected in his honor at Giessen in 1892. Among his works may be mentioned: *Beiträge zur Forstwissenschaft* (Giessen, 1842 and 1847); *Anleitung zu forststatistischen Untersuchungen* (Giessen, 1846); *Der Waldbau oder die Forstproduktenzucht* (Leipzig, 1854; 4th ed. by Richard Hess, 1891-93).

HEYLLI, á'yé', EDMOND ANTOINE POINSOT, called GEORGES D' (1833—). A French bibliographer and editor. He was born at Nogent-sur-Seine, and in 1877 became chief of the Bureau of the Legion of Honor. He is best known as a collector of anecdotes about celebrities, Louis XV., Countess du Barry, Mme. Emile de Girardin, Marshal Ney, Madame Rachel, and others, and published a number of books, such as *Le scandale au théâtre* (1864); *Dictionnaire des pseudonymes* (1867), of which a third and enlarged edition came out twenty years later. He founded (1876) the *Gazette Anecdotique, Littéraire, Théâtrale*, brought out curious editions of *Manon Lescaut* and of *Paul et Virginie*, and collected a number of interesting documents relating to the War of 1870 and the Commune.

HEYLYN, hi'lin, PETER (1600-62). A Church of England divine. He was born at Burford, in Oxfordshire, November 29, 1600. He studied at Oxford, and through the interest of Laud, in whose theory of Church and King he devoutly believed, was appointed chaplain-in-ordinary to King Charles in 1630. Subsequently he held a variety of livings, but was deprived of them during the period of the Commonwealth. In 1651 he became blind. At the Restoration he was made subdean of Westminster as a reward for his literary services to the royal cause. He died in London, May 8, 1662. Heylyn was a very voluminous controversial writer, but his works are of no value now, except as illustrative of the age in which he lived and the ecclesiastical party to

which he belonged. For his life, consult Robertson in his edition of Heylyn's *Ecclesia Restaurata* (London, 1840).

HEYNE, hi'ne, CHRISTIAN GOTTLÖB (1729-1812). A German classical scholar, born at Chemnitz, in Upper Saxony, September 25, 1729. His father was a poor weaver. The pastor of Chemnitz, himself very poor, had Heyne educated at a school in the suburbs, and afterwards sent him to the University of Leipzig, where he suffered from extreme poverty. In 1753 he obtained a situation as copyist in the Brühl Library at Dresden. While in this office, he prepared his edition of *Tibullus*, which appeared in 1755, and roused the admiration of Ruhnken of Leyden. In 1756, unfortunately for Heyne, the Seven Years' War broke out. Frederick the Great marched against Dresden, and burned, among other things, the Brühl Library, but not before Heyne had edited, from a *codex* there, the *Enchiridion* of Epictetus. For some time he led a precarious life, being often without employment and without bread. In 1761 he married, and supported himself as best he could by writing for the booksellers; and in 1763 he was appointed professor of rhetoric at Göttingen on the recommendation of Ruhnken. This closed his period of misfortune. The rest of his long life was spent in comfort and professional activity. He died July 14, 1812. The principal works of Heyne, besides those mentioned, are his editions of Vergil (1767, 6th ed. 1803); Pindar (1774); Apollodorus (1787); Pliny (1790); Conon and Parthenius (1798); and Homer (8 vols., 1892; 2d ed. 1804). He published many translations, besides some ten or twelve volumes of minor works, of which six volumes were published separately under the title of *Opuscula Academica* (Göttingen, 1785-1812); and, finally, a great many reviews of books in the *Göttinger Gelehrte Anzeigen*, of which he was editor from 1770. In addition to this work, he had a seminar for the advanced study of philology and classical antiquity, from which he sent forth, in the course of his life, no fewer than 135 professors. Consult the life of Heyne by his son-in-law, Ludwig Heeren (Göttingen, 1813), and Carlyle's essay, *On the Life of Heyne*.

HEYNE, MORITZ (1837—). A Germanic philologist. He was born at Weissenfels, studied at Halle, and became docent there in 1864, and professor in 1869. In the following year he went to Basel as professor of German language and literature, and in 1883 was called to a similar chair at Göttingen. His most widely known work is that in the continuation of Grimm's *Deutsches Wörterbuch* (in which he edited the letter H, I, J, L, M, R, and part of S) and his own *Deutsche Wörterbuch* (1890-95). More important possibly is his work in phonetics and old Germanic literature: *Kurze Laut- und Flexionslehre der altgermanischen Dialekte* (3d ed. 1880); *Altsächsische und altniederfränkische Grammatik* (1873); editions of Beowulf (6th ed. 1898; also a metrical translation of Beowulf, 1898); of Heliand (3d ed. 1883); and *Altdeutsch-lateinische Spielmannsgedichte des zehnten Jahrhunderts* (1900); and in antiquities: *Kunst im Hause* (1881-83) and *Fünf Bücher deutscher Hausaltertümer* (1899-1901, the first two parts).

HEYNLIN, A'lin', JOHANNES (c.1425-96). A prominent theologian and humanist of the fifteenth century.

teenth century, variously called a *Lapide* and *Lapidanus*. He studied at Leipzig, at Basel, and at Paris, where, in 1468, he was made rector of the university, and in the same year, and in 1470, prior of the Sorbonne. After teaching at Basel and the new University of Tübingen (1478), he was preacher in the cathedral of the former city (1484), but retired to a cloister three years afterwards. With Fichet he introduced the art of printing in Paris (1469). Consult Fischer, *Johannes Heynlin, genannt a Lapide* (Basel, 1851).

HEYNRICHS, hī'n'riks, J. N. The pseudonym of the German author and reformer Jenny Hirsch (q.v.).

HEYSE, hī'ze, JOHANN CHRISTIAN AUGUST (1764-1829). A German grammarian and lexicographer, born at Nordhausen, and educated at Göttingen. He taught at Oldenburg, in his native town, and in Magdeburg. His writings, practical rather than scholarly in nature, are: *Allgemeines Fremdwörterbuch* (17th ed. 1892); *Deutsche Schulgrammatik* (26th ed., by Lyon, 1900); and *Leitfaden zum Unterricht in der deutschen Sprache* (25th ed. 1885).

HEYSE, KARL WILHELM LUDWIG (1797-1855). A German philologist, son of Johann Christian August Heyse, born at Oldenburg. In 1816 he began his studies of philology and linguistics under Böckh and Bopp at Berlin, where he became professor in 1829. His work at first was mainly in Latin and Greek, but after his father's death he took up Germanics as well, and revised many of his father's works, especially the *Allgemeines Fremdwörterbuch*. His own works are: *Handwörterbuch der deutschen Sprache* (1833-49), which is both practical and scholarly; *Ausführliches Lehrbuch der deutschen Sprache* (1838-49), popularizing the results of historical and comparative linguistics; and *System der Sprachwissenschaft*, his most important work, edited by Steinthal (1856).

HEYSE, PAUL (1830-). A distinguished German author, the son of Karl Wilhelm Ludwig Heyse. He was born in Berlin, and educated there and at Bonn. A classical training was ripened by travel, during which he pursued in the libraries of Switzerland and Italy the philological researches, a taste for which was inherited. Even earlier, however, he had made his first dramatic essay on a subject which the romantic revival had made very popular, *Francesca da Rimini* (1850). A little later appeared his epics, *Die Brüder* (Berlin, 1852) and *Urica* (Berlin, 1851), which, when they were republished in 1854, made him so conspicuous that King Maximilian of Bavaria invited him to make Munich his home. Here he resided for many years with frequent visits to Italy, whose culture influenced all his writing deeply. In later life he spent most of his time in Italy on the banks of Lake Garda. The sum of Heyse's many and varied productions has made him a dominant figure among German men of letters. His prose fiction has been chiefly in the shape of short stories, for which he came to hold a high position in German letters. These tales are models of their kind, masterpieces in miniature, cameos in which every line leaves an impression. The best collection of them is *Das Buch der Freundschaft* (1883); the most fa-

mous single example is *L'Arrabbiata*. He also produced a few longer novels, tinged with radical thought on social and religious questions, especially: *Kinder der Welt* (1873); *Im Paradiese* (1875); and *Ueber allen Gipfeln* (1895), pessimistic in tendency, but fresh in style and gracefully light in movement. A large number of lyric and epic poems testify to a ripe culture, a warm imagination, and a suavity of expression which at times sacrifices strength to sweetness. The best-known of the longer poems is the epic *Thekla* (1858). In his dramas he maintained a high level, although he has not in any of them attained the highest dramatic rank. *Die Sabinerinnen* (1859), *Ludwig der Bayer* (1862), and *Hans Lange* (1866) are noteworthy among his earlier plays; and in the closing years of the century he produced some striking dramas, such as *Das verschleierte Bild von Sais*, *Der Heilige*, and *Maria von Magdala*, the last of which had a pronounced American success in 1902. At the same time he studied Italian literature and published a number of translations from the Italian. His *Complete Works* were first published in 1871, but large additions have since brought the number up to some forty volumes. His reminiscences, *Jugenderinnerungen und Bekenntnisse*, appeared in 1900. Consult: Brandes, *Moderne Geister* (Frankfort, 1887); Kraus, *Paul Heyses Novellen und Romane* (ib., 1888).

HEYWARD, THOMAS, JR. (1746-1809). An American jurist, one of the signers of the Declaration of Independence. He was born on the estate of his father, a wealthy planter of Saint Luke's, South Carolina, and was educated in his native parish and in London, where he went to finish his law studies. His observations there and in other parts of Europe sent him home with strong republican ideas. From 1776 to 1798 he represented North Carolina in the Continental Congress, was a judge of the civil and criminal court in his native province from 1780 to 1798; was a captain of artillery in the war, and became a prisoner of the British at the surrender of Charleston. He was a member of the State convention for framing a constitution in 1790, and retired into private life the following year.

HEYWOOD. A town in Lancashire, England, on the Roach, 9 miles north of Manchester (Map: England, D 3). It is an important centre of the cotton manufacture, has extensive coal-mines, iron and brass foundries, boiler-making, railway plant, and chemical works. It possesses handsome churches and other fine buildings. The municipality provides water, gas, markets, baths, fire brigade, technical school, free library, hospital, cemeteries, and owns a spacious park and recreation ground. Its incorporation dates from 1881. Population, in 1891, 23,300; in 1901, 25,460.

HEYWOOD, JOHN (c.1497-c.1577). An English author, sometimes called 'The Old Epigrammatist.' The place of his birth has not been definitely ascertained, but it was probably London or North Mimms, Hertfordshire. At an early age he came to Court, introduced, according to some traditions, by Sir Thomas More; and the "Book of Payments" of Henry VIII. shows him to have been in the royal service in 1515. He found great favor at the Courts of Edward VI. and Mary, where his quickness at repartee

and his witty imagination, besides the literary flavor of his writings, made him the superior intellectually of the usual Court jester. Shortly after the accession of Queen Elizabeth, he withdrew to Malines, Belgium. Of his literary remains the first chronologically were five *Interludes*, printed between 1533 and 1569. There are frequent plagiarisms from Chaucer, but they contain some original humor and vigorous satire; and the semi-dramatic form in which they are cast places them among the precursors of English comedy. A more ambitious but less successful production was *The Spider and the Fly*, which was printed in 1556. Written partly as a compliment to Queen Mary for her theological attitude, it represented Roman Catholics as the flies and Protestants as the spiders, with the Queen as the housemaid wielding her destroying broom. His best-known and most popular writings were the *Epigrammes*, the first extant edition of which bears the date 1562. The *Interludes* included: *A mery Play between the Pardoner and the Frere, the Curate and Neybour Pratte* (1533); *A mery Play between Johan the Husbunde, Tyb the Wife, and Syr Han the Priest* (1533); *The Four P's* (1569); *The Play of the Wether* (1533); and *The Play of Love*. His other works besides those mentioned were *A Dialogue on Wit and Folly*, and several ballads. Consult: Halliwell, *Dictionary of Old English Plays* (London, 1860); Sharman's Introduction to an edition of the *Proverbs* (London, 1874); and Symond, *Shakspeare's Predecessors in the English Drama* (London, 1884).

HEYWOOD, THOMAS (c.1575-c.1650). A celebrated English dramatist and general writer, born in Lincolnshire. He seems to have studied at Cambridge. By 1596 he was apparently writing for the stage, and two years later he was engaged by Philip Henslowe as an actor. Heywood was a most prolific writer. In 1633 he claimed to have had "an entire hand, or at the least a main finger," in 220 plays. His career was not yet ended. Of these plays only twenty-four are extant. The best of them is a domestic drama entitled *A Woman Killed with Kindness*, performed in 1603. This play brings us close to the heart of English middle-class life. Somewhat similar to it is *The English Traveller* (1633). Representative of his work in low life is *The Wise Woman of Hogsdon* (1638). There are three admirable comedies of adventure: *The Captives*, *The Fair Maid of the West*, and *Fortune by Land and Sea*. Besides his 220 plays, Heywood wrote many pageants, triumphs, elegies, a long heroic poem entitled *Troia Britannica*, a universal chronicle history (1609); *An Apology for Actors* (1612); reprinted for the Shakespearean Society, 1841); *Nine Books of Various History Concerning Women* (1624); *The Hierarchy of the Blessed Angels* (1635); and much else. He also made translations from Sallust, Lucian, Erasmus, and others. He died about 1650. Consult: *Dramatic Works*, ed. by Pearson (6 vols., London, 1874); *Thomas Heywood*, a selection from his plays, ed. by J. A. Symonds and A. W. Verity, "Mermaid Series" (London, 1888); *Old English Plays*, ed. by Bullen, vol. iv. (London, 1885); and Ward, *History of English Dramatic Literature* (New York, 1899).

HEZEKIAH (Heb. *Khizkiyāh*, Yahweh is my strength). King of Judah, son of Ahaz.

His reign may be approximately fixed as extending from B.C. 720 to 691. He ascended the throne at an early age—probably less than twenty—and appears to have been early influenced by the discourses of the prophet Isaiah, through whom he was induced to remove from the cult at Jerusalem certain practices, such as the worship of the brazen serpent (II. Kings xviii. 3, 4). We possess but little authentic information about Hezekiah's reign. The most important event was an invasion of Palestine by Sennacherib (q.v.), King of Assyria, c.701 B.C. With the help of the cuneiform annals of Sennacherib we can obtain a tolerably clear idea of this campaign, which was undertaken to offset the efforts of Babylonian and Chaldean chieftains like Merodach-Baladan (cf. II. Kings xx. 12-19) to make alliances with nations to the west whom Assyria claimed as vassals. Hezekiah and other rulers, such as the chiefs of the Philistines, of Edom and Moab, had actually promised Merodach-Baladan aid in making Babylon independent of Assyria. Sennacherib, after overthrowing Merodach-Baladan, proceeds to the west to wreak vengeance on Hezekiah and his allies. He succeeds in quelling the uprising, and removes those who had shown themselves faithless to him. Sennacherib advances within a few miles of Jerusalem, but after exacting a heavy tribute, withdraws without capturing the Judean capital (II. Kings xviii. 13; xix. 36). This deliverance is said to be due to the 'angel of the Lord,' who 'smites' the Assyrian camp (II. Kings xix. 35). The traditional interpretation of the passage makes it refer to a pestilence. The more probable reason for the withdrawal was the receipt of news from some troublesome Babylonian province which obliged Sennacherib to return to his land, content with having once more made his authority recognized in the west. It is hardly likely that after this Hezekiah ventured on any campaigns, so that the account (II. Kings xviii. 8) of a successful conflict with the Philistines is probably to be placed at the beginning of his reign. From certain notices (e.g. Proverbs xxv.) it would appear that in his days considerable literary activity prevailed, though it is highly improbable that the King himself wrote anything. The song in Isaiah xxxviii., ascribed to the King as having been composed by him after a severe illness, belongs to the post-exilic period, on the evidence of the language and contents, and the entire story of this illness is probably a bit of legendary lore that has found its way into an historical narrative because it served to illustrate the view taken by a later age of Hezekiah, who had become idealized like David and Solomon into the model of a God-fearing, pious Israelite after the pattern of the Yahweh purists.

H. H. The initials denoting the authorship of Helen Hunt (q.v.), *née* Fiske.

HIAWATHA, hī'ā-wā'thā. A city and the county-seat of Brown County, Kan., 40 miles northwest of Atchison; on the Missouri Pacific and the Saint Joseph and Grand Island railroads (Map: Kansas, G 2). It has Hiawatha Academy and the Morrill Public Library. The city is chiefly important as the commercial centre of a fertile agricultural country, and has lumber-yards, grain-elevators, a flour-mill, foundries, machine-shops, etc. There are municipal water-works and two electric-light plants, one of which

is owned by the city. Population, in 1890, 2486; in 1900, 2829.

HIAWATHA, hī'a-wā'tā or -thā. A narrative poem by Henry Wadsworth Longfellow, founded on an Indian legend preserved in Schoolcraft's *Alcic Researches, and History, Condition, and Prospects of the Indian Tribes of the United States*. However, the miraculously born hero is declared to be an Iroquois and not an Ojibway, according to other sources. Longfellow adopted the metre of the Finnish epic *Kalevala*, and was accused of taking the entire plan from that poem. But the incidents common to both show merely the recurrence of early myths.

HIBBERT LECTURES, THE. A course of lectures given annually in London, discussing some unsettled problem in religion or theology. The lectures are supported from a fund left by Robert Hibbert, a Jamaica merchant, who died in 1849, leaving his property in trust for the promotion of scholarship, particularly among Unitarians. By a wise provision the trustees were empowered to revise the terms of administration from time to time, and in the exercise of this power they established the lectures in 1878. The first series was delivered in that year by F. Max Müller on "The Origin and Growth of Religion," and succeeding series have been given by Kuenen, Beard, Reville, Page Renouf, Renan, Rhys Davids, Pfeleiderer, Rhys, Sayce, Hatch, and others.

HIBERNATION (Fr. *hibernation*, *hibernation*, from Lat. *hibernare*, to hibernate, from *hibernus*, winter, from *hiems*, winter, Gk. *χίμα*, *chiōn*, Skt. *hima*, Av. *zima*, winter), AND **ESTIVATION** (Fr. *estivation*, from Lat. *æstivare*, to pass the summer, from *æstivus*, pertaining to the summer, from *æstas*, summer; connected with Lat. *æstus*, heat, Gk. *αἶθερ*, *aithēin*, to burn, AS. *ād*, funeral pile, Skt. *idh*, to kindle). A physiological state of dormant vitality in which many animals in northern countries are able to pass the winter. It should not be confused with the torpor of freezing, which is a pathological and usually a fatal condition. The immediate cause of hibernation is not cold, for many animals go into their winter sleep some time before winter is on. Nor is it the lack of food, for the great bat begins sometimes to hibernate as early as the end of July, at a time when its insect food is still abundant. Moreover, the winter season is not the only one passed by animals in this kind of torpor. In dry countries, at the approach of the dry season, when moisture, herbage, and consequently animal food will be scarce, many kinds of animals are enabled to survive until the time of plenty again by going into a prolonged stupor, which seems not to be very different in kind or duration from the hibernation of northern forms. The Germans have for these two conditions the words 'Winterschlaf' (winter sleep) and 'Sommerschlaf' (summer sleep). The latter state is known in English as 'estivation.'

DORMANT VITALITY, or 'rigor,' is a term used for an apparent suspension of vital activity, distinguished from death by the possibility of resuscitation. Two general classes may be distinguished: (1) Dormant vitality induced by external conditions; and (2) dormant vitality determined by internal conditions. The first class is of three kinds: (a) *Desiccation rigor*. There are certain animals, notably rotifers, tar-

trigrades, and nematodes, which can be dried in a vacuum until they become immobile, and can remain thus immobile for days or even months until, on the addition of water, they become active again. The organism has probably not lost all of its water, but has passed into an encysted condition; it is not dead, but its metabolism is greatly reduced. Even snails and other animals which can protect their internal tissues from complete loss of water may live for months without showing external activity. (b) *Dark rigor* is induced in green plants and even in certain fungi by their removal for several days from the light. The sensitive plant treated thus becomes immobile. Light is essential to movement. The reverse, or 'light rigor,' has been seen in bacteria. (c) *Heat rigor*.—The sensitive plant, muscels, and various other forms of protoplasm become quiescent at a temperature a few degrees below that at which they are killed by heat. The rigor seems to be due to the beginning of the death changes. Cold rigor occurs in simple protoplasm as it approaches the zero (centigrade) temperature. The chlorophyll granules of *Vallisneria* move only about one mm. per minute at 1° C., and not at all at 0°; the rotation of *Nitella* ceases at 0° C.; in *Tradescantia* hairs, movement is wholly arrested on freezing the cell-cap. Even in seeds and bacteria, which are not killed by the lowest temperatures, all vital activities have probably ceased at 0°, for De Candolle found that in only one species out of ten could he get a seed kept at 0° to germinate, and even then germination was so retarded that it took from 11 to 17 days as opposed to 4 days at 5.7°. Likewise, bacteria do not multiply below 5° to 10°. Among animals Kuhne found *Amœba* cooled to near 0° almost motionless. Purkinje and Valentin first noticed that the ciliated epithelium of the frog ceased its movements at 0°. Muscles of the frog were found by Kuhne to become at -3° to -7° a solid lump, which did not, however, wholly lack irritability. The evidence of all these cases shows that activity nearly ceases in protoplasm at or near 0° C.

Determined by internal conditions, seeds, resting spores, cysts, gemmules of sponges, and statoblasts of Bryozoa are all conditions of natural dormant vitality. The period of dormancy is not unlimited, however, the alleged germination of seeds many hundred years old not being confirmed. This indicates that even with a slow rate of living the food material eventually becomes exhausted.

Belief in human dormancy rests largely upon a certain collection of cases observed in India and published by James Braid.

PHENOMENA OF HIBERNATION AND ESTIVATION.

The physiological facts mentioned above must be considered in studying the phenomena of habitual animal dormancy under conditions of winter, seasons of drought, and so on. The respiration in winter sleep is diminished much more than in ordinary sleep, and consequently the heart-beat is very slow. The digestive organs are practically inactive. Many animals void almost no feces during this period, and the anal opening of those bears that hibernate is closed by a resinous plug known to hunters as the 'seal.' The temperature of the body is lowered to that or nearly that of the air. The voluntary control of the muscles is lost, but there is an increased muscular irritability, an unusual sensitiveness to external

stimuli. The slightest touch possible, even on the end of a quill of a hibernating porcupine, will result in deep breathing and perhaps muscular movements. There can be no sharp line drawn between normal sleep and the lethargy of hibernation, for there are all gradations in the depth and duration of this lethargy, beginning at the one end of the scale with what might, perhaps, be simply termed sleep, and ending with animals that do not once wake up from the hibernating stupor until the time for its final termination has come.

Nearly all of the burrowing rodents are hibernators, especially, in the United States, the woodchuck. A number of animals indulge in alternate periods of waking and hibernation. The English squirrel, the hedgehog, and the mourning-cloak butterfly are frequently awake on warm days in winter. Grain-storing animals spend a great deal of their time in sleep, but when hungry they awake to partake of their food-supply, or go outside in search of fresh food if weather permits. In the case of the northern brown, black, and polar bears only the female hibernates in the strict sense of the word, probably because she must remain quiet until her young is born, often before the snow releases her. The males sleep a great deal, but they go out now and then in search of food. A number of animals of wide range of distribution hibernate in the northern but not in the southernmost parts of their range. Such is the case with the American prairie-dogs and the skunk. In the centre of their range they are awake and active during warm winters or warm days in winter. Thus there are all degrees of torpidity, and likewise gradations between ordinary periodical sleep and hibernating dormancy. Although we cannot understand why animals of one species should be active in winter while those of a nearly related species should hibernate, as is the case among mice, nevertheless, it is probably of advantage in the struggle for existence, since it enables animals to remain in certain geographical areas in which they could not possibly survive without long and perilous migrations twice each year. This is especially true of the small vegetable-eating animals of northern plains.

Mammals usually hibernate in hollow logs, in trees, in caverns, or even in burrows in the ground. Usually their winter homes are made additionally fitting by a bed or nest of dry grass and autumn leaves. Most of the hibernators are entirely or in part vegetable feeders. All the grain-storing species are active all winter, or else are intermittent hibernators.

Reptiles, amphibians, and some fishes hibernate. The land reptiles and amphibians bury themselves in the ground below frost-line and there remain until spring. Aquatic species, such as the water-turtles, burrow in the mud at the bottom of streams. A few fishes, such as carp, chub, minnows, and eels, likewise lie throughout the coldest part of the winter in the mud and débris at the bottom of the water. Various snakes crawl into crevices between rocks, or into hollows beneath stumps, or take possession of gopher-burrows and the like, or even burrow themselves into loose soil, and pass the winter often wrapped in a tangled mass composed of scores of individuals of the same species. The temperature of these sinks to that of the water or mud in which they lie; and those of a northern habitat

can endure a stress of cold to which individuals of the same species living in a warmer region will succumb.

Among the invertebrates, land-snails hibernate within their closed shells. They also afford the most conspicuous American example of estivation. When the dry, hot weather of midsummer approaches many species secrete two or three diaphragms across the aperture of their shells, and behind these remain as torpid as in winter until tempted out by a prolonged shower, until the autumn coolness and dampness arrive. Slugs bury themselves in the ground, and the bivalve mollusks in the mud at the bottom of streams and ponds. A great many of the other land invertebrates survive as eggs or spores which remain inactive during the winter, and begin to develop on the return of spring. Spiders, more or less active, hide under fallen leaves or bark, and in other secluded places. Insects pass the winter in all stages of development. A number of beetles, flies, bugs, and a few butterflies winter as adults in northern climates. A large number of butterflies and moths pass the winter as pupæ, frequently protected by a silken cocoon. Several kinds of caterpillars are able to survive the winter either in spun nets or in sheltered hollows or chinks. A vast host of insects survive as eggs, whose development is delayed until spring.

Upon waking from their stupor the heat of the body of hibernating animals very quickly increases to the normal. Hunger is probably the chief agent that calls such animals to activity again. The most profound sleepers can scarcely be kept awake when brought into a warm room and stimulated. Partial hibernators, after a hearty meal in winter, resume their torpor again. The air under a bell jar, in which a hibernating dormouse is put, remains unchanged. Hall kept a hibernating bat under water fifteen minutes without fatal effect, while a wakened bat will succumb after three minutes. Carbon dioxide, which is speedily fatal to active animals, has no effect on a torpid mammal. Hibernators lose their weight in winter to the extent of 30 to 40 per cent. This loss of weight indicates that, notwithstanding their great diminution, the vital processes are going on in the hibernating animal all the time.

Consult: Hall, "Hibernation." in Todd, *Cyclopædia of Anatomy and Physiology*, vol. ii. (London, 1838); Browne, *Animal Torpidity and Hibernation* (Philadelphia, 1847); Semper, *Animal Life* (New York, 1881); Gadow, Beddard, Sharp, and other writers in the *Cambridge Natural History* (London, 1895-1903).

HIBERNIA, IVERNA, JUVERNA, or IERNE (probably connected with Welsh *Yucrdon*, MBret. *Yucrdon*, Ir. *Erin*, *Ilerin*, Ireland, akin to Gk. *Περα*, *Pieria*, name of a district in Greece, Skt. *pivan*, fat; cf. also MWelsh *Ewyr-donic*, Irish). Names by which Ireland is designated in the classical writers. Aristotle speaks of two islands situated in the ocean beyond the Pillars of Hercules, called British, Albion, and *Ierne*, beyond the Celts. Both Diodorus Siculus and Strabo report the natives to be addicted to cannibalism, but without proof. Pomponius Mela declares the herbage to be so luxuriant that the cattle who feed on it sometimes burst. Pliny repeats this statement, and adds that the Hibernian mother trains her child from the very

first to eat food from the point of a sword. The most important of all classical authorities on Hibernia is Ptolemy, who describes the country, and gives the names of the principal rivers, promontories, seaports, and inland towns. The island was never conquered by the Romans. See IRELAND.

HIBERNIANS, ANCIENT ORDER OF. A prominent Catholic Irish organization. The society was instituted originally for the protection of the Catholic priesthood and religion in Ireland, but it has now as its main object 'the advancement of the principles of Irish nationality.' According to some authorities the order was first instituted in 1642, following the great uprising in the north; according to others, in 1651, when Cromwell had proclaimed nearly the whole native population outlawed, and had put a price upon the head of every priest and made it death to attend a Catholic service. The founder was Rory Og O'Moo, and the society was at first known as The Defenders. On the establishment of Catholic emancipation, in 1829, the society was reorganized under its present name as a beneficial and nationalist organization. It was soon afterwards extended to England and Scotland and was introduced into the United States in 1836. Its membership is restricted to persons of Irish birth or descent and of Catholic faith. Military drill is a prominent feature in some of the branches. The order is an active supporter of the present Gaelic movement (see GAELIC LEAGUE), having endowed a Celtic chair at the Catholic University of America, and contributed generously toward the support of Gaelic organizers in Ireland. The latest report shows that, including the ladies' auxiliary, the American branch had a membership of 150,000, and disbursed annually nearly \$1,000,000 in benefits. This branch is closely affiliated with the parent body in Ireland, as well as with those in England, Scotland, Australia, and other parts of the world.

HIBERNICISM. A term used to denote an Irish bull, i. e. a sentence expressing ideas that a moment's thought would show to be incompatible and absurd. A famous bull was made, it is said, by Sir Richard Steele when inviting a certain lord to visit him: "If, sir, you ever come within a mile of my house, I trust you will stop." Curran also used to relate a fine specimen: He started one day to attend a levee at the castle in Dublin. There was a long line of carriages, and he was suddenly startled by the pole of the carriage behind crashing into the back of his own carriage. He hastily called to his coachman to stop, saying, "The pole of the carriage in the rear is driven into ours." "And, sure, it's all right again, thin, your honor," cried Pat, "for I've just drove me pole into the carriage in front." Richard and Maria Edgeworth wrote a learned treatise entitled, *An Essay on Irish Bulls* (1802); and Maria Edgeworth's *Castle Rackrent* (1800) is full of the most delightful blunders in speech.

HIBISCUS (Lat., from Gk. *ἵβισκος*, *hibiskos*, mallow). A genus of plants of the natural order Malvaceæ, the numerous species of which are shrubs or trees, but mostly large herbaceous annuals and perennials, natives of warm climates. The flowers of many are very beautiful. *Hibiscus syriacus*, a native of Syria and Carniola, has long been in cultivation as an ornamental shrub

and has proved hardy in Great Britain and parts of the United States. Some are favorite hot-house plants. The characteristic mucilaginous and fibrous properties of the Malvaceæ are very strongly developed in this genus. *Hibiscus abelmoschus* so abounds in mucilage that it is much used in the northwest of India for clarifying sugar. The unripe fruit of *Hibiscus esculentus*, an annual plant with a soft herbaceous stem three to five feet high, crenate leaves, axillary sulphur-colored flowers, and pyramidal, somewhat pod-like capsules, is in general use both in the East and West Indies for thickening soups, and otherwise as an article of food. It is called okra, gumbo, gombo, gobbo, and ochro in the West Indies and Southern United States; bandikai, ram-turai, and denroos in different parts of India; and bammia in the west of Africa. The bark of *Hibiscus tiliaceus*, a tree twenty feet high with a very thick bole, abounds

HIBISCUS SYRIACUS.

in mucilage and is chewed by the natives of South Sea Islands when food is scarce. This tree, the bola of Bengal, and the moho, majagua, or mohant of the West Indies is one of the most abundant trees of the South Sea Islands; and the wood, which is light, tough, and durable, is much used for many purposes. The very porous bark is made into cordage and matting in various tropical countries. Many other species yield fibres, some of them coarse, others fine and beautiful, which are used in different countries; but the most important in this respect is *Hibiscus cannabinus*, the Ambaree hemp, and Deccan hemp of Western India, called palungoo at Madras, and mesta pat in Bengal; a plant very generally cultivated in all parts of India, although nowhere to a great extent. It is an annual herb with a straight, unbranched stem, three to seven feet high. The fibre is not so strong as hemp, and is useful only for ropes and coarse fabrics. It has been suggested that many species of *Hibiscus* might be found valuable for the manufacture of paper. *Hibiscus sabdariffa*, Jamaica sorrel or roselle, is very generally cultivated in warm countries, on account of its calyx, which, as the fruit ripens, becomes fleshy, and acquires a very pleasant acidity. It is much used for making tarts and jelly, and a decoction of it, sweetened and fermented, affords a refreshing beverage. *Hibiscus abelmoschus*, sometimes called muskmallow, another plant common in widely scattered tropical countries, is cultivated for its seeds, called ambrette, or *graines d'ambrette*,

which have a fragrance intermediate between musk and amber, and which are much used by perfumers. In Egypt and Arabia, these seeds are mixed with coffee, and stimulant and stomachic qualities are ascribed to them. The petals of *Hibiscus rosa-sinensis* are astringent, and are used by the Chinese to blacken their eyebrows and their shoes. A number of species of *Hibiscus* are cultivated as ornamental plants in the United States. There are also several indigenous species.

HICCOUGH, hik'küp, or **HICCUP**. Sudden short, convulsive inspirations, attended with a peculiar sound produced in the larynx by the inrush of air. The movements concerned in the production of hiccough are a spasmodic contraction of the diaphragm, and a certain degree of constriction in the glottis, which occasions the peculiar sound, and limits the amount of air inspired. These convulsive inspirations commonly succeed each other at intervals of a few seconds. The paroxysm may last only a few minutes; or may extend to hours or days, in which case it may be dangerous to life, from the exhaustion which it causes. Over-distention of the stomach, the ingestion of cold water, excessive acidity, etc., will provoke it. Certain diseases are frequently attended by hiccough. It occurs occasionally after severe hemorrhage, in debilitating diseases, pneumonia, peritonitis, appendicitis, etc., in which cases it is a grave symptom.

When the attack is slight it may often be stopped by making a very full inspiration, and then holding the breath as long as possible, the diaphragm being thus held in a state of voluntary contraction. A drink of water gives relief in ordinary cases. In more obstinate cases, aromatic spirit of ammonia, camphor, musk, etc., may be resorted to. When hiccough continues for an hour or more and the exhaustion is great, an anæsthetic may be necessary.

HICH'BORN, PHILIP (1839—). An American naval officer. He was born in Charlestown, Mass., studied in the Boston High School, was a shipwright apprentice in the Boston Navy-Yard, and, having gone to California in 1860, became master shipwright of the Mare Island Navy-Yard (1862). He entered the Navy in 1869, with rank of lieutenant, and served as assistant naval constructor until 1875, when he was commissioned full constructor. Four years afterwards Hichborn was sent to Europe to report on foreign dock-yards, and his book on this subject is a standard text-book. Having served on the Board of Inspection and Surgery, in 1881 he was appointed to the Naval Advisory Board. In that capacity and as chief constructor (appointed 1893 and 1897) he was prominently connected with the construction of the new navy. He was retired 1901, with the grade of rear-admiral.

HICH'ENS, ROBERT SMYTHE (1864—). An English novelist, born at Speldhurst, in Kent. He was educated at Clifton College, the Royal College of Music, and the London School of Journalism, and became a member of the staff of the *London World*. He began early to write musical lyrics and stories. His *Green Carnation* (1894), published anonymously and attributed to Oscar Wilde, created a sensation. It is a satire on the decadents. Among succeeding novels are: *An Imaginative Man* (1895); *Flames* (1897); *The Slave* (1899); *Tongues of Con-*

science, short stories (1900); *The Prophet of Berkeley Square* (1901); and *Felix* (1902). He has also collaborated in successful plays, as *The Medicine Man* and *Becky Sharp*.

HICKES, GEORGE (1642-1715). An English non-juring clergyman, philologist, and author. He was born at Newsham, Yorkshire; studied at Northallerton Grammar School, then proceeded as sizar to Oxford, where he graduated B.A. In 1664 he received a fellowship of Lincoln College, and the following year received his M.A. degree. He took holy orders in 1666, was a tutor for several years, visited France in 1673, was appointed rector of Saint Elbe, Oxford, in 1675, and in 1676 became chaplain to the Duke of Lauderdale, whom he accompanied on his journey as High Commissioner to Scotland. Several rapid promotions culminated in a chaplaincy to James II, and the Deanship of Worcester (1683). At Worcester his study of the Germanic languages resulted in the publication of the *Anglo-Saxon and Maso-Gothic Grammar* (1689). At the time of the Revolution he refused to take the oath of allegiance to William and Mary, and was deprived of his benefices. In 1693 he visited the exiled King at Saint Germain, with a mission from the non-juring clergy for coördinate action in regard to the continuance of their episcopal rights, and in 1694 he was consecrated by their leaders as Suffragan Bishop of Thetford. His subsequent publications in controversial and practical divinity were numerous. His greatest work is *Linguarum Veterum Septentrionalium Thesaurum Grammatico-Criticum et Archæologicum* (3 vols., 1703-05). Among his other writings are: *Controversial Letters* (1710); *Sermons* (1711); and a volume of *Posthumous Discourses*, published in 1726.

HICK'EY, EMILY HENRIETTA (1845—). An English poet, born at Macmine Castle, Wexford, Ireland. With F. J. Furnivall she founded the Browning Society (1881), and she became known as a lecturer. In 1902 she edited *Havelok the Dane*, a Middle-English romance. Among her volumes of poems are: *A Sculptor and Other Poems* (1881); *Verse Tales* (1889); *Michael Villiers, Idealist, and Other Poems* (1891); *Poems* (1895); *Our Lady of May and Other Poems* (1902).

HICK'OK, LAURENS PERSEUS (1798-1888). An American writer on philosophy. He was born in Bethel, Conn.; was pastor at Newtown, Kent, and Litchfield, Conn. (1822-36); professor of theology in Western Reserve College, Ohio (1836-44); professor in Auburn Theological Seminary (1844-52); professor of mental and moral science in Union College, and vice-president (1852-66) and president (1866-68). After his resignation of the last-named office, Dr. Hickok resided at Amherst, Mass. Among his published works are: *Moral Science* (1853); *Mental Science* (1854); *Rational Cosmology* (1858); *Rational Psychology* (1861); *Humanity Immortal* (1872); *Creator and Creation* (1872); *Logic of Reason* (1874). He died May 6, 1888.

HICK'ORY. A town in Catawba County, N. C., 50 miles northwest of Charlotte, on the Southern Railway (Map: North Carolina, A 2). It is the seat of Lenoir College (Lutheran), opened in 1891, and of the Claremont Female College, opened in 1880, and has Saint Paul's Lutheran Seminary and other educational insti-

tutions. There are manufactures of flour, lumber, foundry products, carriages and wagons, leather, etc. Population, in 1890, 2023; in 1900, 2535.

HICKORY (formerly *hiccory*, *pohickery*, from the North American Indian name), *Carya*, or *Hicoria*. A genus of trees formerly included among walnuts (*Juglans*). The hickories are exclusively North American. They are large and beautiful trees, with pinnate leaves, and attain a height of 70 or 80 feet. Their timber is very heavy, strong, elastic, and tenacious, but decays speedily when exposed to heat and moisture, and is peculiarly liable to injury from worms. Great quantities of hickory are used to make hoops for casks. It is much used for handspikes, axe-handles, baskets, agricultural implements, etc., the second growth being tougher, is preferred for these purposes. When used for baskets the logs are cut into sections of the required length, steamed in vats, and cut in a veneering machine, after which they are chopped into splints of the required width. Shafts of carriages, handles of whips, and golf-clubs, large screws, etc., are made of hickory. It

SHELLBARK HICKORY (*Carya ovata*).

is greatly esteemed for fuel. The fruit of the hickory is a smooth, hard-shelled nut covered by a four-parted husk, which in most species separates to the base upon maturity. The nuts of some of the species are of excellent flavor. The shell-bark and shag-bark hickory are so called from their shaggy outer bark, which peels off in long, narrow plates. The hickories are found from Maine to Florida and west to Minnesota, Kansas, and Texas, and extending into Mexico, several species occurring throughout the entire range. The trees are mostly slow growing. In forests they grow tall with few limbs, but in the open they branch widely and have many desirable qualities desired in park trees.

The principal species, according to different authorities, are:

	Gray	Britton and Brown
Pecan	<i>Carya olivæformis</i>	<i>Hicoria pecan</i>
Shagbark hickory	" <i>alba</i>	" <i>ovata</i>
Shellbark hickory	" <i>sulcata</i>	" <i>lacin</i>
Mocker nut hickory	" <i>tomentosa</i>	" <i>alba</i>
Pig-nut hickory	" <i>porcina</i>	" <i>glabra</i>
Bitter-nut hickory	" <i>amara</i>	" <i>minima</i>
Water hickory	" <i>aquatica</i>	" <i>aquatica</i>
Nutmeg hickory	" <i>myristicæformis</i>	" <i>myristicæformis</i>
Mexican hickory	" <i>Mexicana</i>	" <i>Mexicana</i>
Small pig-nut hickory	" <i>microcarpa</i>	" <i>odorata</i>

HICKORY-POLE CANVASS. The name given to the canvass for Andrew Jackson in the Presidential election of 1828.

HICKORY SHAD. See MUD-SHAD.

HICKS, ELIAS (1748-1830). An American minister of the Society of Friends, born at Hempstead, Long Island. While still a young man of twenty he began to feel a deep interest in religion, and within a few years his upright life and his ability as a speaker gained for him universal recognition as a minister in the Society. During the next half-century he traveled widely through the Eastern States from Maine to Maryland, preaching and organizing new meetings. He was an earnest and influential advocate of abolition, not hesitating to speak against slavery even in such a slaveholding community as Maryland. To his efforts was due in large measure the passing of the act which emancipated all slaves in New York in 1827. He first became the leader of a faction in the Society in 1817. For a number of years before that there had been a determined effort made by some of the members to effect a closer union with the Friends of the English society, and as a step toward this was proposed the adoption of an orthodox creed, the main points of which were the deity of Christ and the vicarious atonement. The proposition met with considerable favor in Philadelphia, and a number of Friends from that city went down to the Baltimore yearly meeting in 1817 to advocate it there. Hicks, who was present, spoke eloquently against the measure, and secured its rejection. From that time may be dated the schism in the Society which became complete in 1828. Those who followed Hicks—called 'Hicksites' as a term of reproach—far outnumbered the orthodox, and for many years there was great bitterness of feeling between the two factions. Of late, however, this has largely disappeared. Hicks published: *Observations on Slavery* (1811); *Sermons* (1828); *Journal of the Life and Religious Labors of Elias Hicks* (1832); and *Letters* (1834).

HICKS, JOHN BRAXTON (1823—). An English gynecologist and anatomist, born at Rye, and educated at Guy's Hospital in London and at the University of London. In 1865 he became lecturer at Guy's Hospital, was later obstetrical examiner to the Royal College of Physicians, then (1892) consulting obstetric physician at Saint Mary's Hospital, president of the Obstetrical Society (1871-73), and Hunterian orator (1878). He wrote *The Honey Bee* (1860), with James Samuelson, besides many contributions to the *Guy's Hospital Reports*, to the *Transactions of the Obstetrical Society*, to the *Proceedings of the Medical Society*, and to the *Lancet*.

HICKS, THOMAS (1823-90). An American portrait painter. He was born in Newtown, Pa., October 18, 1823. He studied at the Philadelphia Academy, and afterwards at the National Academy, New York. Visiting Europe from 1845 to 1849, he studied with Couture in Paris. He was elected member of the National Academy in 1851, and established studios in New York, and Trenton, N. J. His color is good, his drawing is carefully executed, with elaborate accessories, and his composition is well balanced. He died in 1890. Some of his best-known portraits are: Edwin Booth as Iago, Henry Ward Beecher, Longfellow, Dr. Kane, William M. Everts, Bayard Taylor, Hamilton Fish, Luther Bradish (1857); Henry Abbot (1863), in the Historical Society, New York; Parke Godwin (1879); Mrs.

HICKORIES

1. BITTERNUT HICKORY (*Carya amara*).

2. SHAGBARK HICKORY (*Carya alba*).

S. F. Billings (1883); Dr. James R. Wood (1884), New York Academy of Medicine. Among his other subjects are: "Birches at Thornwood;" "Trenton Falls" (1879); "End of a Winter Day" (1885); "In Brittany" (1884).

HICKS, THOMAS HOLLIDAY (1798-1865). An American politician, born in Dorchester County, Md. He became sheriff in 1824, and a member of the State Legislature a few years later; was a member of the State Electoral College and was again elected to the Legislature in 1836; and in 1837 served on the Governor's Council. From 1858 to 1862 he was Governor of the State. He strongly sympathized with the South, and was indignant with the Northern people for their general attitude toward slavery, and in particular for their refusal to enforce the Fugitive Slave Law. When actual hostilities between the two sections began he seemed to think that the State could assume a neutral attitude, and largely by his refusal to call a special session of the Legislature managed to block radical measures. He saw that secession for Maryland meant devastation, and his policy gradually evolved itself until he found himself vigorously opposing secession and defying the Legislature. Rumors were current in the early part of 1861 of a plot, in which 3000 citizens of the State were organized to prevent Lincoln's inauguration and seize the city of Washington. He made preparations to thwart the attempt, caused State arms to be seized, suspended the writ of habeas corpus, planned the arrest of suspected persons, and indorsed the Administration in establishing a censorship of the press and in breaking up the Legislature. The proximity and alertness of the Federal headquarters was in reality all that prevented a serious secessionist movement, Hicks being the only prominent official of the State who stood by the Government. At the expiration of his term as Governor a new Legislature passed resolutions thanking him in its name and in the name of the people of Maryland for his attitude during the crisis, and declaring that it was he who had kept the State from joining the Confederacy. In 1862 Lincoln offered him the rank of brigadier-general, but ill health prevented his acceptance. In the same year he was appointed to the Senate to supply the vacancy occasioned by the death of Senator Pearce, and served in that body during the remainder of his life. Although he was at the same time denounced for selling the State to Lincoln, and praised for saving it by his remarkable ability, it is largely the uniqueness of the position in which he was placed which makes him especially memorable. Consult: Radcliffe, "Governor Hicks of Maryland and the Civil War," in the *Johns Hopkins University Studies in Historical and Political Science*, nineteenth series, Nos. xi., xii. (Baltimore, 1901).

HICKS, WILLIAM. See **HICKS PASHA.**

HICKS-BEACH, Sir MICHAEL EDWARD (1837-). An English Conservative politician, born in London. He was educated at Eton and Christ Church, Oxford; entered Parliament in 1864, and after 1885 represented West Bristol. He was Chief Secretary for Ireland from 1874 to 1878, and Secretary of State for the Colonies in 1878-80. In 1885 Lord Salisbury appointed him Chancellor of the Exchequer and leader of the House of Commons. In 1886 he again became Secretary for Ireland, but held the office less than a year.

He was President of the Board of Trade from 1888 to 1892. In 1895, after the fall of the Gladstone Ministry, he became Chancellor of the Exchequer, from which post he resigned in 1902, immediately after the retirement of Salisbury. In the character of strict economist he greatly embarrassed the Balfour Government by an attack (October, 1902) on the finances of the War Office, in which he insisted that that department was not spending to best advantage the money assigned to it.

HICKSITES. See **FRIENDS.**

HICKS PASHA, pà-shà' (WILLIAM HICKS) (1831-83). An English soldier. He entered the British East Indian army as an ensign in 1849, and left the service in 1880 as an honorary colonel. Three years later he was appointed to the command of the Egyptian army in the Sudan, and with a force of from ten to twelve thousand native troops went against the Mahdi. He at first won what seemed a decisive victory near Khartum in April. In September, however, he went with a force of 10,000 to suppress a rebellion, and crossed the desert to El Obeid. Then Hicks Pasha found himself betrayed into an ambush, and after a battle of three days, ending with the massacre of nearly all his army, he fell in a last desperate charge of his mounted staff. Consult Colborne, *With Hicks Pasha in the Sudan* (London, 1884).

HIDAGE, híd'áj (from *hide*, AS. *hid*, *higid*, *higed*, a certain portion of land, from ONorthumbrian *higan*, AS. *hūcan*, members of a family). An extraordinary tax paid to the kings of England on every 'hide' (q.v.) of land. It was abolished during the reign of Henry II.

HIDALGO, ê-däl'gò. A central State of Mexico, bounded by the State of San Luis Potosí on the north, Vera Cruz and Pueblo on the east, Tlaxcala and Mexico on the south, and Querétaro on the west (Map: Mexico, J 7). Area, 8917 square miles. The northern and northeastern portions are traversed by the eastern range of the Sierra Madre, and form a wild and rough mountain region, rising in its highest elevation to over 10,000 feet. The southern and western parts are mostly flat and traversed by fertile valleys. The climate is warm in the lower regions, and the agricultural products include cereals, sugar-cane, tobacco, coffee, and cotton. The State has extensive mineral wealth and mining is the chief industry. The chief mineral products are silver, quicksilver, copper, iron, lead, and zinc. Coal and marble are found. The southern part is traversed by several railway lines. Population, in 1900, 603,074. Capital, Pachuca (q.v.).

HIDALGO DEL PARRAL, dël pâr-räl'. See **PARRAL.**

HIDALGO Y COSTILLA, ê-päl'gò ê kò-sté'lyá, DON MIGUEL (1753-1811). A Mexican priest and revolutionist. He was born at Corralejos, studied at Valladolid in Mexico, and was given charge of the parish of Dolores, in the State of Guanajuato. Dissatisfied with the Government, he conspired with the Indians to raise a general insurrection on November 1, 1810. Fear of discovery led him to hasten his plans, and the revolt began in September in the town of Dolores. His eloquence had a powerful effect on the people, and to heighten the enthusiasm he carried aloft the banner of Our Lady of Guadalupe, patron

saint of Mexico, and gave to his insurrection the character of a crusade. He took the towns of Guanajuato and Guadalajara, and with an army of 50,000 men marched on Mexico, defeating on the way a small force of soldiers sent to oppose him. But the decree of excommunication launched against him, and the discord prevailing among his lieutenants, caused his forces to melt away, and forced him to retreat. He succeeded, however, in reuniting his men to meet the army sent against him by the Government, but his disorderly mob of 100,000 men were pitilessly crushed by the onset of 6000 Spanish veterans, January 17, 1811. Hidalgo fled and set out for the United States to procure assistance, but was captured, degraded from his priestly office, and shot. Some years later he was extolled as a saint, and the new-born republic erected a magnificent statue to him.

HID'DENITE. A yellow-green to emerald-green variety of spodumene, discovered in 1879 by W. E. Hidden, in Alexander County, N. C. The transparent crystals, when cut and polished, resemble the emerald in lustre, although the color is not so intense as in the finer varieties of the latter gem. Hiddenite has a specific gravity of 3.19, and gems of 2½ carats in weight have been cut from it. When first introduced it aroused considerable interest on account of its novelty as an American gem. It is sometimes called the *lithia emerald*.

HIDE (AS. *hid*, *higed*, *higid*, from ONorthumbrian *higan*, AS. *hivan*, members of a family). In Anglo-Saxon law, the family estate, corresponding to the *huba* of early Germanic law. It consisted apparently of a farm, or allotment, of definite extent, though its size varied greatly at different periods of German and English history. The normal hide at the time of the Conquest was 120 acres. But the term does not seem to have been employed to denote a unit of land measurement, but a definite parcel of land in the nature of a homestead, owned in severalty by the head of a family. As such, however, it was used by the Saxon kings as a unit of taxation, the amount assessed on each hide being known as *hide-gild*. After the Conquest the term gradually changes its meaning and comes to designate a measure of land, but its signification is not free from obscurity at any period of its history. See Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899); Stubbs, *Constitutional History of England* (Oxford, 1880); Jenks, *Law and Politics in the Middle Ages* (New York, 1898); Seebohm, *English Village Community*; Maitland, *Domesday Book and Beyond*.

HIDEYOSHI, hē'dā-yō'shē, TOYOTOMI (1536-98). A Japanese warrior and statesman, the son of a peasant. He was born in the village of Nakamura, Aichi Ken, province of Owari, in 1536; became groom to Nobunaga (q.v.), who made him a soldier. He speedily distinguished himself by his military talents, and in 1575 was by Nobunaga created lord of Chikuzen, and was allowed to change his family name to Hashiba. On the death of Nobunaga in 1582 he took such vigorous action that he became in 1586 the practical ruler of the Empire under the title of Kuambaku, or regent, a high office that had been reserved exclusively for members of the Fujiwara (q.v.) family. In 1591 he nominally retired in favor of his son Hidetsugu, taking, as

was customary in such circumstances, the title of Taikō, hence popularly known as Taikō-sama. In 1592 he dispatched a large army to Korea to conquer it as a preliminary step in the conquest of China, but the expedition met with disaster, the Emperor of China having sent a large army to the assistance of the Koreans, and after his death at Kioto in 1598 it was recalled. Displeased with the conduct and teachings of the Jesuits, he ordered their expulsion, but no steps were taken to carry out this edict until 1596, when several Franciscan priests, Jesuits, and native Christians were crucified at Nagasaki. A monument in his honor was erected at Kioto in 1896. He had many names; Toyotomi he received from the Emperor. His posthumous name is Toyokuni. Consult: Adams, *History of Japan* (London, 1874); Denig, *Life of Hideyoshi* (Tokio, 1889); Griffis, *The Mikado's Empire* (New York, 1900); and Brinkley, *Japan, Its History, Arts, and Literature* (8 vols., beautifully illustrated, Boston, 1901-02).

HIEL, hēl, EMANUEL (1834-99). A Flemish poet, born at Dendermonde. At first he was a bookseller; then he obtained a minor Government appointment and later the position of professor of oratory at the Brussels Conservatory, and librarian of the Industrial Museum in the same city. He is generally considered the chief Flemish lyricist of recent times. Among his longer poems are *Jacobæa van Beieren* (1867; new ed. 1880) and *Bloemardinne* (1877). In addition to these there are the collections *Nieuwe Liedekens* (1861); *Gedichten* (1863); *Bloemeken een liederkrans* (1877); and some verses for children, *Liederen voor groote en kleine kinderen*, many of which were adapted to well-known melodies, and some of which were set to music by Van Gheluwe, *Liedersolfège* (1875). Hiel's greatest works are the poems *Lucifer* and *De Schelde*, for which Benoit composed oratorio settings; *Vrijheidshymnus* (music by Richard Hol); and *Prometheus* (1868). An edition of his poetry, *Volledige dichtwerken*, was published in 1885.

HIEN FŪNG, hyēn fūng, or HSIEN FĒNG, syēn fēng. The name of the period during which I-chu, the seventh Emperor of the present Manchu dynasty of China, ruled; but the name is commonly transferred from the period to the Emperor himself. He was the fourth son of the Emperor Tao-Kwang, was born in 1831, and succeeded to the throne in 1850, but his reign, according to custom, dates only from the following year. He proved to be a weakling. At the beginning of his reign the Tai-ping Rebellion broke out in Canton Province; hordes of fanatics and lawless persons joined the standard of the 'Prince of Peace,' as the leader, Hung Hsü-Chüan, styled himself; half the country was devastated, and twenty millions are said to have been put to the sword. The rebellion would have taxed a stronger man, but able statesmen and generals arose, and in 1864 this greatest of all rebellions was crushed. Meanwhile a war with Great Britain had been precipitated in 1857 by an outrage on the British flag. Canton was for a second time taken by British troops, the Taku forts at the mouth of Peiho were captured, and a treaty was concluded in 1858 opening more new ports, throwing the country open to travelers, permitting the preaching and the practice of Christianity, and calling for more indemnity. In the following year, as the British envoy

was on his way to Peking to exchange ratification as previously arranged, he was fired upon, and his party driven back. This made another expedition necessary, and in 1860 another army (France joining) and fleet took the Taku forts a second time, captured Tientsin, and proceeded to Peking. Hien Fung fled to Jehol (q.v.), where he died in the following year, leaving his brother, Prince Kung, to negotiate a new treaty of peace, which in the circumstances was more rigorous than that of 1858. Additional ports were to be opened, and it was agreed that henceforth a British envoy or ambassador was to be allowed to reside at Peking, and in connection with this a Department of Foreign Affairs—the Tsung-li-Yamên—was established, Prince Kung becoming its first president.

HIERACITES, hi-ēr'a-sīts. See HIERAX.

HIERACIUM, hi'ê-râ'sh'î-üm. See HAWK-WEED.

HIERAPOLIS, hi-ê-râp'ô-lis (Lat., from Gk. Ἱεράπολις, sacred city, from ἱερός, hieros, sacred + πόλις, polis, city). (1) A city in Southwest Phrygia, about six miles north of Laodicea. It was the religious centre of the native worship of the district, and was an important seat of the mysteries of the Phrygian nature-goddess, who was here called Leto, her daughter, Cora, a male deity, and a son. It possessed warm springs which had, and still have, a remarkable power of forming incrustations. Its religious fame was also increased by the Plutonium or Charonium, a narrow but deep chasm, from which issued a noxious vapor, supposed to be fatal to all except the eunuch priests of the goddess. This chasm had disappeared in the fourth century A.D. Consult: Ramsay, *Cities and Bishoprics of Phrygia*, vol. i. (Oxford, 1895); Hermann and others, *Alterthümer von Hierapolis* (Berlin, 1898).

(2) A city in the Glaucon Valley in Central Phrygia (now Koteh-Hissar), which seems to have been the old centre of a pentapolis, and is known in early Christian history from the life of Saint Abercius, or (better) Avircius, a leader in the second century A.D., who caused a remarkable protest against Montanism to be inscribed on his tomb. The original document has survived and is now in Rome. It is so drawn up that it bears a double meaning, and the esoteric Christian sense was clear only to 'him who comprehends.' It has also been interpreted as a heathen document. Consult: Ramsay, *Cities and Bishoprics*, vol. ii. (Oxford, 1897); and Dietrich, *Die Grabschrift des Aberkios* (Leipzig, 1896).

(3) A city of Syria Cyrrestica, known also as Bambyce (Gk. Βαμβύκη), situated about twenty-five miles south of the ancient Carhemish, on the hills southwest of the meeting of the Euphrates and Sajur rivers. It is now in ruins, but in the times of the Seleucids was a city of much commercial importance. In the reorganization of the Roman Empire under Diocletian it became the capital of the province of Euphratensis or Commagene. In the time of Justinian it had retrogressed, but the fortifications were restored by the Arabs, and it endured many vicissitudes during the Crusades.

HIERARCHY, hi'êr-îrk-î (from ML. *hierarchia*, Gk. ἱεραρχία, hierarchy, from ἱεράρχης, hierarchēs, hierarch, from ἱερός, hieros, sacred + ἀρχός, archos, leader, from ἀρχεῖν, archein, to

lead). The name used by theological writers to designate the whole governing and ministering body in the Church, distributed according to its several gradations. The word, in its strict acceptance is applicable only to the Roman Catholic Church, and to those Christian communities which retain the prelatical form of Church government, or at least the distinctions of ecclesiastical order and gradation. In considering the hierarchy it is necessary to bear in mind the well-known distinction of *order* and of *jurisdiction*. (I.) Considered under the head of *order*, the hierarchy embraces all the various orders or classes of ministers to whom has been assigned the duty of directing public worship, administering the sacraments, and discharging the various other offices connected with the preaching of the gospel; and these are of two kinds—the orders directly instituted by divine authority, and those established by ecclesiastical ordinance. Theologians commonly distinguish a *hierarchy of divine right*, and a *hierarchy of ecclesiastical right*.

(1) The first includes the three ranks of bishops, priests, and deacons. The bishops are believed, as successors of the Apostles, to have inherited the integrity of the Christian priesthood. The order of episcopate, however, is not believed to be a distinct order from that of priesthood, but only a fuller and entirely unrestricted form of that order. In all that regards what Roman Catholics believe to be the Christian sacrifice of the eucharist, they hold that the priest possesses the same powers of *order* with the bishop; but he cannot confer the sacrament of orders, nor can he validly exercise the power of absolving in the sacrament of penance without the approbation of the bishop. (2) To the three ranks thus primitively instituted several others have been added by ecclesiastical ordinance. (See ORDERS, HOLY.) (II.) The *hierarchy of jurisdiction* directly regards the government of the Church, and comprises not only all the successive degrees of ecclesiastical authority derived from the greater or less local extension of the several spheres within which such governing authority is limited—beginning with the Pope as primate of the universal Church, and extending to the patriarchs as ruling their several patriarchates, the primates in the several kingdoms as national churches, the metropolitans or archbishops within their respective provinces, and the bishops in their dioceses.

In the Anglican Church, with the office of the episcopate, the theory of a hierarchical gradation of rank and of authority has been retained. The Anglican hierarchy comprises bishops, priests, and deacons. In the other reformed churches a hierarchical government is practically non-existent. Many theological writers, following Dionysius the Areopagite, regard the angels as organized in the same hierarchical manner according to their various orders.

HIERATIC WRITING. See HIEROGLYPHICS.

HI'ERAX, or **HIER'ACOS** (Lat., from Gk. Ἱέραξ). An Egyptian ascetic of the third century. He is said to have lived to the age of ninety, and devoted himself to scientific and literary pursuits. He was the author of biblical commentaries, both in Greek and Coptic, and is said to have composed many hymns. He became leader of the sect of the Hieracites, an ascetic society from which persons living in the married state were excluded. On other points Hierax fol-

lowed Origen in allegorizing Scripture. From this apparently Manichæan view of matrimony, taken with his denial of the resurrection and of a visible paradise, and his assertion that infants, as incapable of 'striving lawfully,' cannot inherit the kingdom of God, Hierax was regarded as a heretic.

HIERO (hī'ê-rō) I. (Lat., from Gk. Ἱέρων). A tyrant of Syracuse, who succeeded his brother Gelo in B.C. 478, having already, a short time before, distinguished himself in the battle of Himera. Being jealous of his brother Polyzelus, who had command of the army, he dispatched him on an expedition against the Crotonians, but Polyzelus fled to his brother-in-law, Theron of Agrigentum. Hiero undertook to make war on the two, but a reconciliation was effected, it is said, by the poet Simonides. Some time after this reconciliation Hiero assisted the people of Cumæ in driving off the Etruscan pirates, by whom they were harassed. He transferred the inhabitants of Naxos and Catana to Leontini, and re-peopling Catana with citizens from Syracuse, Gela, and elsewhere, called the place Ætna. After the death of Theron, about B.C. 472, war broke out between Theron's son, Thrasydæus, and Hiero. The former was defeated and compelled to flee from Sicily. Hiero was now supreme in the island. He died, however, shortly after, having reigned ten years. As a ruler Hiero was jealous, cruel, and rapacious; fearing for his life, he surrounded himself with mercenaries and spies. He was, however, a patron of poets and philosophers, and he competed successfully at the Grecian games.

HIERO II. (c.308-216 B.C.). A king of Syracuse, son of a noble Syracusan named Hierocles. He first distinguished himself in the wars with Pyrrhus, and then, after Pyrrhus's departure from Sicily, B.C. 275, in the war with the Mamertines. In consequence of his military successes he was, in B.C. 270, chosen King of Syracuse. In B.C. 264 he assisted the Carthaginians in the siege of Messana, but was himself defeated by the Roman consul, Appius Claudius, and in B.C. 263 concluded a treaty with the Romans, to whom he thereafter remained faithful. In both Punic wars he assisted them with money and troops. During the interval of peace between the two wars he visited Rome and was received with great honors, while he himself on this occasion distributed a vast quantity of corn to the people. Hiero was a wise and merciful sovereign, simple in his ways and just in his rule. We are told that he was prevented from laying aside the kingly power only by the unanimous votes of his subjects. He bestowed great care upon the financial department of his government, and his agricultural laws (*leges Hieronicæ*) were in force in Cicero's time. He was also a patron of the arts, and beautified his city with many fine public buildings. His kinsman Archimedes he employed in the construction of a number of powerful engines of war.

HIEROCLES, hī-êr'ô-klêz (Lat., from Gk. Ἱεροκλῆς, *Hieroklês*). (1) A Greek writer of the sixth century A.D., who composed, under the title *Traveling Companion* (Συνέκμητος), a work containing a description of the 64 provinces of the Byzantine Empire and of 912 cities in it. It is best edited by Burekhardt (Leipzig, 1893). (2) An Alexandrian Neo-Platonist of

the fifth century A.D. He wrote a commentary on the Golden Verses of Pythagoras, and a treatise *On Providence and Fate*. Of the latter work only a few extracts have been preserved by Photius, and there is also an anonymous abridgment. The commentary is printed by Mullah, *Fragmenta Philosophorum Græcorum*, vol. i. (Paris, 1875). Under the name of Hierocles we also possess a very old collection of jokes and amusing stories ('*Ἀστεία*'), edited by Eberhard (Berlin, 1869).

HIEROCLES OF BITHYNIA. A Roman proconsul in the reign of Diocletian (A.D. 284-305), said to have been the instigator of the fierce persecution of the Christians under Galerius Cæsar in 303. He was a man of considerable intellectual culture, and wrote a work in two books, in which he endeavored to persuade Christians that their sacred books were full of contradictions, and that in moral influence and miraculous power Christ was inferior to Apollonius of Tyana. This treatise has not come down to our times, and is known to us through Lactantius, and still more through Eusebius, who is the author of a refutation.

HIEROGLYPHICS, or HIEROGLYPHS (Lat. *hieroglyphicus*, from Gk. ἱερογλυφικός, *hieroglyphikos*, hieroglyphic, from ἱερογλύφος, *hieroglyphos*, carver of hieroglyphics, from ἱερός, *hieros*, sacred + γλύφειν, *glyphein*, to carve). The term applied to those systems of writing in which figures of objects take the place of purely conventional signs, and especially used to designate the writing of the Egyptians and Mexicans. The system of Babylonia (whence the cuneiform writing developed) and that of China were likewise originally picture-writings, but were very early simplified and conventionalized, and thus lost their hieroglyphic character. These two systems present so many striking analogies to the Egyptian that a connection is often assumed, but these analogies appear merely to afford an illustration of the tendency of the human mind to run, under certain conditions, in the same channel, and this view is strengthened by some analogies from American pictographs and hieroglyphics. Hieroglyphic systems are also represented by the monuments of the Hittites and the early Cretans, both as yet undeciphered; an Egyptian origin would, in these cases, be less improbable than in the cases of Babylonian and Chinese characters. The Phœnician alphabet cannot be proved to descend from a hieroglyphic system; the names of the letters (ox, house, etc.) seem to have been merely mnemotechnic helps for learners. The Egyptian system is the most remarkable of all, because it always retained the most primitive form, although developing to a high degree of philological perfection. It is impossible to trace this system back to its origin in descriptive pictures; such pictures, for example, as the North American Indians sometimes used for communications, though without developing a real writing. The very earliest monuments of Egypt, anterior to Menes, the first historical king, exhibit the system already perfected, differing in many details from the later orthography, but what were then the principles are the same as at all later periods. The invention must therefore belong to a very remote age.

The most primitive part is represented by the so-called ideographs or word-signs. Some of

these are shown in the accompanying illustrations. It is very easy to represent a man

(romet), a woman  (himet). Both taken

together mean 'mankind'; one repeated three times, 'men' or 'women.' A soldier  is easily

characterized by his arms and costume; a chief  by his staff; a king by the addition of the

crown; a child  (khrod) by sucking its

finger. Animals can be figured to a large extent, also some plants, the parts of the human body, etc. But wood (khet) can be represented only by a twig ; grain (yot) by three grains

; water (mou) by wavy lines . From indications of this nature there is but a step to symbolism. 'Hearing' (sotem) is expressed by the ear of an ox ,

while the human ear  means only 'ear'; 'weeping' (remy) by a weeping eye ; 'drinking' by a man drink-

ing  (the arm and bowl alone suffice).

'Fighting battle' is symbolized by weapons 

'going' by a pair of legs ; 'returning' by an inversion  of this sign; 'bringing' (eny) by

a vessel, in combination with the sign for 'going' 

; 'giving' (day) by an arm presenting a cake .

'Rain' can, of course, be easily represented by a sky with water falling from it 

; but the ideas 'night,' 'darkness,' must be symbolized  by a star hanging from the

sky; 'cool' (qohh) is indicated by a water-sprinkler .

A great many words and ideas, however, cannot be represented at all, and here the writer surmounts the difficulty by using the signs for homophonous words or for words of somewhat similar sound, exactly as such signs are employed in our modern rebus. For example khun, khen, 'inside, in,' and kheny, 'to approach,' have no etymological connection whatever with

the pictorial sign for 'hide,' 'skin' (khen) ,

but the same picture is used for all three words. Thus many signs pass from the ideographic into the phonetic class, that is, they merely represent sounds without regard to the meaning, and from word-signs they develop into syllabic signs of two consonants (for example, the figure of the hide becomes the syllabic sign khn, representing any syllable with the two consonants kh and n); a few signs finally obtain the value of single consonants and form the alphabet.

The rebus system, however, would have led to many obscurities. Some inscriptions, indeed, simply use the sign for khn for all three words, and leave it to the reader to decide from the context whether 'skin,' 'in,' or 'approach' is

meant. The majority of scribes, however, use as helps the so-called determinatives. For example, they place after the sign khn the hieroglyph for 'house'  to indicate that it means 'within,' and distinguish the word 'approach' by the addition of a pair of legs, indicating a

verb of motion. Again  (writing imple-

ments) means 'writing,' 'write,' 'scribe,' but by applying the proper determinatives, the writer can readily indicate which of these meanings he wishes to convey. By placing after this sign the figure of a man he makes it clear that 'scribe' is intended, while the addition of a roll of papyrus

 indicates that 'writing,' 'book,' is meant.

These determinatives are not arbitrary, but are used in accordance with certain fixed principles. Thus all words for quadrupeds which cannot be easily represented are written phonetically, and

determined by  a piece of skin; all names of

persons are determined by the figure of a man or woman; all names of trees by a tree ;

small plants by ; drugs, sand, etc., by round

grains ; actions of the mouth (eating, speak-

ing, etc.); or thought by ; violent actions

by a man  or an arm in the act of strik-

ing ; localities by a house, etc. To these determinatives belongs also the so-called car-

touche (q.v.) or frame surrounding royal names. Perfectly analogous determinatives are found in Babylonian (where, however, they are rather sparingly employed), and in Chinese.

A great many of the ideographs are poly-phonus, that is, they admit of more than one pronunciation; as, for example, the picture of a horse might be understood by an Englishman as

standing for 'horse,' 'steed,' 'mare.' To prevent such ambiguity, many signs receive what is called the phonetic complement. For example, the sign  mn (originally representing a chess-board) is very rarely used alone; an n is generally

placed after it to fix the pronunciation. There-

fore, men, 'to remain,' is usually written 

i.e. the syllabic sign mn + the phonetic complement n (not to be pronounced separately) + the determinative 'book,' indicating that the word belongs to the category of abstract ideas. In

classical orthography, many signs are invariably followed by a phonetic complement. With some signs the phonetic complement precedes, while others have two or even three complements. For

example, the word seshem, 'to lead,' is always

written  s (phonetic comple-

ment); the word-sign sshm + m (second phonetic complement) + the determinative of a verb of motion. Thus arises a very complicated but

quite regular orthography, which is of special service to the reader in that it enables him to

distinguish between the different values of the polyphonous hieroglyphs. The sign 'star,' for example, may be read *sb* or *dw*; if the latter reading be intended a *w* follows as phonetic complement, while for the former reading an *s* is prefixed. Word-signs having several synonymous values do not always have phonetic complements. The reader, for example, may be left to discover from the context whether the sign 'horse' is to be read *sesem*, 'horse,' *sesmet*, 'mare,' *nofer*, 'colt,' etc. The sign ☉ (the sun) may be understood as 'day' (*hrow*), or as 'sun' (*rê*).

The alphabet developed from signs for very short words containing only one firm consonant. The opinion of the first decipherers, that the alphabet was acrophonic—that is, that the phonetic value of each letter was taken from the initial sound of the word represented by its sign—has not been confirmed. The alphabetic signs ought, of course, to be the latest element of the system, but we find them fully established on the earliest monuments, so that they certainly go back to the fifth millennium B.C. The Egyptian alphabet is as follows:*

- (1)  The Semitic Aleph ('), i.e. the general indication of a vowel beginning a syllable; later treated as a vowel.
- (2)  (A reed leaf) *y*, as a consonant; at a very early period confounded with the preceding letter, and later distinguished from it by doubling. Thus in the later orthography a single reed-leaf stood for Aleph, a double reed-leaf for the consonant *y*.
- (3)  (An arm, *ê*), the Semitic guttural Ain.
- (4)  *w* or secondarily *u*; later variant  from about 1500 B.C.
- (5)  *b*.
- (6)  or more elaborately  *p* (representing a mat?).
- (7)  *f* (representing a viper or snail).
- (8)  *m* (an owl); later variant .
- (9)  *n* (water); later variant .
- (10)  *r* (*ro*, 'a mouth').
- (11)  *h* (*hay*, 'a hall').
- (12)  *h*; (a rough *h*; the lighter sound of Hebrew Kheth, Heth).
- (13)  *kh*; (the Scotch and German guttural *ch*).
- (14)  *h* (similar in sound to the preceding, but somewhat softer). The sign originally stood for *hêt*, 'a belly,' and represented an animal cut open; the form here given is partially conventionalized.
- (15)  *s* (originally different from the

following, but soon after 3000 B.C. confounded with it). The sign represented a door-bolt.

- (16)  *s* (sharp *s*; early confused with the preceding).
- (17)  *sh*; a conventional representation of a lake (*Shei*).
- (18)  *q*. Hebrew Koph, Qoph, a guttural *k*. The sign represents a hill (*gay*).
- (19)  *k*. It represents a working-basket (*kay?*).
- (20)  *g*.
- (21)  *t*. Perhaps another kind of basket, or a vase.
- (22)  *t*, a sibilant dental which is usually assumed to have been *th* or *z*, but seems to have been quite a peculiar sound. It was later commonly pronounced *t*.
- (23)  *d*.
- (24)  *z*, or more correctly the Hebrew emphatic *s* (*Sade*).

In later times the variants increased considerably, as the scribes were continually inventing new and playful forms of the letters; in Roman times hundreds of signs were in use for the alphabet, but several of the original sounds were lost or confused in later pronunciation. However, down to B.C. 1000 the variants enumerated above were the only ones, and all these sprang up after B.C. 1600. It will be observed that originally the letters expressed only the consonants, and the vowels were, with exception of a few vague indications, left for the reader to fill in, exactly as in unpointed Hebrew or Arabic. The group *hbs*, for example, may be read *hobs*, *hvos*, *hebos*, etc. Later orthography attempted to express the vowels in certain cases, especially in foreign names which demanded a more exact notation, but neither consistently nor successfully. All this adds greatly to the difficulties of the Egyptologists. They have not only to supply the vowels from Greek and other traditions, from the corresponding Coptic words, from variants, etc., but they must also reckon with the tendency of the Egyptian scribes to abbreviate and to omit consonants, where they were supposed to be readily supplied by the reader. For example, *henqet*, 'beer,' is always spelled *hqt*. See, however, below on the present degree of certainty of reading. Foreign names and words were, in the time of Dynasties 18-22, written in a strange orthography called the syllabic system. The vowels were copiously expressed by placing syllabic signs for every consonant, even where no vowel followed. For example, the Palestinian name of a city, *Shalem*, was spelled: *Sha-ra-ma*, the word *markabt*, 'chariot,' *ma-(i)ra-ka-bu-ti*, etc. This wild heaping of vowels is of little advantage to the reader, and has led to many errors.

The hieroglyphics were commonly written from the right to left; more rarely from left to right. On early monuments they are frequently written from above downward, like the earliest Babylonian and Chinese writing; the arrangement called *boustrophedon* by the Greeks is never met with. The number of signs is, in a certain sense, unlimited, as the artist could vary the de-

*The arrangement is, of course, modern; explanations are added only where they are quite certain.

tails of each hieroglyphic according to his individual taste. But the sculptors did not greatly abuse this liberty, and usually kept within the bounds of intelligibility. As a matter of fact, the signs commonly used are only from five to six hundred in number. The artists found full play for their fancy in the minor details of execution; in the case of some magnificent buildings, they have actually designed and painted every feather of a bird, every finger of a human figure, etc., in inscriptions containing many thousand signs. The decorative effect of the brightly painted signs is exquisite. In other cases, however, when the sculpture had to be inexpensive, the signs were reduced to the simplest possible forms; in cheap funerary inscriptions they are often mere indications of figures, and their recognition calls for all the skill and ingenuity of the trained reader.

While in monumental use the pictorial character of the hieroglyphs always remained distinct, in the writing of books this was not the case. Here a simpler, more rapid method of writing was required, and even on the monuments of the First Dynasty we find the hieroglyphs simplified to a few strokes, where the pen is used instead of the chisel. On papyrus the writing soon assumed a cursive character, bearing no closer resemblance to the original pictorial hieroglyphs than our cursive script bears to our printed letters. The cursive style thus developed was called by the Greeks 'hieratic,' or the style for sacred writings, in contradistinction to the demotic character (see below), which was exclusively employed for profaner matters. This cursive style is found on the earliest books which have been preserved (dating from Dynasty 5). To give an idea of hieratic, we reproduce here the first seven letters of the alphabet (without variants) in the cursive style of about B.C. 1400.

One can still recognize the original form of the *a*, the *b* (*leg*), and the *f*, but the two birds have become mere flourishes in which only the boldest fancy can detect a resemblance to the original pictures. Of course, this style of writing changed more than the monumental forms, and every century had its marked peculiarities. The Greek name must not be misunderstood; all literature, secular and religious, history, novels, love songs, business documents, letters, used the more convenient rapid style. Only funerary texts are frequently written in a simplified hieroglyphic character. It was only after the demotic had become prevalent that hieratic was reserved for books of a religious character (after B.C. 600). Hieratic runs from right to left like most Oriental writings; in the earliest times, however, it was sometimes written perpendicularly.

Demotic, or popular writing, is a later development of hieratic. The Egyptians themselves called it 'the documental or epistolary style,' as it seems to have been developed in the law courts and offices where the necessity of tachygraphy led to constant abbreviations, until finally a real stenography resulted. Its origin goes back to the seventh century B.C. In B.C. 400 it had assumed a convenient form, and came into general use, so that the Greeks found it employed for everything except religious literature (see above), and called it, therefore, the demotic (the

common, popular) style or the enchorial (the writing of the country). In Roman times even religious texts were frequently written in demotic. As specimens we give here the same seven letters of the alphabet which were reproduced

above in hieratic. The second of these characters is more commonly represented by a single vertical stroke. It will be observed that two forms of the letter *p* are given, of which the first is more elaborately formed. The sign representing a crouching lion was reduced to a slanting stroke, etc. Whole groups of five or six hieratic signs were combined in a single flourish. Thus the writing became rapid enough to equal in speed our modern writing and the stenographic systems of the Romans; but its study was complicated and it became unintelligible where not written very distinctly. The number of demotic signs was smaller than that of hieratic (not over two hundred). Like hieratic, demotic was written from right to left. It is a common error to suppose that demotic means 'popular language'; the term properly designates a style of Egyptian writing, and a phase of the language, although documents written in the demotic script are usually composed in a later form of Egyptian. The Egyptian language, of course, underwent great modifications in course of time; the language of the earliest texts known to us—the religious texts in the pyramids—seems to have offered great difficulties to the Egyptian scholars of about B.C. 2500.

The use of the contemporary vernacular language was rarely allowed in literature, and in general the hierogrammates (sacred scribes) sought to write in an archaistic style as possible. After B.C. 1600 they found it more and more difficult to write the old language correctly, and from about B.C. 1400 to 1100 the living vernacular language was used for letters, legal documents, and entertaining literature. The language of this period, the so-called Neo-Egyptian, has been treated by Erman, in his *Neuägyptische Grammatik* (Leipzig, 1880). After B.C. 1000 the scribes reverted to an exaggerated archaistic style, and the texts became more and more ungrammatical; the barbarous age began after B.C. 500, and in Roman times the monumental texts are so wild in grammar and orthography that their decipherment is especially difficult. In demotic literature a mixture of ancient and modern language prevailed. The vernacular language finally came into literary use in Roman times through the influence of Christianity. The heathen and their priests continued to write hieroglyphs on the monuments, hieratic and demotic on papyrus, almost to the end of heathenism. The last datable hieroglyphic inscription is found in the Temple of Esneh (q.v.), and contains the name of the Emperor Decius, A.D. 250. A demotic inscription at Philæ (where paganism lingered on after the edict of Theodosius, A.D. 379) is dated in the year A.D. 453. Even later, some sporadic knowledge of the old writing may have existed, but, stamped with the reproach of heathenism, it soon sank into oblivion.

Some attempts to write the living language in the Greek alphabet, supplemented by some demotic signs, had been made in pagan times, and we possess a papyrus, containing a horoscope,

which seems to have been written about A.D. 100. It was, however, the desire to make the sacred Christian writings accessible even to the unlearned that led to the origin of Coptic writing and literature. The date of the Coptic version of the Bible is disputed, but it does not seem to be older than the third century, perhaps later. Coptic was written with 24 Greek and 7 demotic letters. On its history and its extinction as a living language at the end of the Middle Ages, see COPTIC.

Interest in the lost knowledge of hieroglyphics was awakened in Europe in the sixteenth century. About 1650 the learned Jesuit Athanasius Kircher endeavored to interpret them by a fanciful method of his own, finding long theological and philosophic systems in groups which contained only the names of kings, etc. The few monuments with hieroglyphics which were then known were explained by means of Hebrew, Chaldee, Chinese, etc., rarely by means of Coptic, which was known only imperfectly in Europe before the eighteenth century. The Greek traditions on hieroglyphics in Horapollo, Tsetses, etc., were not incorrect, as has now been recognized, but insufficient. The basis for decipherment was furnished by the French expedition to Egypt under Napoleon. Through it a much larger number of the Egyptian monuments became known, above all the famous inscription of Rosetta, which proved the key to the decipherment. This stone, found by a French artillery officer in building a fort near Rosetta in 1799, and brought to London after the capitulation of the French army (see ROSETTA STONE), contains a decree of the Egyptian priests in honor of Ptolemy V., Epiphanes, written in Greek, and preceded by a translation into hieroglyphics and demotic. Unfortunately, the hieroglyphic text was much mutilated, and for some time defied the efforts of the decipherers. The demotic part was better preserved and De Sacy, Akerbald (1802), especially Thomas Young (1815, etc.), correctly established the sense of many groups and sentences. Dr. Young came very near finding the correct value of some hieroglyphic letters (1819), but the merit of the decipherment belongs entirely to Champollion (q.v.), even if he did not work quite independently of Young, as he always claimed. He took as starting-point the two names Ptolemy and Cleopatra, furnished by the Rosetta Stone and an obelisk at Philæ. These two names yielded thirteen signs, the phonetic value of which Champollion determined correctly or approximately. He next identified the name Alexander, which furnished three more signs, and thus went on step by step, through the names of the Ptolemaic kings and Roman emperors found on the monuments, and if he had not died prematurely (1832) he would doubtless have succeeded in reading more than single sentences and in perfecting his system, which even in his posthumous works does not do full justice to his genius. His discoveries were continued by Rosellini, Salvolini, later by Birch, Lepsius, and De Rougé. For a long time the errors of Seyffarth and Uhlemann exercised a confusing and hindering influence. The French and Tuscan expeditions under Champollion and Rosellini, and especially the Prussian expedition under Lepsius (q.v.), furnished rich material from the monuments. Grammars of the language of the hieroglyphics were published by De Rougé (*Chrestomathie égyptienne*,

Paris, 1867-75); Birch (in Bunsen, *Egypt's Place in the World's History*, trans. vol., London, 1887); Brugsch, *Hieroglyphische Grammatik* (Leipzig, 1872), also in French (1867). Later grammars by Lepage Renouf, *Elementary Grammar of the Egyptian Language* (London, 1875); Budge, *First Steps in Egyptian* (London, 1895); Loret, *Manuel de la langue égyptienne* (Paris, 1889). Erman's book, *Ägyptische Grammatik*, also in English (London, 1894), is very brief, but best represents the present knowledge. On his grammar of Neo-Egyptian, see above; his *Sprache des Papyrus Westcar* (Göttingen, 1889) treats of an early vernacular phase of the language. A copious dictionary is in preparation under the auspices of the Berlin Academy, as Brugsch's *Hieroglyphisch-demotisches Wörterbuch* (7 vols., Leipzig, 1867-80), although the best Egyptian dictionary at present in existence, is rapidly becoming antiquated. The dictionaries of Birch (in Bunsen V.), Pierret, *Vocabulaire hiéroglyphique* (Paris, 1875); Levi, *Vocabolario geroglifico copto Ebraico* (Turin, 1887), are less reliable than that of Brugsch. Several journals are devoted to Egyptology, viz.: *Zeitschrift für ägyptische Sprache und Altertumskunde* (Berlin); *Recueil de travaux relatifs à la philologie et à l'archéologie égyptiennes et assyriennes* (Paris); *Sphinx* (Upsala); and the literature of the subject is growing immensely. The success which attended the study of hieroglyphics attracted the attention of students to this branch of Egyptology, and demotic was for a long time neglected. In 1855 Brugsch published his *Grammaire démotique*, which, though now antiquated, formed the basis for all subsequent investigations. Again neglected for a considerable time, the study of demotic was revived by Revillout, who devoted special attention to the legal documents written in demotic script (*Chrestomathie démotique*, Paris, 1880), but his works are to be used with great caution. In more recent times, the most meritorious publications on the subject of demotic are those of F. Ll. Griffith and W. Spiegelberg. The hieratic documents were first made intelligible by the works of Chabas and Goodwin. The paleography of hieroglyphics has recently been treated by Griffith in several volumes of the Archæological Survey of Egypt. (See EGYPTOLOGY.) It may be remarked that the question as to whether the decipherment of Egyptologists rests on a better basis than the vagaries of Kircher was frequently asked as long as the fragmentary Rosetta Stone was the only bilingual (or rather trilingual) text. After the discovery of the larger and perfectly intact trilingual text, called the decree of Canopus, containing a decree of the priests in honor of Ptolemy III., Euergetes, in the year B.C. 238 (found by L. Reinisch, 1886, near Tanis; his companion Lepsius also claimed the discovery), such doubts became impossible. Since that time various bilinguals have been found, and other sources which control the decipherment are now available. The exact pronunciation of the vowels, which were never perfectly expressed in Egyptian writing, and changed frequently in course of time, is much disputed, and will possibly never be settled with absolute certainty in all points. The texts, however, are now, generally speaking, at least as well understood as any Phœnician inscription or as the Hebrew text of the Bible. The time when they will be understood as well as Greek or Latin

writers may not be far distant. That the Phœnician alphabet, the mother of our modern writing, was derived from the Egyptian hieratic signs was claimed by De Rougé (*Mémoire sur l'origine égyptienne de l'alphabet phénicien*, Paris, 1874), and this hypothesis has become very popular; it is, however, highly improbable and is losing ground among scholars.

Much less perfect was the hieroglyphic writing of the Aztecs or Mexicans, which was used also in Central America, especially by the Mayas. Unfortunately, the literature written in those hieroglyphs was destroyed so thoroughly by the Spanish priests that only a very few manuscripts (preserved in Rome, Dresden, etc.) have survived, besides a few inscriptions on stone. The Spanish writers of the sixteenth century have left the explanation of a few signs only, so that the Aztec writing is almost entirely unintelligible. However, what we understand of it seems to show that the Mexicans did not advance much beyond the pictographic stage, though the pictures they used were highly conventionalized. They could express the names of persons, places, months, etc., by painting the objects or beings after which they were called, and went so far as to use symbolical signs of plants and animals, to express grammatical forms so that their pictures were not read, but interpreted. Where, for example, they recorded historical events, they had to picture these, as the inscriptions alone would have been insufficient. The majority of their books seem to have been calendars, lists of omens, etc., for which their imperfect writing system sufficed. It is said that some Spanish monks made use of hieroglyphic signs for expressing Latin prayers. For example, they are said to have expressed the words *pater noster* by a flag (*pantli = pa*), a stone (*tetl = te*), a cactus-fruit (*nochtli = noch*), and a stone (= *te*, see above). Rude as this system seems, it marked, nevertheless, a step in advance, as the hieroglyphs from word-signs became phonetic signs. Such attempts, however, remained perfectly isolated; the Spanish missionaries usually showed the greatest hostility to anything recalling the former Aztec idolatry. The term hieroglyphic was used by the writers of emblemata or devices, symbolizing gnomic sentences taken from the Greek and Latin poets, and having no relation to Egyptian hieroglyphics. In recent times, also, the astrological almanacs have had their symbolical representations and supposed prognostics of future events, which they called hieroglyphs. Consult Brugsch, *Ägyptologie* (Leipzig, 1891); Berger, *Histoire de l'écriture dans l'antiquité* (Paris, 1891); Erman, *Life in Ancient Egypt* (London, 1894); Lepsius and Stern, *Liste der hieroglyphischen Typen aus der Schriftgelehrer des Herr F. Theinhardt* (Berlin, 1875); Von Lemm, *Ägyptische Lesestücke* (Leipzig, 1883); Erman, *Egyptian Grammar* (London, 1894); Levi, *Raccolta dei segni ieratici egizi* (Turin, 1880); Erman, *Die Märchen des papyrus Westcar* (part ii., Berlin, 1890); Brugsch, *Grammaire démotique* (Paris, 1855); Hess, *Der demotische Roman von Ste Ne-m-us* (Leipzig, 1888); Revillout, *Chrestomathie démotique* (Paris, 1880).

HIERON, hi'ér-ôn. The name of two rulers of Syracuse. See **HIERO** I. and II.

HIERONYMITES, hi'ér-ôn'í-mits. The common name of four associations of hermits in Spain and Italy, who all regarded Saint Jerome as their patron and example, and hence derived their name. (1) The Spanish congregation founded in the reign of Alfonso XI. of Castile (1312-50) by some disciples of Tommasuccio of Siena, a hermit who had considerable following in Northern Italy and observed the Franciscan rule. Their two earliest settlements were in the mountains near Toledo. Their numbers soon grew, and included many persons of rank and station, such as Ferdinand Pecha, principal chamberlain to Pedro IV., and his brother Alfonso, Bishop of Jaen. The former obtained confirmation for their association from Gregory XI. in 1373, under the rule of Saint Augustine, and is regarded as the real founder of the Order. By 1415 they had twenty-five cloisters, among them that of San Gerónimo de Yuste, in which the Emperor Charles V. passed his last years. That of Belem, near Lisbon, became the burial-place of the Portuguese royal family. A female branch of the Order was founded by Maria Garcias (died 1426). (2) The congregation of the Observance or of Lombardy, founded by the Spaniard, Lope de Olmedo (1370-1433), who became general of the foregoing Order in 1422. His purpose in establishing a separate congregation was the attainment of still greater strictness. The rule which he drew up was confirmed in 1429, but after his death was exchanged for that of Saint Augustine. The seven Spanish cloisters of the Order were in 1595 united by Philip II. with the foregoing, but the seventeen Italian retained their separate existence under a general residing at Hospitaletto, near Lodi. (3) The congregation of Peter of Pisa (Pietro Gambacorta, 1355-1435), who turned from a worldly to a hermit's life in 1377 and built a church and hermitage on Montebello, near Urbino. Several small communities of Franciscan tertiaries associated themselves with him; the principal settlements were at Vicenza and Mantua. Only simple vows were taken until 1569; but Pius V. imposed the solemn vows and the Augustinian rule. The Order had at one time over fifty houses, including one founded at Walchensee in Bavaria in 1688, and removed to Munich in 1725. (4) The congregation of Fiesole, founded by Carlo di Montegranello and confirmed by Innocent VII. in 1406. It came to possess more than forty houses, including the Convent of Saints Vincent and Anastasius in Rome, but was suppressed as a separate organization by Pope Clement IX. in 1688.

HIEROPHANT, hi'ér-ô-fánt (Lat. *hierophanta*, *hierophantes*, from Gk. *ιεροφάντης*, *hierophantēs*, hierophant, from *ιερός*, *hieros*, sacred + *φαίνω*, *phainō*, to show). The head of the secret worship of Demeter, at Eleusis, who at the celebration of the mysteries showed the sacred objects and explained the ceremonies. He was required to be one of the old priestly family of Eleusis, the Eumolpidae, and probably was prohibited from holding any other office. With him was associated a hierophantes, or possibly two. The hierophant was required to be of mature age and clear voice; he seems to have held the office for life, but the statement that celibacy was required is of doubtful value. The hierophant laid aside his own name on assuming his office, and henceforth was known only as Hierophantes, though his father's name and his deme are ap-

pended as in the case of personal names. His costume was that usually worn by kings in tragedy. Consult Foucart, *Les grands mystères d'Eleusis* (Paris, 1900). See MYSTERIES.

HIEROSOLYMA, hi'ér-ò-sòl'i-mà. See JERUSALEM.

HIG'DEN, RANULF (?-1364). An English chronicler and monk of the Benedictine Order. A native of the west of England, he entered Saint Werburgh's monastery at Chester, in 1299, and is remembered chiefly for his *Polychronicon*, a synopsis of which was printed by Caxton in 1480, and in an English translation two years later. It is a universal history in seven books, extending down to Higden's own day and giving an excellent general idea of the learning of his time. The events after 1342 are recorded by other pens, and the whole has been edited and translated for the "Rolls Series" (9 vols., 1865-86).

HIG'GINS, ANTHONY (1840-). A United States Senator, born at Red Lion Hundred, Del. He graduated at Yale in 1861; studied at Harvard Law School, and in 1864 was admitted to the bar. From 1869 to 1876 he was United States Attorney-General for Delaware, and in 1881 received the Republican vote of the Delaware Legislature for United States Senator. In 1889 he was elected to the Senate, his term of office expiring in 1895.

HIGGINS, MATTHEW JAMES (1810-68). An English essayist and pamphleteer; often called by his pen-name Jacob Omnium. He was born at Benown Castle, and was educated at a school near Bath, at Eton, and at University College, Oxford, where, because of a preference for hunting, he never graduated. In 1847 he became an ardent Peelite, and wrote for the *Morning Chronicle*. In 1850 he married Mrs. Benett, née Tichborn, and moved to London, where he became a popular club man. He was most famed for his letters to the *Times*, over such signatures as 'Paterfamilias,' 'Mother of Six,' and 'A Thirsty Soul,' in which he exposed many abuses; for his dispute with the *Times* in connection with Major Crawley and his court-martial, and for his contributions to the *New Monthly Magazine*, where he first appeared as 'Jacob Omnium' in a satire on mercantile dishonesty; for his essays to the *Edinburgh Review*, the *Cornhill*, under the editorship of his friend Thackeray, and to the *Pall Mall Gazette*. Several of his essays were reprinted under the title, *Essays on Social Subjects* (1875), with a memoir by Sir William Stirling Maxwell.

HIG'GINSON, FRANCIS (1588-1630). An English Puritan clergyman, and one of the first ministers of Salem, Mass. He graduated M.A. at Cambridge University, England, in 1613; received his first charge in the Anglican Church in Claybrooke, Leicestershire, two years afterwards, and later was appointed preacher at Saint Nicholas, Leicester. He, however, became a Nonconformist, and was suspended about 1627; but continued working among his parishioners as a lecturer, and as a tutor to young men preparing for a university course, until, proceedings being instituted against him in the high commission court, he applied for a position as minister to one of the settlements of the Massachusetts Bay Company. He arrived at Salem in June, 1629, and was appointed assistant minister to Samuel Skelton, but died fourteen months later, August

6, 1630. He was author of "A True Relation of the Last Voyage to England, etc.," written from New England, July 21, 1629," printed in ch. xi, of *Young's Chronicles of the First Planters*, etc. (1846); and of *New England's Plantation, or a Short and True Description of the Commodities and Discommodities of that Country* (3d ed. London, 1630). Consult: Felt, "Life of F. Higginson," in *Annals of Salem* (Boston, 1845); and Higginson, *Life of Francis Higginson* (New York, 1891).

HIGGINSON, THOMAS WENTWORTH (1823-). An American essayist, born in Cambridge, Mass., of a distinguished New England family. He graduated at Harvard in 1841, and after some teaching at the Divinity School there in 1847, he took pastoral charge of the Congregational Church in Newburyport; but he left this because of anti-slavery convictions in 1850, when he was an unsuccessful candidate for Congress. After a six years' pastorate in Worcester, Mass. (1852-58), he left the ministry, was active in the anti-slavery agitation, especially in Kansas, served with distinction in the Civil War as colonel of the first regiment of freed slaves, was wounded in 1863, and, after peace, devoted himself to literature, education, and the political rights of women. He resided till 1878 in Newport, but afterwards he made his permanent home at Cambridge. His works have lately been published in a uniform edition. Among the more noteworthy of many volumes are: *Outdoor Papers* (1863); *Malbone, an Oldport Romance* (1869); *Army Life in a Black Regiment* (1870); *Atlantic Essays* (1871); *Oldport Days* (1873); *Young Folks' History of the United States* (1875), translated (French, 1875; German, 1876); *Short Studies of American Authors* (1879); *Common Sense About Woman* (1881); *Life of Margaret Fuller Ossoli* (1884); *Larger History of the United States* (1885); *The Afternoon Landscape; Poems and Translations* (1889); *Concerning All of Us* (1892). His later volumes, beginning with *Cheerful Yesterdays* (1898), continued by *Old Cambridge* (1899) and *Contemporaries* (1899), have mainly dealt with the interesting generation of which he is almost the sole survivor. His latest volume (1902) is a memoir of Longfellow. As an essayist he is noted for his consistent defense of things American, and for his epigrammatic power of expressing thoughts that are often as subtle as they are convincing. Higginson's collected works were published in 7 vols. in 1900. Consult Bentzon, "Un Américain représentatif—Thomas Wentworth Higginson," in *Revue des Deux Mondes* (Paris, 1901), and translated in book form, 1903.

HIG'GINSVILLE. A city in Lafayette County, Mo., 55 miles east of Kansas City; on the Missouri Pacific and the Chicago and Alton railroads (Map: Missouri, C 2). A State Confederate Home is situated here. The city is of importance as a grain, poultry, and coal market, several coal-mines being operated in the vicinity, and has flour-mills, machine-shops, brick-works, a large beehive-factory, etc. The water-works and electric-light plant are owned by the municipality. Population, in 1890, 2342; in 1900, 2791.

HIGHBINDERS (probably *high*, in slang sense + *binder*, variant of *bender*, spree). A name used in California to designate the disorderly and dangerous Chinamen domiciled there. They are not connected with the Six Companies

(q.v.), nor are they regularly organized, but act in an irresponsible, lawless way for and among themselves. They are men without definite occupation, living as best they can upon the Chinese communities, as keepers of evil resorts, gamblers, parasites upon prostitutes, thieves, and criminals generally. The name was originally applied to any rough, and was in use in New York and Baltimore as early as 1849, but has gradually become restricted to its present application.

HIGH COMMISSION, THE COURT OF. An extraordinary tribunal, famous in English history, originating under the Act of Supremacy during the first year of Elizabeth's reign, which authorized the Queen to appoint an ecclesiastical commission to reform or correct all "heresies, errors, schisms, abuses, contempts, and enormities whatsoever." In July, 1559, Elizabeth granted a commission to "Matthew Parker, nominate Bishop of Canterbury, and Edmund Grindall, nominate Bishop of London," with seventeen laymen, constituting them a court for the whole realm. The court might proceed by witness, with or without a jury, or in any way it should deem proper. It might compel attendance on mere suspicion, examine either the witnesses or the accused "upon their corporal oath," and commit them to 'ward' for disobeying its summons or any of its decrees.

The tribunal was created primarily to administer the Acts of Supremacy and Uniformity. As already seen, this first commission authorizes the use of the oath *ex officio*, through which the accused might be forced to convict himself. "This procedure, which was wholly founded on the canon law, consisted in a series of interrogations so comprehensive as to embrace the whole scope of clerical uniformity, yet so precise and minute as to leave no room for evasion, to which the suspected party was bound to answer" upon his 'corporal' oath. According to Strype, the oath *ex officio* was the ground of much of the popular hatred of the High Commission. That tribunal was regarded as a kind of ecclesiastical star chamber; and, in fact, the relations of the two bodies were very close. The real activity of the High Commission began in 1583 on the succession of Whitgift to the office of Archbishop of Canterbury. It was maintained with increased powers during the reigns of James I. and Charles I.; but, hated by the people and opposed by the law courts, with the Star Chamber it was abolished by the Long Parliament in 1641. It was restored in a modified form by James II. in 1686, but was definitively abolished in 1688. The commission issued by Elizabeth authorized the commissioners to act throughout the whole kingdom; but in practice their jurisdiction was restricted to the Province of Canterbury or Southern England. "There is evidence to show that during, at all events, the greater part of the period 1559-1640, a northern commission was sitting at York, Durham, Ripon, or elsewhere, and discharged functions analogous to those discharged by the southern commission at Lambeth, Fulham, Croydon, or Canterbury" (Prothero, *Select Statutes*, xlv.). There was also a commission for Ireland, and until 1606 commissions were sometimes issued for particular dioceses. The text of the principal commissions and other documents may be found in Prothero's *Select Statutes* (Oxford, 1894). Consult also: Hallam, *Constitutional History* (new ed., London, 1876); Strype, *Annals* (4

vols., new ed., Oxford, 1824), vol. iii.; Burn, *The Star Chamber: Notices of the Court and Its Proceedings, with Notes on the High Commission*; Gardiner, *Report of Cases in the Court of Star Chamber and High Commission, 1631-32*, in Camden Society, new series, vol. xxxix. (Westminster, 1886); and the histories of Green, Ranke, and Gardiner.

HIGH COURT OF JUSTICE. The division of the English Supreme Court that has general original jurisdiction. It was created by the Judicature Acts (q.v.).

HIGHER CRITICISM. See BIBLICAL CRITICISM.

HIGHER LIFE, THE. A name given to an advanced state of grace which many persons claim may be reached in this life. It is also called entire holiness, full salvation, and Christian perfection. The doctrine has various forms. (1) Complete sinlessness may be reached by a single act of complete consecration to God, continuing according to some during life, according to others for indefinite periods. The objection to this claim is twofold. Complete sinlessness does not seem to be established as a fact. Nor is any previous state, founded on a consecration of self to God which is less than complete, truly a Christian state at all. (2) The state is one of perfection of Christian love, by grace made supreme in the soul. Most sin would necessarily be excluded by such a love, and errors that were objectively wrong would not be subjectively sins, because not intended as such. The question as to this form of the doctrine is one of fact. Is there reason to believe that given individuals are thus under the domination of uninterrupted, perfect love? (3) The state is attained by conformity to the actual demands of God, which are lowered from the strict standard of ideal perfection to meet the capacity of our feeble natures. This theory confounds the standard of conscience and the demands of God with what may be effected as a rational probability that men shall attain. Consult Johnson, *The Highest Life* (New York, 1901).

HIGH GATE. A northern, hilly section of metropolitan London, in Middlesex, 5 miles north-west of Saint Paul's (Map: London, C 7). It commands a fine view of the city, comprises many elegant villas and historical residences, and is the seat of important benevolent institutions. The Highgate or North London Cemetery contains the graves of numerous celebrities, including Lord Lyndhurst, George Eliot, Coleridge, and Faraday.

HIGH-HEELS AND LOW-HEELS. The two political parties of Lilliput, in Swift's *Gulliver's Travels*. They are so called from the distinguishing mark adopted by themselves. They are designed to represent respectively the Tories and the Whigs.

HIGHHOLE (variant of *highhoc*, *heighaw*, *haihour*, possibly onomatopoeic in origin; connected by popular etymology with *high* + *hole*). A local name in the United States for the flicker (q.v.), heard in many forms, and having many relatives in the provincial speech of both Great Britain and America. Consult *Bulletin Nuttall Ornithological Club* (Cambridge, 1881).

HIGHLAND, or KYLOE CATTLE. A race of small hardy cattle, of the western 'Highlands'

of Scotland, descended from ancient stock, and noted for their shaggy, usually reddish coats and hardy constitutions. They are comparatively short-horned, and feed in a semi-wild condition upon the hilly moors. See Plate of WILD CATTLE, under CATTLE.

HIGHLANDERS. Scottish regiments of the British Army, the oldest of which is the Black Watch (q.v.), founded in 1668. The Scottish social structure and conditions generally offered peculiar facilities for good recruiting—which fact, together with their proved military qualifications, encouraged the British Government in the organization of the following regiments:

ORIGINAL TITLE	Regimental number	Date of formation	Present territorial title	Number and headquarters depot of territorial district		Battalion numbers	
						1st	2d
Black Watch, The.....	42	1704	Royal Highlanders, The.....	42	Perth, N. B.....	42	73
71st Highlanders.....	71	1777	Highland Light Infantry.....	71	Hamilton, N. B....	71	74
Ross-shire Buffs.....	72	1777	Seaforth Highlanders.....	72	Fort George.....	72	78
74th Highlanders.....	74	1787	2d Battalion Highland L. I.....	71	Hamilton, N. B....	71	74
Duke of Albany's Own..	78	1793	2d Battalion Seaforth High'nders.	72	Fort George.....	72	78
Cameron Highlanders...	79	1805	The Queen's Own, Cameron H'nders	79	Inverness.....	79	79
Gordon Highlanders...	92	1796	2d Battalion Gordon Highlanders	75	Aberdeen.....	75	92
Sutherland High'nders.	93	1800	2d Bat. Argyle and Sutherland H.	91	Stirling.....	91	93
Other Scottish regiments (not Highlanders) are:							
Cameronians.....	26	1688	Scottish Rifles.....	26	Hamilton, N. B....	26	90
The Douglas Reg't.....	1st	1660	Royal Scots, Lothian Regt.....	1	Glencorse, N. B....	1	1
Scots Fusilier Guards...	21	1660	Scots Fusiliers.....	21	Ayr, N. B.....	21	21

The personnel of the Highland regiments is no longer confined to Scottish officers and men; the changed industrial conditions and widely diffused educational facilities having reduced recruiting in Scotland to a very low ebb, despite the efforts of the British Government. See *British Empire* under ARMIES.

HIGHLAND FLING. One of the distinctive national dances of Scotland. It is ordinarily danced by three or four persons to the music of the strathspey (q.v.). The time is $\frac{3}{4}$, and most of the music is distinguished by an extended use of syncopation. Its name is derived from the peculiar, flinging action of the steps as the performer dances alternately on each leg, throwing the other out in front and behind. Like all Scotch dances, the Highland fling is animated, sharp, and vigorous.

HIGHLAND MARY. A poem by Robert Burns (1792), celebrating his affection for Mary Campbell, a nursemaid in the family of Gavin Hamilton and daughter of a sailor settled near Dunoon. She died shortly after their betrothal.

HIGHLAND PARK. A city in Lake County, Ill., 22 miles north of Chicago; on Lake Michigan and on the Chicago and Northwestern Railroad (Map: Illinois, E 1). Picturesquely situated on wooded bluffs one hundred feet above the lake, it is a popular residential suburb of Chicago, and has the Northwestern Military Academy and other educational institutions. Fort Sheridan (q.v.) adjoins the city on the north. Population, in 1890, 2163; in 1900, 2806.

HIGHLANDS. A name applied to the mountainous region north of and including the Grampian Mountains in Scotland. This district has no political or civil boundary, and is separated by only a vague line of demarkation from the division called the Lowlands. It may be briefly described

as that portion of the north and northwest of Scotland in which the Celtic language and manners have lingered until modern times. See GREAT BRITAIN; also Browne, *History of the Highlands and the Highland Clans* (4 vols., 1838).

HIGHLANDS OF THE HUDSON. A group of mountains extending in a southwest-northeast direction through Rockland, Orange, Putnam, and Dutchess counties, N. Y., and forming a northerly continuation of the Blue Ridge of Pennsylvania and New Jersey. The Hudson River crosses the mountains through a winding gorge whose sides rise abruptly in places to peaks about

1500 feet above the water. The region abounds in beautiful scenery, and has great historic interest. Stony Point and West Point, two promontories on the west side of the river, were the scenes of stirring struggles during the Revolution. See HUDSON RIVER; NEW YORK.

HIGH LIFE BELOW STAIRS. An amusing farce by James Townley (1759). The authorship was concealed for some time, and the comedy has been attributed to Garrick. It has been translated into French and German, and frequently produced. See LADY BAB.

HIGHNESS. See TITLES OF HONOR.

HIGH PLACE (Heb. *bamah*). A term never used in its literal sense 'heights' except in poetry, but always in prose as a designation of a sanctuary. All worship in ancient Israel was conducted at high places, and there was, therefore, a very large number of such shrines. Generally they were located on the top of a hill or a mountain, which accounts for the name; but sometimes a *bamah* was within a city, at the gate, or in a valley, not necessarily even on an artificial mound, as has been supposed. At such a high place there would be an altar, a sacred stone of phallic shape, a wooden post, a sacred tree, or often a sacred fountain. While some may have been only small shrines, others had large halls where the worshipers took part in the sacrificial meal, as well as an *adytum* for the image of the deity. There probably was an idol in every such temple. At Bethel and Dan there were bull images of Yahweh, at Jerusalem a brazen serpent as well as bulls. The worship at these sanctuaries was, in earlier times, characterized by joy, by eating, drinking, dancing, and sexual indulgences. This rejoicing was hallowed by offerings of sacrifices, libations, and intercourse with the hierodules. As most of these

high places were taken over from the Canaanites and the denunciations of the prophets show the continuance in Israel, even at a late date, of the worship of the Baals, it is probable that with Yahweh other deities also, especially the *Baalim* or *Elim*, 'lords' or 'gods,' to whom the sanctuaries had once belonged, were recognized by sacrifices in these temples. That these high places were once regarded as altogether legitimate is evident from the fact that Samuel conducted worship at a number of them, David, Solomon, and all his successors down to Josiah sacrificed in them, and at these sanctuaries the stories of the patriarchs were told. Many of the stories of Genesis cluster about the high places of Shechem and Bethel, Mizpah and Mahanaim, Hebron and Beersheba, and Beer-la-hai-roi. But the prophets of the eighth century, men like Amos and Hosea, Isaiah and Micah, denounced these temples of the nation and the sacrificial cult there carried on. They maintained that Yahweh had not commanded that sacrifices be brought to Him, that Israel was happiest and most pleasing to Yahweh when no sacrifices could be offered, viz. in the wilderness; and they attacked the drunkenness and religious prostitution that flourished at these temples. While the earliest law of Israel, the Covenant Code (Ex. xxi.-xxiii.), regards worship at those sanctuaries where Yahweh had revealed Himself as perfectly legitimate, the Deuteronomic law introduced by King Josiah about 620 declares that sacrifices shall be offered in only one place. This centralization of the cult in Jerusalem may have been an ideal of the local priesthood as early as the days of Hezekiah, and some Judean temples may have been closed and destroyed as is stated in II. Kings xviii. 4, 22; xxi. 3, though it is probable that the author of these verses has wrongly given Hezekiah credit for the same reformatory work as Josiah. That Josiah attempted to carry out the change proposed in Deuteronomy, and did so with a high hand, there can be no doubt (II. Kings, xxiii.). But it is equally certain that the affection of the people could not by his violent measures be diverted from their ancient temples. The destruction of the temple in Jerusalem by Nebuchadnezzar naturally enhanced the importance of the smaller shrines and caused a reaction against the Yahweh cult in favor of the worship of other gods. The reluctance to rebuild the temple in Jerusalem complained of by Haggai was no doubt in part caused by this reaction. There is evidence in parts of the Book of Isaiah written during the Persian and Greek periods of the survival of licentious and idolatrous rites that can scarcely be connected with the temple in Jerusalem. A positive proof of the existence of other temples besides that in the capital at a very late time is found in the letter of Onias to Ptolemy and Cleopatra, quoted by Josephus (*Ant.* xiii. 3, 1), in which he states that the Jews of Egypt, Coele-Syria, and Phœnicia have many temples of different patterns, and therefore wishes to have permission to build his temple in Leontopolis (see ONIAS'S TEMPLE), on the model of that in Jerusalem. From this it must be concluded that the idea of the illegitimacy of all worship except at Jerusalem cannot have been universally cherished among the Jews, and that the hill temples are likely to have attracted worshippers as late as in the second century B.C. If Onias's letter should prove to be a forgery, its testimony would not be

of less value, as it would then show a still longer survival of this attitude. Consult Von Gall, *Altisraelitische Kultstätten* (Giessen, 1898), and Moore, in *Encyclopædia Biblica*.

HIGH PRIEST (Heb. *hakkohen haggadol*). The chief of the Jewish priesthood. There is no evidence that in the pre-exilic period there was any distinctive office of high priest. In early days among the Hebrews, the rulers united in their persons priestly and civil functions, and to a certain extent the Kings of Israel and Judah continued to perform offices of a priestly character. By the side of the king-priest there were guardians of the sanctuaries scattered throughout the country, and as some of those (e.g. at Shiloh, Bethel, Samaria, and Jerusalem) grew in importance an ecclesiastical government gradually developed, and naturally in such significant centres as Samaria and Jerusalem there was always one priest who was regarded as supreme over the others. In the Deuteronomic code there is no reference as yet to the high priest as such; nor does Ezekiel make mention of such an office in his sketch of the future theocracy. Deuteronomy makes no distinction between priests and Levites; in Ezekiel the priests are members of the Zadokite family, to whom is assured control of the temple at Jerusalem, while the Levites are the body-servants of the priests and represent those attached to the old sanctuaries of the country, which were set aside with the establishment of the principle of central authority for the temple of Jerusalem. (See DEUTERONOMY.) In the post-exilic priestly code (see EZRA; LEVITICUS), however, the prerogatives of the Zadokites are thrown aside, and in accord with the general theory underlying this code, which traces everything back to the days of Moses, the priesthood is fixed by Moses himself in the family of his brother Aaron. The latter is accorded the dignity of high priest and the office is handed down to Aaron's eldest son, Eleazer, and by the latter to his son, Phinehas, and so in regular succession. The regulations for the office are set forth in great detail in the Priestly Code (cf. Lev. viii., x., xxi., etc.), but it must be borne in mind that these regulations remained to a certain extent in the domain of theory. Many more restrictions were attached to the office than belonged to the ordinary office of a priest. The high priest was allowed to marry none but a virgin, and one of his own tribe; every impure contact, even of the dead bodies of his own parents, he was strictly forbidden, besides many other things that might cause defilement. His functions consisted principally in the general administration of the sanctuary and all that belonged to the sacred service. He alone was allowed to enter the Holy of Holies on the Day of Atonement, and to consult the urim and thummim (q.v.). His costume was of surpassing costliness and splendor, comprising numerous vestments in addition to those of the ordinary priests. This costume was laid aside by the high priest when, on the Day of Atonement, he went to perform the service in the Holy of Holies; a simple garb of white linen—the funeral dress of the Jews in later times—was all he wore on that occasion. The revenues of the high priest were in the main the same as those of the other priests; but, according to the Talmud, he was to be richer than these, and if his own means were insufficient, he was to be

provided with means by his brethren, in virtue of his position; the other priests never addressed the high priest but by *ishi kohen gadol*, 'my lord high priest.' Before the law, however, the high priest was equal to any other Israelite. See PRIEST; LEVITE; AARON; LEVITICUS.

HIGH SCHOOLS. A term that has been variously employed in different countries at different times to indicate a type of schools. In Germany in official language it is customary to refer to the universities as high schools (*Hochschulen*). In the middle of the sixteenth century in Edinburgh the designation was applied to a famous educational institution of a liberal character, but in grade below the university. In the United States it is very generally used to indicate an important and definite type of schools which forms a component part of the public-school system. This term came into use between 1820 and 1850, when, in place of or by the side of schools called 'academies,' which were maintained by endowment or at private expense, schools of a corresponding grade were established at public expense. Such institutions were variously designated at first. In Philadelphia the Central High School yet retains its original name; in New York the corresponding institution was known first as the Free Academy, and later as the College of the City of New York. This institution has since expanded in scope until it offers approximately the ordinary college course. In Baltimore the corresponding institution is known as the City College, while similar institutions for girls bear the name of high schools. The Boston Latin School, founded in early colonial times, is a free public high school, fitting boys for college.

The term high school came into use in Boston when in 1821 the English High School was established as complementary to the Latin school. A few years later the girls' high school was founded. During the period of Horace Mann's secretaryship of the Massachusetts Board of Education (1837-48) a system of high schools was instituted. This example of Horace Mann was followed by other educational leaders, notably by Henry Barnard in Connecticut. From the middle of the nineteenth century the movement in the establishment of high schools became very general. In many of the Western States high schools have from the first formed a part of the public-school system, and in some instances their maintenance is recognized by the Constitution of the State. During the year 1899-1900 there were reported to the United States Commissioner of Education 6005 public high schools, having an attendance of 519,251 pupils. This was an increase in the year of more than 137 per cent. in the number of schools, and of more than 155 per cent. in the number of students attending. The courses of study, the terms of admission, and the length of time required for completing the instruction differ widely, but in general the term high school in this country means a school supported from the public treasury, where tuition is usually (but not necessarily) free, and where pupils of both sexes are carried forward from the grammar schools to the study of 'higher' branches, and thus fitted for active life or for admission to universities, colleges, and technical schools. In its origin the high school, as also the academy, arose in answer to the demands for schools of a lower grade than colleges, appealing to a wider constituency and satisfying more

needs. For the most part the high school yet retains these characteristics. In the central and western Commonwealths of the Union it fits directly for colleges, and especially for the State university; but this is due to the fact that there is a very great freedom of choice in regard to the subjects essential for entrance to college and university courses. The adjustment has been made by the college rather than by the high school. By far the larger part of high-school graduates do not enter college. However, high schools seek to meet various needs either by offering a variety of courses or in large cities through distinct schools. Thus, there are the classical courses or schools, which are distinctively college-preparatory in their nature; the scientific or English courses or schools, which furnish preparation for professional schools or simply equipment in general; there are also of recent years manual training (q.v.) high schools or courses, giving a technical or industrial preparation, and commercial high schools, with a corresponding purpose in view. No part of the educational system of the United States is so responsive to local demands and to public opinion. Hence arises the greatest variety of local conditions in these schools in city and country. For the most part they are wholly under local control, and are subject to general State supervision of only a nominal character. In some States, such as New York, this supervision is more intimate; in others, such as California or Michigan, it is exercised chiefly through the State universities. This amenability to local influences constitutes the greatest element of their strength, while at the same time the absence of general standards constitutes a most serious element of weakness. That the public high school is the representative secondary school of the United States is indicated by the fact that during 1899-1900 private secondary schools numbered only 1632, with an attendance of 110,797 pupils, while the increase for the previous decade had been only 21 per cent. and 16 per cent. respectively.

Consult: Butler, *Education in the United States* (Albany, 1900); Brown, *History of Secondary Education in the United States* (New York, 1902); *Reports of the United States Commissioner of Education* (Washington). See ELECTIVE COURSES AND STUDIES; GRAMMAR SCHOOL; NATIONAL EDUCATION, SYSTEMS OF; SECONDARY SCHOOLS.

HIGH SEAS. As a term of admiralty law in England, the open, uninclosed waters of the ocean; that "part of the sea which lies not within the body of a county." It is used in contradistinction to bays, harbors, and arms of the sea inclosed within the *fauces terre*, or narrow headlands or promontories. The high seas, or 'the main sea,' to use Sir Matthew Hale's synonym, are deemed within the exclusive jurisdiction of the Admiralty, up to high-water mark when the tide is full.

The term has been much considered by the judicial tribunals of the United States, and the Federal Supreme Court has held it applicable to the open, uninclosed waters of the Great Lakes. This conclusion, however, was not unanimous. According to the majority view, the Great Lakes possess every characteristic of seas. They are of large extent, wholly navigable by the largest vessels; they separate States in many instances, and in some instances constitute the boundary

between independent nations; and their waters, after passing long distances, debouch into the ocean. We may as approximately designate the open, uninclosed waters of the lakes as the high seas of the lakes, as to designate similar waters of the ocean as the high seas of the ocean, or similar waters of the Mediterranean as the high seas of the Mediterranean. A minority of the court vigorously dissented, insisting that legal usage had limited the term to the ocean, the common highway of all nations.

While the high seas are, as a rule, the common highway of all nations and not the subject of ownership or monopoly by any one, a State is entitled to a large measure of jurisdiction over that part of them lying within a marine league of its coast. This control is accorded by international law, in order that a State may protect itself by proper fiscal and defensive regulations. Accordingly, within this three-mile limit, the vessel of a friendly power may be boarded and searched, on suspicion of being engaged in unlawful commerce, or of violating the revenue laws. It may even be chased beyond these territorial waters and arrested and searched outside their limits. See *BERING SEA CONTROVERSY*; *FISHERIES*; and *MARE CLAUSUM*. Consult the authorities cited under the above titles and under *ADMIRALTY LAW*; also *United States vs. Rodgers*, 150 United States Reports, 249 (1893).

HIGH STEWARD. See *STEWARD*.

HIGH TREASON. See *TREASON*.

HIGHWAY. A place over which the public generally has a right to pass. In Lord Holt's language, "it is the *genus* of all public ways." As a term of the common law, it includes roads, streets, foot-paths, bridle-paths (or ways along which the public is entitled to ride or lead a horse), driftways (or places along which the public may drive cattle), public canals, ferries, bridges with their approaches, public squares, and navigable streams. In statutes, however, it is sometimes used in a narrower sense, being limited to country roads.

Ordinarily, the right of the public in a highway is that of user, not of land-ownership. To this extent it partakes of the nature of an easement (q.v.), but it is not a true easement, because there is no dominant estate. The public enjoys a right of way, but not as the owner of an estate in land to which such a right is appurtenant. A private way, on the other hand, is an easement, for its user belongs to particular persons, by reason of their ownership of certain lands. Whether a place of passage is a highway or a private way does not depend upon its being a thoroughfare, that is open at both ends, or leading to a public place. It is now well settled that a *cul-de-sac* may be a highway. If the public is entitled to pass and repass, the place is a highway, although its terminus is at the gate of a private house.

Highways are created either by act of the Government, or by dedication of the landowner and acceptance by the public. Dedication may be either express or implied. It is of the first kind where a landowner formally lays out a public road or street and gives notice that the public may use it. The dedication is implied where the public makes use of a way without objection of the landowner, and under circumstances indicating his assent to the public use. One may

irrevocably convert a portion of his land into a highway, by selling lots bounded along a specified road or street, without securing an acceptance of the highway by the proper authorities. In such a case, he is bound to keep the road or street open for the benefit of those who have been induced by his representations to become purchasers of abutting property, but the public is not bound to keep the way in repair. In order that this burden be cast upon the public, there must be an acceptance by the proper authorities. At common law, a formal act of acceptance is not required. Any assumption of control, which is properly exercisable by the proper authorities in the case of highways, such as letting a contract for the improvement of the road or street in question, will establish an implied acceptance. In the United States country highways are created more frequently by the act of Government than by private dedication. At times they are established by special legislation, but as a rule under general statutes. These differ in the various States, although their principal provisions are much alike. They ordinarily require a formal application for the highway, proper notice to the various persons whose property will be directly affected, a proper hearing before certain officers or tribunals, a proper assessment of damages or of benefits, and a proper record of the proceedings. After a highway has been established, it can be lawfully altered or vacated only by act of Government. This may be accomplished by special legislation. As a rule, however, the State delegates its authority over this subject to county, town, or city officials. In this country, even the State cannot change or vacate a highway without making compensation to landowners, whose property rights are taken away thereby. This is because of constitutional prohibitions against the taking of private property for public use without just compensation. In England, Parliament is not thus hampered by constitutional limitations.

The ordinary rule, both in England and in this country, is that the public has only a user of the surface of the highway; the fee of the land remains in the adjoining owner. Under the first branch of the rule, the public is entitled to use every part of the highway, and is not limited to the traveled or beaten part only. Accordingly, if any portion of a highway is unlawfully occupied by a fence, gate, wall, or building, such obstruction is a nuisance, and may be abated either by the public authorities, or by any traveler whose right to use the road is interfered with. This is one of the few cases where a person is allowed to take the law into his own hands. It is his duty, in such cases, to proceed in a peaceable manner, and to do no more injury than necessary to the property which constitutes the nuisance. The person who is responsible for the nuisance is liable in damages to any one injured thereby. In some circumstances a traveler has a right to deviate from the highway and go upon adjoining lands. This is based upon the ground of public convenience and necessity. Highways being established for the use and benefit of the whole community, a due regard for the welfare of all requires that when temporarily obstructed by storm or flood, travel should not be interrupted. A person traveling on a highway is in the exercise of a public right, and if he is compelled by impassable obstructions to leave the

thoroughfare and go upon private lands, he is still in the exercise of the same right. But this right of deviation rests upon necessity, not upon the personal convenience of the traveler. It is properly exercisable, therefore, only when the obstructions are due to sudden or recent causes, or when the traveler cannot make his journey by other ways.

Under the second branch of the rule, stated above, if the land on both sides of a highway belongs to the same owner, then the right to the ground beneath the road belongs to him also; and if the land on one side belongs to a different owner from the land on the other side, then each is presumed to have the right to the ground under the highway up to the middle line. This rule is more than a mere theory, for though neither of the adjoining owners can ever interfere with the passage of the public, who have an absolute right forever to use it for every lawful purpose of transit, yet the adjoining owner has all the rights incidental to the property which do not interfere with this public right of passage. Thus, if a mine were discovered under the road, the adjoining owner would have the sole right to dig it and keep the contents; all that he would require to attend to would be to leave sufficient support for the surface of the road. So, in like manner, where there are strips of land at the side of the road on which, trees grow or grass, these belong solely to the adjoining owner, and the public have no right to them. Another consequence follows, that if, for example, a gas company or a water company without due permission were to presume to take up the highway in order to lay pipes under the surface, this would be not only an indictable nuisance as regards the public, inasmuch as it obstructs the use of the road for the time being, but would subject the company to an action of trespass at the suit of the adjacent owner, whose property consists of all that lies under the surface of the highway. Still another consequence of the same rule is, that if a person is loitering on a highway, not with the intention of using it as a traveler, but for some unlawful purpose, such as creating a disturbance and abusing an adjoining property-owner, he may be dealt with as a trespasser.

The English common law imposed the duty of maintaining and repairing all highways upon the parish. If the duty was neglected the parish was indictable, and was liable for damages sustained by travelers through its negligence. Public bridges, although included in the term highways, as we have seen, were an exception to the rule just stated. The duty of constructing and maintaining them rested upon the county as a part of the *trinoda necessitas*, or threefold service, to which all grants of absolute ownership of land were formerly subject. At present, the maintenance and general control of highways and bridges in England and Wales are committed chiefly to district and county councils, in accordance with the Local Government Act, 1894 (56 and 57 Vict., c. 73).

In this country, while every highway is subject to the control of the State or Federal Government, comparatively few roads are constructed and maintained directly either by a State or the nation. The power to establish them and the duty of keeping them in repair are generally delegated to some subdivision of the State, such as the township, the county, or the city. The liabil-

ity of these political subdivisions for their negligent performance of this duty varies in the different States. As a rule, however, they must respond in damages for injuries caused to travelers by defects in highways of which the proper authorities had notice, and which it was their duty to remedy. In some States, a township is divided into road districts, and all ordinary repairs are made by the inhabitants of these several divisions, while extraordinary repairs, as well as the maintenance of bridges, belong to the township at large. In other States, the unit of highway administration is the county or city.

The Legislature has power to commit the work of improving and repairing highways to private corporations. Accordingly, turnpike and similar companies receive from the State authority to construct roads and keep them in good repair, and to reimburse themselves by tolls levied upon the members of the public using the roads. By this system, the cost of maintaining proper roads is shifted from the property-owners of a particular territory to the traveling public; but the cost is still borne as a tax, which the State has a right to impose. It is also established that the Legislature of a State may lawfully authorize temporary obstructions in highways, and may delegate the exercise of this power to municipal corporations. Hence come city ordinances providing for permits to deposit building materials in city streets, to erect stands, to use apparatus for hoisting goods, and the like. Gas and water companies receive authority to excavate highways and lay pipes; telegraph and telephone companies are permitted to erect poles and string wires along public thoroughfares, and even railroad companies are allowed to lay tracks and run cars over their surface. If the use which such companies are authorized to make of the street subjects adjoining property to injuries not contemplated or provided for when the street was laid out, it may give the property-owners the right to compensation for these injuries from the users. The use of city and village streets for gas and water mains is generally deemed to be within the scope of the original dedication, but not so in the case of country highways. Railroads, on the other hand, are usually regarded as an encroachment on the rights of the owner of the fee of a road, whether urban or rural, though the contrary has usually been held in the case of street railways.

In England, teams meeting upon a highway turn to the left. In this country, they turn to the right. This usage of the road has received legislative sanction in some of our States, and penalties are imposed upon its violators. Consult: Woolrych, *The Law of Ways* (2d ed., London, 1847); Elliott, *The Law of Roads and Streets* (Indianapolis, 1900); Birdseye, *General Statutes of New York—Highway Law* (New York, 1901).

HIKONE, hē'kō-nā. A town in the Japanese Prefecture of Shigo, situated in the central part of Nippon, on the eastern shore of Lake Biwa (Map: Japan, D 6). Its chief attraction is the remains of a fine feudal castle, the former seat of a famous Daimio. Population, about 19,000.

HILALI, hā-lā'le, BADR UD-DIN. A Persian Sufi poet of the first third of the sixteenth century, born in Astrabad and educated at Herat. In 1531 he was imprisoned and killed by Obeid

Khan, as a Shiite heretic, although it seems certain that he had long before forsaken the national heresy and become an orthodox Sunnite. His poems include the epics, *Sifat Alasyikin* ("On the Ways of Lovers"), and, most famous of all, *Shāh u Gada* ("King and Dervish"), translated by Ethé in *Morgentländische Studien* (1870), and the lyric *Divan*, published at Cawnpore in 1864.

HILA'RIA (Lat. nom. pl. of *hilaris*, Gk. *ἰλαρός*, *hilaros*, gay). A Roman festival, celebrated in honor of Cybele at the vernal equinox. It began on March 22d and closed on the 25th. The last day of the feast was the most important, and on it the inhabitants of the city abandoned themselves to the most extravagant merry-making. The only religious ceremony in connection with it was the solemn procession of the priests who bore round the streets the statue of the mother of the gods. The festival celebrated the departure of winter, and hailed the approach of spring.

HILA'RION, SAINT (c.288-371). The reputed founder of monachism in Palestine. According to the legendary and untrustworthy account of his life, he was born at Tabatha, near Gaza, in 288, was converted at Alexandria, and, attracted by the fame of Saint Anthony, went to visit the latter in his hermitage and became his disciple. Returning to Palestine with some companions, while still only a lad of fifteen, he gave away all the property which he had inherited by the recent death of his parents, and withdrew into the desert between the sea and the marshes on the Egyptian border. He observed the most rigid asceticism, and after twenty years of this life was rewarded with rapidly growing fame, miraculous gifts being attributed to him; disciples and imitators multiplied to the number of two or three thousand, all under the spiritual control of Hilarion. When sixty-three years old, the death of Saint Anthony being revealed to him, he went to Egypt and visited the scene of that saint's labors; afterwards he proceeded with a favorite disciple, Hesyehius, to Sicily, where his popularity rendered the quiet and retirement which were congenial to him impossible. A further migration to Epidauros thus became necessary, and ultimately he found a resting-place in Cyprus, the diocese of his friend Epiphanius, where in a lonely cell among some almost inaccessible rocks he died in 371. He is commemorated by the Roman Church on October 21st. Consult Israel, "Die Vita Hilarionis des Hieronymus," in *Zeitschrift für wissenschaftliche Theologie* (Jena, 1880).

HIL'ARY (Lat. *Hilarius*). Pope, A.D. 461-68. He was an earnest promoter of the faith, and severe in discipline. During his pontificate canons were adopted forbidding the ordination of men who had married a second time, or those who had married widows, and also forbidding bishops to nominate their successors. He is a saint in the Roman calendar, and his day is September 10th.

HILARY, SAINT, Bishop of Arles (401-49). A churchman whose name occupies a conspicuous place in the history of the fifth century. He was born at Arles, and was made bishop there in 426. As metropolitan bishop he became involved in a serious controversy with the Pope, Leo the Great. The cases of two deposed bishops having been

carried to Rome on appeal, the condemnation was reversed; but Hilary refused to submit to the decision, maintaining that the authority was uncanonically exercised. In the end, however, he sought a reconciliation with the Pope, and the dispute was amicably terminated. Hilary died at Arles in 449. His works are in Migne, *Patrol. Lat.*, i. His day is May 5th.

HILARY, SAINT, Bishop of Poitiers (c.320-66). One of the Latin Church fathers. He was born of pagan parents at Poitiers about 320. His conversion to Christianity was mainly the result of his own study. About the year 353 he was elected bishop of his native city, and immediately rose to the first place in the Arian controversy. Having provoked the displeasure of the Court party, he was imprisoned and sent into exile in Phrygia (356); but appears in the Council of Seleucia in 359, and was permitted to resume possession of his see, where he died in 366. The Church holds his day on January 13th. Hilary's theological writings are especially valuable for the history of the Arian party, and particularly for the doctrinal variations of that sect, and the successive phases through which it passed between the Council of Nicaea and the first Council of Constantinople. The best edition is that of the Benedictine Dom. Constant (Paris, 1693), or the reprint of it with additional matter by Maffei (Verona, 1730; in Migne, *Patrol. Lat.*, ix. and x.). His selected works, with biographical and critical introductions, have been translated in the *Nicene and Post-Nicene Fathers*, 2d series, vol. ix. (New York, 1890). His determined opposition to Arianism won him the epithet 'Athanasius of the West.' For his life, consult Cazenove (London, 1883) and Largent (Paris, 1902).

HILARY TERM. In English law, one of the four terms held for the administration of justice by the courts of common law, and named from the saints' days nearest to the date of beginning the terms. Hilary term was formerly appointed to commence on January 11th and to end on January 31st. It is now, by statute, a movable term, ending on the Wednesday before Easter. See **TERM (OF COURT)**.

HIL'DA. A New England girl who goes to Rome to pursue the profession of painting, in Hawthorne's *Marble Faun*. A watch-tower which contains an image of the Virgin, and in which the original of this character is supposed to have kept a light continuously burning, is still pointed out, in Rome, as Hilda's Tower.

HILDA, or **HILD**, SAINT (614-80). Abbess of Streanshalch or Whitby. She was a member of the royal family of Northumbria, and was baptized by Paulinus (q.v.), with her kinsman, King Edwin, April 11, 627. During the pagan reaction which followed Edwin's defeat and death Hilda was tempted to settle with her widowed sister Hereswid at the Monastery of Chelles, 10 miles from Paris; but she was recalled to England by Bishop Aidan (q.v.), and in 649, two years after her consecration as a nun, she was appointed to succeed Heiu, the abbess of Heortea, or Hartlepool. When, in fulfillment of the vow which he had made before the decisive battle with Penda (November 15, 655), Oswy dedicated his infant daughter to God, it was to the care of Hilda that he intrusted her. In 657 the abbess founded the famous monastery on the cliffs of Streanshalch or Whitby, and for the next twenty-

two years she ruled over her double community of monks and nuns, among whom were Saint John of Beverley and the poet Cædmon. Hilda died November 17, 680. Her day in the Roman calendar is November 17th.

HILDEBERT OF TOURS, tōor (c.1055-c.1133). A French prelate and author, born at Lavardin, near Vendôme. Tradition says he was the pupil of Berengarius of Tours, but this is not established. In 1092 he was made archdeacon, and in 1097 Bishop of Le Mans. After some difficulties with the Count of Le Mans, the Bishop found a new enemy in William Rufus, who took the city about 1099. He had constant quarrels with the neighboring prelates, and finally was in almost open rebellion against the King, Louis the Fat. In 1125, somewhat against his will, he was elected Bishop of Tours. Two years afterwards he presided at the Synod of Nantes. Toward the end of his life he was on more amiable terms with the King. The works of Hildebert were edited by Antoine Beaugendre (1708), but far from perfectly, and in part by Baluze and Muratori. They consist of sermons, letters, theological writings, and poems. A collection of the latter was published under the title *Mélanges poétiques d'Hilbert de Lavardin* (1882). The treatise *Tractatus Theologicus*, formerly attributed to Hildebert, is by Hugues of Saint Victor.

HILDEBRAND. See GREGORY VII.

HILDEBRAND, hil'de-bränt. The pseudonym of the Dutch poet Nickolaas Beets (q.v.).

HILDEBRAND. An aged warrior and sage in German legend, the tutor of Dietrich von Bern. He appears in the *Hildebrandslied*, and plays a leading part in the *Nibelungenlied* and other legends.

HILDEBRAND, BRUNO (1812-78). A German economist and statistician, born at Naumburg-an-der-Saale, and educated at Leipzig and at Breslau, where in 1839 he became professor. In 1841 he was appointed to a professorship at Marburg, from which he was suspended in 1846, because of the tone of a contribution to a London paper. He was elected to the National Assembly at Frankfort from Marburg in 1849, after having been reinstated in his academic position. He went to Zurich as professor in 1851, and five years later to Bern as the head of the new Swiss Bureau of Statistics. But, as a result of differences with his superiors, he was dismissed, and in 1861 became professor in the University of Jena and director of the Bureau of Statistics. His works comprise: *Nationalökonomie der Gegenwart und Zukunft* (1848); *Die Kurhessische Finanzverwaltung* (1850); *Statistische Mitteilungen über die volkwirtschaftlichen Zustände Kurhessens* (1853); and *Beiträge zur Statistik des Kantons Bern* (1860). He edited *Jahrbücher für Nationalökonomie und Statistik* (1863 et seq.).

HILDEBRAND, HANS OLOF (1842-). A Swedish historian and antiquarian; son of the archaeologist and numismatist Bror Emil Hildebrand (1806-84). He was born at Stockholm; studied at Upsala; in 1865 was made amanuensis of the archaeological museum; and in 1879 succeeded to his father's position of State antiquarian. His special study was Norse archaeology and the related subjects, and his works are: *Svenska folket under hednatiden*

(last edition, 1872); *De förhistoriska folken i Europa* (1873-80); *Fynder i Troas og Homers Troja* (1878); *Lifvet på Island under sagotiden* (last edition, 1883); *Sveriges medeltid* (1879-97), a history of civilization; the second volume of *Sveriges Historia*, dealing with the mediæval period; *Från äldre tider* (1882); *The Industrial Art of Scandinavia in the Pagan Time* (1882); *Zur Geschichte des Dreiperiodensystems* (1886); *Wisby och dess minnesmärker* (1892-93); *The Industrial Art of Scandinavia in the Middle Age* (1893); and *Sveriges mynt under medeltiden* (1895). In 1872 he founded the *Kongl. Vitterhets Historie och Antiquitets-akademiens månadsblad*, and in 1880 became editor of *Antiquarisk Tidskrift för Sverige*.

HILDEBRAND, RUDOLF (1824-94). A German philologist. He was born in Leipzig, and studied there. From 1848 to 1868 he taught in the Thomasschule. In 1864 he began to act as one of the editors of Grimm's *Deutsches Wörterbuch*, and five years later became professor of modern German literature and language in the University of Leipzig. His most important works are: *Vom deutschen Sprachenunterricht in der Schule und von deutscher Erziehung und Bildung überhaupt* (7th ed. 1901); and *Gesammelte Aufsätze und Vorträge zur deutschen Philologie und zum deutschen Unterricht* (1890). Consult Burdach, *Zum Gedächtnis Rudolf Hildebrands* (Hamburg, 1896).

HILDEBRANDSLIED, hil'de-bränts-lët. A fragmentary Old High German poem, the oldest preserved specimen of German heroic poetry. It is written in alliterative verse, and dates from the eighth century. It is known only through a manuscript preserved in the museum at Kassel, and written by two monks of Fulda at the beginning of the ninth century on two blank pages of a religious work. It narrates the combat of Hildebrand and his son, Hadubrand, who after many years of separation meet, and unknown to each other engage in a duel. The account breaks off without completing the story of the combat. The facsimiles of the manuscript have been published by W. Grimm (1830) and E. Sievers (1872), and a number of annotated editions of the text have appeared.

HILDEBRANDT, hil'de-bränt, EDUARD (1818-68). A German landscape and marine painter. He was born at Danzig, September 9, 1818, the son of a house-painter. He traveled extensively, and was celebrated for his paintings of striking points of view, such as would interest the traveling public. As a lad he wished to be a sailor, but his father apprenticed him to the painter Meyerheim. He studied under Krause in Berlin, and under Isabey in Paris, in 1841. In 1843 he gained a gold medal in that city, and was invited by Humboldt to visit Brazil. The water-colors and oil paintings he made while there are now in the possession of the German Emperor. Hildebrandt visited the Canary Islands, Spain, and Portugal, and brought from those places two hundred water-colors of various subjects, also in the Emperor's possession. In 1851, by order of the King of Prussia, he went to Italy, Malta, Egypt, Palestine, Turkey, and Greece, and later traveled through Switzerland. In 1855 he was made professor and member of the Berlin Academy, and in 1856 he joined an Arctic expedition, as the result of which, at

Brussels in 1858, he obtained the gold medal for his "North Cape," painted while on that expedition. At Amsterdam he was given another gold medal for his "Sea of Marmora." Between 1862 and 1864 he traveled around the world, and brought home four hundred water-colors, which were exhibited in London in 1866. Among his works are: "Brazilian Primeval Forest," "Cave at Staffa" (1865), "Castle Kronborg" (1857), in the National Gallery, Berlin; "Moonrise in Madeira," Corcoran Gallery, Washington; "The Bay of Naples," Metropolitan Museum, New York; "By the Dead Sea," "Benares at Early Dawn," "Evening in Siam," and many others. His last work, "Under the Equator," a study of the ocean, popularly called "Das Blaue Wunder" (the blue wonder), was the occasion of much argument and imitation. His paintings are not without technical merit, especially in color, but the painter of 'striking views' is never the great artist. His aquarelles excel his oil paintings. He died in Berlin, October 25, 1868. Consult: his *Reise um die Erde* (Voyage Around the World), edited by Ernst Kossak (Berlin, 1857); Arndt, *Ernst Hildebrandt, der Maler des Kosmos* (ib., 1869); Bruno Meyer, *Studien und Kritiken* (Stuttgart, 1877).

HILDEBRANDT, THEODOR (1804-74). A German painter, born at Stettin. He studied at the Berlin Academy, and afterwards became a pupil of Schadow. With this master he went to the Netherlands and traveled in Italy. Ultimately he was made professor at the Düsseldorf Academy (1836). His works are largely historical; many of them illustrate scenes from Shakespeare or Goethe; and he is also a portrait painter. His masterpiece is the "Murder of the Children of Edward IV." (1836), which is in the Spiegel Gallery at Halberstadt.

HILDEBURN, CHARLES SWIFT RICHÉ (1855—). An American bibliographer and librarian. He received his education in the private schools of his native city, Philadelphia, and in 1876 became librarian at its Athenæum. His literary work includes the compilation, *A Century of Printing: The Issues of the Press in Pennsylvania, 1685-1784* (2 vols., 1885-86), and the editorship of the *Statutes at Large* of Pennsylvania.

HILDEGARD, SAINT (c.1098-1179). A German nun, a friend of Bernard of Clairvaux, born at Böckelheim. She founded an abbey near Bingen; boldly attacked ecclesiastical abuses; and composed many mystical works, of which the best known is the *Scivias* (edited in Migne, *Patrologia Latina*, vol. xcivii.). Consult the biography by Schneegans (Barmen, 1891); and Roth, *Die Lieder und die unbekanntete Sprache der heiligen Hildegard* (Wiesbaden, 1880).

HILDEN. A town of the Prussian Rhine Province, situated nine miles east-southeast of Düsseldorf (Map: Prussia, B 3). It is a growing place, with manufactures of silk goods, carpets, machinery, etc. Population, in 1890, 8600; in 1900, 11,296.

HILDESHEIM, hîl'dēs-hîm. The former capital of the Bishopric of Hildesheim, in the Prussian Province of Hanover, situated on the Innerste, 21 miles south-southeast of Hanover (Map: Prussia, C 2). It has narrow streets, old monuments, some quaint, mediæval, highly ornamented façades, is partly surrounded by lofty

walls, and contains many excellent examples of architecture owing to its having been a German home of the Romanesque and Renaissance art, including particularly the timber framework features. The Catholic cathedral, erected in the eleventh century and greatly modified, is built partly in the Romanesque and partly in the late Gothic. Its ancient cloisters are exceptionally curious and interesting. Its treasury is rich in objects associated with the lives of Charlemagne, Bishop Bernwald, and others. The brass doors and bronze Easter column are richly ornamented with reliefs; there are also a number of gilded sarcophagi, including that of Bishop Godehard. Against the wall of the cathedral stands a rose-bush which is 25 feet high and reputed to be a thousand years old. Two of the best examples of Romanesque architecture in Germany are the Catholic Church of Saint Godehard, erected in the twelfth century and recently restored—a basilica-shaped edifice surmounted by three towers—and the large Protestant Church of Saint Michael, founded by Bishop Bernwald at the beginning of the eleventh century, and containing his tomb. Saint Michael has an interesting interior, with good mediæval ceiling paintings.

Hildesheim contains also a number of interesting secular buildings, notably the fifteenth-century late-Gothic Rathaus, adorned with rare frescoes by Prell, and possessing valuable archives; and the former butchers' guild-house, regarded as perhaps the finest wooden building in Germany. There is an interesting mediæval public square—Altstädter Markt. The environs are pleasant, and not without interest. In recent times Hildesheim has been brought into special prominence by the collection of elaborate Roman silver plate (known as the Hildesheimer Silberschatz) discovered near the town in 1868. The collection consists of a complete service for three persons (69 pieces), and is believed to belong to the Augustan age. It is in the Berlin Museum. The educational institutions of Hildesheim include a Catholic Gymnasium, originally founded as a cathedral school in the ninth century, a Protestant Gymnasium, dating from the Middle Ages, a seminary for teachers, a theological seminary, an agricultural school, etc. There are also two museums of art and antiquities, including the valuable Römer Museum, and a municipal library of about 30,000 volumes. Hildesheim manufactures iron products, tobacco, sugar, cotton and woolen goods, machinery, church bells, carpets, preserves, wagons, glass, stoves, etc. The chief articles of commerce are grain, wool, leather, and building materials. Population, in 1890, 33,481; in 1900, 42,973, including 14,300 Catholics.

The town existed before the ninth century. It came into great prominence after it was made in 818 the seat of the Bishopric of Hildesheim. Under Bishop Bernwald (993-1022) Hildesheim became famous for its fine ecclesiastical buildings and religious art productions executed under the supervision of the Bishop. In the thirteenth century the town joined the Hanseatic League and acquired considerable privileges. After continuous struggles with its bishops Hildesheim came, upon the secularization of the bishopric, into the hands of Prussia in 1803, was annexed to Westphalia in 1807, and to Hanover in 1813, and with Hanover passed to Prussia in 1866. Consult: Wachs-

moth, *Geschichte von Hochstift und Stadt Hildesheim* (Hildesheim, 1863); Bauer, *Geschichte von Hildesheim* (ib., 1891); Holzer, *Der Hildesheimer antike Silberfund* (ib., 1870); Lachner, *Die Holzarchitektur Hildesheims* (ib., 1882).

HILDRETH, RICHARD (1807-65). An American historian, born at Deerfield, Mass. He graduated at Harvard College in 1826, studied law, and began to practice in Boston in 1830. In 1832, however, he abandoned his profession to become editor of the *Boston Atlas*. In the autumn of 1834, being out of health, he went to the South, where he resided nearly two years on a slave plantation in Florida, and used his opportunity to study the workings of slavery. The result was a powerful anti-slavery novel, published in 1837 under the title of *The Slave*, or a *Memoir of Archy Moore*. It was reprinted in England, and in 1852 was republished in America under the title of *The White Slave*. When the annexation of Texas began to attract attention, he published in the *Boston Atlas* a series of articles which did much to intensify the hostility of the Northern people to that scheme. After publishing a *History of Banks* (1837) he passed the winter of 1837-38 in Washington as correspondent of the *Atlas*, and, upon his return to his editorial chair, entered warmly into the campaign for the election to the Presidency of General Harrison, a life of whom he published in 1839. A year later (1840) he translated Dumont's version of Bentham's *Theory of Legislation*. The same year appeared his *Despotism in America*, a work on the political, economical, and social aspects of slavery. A second edition with an added chapter was issued in 1854. From 1840 to 1843 he resided in Demerara, British Guiana, busying himself in editing two free-labor newspapers. After his return he published a *Theory of Morals* (1844) and a *Theory of Politics* (1853). The work, however, for which he is most remembered is his *History of the United States*, in six volumes (1849-56), in which he attempts to present the founders of the Republic in their true character, without trying to heighten their virtues or disguise their mistakes and faults. The first three volumes treat the period from 1492 to 1789; the second three from 1789 to the close of Monroe's first term (1821). The bias is Federalist, the treatment accurate and vigorous; but the graces of style are lacking, and the work is more consulted than read. In 1855 Hildreth published *Japan as It Was and Is*, and in 1856 *Atrocious Judges*, based on Campbell's *Lives*. For several years, ending with the inauguration of Lincoln as President, he was engaged on the staff of the *New York Tribune*. He went abroad in the summer of 1861 as United States consul at Trieste, and died in Florence.

HILES, HENRY (1826—). An English musician, born at Shrewsbury. He studied music with his brother John, a well-known organist, and, after holding various positions as organist, became in 1876 lecturer on harmony and counterpoint at Owens College, Manchester, and three years later at Victoria University. In 1867 he had received the degree of Doctor of Music. He was co-founder of the National Society of Professional Musicians (1882); for a time professor of harmony and counterpoint at the Royal Manchester College of Music; and in 1885 became editor of the *Quarterly Musical Review*. His

compositions, which are popular in England, include the oratorios *David* (1860), *The Patriarchs* (1872), cantatas, anthems, psalms, songs, odes, and music for the organ and piano. His best-known treatises are: *Harmony of Sounds* (3 editions, 1871, 1872, 1878); *Part Writing, or Modern Counterpoint* (1884); and *Harmony versus Counterpoint* (1894).

HILFERDING, hil'fēr-ding, ALEXANDER FEDOROVITCH (1831-72). A Russian author, born at Moscow, of German stock. He studied in the city of his birth, and after travels abroad devoted himself to historical and ethnographic studies. An ardent Pan Slavist, he wrote: *On the Servians and Bulgarians* (translated into German by Schmalzer, 1856-67); a history of the Baltic Slavs (1855); a history of their struggle with Germany in the Middle Ages (1861); and the very unscientific discussions of the relation of the Slavic languages to Sanskrit (1853), and to the allied languages (1853). His greatest work is the collection of popular songs, in the search for which he lost his life. The collection was edited by Hildebrandt (Saint Petersburg, 1873). Hilferding's complete works were published 1868-74.

HILGARD, EUGENE WOLDEMAR (1833—). A German-American agricultural chemist and geologist, born at Zweibrücken, Rhenish Bavaria. He studied at Zurich and elsewhere, came to America in 1835, but subsequently returned to complete his studies, receiving the degree of Ph.D. at Heidelberg, in 1853. In 1858 he was appointed State Geologist of Mississippi, and at the close of the Civil War resigned to become professor of chemistry at the University of Mississippi. From 1868 to 1875 he was professor of geology and natural history in the University of Michigan, and in 1875 was made professor of agricultural chemistry and director of the agricultural experiment station at the University of California. In 1894 he received the Liebig medal for distinguished services to agriculture, from the Munich Academy of Sciences. As a member of the Northern Transcontinental Survey, he devoted three years (1880-83) to a study of the agricultural capabilities of Oregon, Washington, and Montana. His investigations on the chemistry and physics of soil, and the reclamation of alkali lands, resulted in important contributions to agricultural science. Much of his work may be found recorded in the publications of the California Agricultural Experiment Station.

HILGARD, JULIUS ERASMUS (1825-91). A German-American engineer. He was born in Zweibrücken, Rhenish Bavaria, went to Illinois in 1835; studied engineering, and was employed in the coast survey service. In 1862 he had chief charge of the office, and supervision under the Treasury Department of weights and measures. He was one of the members of the Metric Commission at Paris in 1872, and was made a member of the permanent committee. In 1847 he was president of the American Association for the Advancement of Science, and from 1881 to 1885 superintendent of the United States Coast Survey.

HILGARD, THEODORE CHARLES (1828-75). An American physician and scientist, born in Zweibrücken, Germany. He came to America in 1833, and began his professional work in Saint Louis.

He gave especial attention to microscopic studies of lower organic life until his health failed, when he came to New York and engaged in the study of terrestrial physics with his brother Julius. His published works, besides papers appearing in the annals of various scientific societies, include: *Experimental Observations on Taste and Smell* (1854); *Exposition of Natural Series in the Vegetable Kingdom* (1858); *Phylotaxis: Its Numeric and Divergent Law* (1859).

HILGENFELD, hil'gen-félt, ADOLF (1823—). An eminent German Protestant theologian, of the Tübingen school, born at Stappenbeck, and educated at Berlin and Halle. In 1847 he became privat-docent, and three years later professor, at Jena. Editor of the *Zeitschrift für wissenschaftliche Theologie* (1858 sqq.), he wrote: *Die Clementinischen Rekognitionen und Homilien* (1848); *Das Evangelium und die Briefe Johannis nach ihren Lehrbegriff* (1849); *Ueber die Evangelien Justins, etc.* (1850); *Das Markusevangelium* (1850); *Der Galaterbrief* (1852); *Das Urchristentum* (1855); *Die jüdische Apokalypitik* (1857); *Der Kanon und die Kritik des Neuen Testaments* (1863); *Novum Testamentum extra Canonem Receptum* (2d ed. 1876-84); *Historisch-Kritische Einleitung in das Neue Testament* (1875); *Ketzergeschichte des Urchristentums* (1884); *Judentum und Judenchristentum* (1886); an edition of Hermas's *Pastor* (1887); and *Acta Apostolorum Græce et Latine Secundum Antiquissimos Testes* (1899).

HILIGUAYNA, ê-lê-gwi'nà, HILIGUEYNA, or HILIGVOYNA. A Visayan dialect in Panay Island, Philippine Islands (q.v.).

HILL, AARON (1685-c.1750). An eccentric English author, born in London. He treated in his verse many themes, from the creation of the world to doomsday. *Elyfrid* (1710) is the earliest of eight dramatic pieces, either original or adapted. In conjunction with William Bond he edited an imitation of the *Spectator*, called the *Plain Dealer* (1724). His poems and letters were collected in 1753, and his plays in 1760.

HILL, ABIGAIL. Favorite of Queen Anne of England. See MASHAM, MRS.

HILL, AMBROSE POWELL (1825-65). An American soldier, prominent on the Confederate side in the Civil War. He was born in Culpeper County, Va.; graduated at West Point in 1847, and served in the United States artillery in the Mexican War; in Florida, against the Seminoles; and on the Coast Survey, but resigned in March, 1861, to accept a commission as colonel in the Confederate service. At the battle of Beaver Dam Creek, June, 1862, his troops took part in the attack on the Federal position, and on the retreat of the latter to Gaines's Mill and New Cold Harbor pursued and again attacked them, only to be again repulsed. At Antietam, September 17, 1862, he arrived just in time to stay the Federals, who were sweeping all before them, and so afforded Lee an opportunity to draw off his exhausted army. He commanded a division under Jackson at Fredericksburg, December 13, 1862. At Chancellorsville, May 2-4, 1863, he commanded the reserve; and it was his troops who, on being moved to the front to take the place of the decimated regiments that had borne the brunt of the first day's fighting, mistook Jackson's escort for Federals, and fired the fatal

volley which caused Jackson's death. On May 10, 1863, General Lee reorganized his army, making three corps instead of two, and gave one corps to Hill, who at the same time was made a lieutenant-general. This corps he led in the battle of Gettysburg, and from the Wilderness until he met his death while reconnoitring at Petersburg, April 2, 1865.

HILL, BENJAMIN HARVEY (1823-82). An American legislator. He was born in Georgia; graduated at the State University in 1844, and within a year began the practice of law. In 1851 he was elected to the State Legislature as a Whig. He was a Unionist member of the State Secession Congress in 1861, but after striving vainly to prevent his State from seceding supported the movement. He was a member of the Provisional Confederate Congress the same year, and was soon afterwards chosen to the Confederate Senate. In 1865 he was for a short time a prisoner of war in New York. After the war he was an earnest Democrat, and denounced the reconstruction acts of Congress, his *Notes on the Situation* (1867-68) attracting wide attention. He supported Horace Greeley for the Presidency in 1872, and was defeated for the United States Senate in the following year. He became a member of the House of Representatives in 1875, and in 1876 was elected to the United States Senate, in which body he served until his death. A statue of him was erected in Atlanta in 1886. Consult Benjamin H. Hill, Jr. (editor), *The Life, Speeches, and Writings of Benjamin Harvey Hill* (Atlanta, 1891).

HILL, DANIEL HARVEY (1821-89). An American soldier in the Confederate service, and an educator, born in South Carolina. He graduated at West Point in 1842, and served in the Mexican War, for his gallantry in which he was brevetted major. He resigned in 1849, and became a professor in Washington College, Lexington, Va., and later filled a similar position in Davidson College, North Carolina. In 1859 he became superintendent of the North Carolina Military Institute, at Charlotte, but resigned in 1861 to enter the Confederate service. He commanded at the battle of Big Bethel, June 10, 1861, and was soon afterwards promoted to be a brigadier-general. He fought against McClellan in the Peninsular campaign, and was especially conspicuous at the battle of Seven Pines and Fair Oaks, May 31 and June 1, 1862. He was with A. P. Hill at the battle of Beaver Dam Creek, and participated in that of Gaines's Mill. At South Mountain, September 14, 1862, with only 9000 men, he managed to hold the whole Federal army in check until Lee was able to get his trains and artillery out of danger, and then joined the main army in time to take part in the battle of Antietam on the 17th. He was appointed a lieutenant-general by President Davis in July, 1863, and was placed in command of a corps in General Bragg's army, with which he fought at the battle of Chickamauga, September 19-20, 1863. In the last year of the war he fought under Joseph E. Johnston at the battle of Bentonville, N. C., and laid down his arms at Durham Station, on April 26, 1865. After the war he was for a number of years editor of a monthly magazine entitled *The Land We Love*, and later edited the *Southern Home*. From 1877 until 1884 he was president of the Arkansas Industrial University,

and from 1885 until the year of his death of the Middle Georgia Military and Agricultural College. His publications include: *Elements of Algebra* (1858); a number of religious tracts; and several articles in *Battles and Leaders of the Civil War* (Johnson and Buel, editors, New York, 1887).

HILL, DAVID BENNETT (1843—). An American politician. He was born at Havana, N. Y.; was admitted to the bar in 1864, and practiced law at Elmira, N. Y. He was a Democratic member of the New York Assembly from 1869 to 1871, and was elected Mayor of Elmira in 1882. He early became prominent in State and National politics, and was chairman of the Democratic State Convention in 1877, and again in 1881, and in the following year was elected Lieutenant-Governor on the ticket with Grover Cleveland, upon whose resignation in 1885, preparatory to assuming the duties of the Presidency, he became Governor. He continued to hold this position until 1891, when he succeeded William M. Evarts as a member of the United States Senate, where he took a prominent part in the debates, especially in those concerning the Wilson Tariff Bill in 1894. During his Senatorial term he opposed various measures approved by President Cleveland, and was instrumental in preventing the confirmation by the Senate of the nominations of William B. Hornblower and Wheeler H. Peckham as justices of the United States Supreme Court. He was a prominent candidate for the Presidential nomination before the Democratic National Convention of 1892, and was defeated for Governor of New York in 1894 by Levi P. Morton. After the expiration of his term in the Senate (1897), Mr. Hill practiced law in Albany, though he continued to take an active part in politics.

HILL, DAVID JAYNE (1850—). An American author and educator, especially well known for his writings on rhetoric. He was born at Plainfield, N. J.; was educated at Bucknell University (then Lewisburg), where he was professor of rhetoric (1877-79), and then president. In 1888 he was made president of Rochester University. After resigning his office he spent three years in the study of public law and diplomacy in Europe, and was subsequently called to the office of Assistant Secretary of State in Washington. In 1903 he was appointed United States Minister to Switzerland. During his residence in Washington he held the professorship of European diplomacy in the School of Comparative Jurisprudence. His works include: *The Science of Rhetoric* (1877); *The Elements of Rhetoric and Composition* (1879); *Life of Washington Irving* (1879); *Life of William Cullen Bryant* (1880); *Principles and Fallacies of Socialism* (1885); *The Elements of Psychology* (1887); *The Social Influence of Christianity* (1887); *Genetic Philosophy* (1893); and an edition of Jevons's *Logic* (1884).

HILL, GEORGE BIRKBECK (1835-1903). An English author, born at Tottenham, Middlesex, and educated at Pembroke College, Oxford. From 1859 to 1876 he was head master of the Bruce Castle School; in the latter year he resigned to devote himself to literature. He is best known as a Johnsonian scholar and editor. His numerous published works include: *Dr. Johnson: His Friends and His Critics* (1878); *Life of Sir*

Rowland Hill (1880); *Colonel Gordon in Central Africa* (1881); *Wit and Wisdom of Dr. Johnson* (1888); *Footsteps of Dr. Johnson in Scotland* (1890); *Writers and Readers* (1892); *Harvard College, by an Oxonian* (1894); *Talks About Autographs* (1896); *Johnsonian Miscellanies* (1897); *Life of Edward Gibbon* (1900). He edited: *Boswell's Correspondence* (1879); *Boswell's Life of Johnson* (1886); *Rasselas* (1888); *Select Essays of Dr. Johnson* (1889); *Letters of Johnson* (1892); *Letters of Dante Gabriel Rossetti* (1897); *Unpublished Letters of Dean Swift* (1899).

HILL, GEORGE WILLIAM (1838—). An American astronomer, born in New York, and educated at Rutgers College. He became an assistant on the staff of the *American Ephemeris* and of the *Nautical Almanac* in 1861, was elected to the National Academy of Sciences in 1874, and was awarded a gold medal by the London Royal Astronomical Society in 1887, for his work on the lunar theory. He wrote largely on celestial mechanics and mathematics, and contributed to the governmental *Astronomical Papers* (especially 1882, 1890, 1891, 1895), to the *Year Book of the Agricultural Department* (1898), and to the publications of the Washington Bureau of Navigation. His most valuable work is *A New Theory of Jupiter and Saturn* (1890).

HILL, HENRY BARKER (1849—). An American chemist, son of Thomas Hill, president of Harvard (1862-68), and born at Waltham, Mass. He was educated at Harvard and the University of Berlin. He was assistant in the chemical laboratory at Harvard (1870), assistant professor (1874), full professor (1884), and director of the chemical laboratory (1894), and was elected to the National Academy of Sciences in 1883. He contributed to its *Proceedings* (1881 sqq.), to the *American Journal of Chemistry*, to Silliman's *American Journal*, and to the *Berichte der deutschen chemischen Gesellschaft* (vols. ix-xxxiii.), and wrote *Notes on Qualitative Analysis* (1874).

HILL, JAMES J. (1838—). An American railway promoter, born near Guelph, Ont. He was of Scotch-Irish descent, and left his father's farm for a business career in Minnesota. In 1870 he formed the Red River Transportation Company, which was the first to open communication between Saint Paul and Winnipeg. Eight years afterwards he helped to form the syndicate which, under another name, ultimately built the Canadian Pacific Railway. From 1883 to 1893 he interested himself in the building of the Great Northern Railway, extending from Lake Superior to Puget Sound, with northern and southern branches and a direct steamship connection with China and Japan. Mr. Hill gave \$500,000 toward the establishment of a Roman Catholic theological seminary in Saint Paul, Minn.

HILL, JOHN HENRY (1791-1882). An American educator, chiefly identified with teaching and missionary work in Greece. He was born in New York City, graduated at Columbia College, and was ordained a deacon in the Protestant Episcopal Church in 1830. In the same year he went as a missionary to Greece, and at Athens he and his wife established a girls' school, afterwards a school for boys, and also a high school for the training of teachers. His work at first received little encouragement, but prospered after

pupils from prominent and wealthy Greek families began to attend the school. Dr. Hill was chaplain of the British Legation in Greece from 1845 to 1875, and continued his teaching during that time. On his death, at Athens, the Greek Government, in recognition of his educational work among the women of Athens, buried him with the honors of a taxiarch, and the Athenian municipality erected a monument to his memory. Honorary degrees were conferred on him by Harvard and Columbia.

HILL, OCTAVIA (c.1836—). An English social reformer, born in London. At an early age she began her efforts to improve the homes of the London poor. She first began this work under Frederick D. Maurice, and later, in 1864, was associated with John Ruskin. The latter advanced the money for undertaking the scheme of owning the houses and improving them or erecting new ones. She taught multitudes to help themselves, impressing upon them ideas of cleanliness, order, and self-respect. Her publications include: *Homes of the London Poor* (1875), and *Our Common Land* (1878).

HILL, ROBERT THOMAS (1858—). An American geologist, who became connected with the United States Geological Survey in 1886. He was born at Nashville, Tenn., and in 1886 graduated at Cornell University. During his explorations on the southern borders of the United States and Mexico, and in Central America and the West Indies, he demonstrated the existence of the Lower Cretaceous formations in the United States, and proved that artesian wells might be procured over a vast area of Texas. In addition to his chief work, *Cuba and Puerto Rico, with Other Islands of the West Indies* (1898), his publications include many papers on the original relations of the Antilles, contributed to the *Proceedings* of scientific societies of which he became a member. For two years he was professor of geology at the University of Texas.

HILL, ROWLAND (1744-1833). An English preacher of great popularity. His father was a baronet, and he was born at Hawkstone Park, Shropshire, on the border of Wales, August 23, 1744. He graduated B.A. at Cambridge in 1769, and while there made the acquaintance of Whitefield, preached in the surrounding villages before taking orders, and conducted religious services in the houses of the sick and poor. He was appointed in 1773 to the parish of Kingston, Somersetshire, where he preached in the open air and attracted great crowds to the services which he held nearly every day of the week. Having, on the death of his father in 1780, inherited considerable property, he built for his own use Surrey Chapel, on the Blackfriars Road, London. The chapel was opened June 8, 1783. Although he now occupied a position as a dissenting minister, Hill conducted his services in accordance with the forms of the Church of England, in whose communion he always remained. His chapel soon became filled with a larger congregation than any other in London. In the summer months he made what he called 'gospel tours' into all parts of the country, sometimes extending them to Scotland and Ireland, attracting, wherever he went, crowded and interested audiences. After these tours he used to return to his duties at the Surrey Chapel, where he continued to officiate to the end of his life. He published

accounts of two journeys through England and Scotland (1799 and 1800); a very popular hymn-book (1783); numerous sermons, but especially *Village Dialogues* (1801, 34th ed. 1839). He was among the founders of the Religious Tract Society and the British and Foreign Bible Society, an early and courageous defender of vaccination, and himself vaccinated thousands of persons. He wrote in favor of the practice, *Cowpock Inoculation Vindicated and Recommended from Matters of Fact* (London, 1806). He died in London, April 11, 1833. His life has been written several times: by Sidney (4th ed. London, 1844); Sherman (London, 1857); Charlesworth (London, 1879).

HILL, ROWLAND, Viscount (1772-1842). An English soldier, nephew of the preacher of the same name, born at Prees Hill, Shropshire. He entered the army when he was fifteen, and studied a year at Strassburg. He served under Abercrombie in Egypt (1801), and accompanied Wellesley to Portugal in 1808. Throughout the Peninsular War he showed ability second only to his chief's. In 1811 he utterly defeated the French army at Cáceres, and in 1812 he took the fortress of Almaraz, thus separating the two French armies. At Vitoria, in 1813, his forces made the initial attack, and in the same year, on the Nive, he again defeated the French. He had been promoted to lieutenant-general in 1812; two years later he was created Baron Hill of Almaraz and Hawkstone, and received an annual grant from Parliament of £2000. During the Hundred Days he was no less active and prominent. After a diplomatic errand to the Prince of Orange, he commanded a division in the allied army. His horse was shot under him at Waterloo, and he was so stunned that, in the thick of the fight, he was for some time lost and supposed to have been killed. Hill remained with the army of occupation in France as second in command. He was promoted general in 1825, and three years later succeeded Wellington as commander-in-chief; but in 1842 he resigned, because of failing health, and turned over the command to Wellington. He became viscount in the same year, a few months before his death.

HILL, Sir ROWLAND (1795-1879). The reformer of the English postal system. At twelve he became a teacher in his father's school at Birmingham, and before he reached his majority he had organized a remarkable system of discipline which came to be known as the Hazelwood method (from the name of the school). This system was described by his elder brother, Matthew Davenport Hill, in a pamphlet entitled *Public Education: Plans for the Government and Liberal Instruction of Boys in Large Numbers* (1822). The school became widely popular, and was carried on with success by the family. Rowland finally withdrew, however, partly because he recognized the defects of his scholarship, and partly because he was oppressed by the religious observances required. He thought of joining Robert Owen in his communistic schemes, but in 1833 became secretary of the commission for colonizing South Australia. From childhood he had a strong bent toward invention. About this time he devised a successful rotary printing-press; but it was not then adopted, because the Treasury demanded that each single sheet for a newspaper should be previously stamped, and

forbade the attaching of the stamps by machinery. But his great work was that of securing the adoption of penny postage. The franking privilege was widely used by members of Parliament and high officials for themselves and their friends. The great body of the people, however, sent few letters, and postage on them had to support the whole service. Rates depended upon distance, and as they were rarely prepaid, to receive a letter was often a hardship. Under this system, rates of postage were advancing and postal revenues diminishing. After making a careful study of the statistics, in 1837 Hill published a pamphlet, *Post-Office Reform*, in which he recommended a penny rate for half-ounce letters, regardless of distance, inside the United Kingdom, and the use of adhesive stamps. His plan was adopted, and in 1840 he was given an appointment in the Treasury, where, against great opposition, he was working out the system when he was dismissed by a change of Ministry. In 1846 a fund of £13,000 was raised by public subscription for him. The same year the Whigs again came into office, and he was made secretary to the Postmaster-General, and in 1854 chief secretary. In 1864 he retired on full salary, and received a Parliamentary grant of £20,000. He wrote a *History of Penny Postage*. This was published in 1880, with an introductory memoir by his nephew, Dr. G. Birkbeck Hill.

HILL, THOMAS (1818-91). An American educator and Unitarian clergyman, born in New Brunswick, N. J., of English parentage. He was left an orphan when about ten years old, and in 1830 was apprenticed to a printer for a term of three years. He spent the year 1834-35 at the Lower Dublin Academy, near Philadelphia, where his eldest brother was principal, and then apprenticed himself to an apothecary in New Brunswick. In 1839 he decided to go to college, and entered Harvard the following year, in the class of 1843. His preëminence in mathematics won him an offer of a high position at the National Observatory in Washington; but he intended to go into the ministry, and, contrary to the advice of his professors, entered the divinity school, from which he graduated in 1845. For the next fourteen years he was pastor of the Unitarian Church in Waltham, Mass. In 1859 he succeeded Horace Mann as president of Antioch College. Although the college was in such financial straits that he was obliged to supplement his salary by preaching in Cincinnati, 70 miles distant, he continued his services until elected president of Harvard in 1862. The elective system and the academic council were instituted during his administration, and the lectures of the university were at this time first opened to the public. Failing health compelled him to resign in 1868. In 1871 he was elected to the Legislature. In the same year he went to South America with Louis Agassiz. On his return he accepted a call to the First Parish Church in Portland, Maine. He was a man of unusual versatility, and gained distinction in many of the pursuits in which he interested himself. He was one of the foremost natural scientists of the time, and an accomplished classical scholar, as well as a mathematician. He invented several mathematical machines, among which his occultator is of the most importance, and made valuable contributions to the knowledge of

curves in simplifying their expression and in discovering new forms. Besides publishing essays, text-books, and volumes of sermons, he edited Eberty's *Stars and the Earth* (1849), and wrote *Christmas and Poems on Slavery* (1843); *Geometry and Faith* (1849); *Curvature* (1850); *Jesus the Interpreter of Nature, and Other Sermons* (1870); *Statement of the Natural Sources of Theology, with Discussion of Their Validity, and of Modern Skeptical Objections* (1877); *In the Woods and Elsewhere*, verse (1888).

HILL, THOMAS (1829-). An American painter, born in Birmingham, England. He came to America in 1841. He studied in Paris under Paul Meyerheim for several months, but beyond this instruction was self-taught. His first important work was the "Yosemite Valley," which was published in chromo by Prang. His other pictures include: "White Mountain Notch;" "The Home of the Eagle;" "Donner Lake;" and the "Grand Cañon of the Sierras."

HILLAH, or HEILA. The capital of a sanjak in the Vilayet of Bagdad, Asiatic Turkey, situated on the Euphrates, not far from the ruins of Babylon, from which most of its building material has been taken (Map: Turkey in Asia, L 6). It is rather poorly built, but has a large number of mosques, and is a stopping-place for pilgrim caravans on the way to the holy cities of Meshhed-Ali and Meshhed-Husein. It has some manufactures of cotton goods and woollen mantles. The population is estimated at about 10,000, largely Arabs.

HILLARD, GEORGE STILLMAN (1808-79). An American lawyer and author. He was born in Machias, Maine; graduated at Harvard in 1828; studied law and acquired an extensive legal practice in Boston. He also served in the State Legislature, and from 1866 to 1870 was United States District Attorney for Massachusetts. At earlier periods he collaborated with George Ripley in editing the *Christian Register*, a Unitarian paper, and with Charles Sumner in publishing the *Jurist*. In 1856 he bought an interest in the *Boston Courier*, and was for some time associated in its editorial management. Among his numerous works are: *Six Months in Italy* (1853); *Life and Campaigns of George B. McClellan* (1864); and, with Mrs. Ticknor, a *Life of George Ticknor* (1873). He also edited *The Poetical Works of Edmund Spenser* (5 vols., 1839).

HILLEBRAND, hil'le-bränt, JOSEPH (1788-1871). A German philosopher and historian of literature, born at Grossdödingen, near Hildesheim. He was originally a Catholic, studied at Hildesheim and at Göttingen, and in 1815 entered the priesthood and taught at Hildesheim, but resigned his position on accepting Protestant views. Upon Hegel's departure from Heidelberg in 1818, he was appointed professor of philosophy there, and in 1822 took a like position at Giessen. He was President of the Lower House of the Hessian Chamber in 1848. His most important work in the field of literary history was *Die deutsche Nationalliteratur seit dem Anfang des 18 Jahrhunderts* (3d ed. 1875). Of less importance are his philosophical works, which show tendencies toward the views of Jacobi: *Die Anthropologie als Wissenschaft* (1822-23); *Lehrbuch der theoretischen Philosophie und philosophischen Propädeutik* (1826); *Litterärästhetik* (1826); *Uni-*

versalphilosophische Prolegomena (1830); *Der Organismus der philosophischen Idee* (1842); and *Philosophie des Geistes* (1835).

HILLEBRAND, KARL (1829-84). A German historian and publicist. He was born in Giessen, and studied law there and at Heidelberg. He was imprisoned for participation in the insurrection at Baden in 1849, but escaped to France and completed his studies at the University of France and the Sorbonne. He next taught German at the Military Academy at Saint Cyr, and in 1863 was appointed professor of foreign literature at Douai. At the outbreak of the Franco-German War he went to Italy as correspondent of the *London Times* and settled at Florence. He contributed numerous articles to French, English, Italian, and German periodicals, and published many separate works, including the prize essay *Des conditions de la bonne comédie* (1863); *La Prusse contemporaine et ses institutions* (1867); *Zeiten, Völker und Menschen Gesammelte Aufsätze* (1874-85); *Geschichte Frankreichs von der Thronbesteigung Ludwig Philips bis zum Fall Napoleons III.* (1877-79); and *Lectures on German Thought During the Last Two Hundred Years* (1880). Consult Homberger, *Karl Hillebrand* (Berlin, 1884).

HILLEBRANDT, ALFRED (1853—). A German Sanskrit scholar, born at Grossnädtitz. He studied at Breslau and Munich, and became professor in the former university. His especial branch of study is Vedic mythology. *Varuna und Mitra* (1877) was a prologue to his great work *Vedische Mythologie* (1891-1902). Hillebrandt also wrote: *Das altindische Neu- und Vollmondopfer* (1880); *Vedachrestomathie* (1885), a section on religious antiquities in Buhler's *Grundriss der indo-arischen Philologie und Altertumskunde* (1897); and *Alt-Indien, Kulturgeschichtliche, Skizzen* (1899).

HIL/LEL, HILLEL HABABLI ('the Babylonian'), or HAZZAKEN ('the elder'). A Jewish rabbi who died a few years after the beginning of the Christian Era. By birth a Babylonian, he left his home and came to Jerusalem to study the law. By doing manual labor he was enabled to support himself while attending the lectures of Shemayah and Abtalion, the president and vice-president respectively of the Sanhedrin. His progress was rapid. His solution of a difficulty which arose concerning the lawfulness of slaughtering the Paschal Lamb on the Sabbath led to his being appointed president of the Sanhedrin (B.C. 30), and he held this position till about A.D. 10. Hillel's character was gentle, patient, and peace-loving. It is Hillel to whom is ascribed the maxim, "What is hateful unto thee do not unto others." He plays an important part in the history of Jewish legal science. He introduced a set of seven rules, by which the Scriptures are to be interpreted and laws derived from them. Entirely the opposite of Hillel in character was Shammai (q.v.), the vice-president of the Sanhedrin. His teaching was marked by a strict adherence to the letter and great vigor. The difference between the leaders was continued by their followers, so that, years afterwards, we still encounter the school of Hillel and the school of Shammai. The honor and respect won by Hillel was so great that his position of president of the Sanhedrin remained in his family. (See

TALMUD.)—**HILLEL HANNASI** ('the prince'). A descendant of the preceding, who lived about A.D. 350. He was also president of the Sanhedrin and had charge of the school at Tiberias. His great work was the arranging of the Hebrew calendar. In this he followed the system of Meton.

HIL/LER, FERDINAND (1811-85). An eminent German pianist, conductor, and composer, born at Frankfort. From early boyhood he was a student of music, his concert début taking place at ten years of age, followed two years later by the production of his first composition. His first teachers were Hofmann for the violin, Aloys Schmitt for the pianoforte, and Vollweiler for harmony and counterpoint. Later (1825) he became a pupil of Hummel at Weimar. For seven years (1828-35) he was engaged as teacher of composition at Choron's School of Music, Paris, but eventually gave up his position so that he might better equip himself as a pianist and composer. He returned to Frankfort the following year (1836), and devoted himself to composition. His abilities were recognized, and although but twenty-five, he was asked to act as conductor of the Cäcilienverein during the illness of Schelle. He had by this time attracted the notice of Rossini and Mendelssohn, the former assisting him to launch his first opera, *Romilda* (which was a failure), at Milan, and the latter obtaining for him the entrée to the Gewandhaus, and affording an opportunity for the public presentation of his oratorio *Die Zerstörung Jerusalems* (1840). After a year of study in Church music at Rome, he returned to Leipzig, and during the season of 1843-44 conducted the Gewandhaus concerts. By this time his position in the musical world was established, and honors and appointments were showered upon him. He became municipal kapellmeister of Düsseldorf in 1847, and in 1850 received a similar appointment at Cologne, in which latter city he founded the well-known Cologne Conservatory. He was conductor at the Italian Opera in Paris during the season of 1852-53. Meanwhile he had increased his reputation and prestige by his conductorship of the Gürzenich concerts and the Lower Rhine music festivals. He was elected a member of the Royal Academy of Fine Arts, Berlin, in 1849, and in 1868 received the title of doctor from the University of Bonn. As a composer Hiller ranks high, not for the magnitude and depth of his work, but for its poetry, elegance, and rhythmic melody. His compositions include operas (six), none of them of more than local significance; six cantatas, one or two of which have been popular in England, and one (*The Lorelei*) occasionally heard in America. Other works comprise pieces in every form and variety of composition. He was also a very successful lecturer and a forceful writer, his contributions to reviews and newspapers having been since collected in book form. He also published among others: *Musikalisches und Persönliches* (1876); *Wie hören wir Musik* (1880); *Goethe's musikalisches Leben* (1880); and *Erinnerungsblätter* (1884). He died at Cologne.

HILLER, JOHANN ADAM (1728-1804). An important German dramatic composer, born at Wendisch-Ossig, near Görlitz. He was of musical parentage, and was endowed with a fine soprano voice, which obtained for him a course

of free instruction at the Görlitz Gymnasium, from which he went to the Kreuzschule at Dresden, where he became a pupil of Homilius for pianoforte and thorough-bass. Later he went to Leipzig for study at the university, and while there earned a bare existence as flutist and singer in local concerts and by private teaching. His first good fortune came with his appointment as tutor to the son of Count Brühl at Dresden, with whom he went in 1758 to Leipzig. It was during his stay here at this time that he conceived the idea of reviving the old subscription concerts, an attempt which ultimately led to the founding of the famous Gewandhaus concerts, of which he was the first conductor. From 1789 to 1801 he was music director of the Thomasschule. He also founded a singing school in 1771. To him has been given the credit of being the originator of the *Singspiel*, the beginnings of German comedy opera as distinct from the French and Italian developments. The most important of these were: *Lottchen am Hofe* (1760); *Der Teufel ist los* (1768); *Pattis, oder Das gerettete Troja* (1782). The lyrics of all his *Singspiele* were of considerable musical value, and have been long popular. Among his sacred compositions are: *A Passion Cantata*; *Funeral Music in Honor of Hasse*; the one hundredth Psalm; and a few symphonies. He also edited many important collections of music, and wrote considerably concerning musical topics. He was one of the most important German musical scholars and writers of the eighteenth century. He died at Leipzig.

HIL/LERN, WILHELMINE VON (1836—). A German novelist, born at Munich, daughter of the popular dramatist Charlotte Birch-Pfeiffer. She is best remembered for her satire of blue-stockings in *Der Arzt der Seele* (1869), and for a charming tale of Freiburg-im-Breisgau in Reformation days, *Höher als die Kirche* (1876). Worthy of mention also are *Die Geier-Wally* (1873), cleverly dramatized by her in 1881, and the Black Forest sketches *Ein Blick ins Weite* (1897).

HILL FORTS. Defensive positions on hills. The customs of early groups of people as to defensive locations for residence on elevations have determined the foundation of many of the most famous cities. Hill forts of various periods from the most ancient are common throughout the world, and refer to the monuments and settlements of small groups of men, both securing them from attack and forming a base for industrial occupations and forays. Rome, Athens, and Jerusalem were such hill forts. Settlements on plains or shores represent either times or localities of greater security or the weight of large bodies of men discounting attack, and they supply the means of building great artificial fortifications. The history of nearly every nation gives evidence of this period, and these forts are still found among the more primitive tribes, especially in India.

HILL/HOUSE, JAMES (1754-1832). An American legislator, born at Montville, Conn. He graduated at Yale in 1773 and practiced law. He took an active part in the war of the Revolution, and when New Haven was attacked by the English under Tryon in 1779, was captain of the Governor's Guards. He became a Federalist member of Congress in 1791, and from 1795 to

1810 was a member of the United States Senate. In 1815 he was a member of the Hartford Convention. That New Haven is known as the 'Elm City' is largely due to Senator Hillhouse, who set out with his own hands many of these trees.

HILLHOUSE, JAMES ABRAHAM (1789-1841). An American poet. He was born in New Haven, Conn., the son of Senator James Hillhouse, graduated at Yale in 1808, and for some time was engaged in business in New York City. After 1822 he devoted himself almost wholly to literature. His chief works are: *The Judgment:—A Vision* (1812), and the dramas *Percy's Masque* (1820) and *Hadad* (1825). An edition of his works was published in two volumes in 1839. His heavy, ambitious dramas were once highly praised.

HILLIARD, hil'yerd, FRANCIS (1806-78). An American jurist, born in Cambridge, Mass. He graduated at the Harvard Law School in 1823, and served for a time as judge, but is known principally as a writer of legal text-books. His best-known works are: *American Law of Real Property* (2d ed. 1846); *American Jurisprudence* (2d ed. 1848); *Law of Mortgages of Real and Personal Property* (1853); *Treatise on Torts* (1859); and *The Law of Injunctions* (1864).

HILLIARD, HENRY WASHINGTON (1808-92). An American lawyer, born in Fayetteville, N. C. He graduated in 1826 at South Carolina College, and was admitted to the bar in 1829. From 1831 to 1834 he was a professor in the Alabama University, Tuscaloosa, and in 1838 was elected to the State Legislature. In 1842-44 he was chargé d'affaires in Belgium, and from 1845 to 1851 was a member of Congress from Alabama. He opposed the secession of the South, but subsequently accepted the posts of commissioner to Tennessee and brigadier-general in the provisional Confederate Army. From 1877 to 1881 he was United States Minister to Brazil. He published: *Roman Nights*, from the Italian (1848); *Speeches and Addresses* (1855); and *De Vane* (1865).

HILL MUSTARD. See BUNIAS.

HILL-MYNA (*hill* + *myna*, from Hindi *mainā*, starling). The common name, in India, of the 'grakles' of the family Eulabetidae. These starling-like birds belong to the group called 'glossy starlings,' and especially to the genus *Eulabates*. They are birds of moderate size and glossy black plumage, marked by fleshy yellow or orange wattles on the head. The shortness and squareness of the tail are noticeable. The best-known species is that of Southern India and Ceylon (*Eulabates religiosa*), which is distinguished from the others by two long patches of bare skin on the neck; also by a white spot at the base of the wing-quills. They live in the forest and feed on small fruits. They are excellent mimics, learn easily to whistle and talk, and are not only highly prized as cage-birds in India, but are exported in large numbers. Other species are known in Northern India and eastward. See MYNA.

HILL - PARTRIDGE, or TREE - PARTRIDGE. One of a numerous group of partridges (genus *Arboriphila*) which frequent elevated forested regions from the Himalayas eastward to Formosa. They are mostly of very dark colors. The plumage is alike in both sexes, and the eggs are pure white. They frequently alight on trees when flushed by dogs, but live upon the ground like

other partridges. They are favorite game birds in Northern India.

HILLSBORO, hîlz'bûr-ô. A city and the county-seat of Montgomery County, Ill., 61 miles northeast of Saint Louis, Mo.; on the Cleveland, Cincinnati, Chicago and Saint Louis Railroad (Map: Illinois, C 4). Among its industrial establishments are a coal-mine, flour and woolen mills, furniture and carriage factories, etc. Population, in 1900, 1937.

HILLSBORO. A village and the county-seat of Highland County, Ohio, 60 miles east of Cincinnati; the terminus of branches of the Baltimore and Ohio Southwestern and the Norfolk and Western railroads (Map: Ohio, C 7). It has a public library of 7500 volumes, and a handsome soldiers' monument of granite. The manufactures include lumber, furniture, flour, foundry products, etc. The water-works are owned by the municipality. Population, in 1890, 3620; in 1900, 4535.

HILLSBORO. A city and the county-seat of Hill County, Tex., 34 miles north of Waco; on the Saint Louis Southwestern and the Missouri, Kansas and Texas railroads (Map: Texas, F 3). It is the centre of a fertile agricultural district, with an important trade in cotton, grain, live stock, and hides, and has cotton gins and compresses, a cotton-mill, a cottonseed-oil mill, flour and planing mills, and manufactures of hosiery, garments, novelties, candy, hay-presses, etc. The water-works are owned by the municipality. Population in 1890, 2541; in 1900, 5346.

HILLSBOROUGH, hîlz'bûr-ô. A seaport town of Albert County, New Brunswick, Can.; on the right bank of the Petitcodiac estuary, just above its outlet into Shepody Bay, 24 miles by rail from Salisbury (Map: New Brunswick, E 4). It has manufactures of plaster, which, with mineral oil from the depleted 'Albertite' coal-mines in the neighborhood, it exports in considerable quantities to the United States. The town was founded in 1763 by a member of the Steeves family, of whom there are now 700 representatives in a population of 3000.

HILLSBOROUGH, WILLS HILL, Earl of (1718-93). A British statesman, first Marquis of Downshire, a native of Fairfield, Gloucestershire. He was elected to Parliament for Warwick in 1741, and the following year succeeded his father as Lord Lieutenant of Downshire. He became a peer of Ireland in 1751, but went from the Irish to the English Privy Council (1754), George II. having made him comptroller of his household. After entering the English House of Lords (1756), he held various political appointments. While Secretary of State for the Colonies (1768), his stubbornness and bad judgment made much mischief between them and the mother country, and he showed but little more tact in advocating the union of England and Ireland. He was said to have been a model Irish landlord. At the conclusion of his first letter, Junius mentions Lord Hillsborough as one of the ministers responsible for the American crisis.

HILLSDALE. A city and the county-seat of Hillsdale County, Mich., 90 miles southwest of Detroit, on the Lake Shore and Michigan Southern Railroad (Map: Michigan, J 7). It is the centre of a fertile agricultural and stock-raising region, and manufactures fur and fur-lined over-

coats, flour, window-screens and screen doors, furnaces, wooden novelties, tables, wagon-wheels, etc. The city has a beautiful private park, and south of the city limits is Baw Beese Park, a popular summer resort. Hillsdale College (Free Baptist) was established here in 1855. Hillsdale, settled about 1840, is governed under a charter of 1896, by a mayor elected annually and a unicameral council, of which the executive is a member. The city owns and operates its water-works and electric-light plant. Population, in 1890, 3915; in 1900, 4151.

HILLSTAR. Any humming-bird of the genera *Diplogena* and *Oreotrochilus*. These are among the largest of the tribe, very gay in color, and inhabit the Andes from Ecuador to Bolivia. Those of the former genus are remarkable for their brilliant crown spots. In the latter genus are many species, each of which is limited in its range to a single mountain, or very limited area of high elevation. See HUMMING-BIRD.

HILL-TIT. One of a numerous family (*Leio-trichidæ*) of small insect and berry eating birds, often brightly colored, which inhabit the Himalayan region and eastward. Among them is the red-billed hill-tit (*Leiothrix lutea*), which is widely dealt in as a cage-bird under the name 'Japanese robin,' though it is unknown in Japan. It has brilliant colors, a sweet song, and gentle manners.

HILMEND, hil'mend. See HELMUND.

HILO, hê'lo. The second town in size and the best seaport of the Hawaiian group, situated on Hilo Bay, on the eastern coast of the island of Hawaii (Map: Hawaii, F 4). It has a protected harbor with a lighthouse, and contains a court-house, a custom-house, and a library. The town is surrounded by luxuriant tropical forests, with extensive lava-fields in the vicinity. There are delightful drives, and an excellent carriage-road winds from the town up toward the crater of Kilauea. The population (district, 19,785 in 1900) is extremely heterogeneous, and the American element is prominent.

HILONGOS, or **ILONGOS**, ê-lông'ô's. A town on the island of Leyte, Philippines, situated on the southwestern shore, 96 miles from Tacloban (Map: Philippine Islands, J 9). Population, 13,800.

HILPRECHT, hil'prêkt. HERMANN VOLLRAT (1859—). An Assyriologist, born at Hohenerxleben, Germany, and educated at Bernburg and Leipzig. In 1885 he was repetent in Old Testament theology at Erlangen, and in the following year came to Philadelphia to become editor of the Oriental department of the *Sunday-School Times*. Afterwards he was appointed professor of Assyrian in the University of Pennsylvania. He studied the Assyrian inscriptions (1882) in the British Museum, traveled in Syria, Babylonia, and Asia Minor, and became an authority on cuneiform paleography, so that the Turkish Government made him head of the Babylonian department of the Imperial Museum in Constantinople. In 1888 he accompanied the University of Pennsylvania's expedition to Nippur, but returned the following year. Many of the documents found after his departure were sent to him, and in 1900 he returned to Nippur, and soon after was put in charge of the excavations, the results of which had much scientific im-

portance. (See NIPPUR.) His main works are: *Freibrief Nebuchadnezar's I.* (1883); *Assyriaca* (1894); *Old Babylonian Inscriptions, Chiefly from Nippur* (1893—); *Business Documents of Murashû Sons, of Nippur* (1898); and many contributions to the *Theologisches Litteraturblatt* and other theological and Oriental journals.

HILTED (from Eng., AS. *hilt*, Icel. *hjalt*, OHG. *helza*, *hilt*; probably connected ultimately with *hold*). A term used in heraldry (q.v.), to indicate the tincture of the handle of a sword.

HILTL, hil'tl, JOHANN GEORG (1826-78). A German actor and author, born in Berlin. After studying for the stage and acting in Hanover from 1843 to 1845, he was engaged at the Berlin Court Theatre, of which he was the manager from 1854 to 1861. His best acting was in serio-comic parts. He translated many French dramas, and wrote a series of historical novels which had considerable popularity, though they lacked permanent literary value. The best known of these are: *Gefährliche Wege* (1865); *Unter der roten Eminenz* (1869); *Der alte Derfflinger und seine Dragoner* (1871); *Das Roggenhauskomplott* (1873); *Die Damen von Nanzig* (1874); and *Auf immer verschwunden* (1878). His works on history are: *Der böhmische Krieg und der Mainfeldzug* (4th ed. 1873); *Der Französische Krieg von 1870-71* (7th ed. 1895); *Preussische Königsgeschichten* (1875); *Unser Fritz* (5th ed. 1891); and *Der grosse Kurfürst und seine Zeit* (3d ed. 1893).

HILTON, WILLIAM (1786-1839). An English painter, born at Lincoln. He was a pupil of Raphael Smith, the engraver, and studied in the Royal Academy, where his first work was exhibited in 1803. In 1827 he was appointed keeper of the academy. Hilton's paintings were better appreciated by men of his own profession than by the general public, and because of his over-use of asphaltum, they have lost in color. Nevertheless the following are in color and composition notable pictures: "Christ Crowned with Thorns" (1825), in South Kensington; "Sir Calpeine Receiving Serena" (1831) and "Edith Discovering the Body of Harold" (1834), both in the National Gallery; "Una with the Lion," "The Crucifixion," "The Murder of the Innocents" (1838), and a portrait of Keats.

HILVERSUM, hil'vēr-sūm. A town in the Province of North Holland, Netherlands, 18 miles southeast of Amsterdam (Map: Netherlands, D 2). It contains a number of textile mills, and is a favorite summer resort for Amsterdam residents. Population, in 1889, 12,393; in 1899, 19,443.

HIMALAYA, hī-mā'lā-yā (Skt., the abode of snow, from *hima*, snow + *ālaya*, abode). In South Central Asia, the most elevated and stupendous mountain system on the globe (Map: India, D 3). It is not, as sometimes represented, a single chain, but a system, consisting of several parallel and converging ranges, with a vast number of rugged, snowy peaks, separated by great elevated valleys and plateaus. On the north the system descends to the elevated plateau of Tibet; on the south to the depression drained by the Ganges and the Indus. The system starts with the Karakoum, in the Pamirs, whence it trends southeast and east, sweeping in a broad curve, convex southward. The mass of the Himalaya proper extends from the great bend of the Indus in the

west to the great bend of the Brahmaputra in the east, or from longitude 73° 23' to 95° 40' E., a distance of nearly 1500 miles. Their average breadth is about 150 miles. The mean elevation of the range is from 16,000 to 18,000 feet, but 45 of its peaks are now known to exceed 23,000 feet in height. Of these, there are in Kumaon, Nanda Devi, 25,600 feet; in Nepal, Dhawalagiri, 28,826 feet; Mount Everest, 29,002 (the highest known point on the globe); in Kashmir, Mounts Godwin Austen, 28,278; Gusherbrum, 26,378; Masherbrum, 25,600; and Kakapushi, 25,560 feet; in Bhutan, Chumalari, 23,946 feet, and Kutha Kangir, 24,740 feet; and on the borders of Sikkim and Nepal, Kunchinginga, 28,156 feet, for a long time thought to be the second summit of the entire system. The southern base of the Himalaya comprises three distinct regions—first, adjoining the plains of Hindustan, the *Terai*, a jungle or grass-covered marshy plain; next, the great belt of *Saul Wood*, stretching along a great part of the range; and beyond it the *Dhuns*, a belt of detritus, extending to the foot of the true mountains. In the foothills above these regions, which are extremely unhealthy, are placed the sanitarium for troops—Darjeling, Simla, Murree. The first is connected by a mountain railway with the Bengal system. There are no plains and but few lakes of large size in the Himalaya; the chief of the latter are Naini Tal, in Kumaon, 6520 feet, and the lake of Kashmir, 6125 feet above the sea. Small glacial lakes are abundant in the heads of the gorges.

Snow falls at rare intervals in the mountains as low as 2500 feet, but at 6000 feet it snows every winter. The limit of perennial snow in the main or central Himalaya is 16,200 feet on the south and 17,400 feet on the north side; an anomaly probably owing to the dry atmosphere of Tibet, and the small quantity of rain and snow that falls there. The high range of the Himalaya forms a vast screen, which intercepts and condenses nearly all the moisture carried by the southwest monsoons from the Indian Ocean, and deposits it on the southern face of the mountains; hence at Cherra Punji, 4200 feet above the sea, as much as 600 inches of rain has been known to fall in one year. Glaciers are found in every part of the range above the snow-line; one of these, that of Deotal in Garhwal, is 17,945 feet above the sea. Among the largest of the glaciers are the Baltoro (33 miles in length) and Biafo, in the Karakorum Range. The passes in the Himalaya are the most elevated of the globe, and the greater number are upward of 17,000 feet in height. The highest known is Ibi-Gamin Pass into Garhwal, 20,457 feet, and the highest used for traffic is the Parang Pass in Spiti, 18,500 feet above the sea. All the passes above 16,000 feet are closed with snow from November till May. While the upheaval of the system probably commenced in early geologic times, the principal uplift occurred in the middle or late Tertiary period, in the mountain-making epoch which was signalized by the elevation of the alpine system of Europe. The geological structure of the Himalaya consist of crystalline rocks, with granite, gneiss, and a schistose formation, comprising micaceous, chloritic, and talcose schists. Earthquakes are of frequent occurrence in the central range. The Sanpo or Brahmaputra and Indus—which rise in close

proximity to one another on the Tibetan side of the Himalaya—with their magnificent tributaries, derive their chief supplies from the melting of the snows of these mountains, and consequently are in flood at the hottest season of the year, when the moisture they supply is most needed. Trees and cultivated grains ordinarily attain their highest limits in the mountains at 11,800, and shrubs at 15,200 feet above the sea, a limited number of flowering plants attaining to 19,500 feet. The tea-plant can be cultivated along the entire southern face of the Himalaya to an elevation of 5000 feet, but the best is produced at from 200 to 3000 feet above the sea. Tigers and apes are found at an elevation of 11,000, and the leopard at 13,000 feet, while the dog follows the herds over passes 18,000 feet high. Snakes are found at an elevation of 15,000 feet, but the highest limit of the mosquito is 8000 feet above the sea.

On account of the majestic height of this mountain range, and the apparent impossibility of reaching its summit, the imagination of the ancient Hindus invested it with the most mysterious properties, and connected it with the history of some of their deities. In the Purānas (q.v.) the Himalaya is placed to the south of the fabulous mountain Meru, which stands in the centre of the world (see MERU), and described as the king of mountains, who was inaugurated as such when Prithu was installed in the government of the earth. As the abode of Siva, he is the goal of penitent pilgrims, who repair to his summit in order to win the favors of this terrific god. His wife was Mena, whom the Pitris or demigods engendered by the mere power of their thought.

HIMALAYAN SUBREGION. A faunal district of the Oriental region (q.v.), also styled 'Himalo-Chinese,' because its most characteristic forms occur along the lower slopes of the Himalaya Mountains and their extension into China. See INDO-CHINESE SUBREGION.

HIMEJI, hē-mā'jē. The capital of the Japanese Province of Harina, situated in the southern part of Hondo, 34 miles by rail from Kobe and at the junction of three highways (Map: Japan, D 6). It has a well-preserved castle dating from the fourteenth century, and the second in size in Japan. Cotton and stamped leather are among the products. Population, in 1898, 35,282.

HIMERA (Lat., from Gk. Ἱμέρα). A city on the north coast of Sicily, founded B.C. 649 by colonists from Zanele (Messana) and exiles from Syracuse. In B.C. 481-80 the tyrant Terillus, being expelled by Theron of Agrigentum, invoked the aid of the Carthaginians. They sent a large army under Hamilcar, but were totally defeated at Himera by the Greeks under Gelon of Syracuse. Thrasydæus, son of Theron, brought a large body of Doric emigrants to the city in 476; but a few years later, after the death of Theron, Thrasydæus was driven from Agrigentum by Hiero, and Himera became free. It seems to have enjoyed great prosperity during the remainder of the fifth century, but in 409 was razed to the ground by the Carthaginians. A new city, Thermae Himerenses, was founded in B.C. 407 close to the former site. This name was derived from the famous hot spring in which Hercules was said to have bathed. The new city remained in Carthaginian hands until it was taken by the Romans

during the First Punic War. It was peculiarly favored by them, and was left a free city under its own laws. In the time of Cicero it was a flourishing town, though not very large. Under Augustus it became a colony. Ergoteles, an Olympian victor, celebrated by Pindar, was a citizen of Himera. Stesichorus the poet was a native of the city, and his statue was preserved at Thermae in the time of Cicero. Agathocles, the great tyrant of Syracuse, was a native of Thermae.

HIME'RIUS (Lat. from Gk. Ἱμέριος) (c.315-c.386). A Greek teacher of rhetoric. He was born at Prusa, in Bithynia, and lived for some time at Antioch at the Court of the Emperor Julian, but settled in Athens as a teacher. Among his pupils were Gregory Nazianzen and Basil the Great. He was a pagan, but did not attack Christianity. His works, of which twenty-four orations are preserved (edited by Dübner, 1849), were in a florid, artificial style. They are valuable because of references to events of the time or quotations from a more classic period, especially from the lyric poets.

HIMEROS (Lat., from Gk. Ἱμερος). In Greek mythology, the personification of longing and desire. He is the companion of Eros and of Aphrodite.

HIMILCO (Phœnician, 'grace of Milkar,' Gk. Ἱμίλκων, *Himilkōn*). A Carthaginian general, son of Hanno, who commanded the expedition against Sicily, B.C. 406, and conquered the western part of that island. When Dionysius of Syracuse renewed the war, B.C. 397, Himilco again commanded the Carthaginians, at first with success, but subsequently Dionysius assaulted him when greatly disabled by pestilence, and forced him to capitulate. Himilco abandoned his allies and mercenaries to the mercy of the enemy, and paid a large gratuity for permission to withdraw with his native Carthaginians. The disgrace of this surrender so weighed upon him that soon after returning to Carthage he committed suicide.

HIMILCO, or **HIMILCAR**. An early Carthaginian navigator of uncertain date, who explored the northwest coast of Europe, at the same time that Hanno explored the west coast of Africa. Avienus has preserved some fragments of the history of this voyage, in which mention is made of the Hiberni and Albioni, and of a promontory, Œstrymnis, thought to be Cornwall, and a group of islands, Œstrymnides, thought to be the Scilly Islands.

HIMMALEH, hīm-mā'lē. See HIMALAYA.

HIMMEL, FRIEDRICH HEINRICH (1765-1814). A German musician, born at Treuenbrietzen. Friedrich Wilhelm II. became his patron and enabled him to study music with Naumann at Dresden. On his return he was made royal chamber composer. In 1794 he went to Italy to continue his studies, producing there the operas *Il primo navigatore* (1794) and *Semiramide* (1795). In the latter year he returned to Germany and became Court kapellmeister in Berlin. In 1798 he went to Russia and brought out at Saint Petersburg his opera *Alessandro*. Subsequently he traveled much throughout Europe, settling finally in Berlin. Of his many popular operas the most successful was *Fanchon, das Leiermädchen* (1804), while of his songs, "An

Alexis" and "Es kann ja nicht immer so bleiben" were best liked. He also composed much Church and instrumental music.

HIM'YARITES. A name formerly used for a people of Southwestern Arabia, the Homerites of Ptolemy. According to tradition they came from a mythical ancestor, Himyar, who lived 3000 years before Mohammed. The more correct name of the people is Sabæan, from Saba, the capital of the district. See SABÆANS; MIREANS.

HINCKLEY, hīnk'li. A manufacturing and market town in Leicestershire, England, 13 miles southwest of Leicester (Map: England, E 4). Its chief buildings are the Gothic Church of Saint Mary, the Roman Catholic priory and Academy of Saint Peter, and a town hall. It has manufactures of cotton hosiery and boots. Hinckley stands on old Watling Street, the famous Roman road; it was created a barony soon after the Conquest, and had a castle and a Benedictine priory; its borough privileges were annulled by Edward IV. Population, in 1891, 9600; in 1901, 11,300.

HINCKLEY, THOMAS (1618-1706). Governor of Plymouth Colony from 1681, except during the administration of Sir Edmund Andros, until 1692, when Plymouth was united with Massachusetts. Of English birth, he came to the New England Colonies in 1635, and began to be active in the affairs of Plymouth in 1639, and was successively deputy, representative, and magistrate during 1645-80. In the latter year he was also Deputy Governor. Seven years before his appointment as Governor he held the office of commissioner on the central board of the Plymouth and Massachusetts Colonies, and continued in that position until the end of his governorship, and was afterwards a councilor. Governor Hinckley collected several volumes of papers which are now in the possession of the Boston Public Library.

HINCKS, EDWARD (1792-1866). An Irish Orientalist, son of Thomas Dix Hincks, the Presbyterian divine, and brother of Sir Francis Hincks, the Canadian statesman. Edward was born at Cork, and studied from 1807 to 1811 in Trinity College, Dublin. In 1825 he was appointed rector of Killyleagh, County Down, where, in spite of his seclusion, he undertook studies in hieroglyphics (1833), and wrote for the *Dublin University Magazine* and the *Journal of Sacred Literature*. Simultaneously with Rawlinson he discovered the syllabic character of the Assyrian cuneiform letters, and he had earlier written on the Egyptian hieroglyphics, and according to Brugsch was the first to decipher them correctly. He began an Assyrian grammar, but did not leave materials for its completion.

HINCKS, SIR FRANCIS (1807-85). A Canadian statesman, born at Cork. He went to Canada at the age of twenty-four, entered into business at Toronto, where he also edited the *Examiner* (1838), and became a leader among the Liberals, taking his seat in the first United Parliament in 1841. Three years afterwards, while his party was out of power, he directed the *Montreal Pilot*, and labored always for responsible government, and for the abolition of the clergy reserves and of the seigniorial system of landholding. When Hincks was made Premier of the Canadas in 1851, he negotiated a commercial treaty with

the United States, and exerted himself to further the development of mines and railways; but got the country into debt, and, being accused by the Upper Canadian Protestants of favoring the Lower Canadian Roman Catholics, he gradually lost ground, and the Conservatives took the helm again in 1854. He was made Governor of Barbadoes (1855-62), and of British Guiana (1862-69), but afterwards returned to Canada, and was Minister of Finance until 1873, and edited afterwards the *Montreal Journal of Commerce*. He published: *Canada: Its Financial Position and Resources* (1849); *Reply to the Speech of Sir J. Howe on the Union of the North American Provinces* (1855); *Religious Endowments in Canada* (1869); *The Political History of Canada Between 1840 and 1855* (1877); and *The Boundaries Formerly in Dispute Between Great Britain and the United States* (1885).

HINC'MAR (806-82). A celebrated churchman of the ninth century. He was born in 806, presumably in Toulouse, as he belonged to the family of the counts of that province. He was educated in the Monastery of Saint-Denis, near Paris, and was intrusted with the framing and carrying out of a plan for the reformation of the monastery. In 845 he was elected Archbishop of Rheims. In this position he had to deal with the case of the alleged heretic Gottschalk (q.v.), whom he treated with great severity. In 862 he became involved in a controversy with Pope Nicholas I. Rothadius, Bishop of Soissons and suffragan of Hincmar, deposed a priest of his diocese, who appealed to Hincmar, as metropolitan, and was ordered by him to be restored to office. Rothadius, resisting this order, and having been, in consequence, condemned and excommunicated by the Archbishop, appealed to the Pope, who ordered Hincmar to restore Rothadius, or to appear at Rome in person, or by his representative, to vindicate the sentence. Hincmar sent a legate to Rome, but refused to restore the deposed bishop; whereupon Nicholas annulled the sentence, and required that the cause should again be heard in Rome. Hincmar, after some demur, was forced to acquiesce. The cause of Rothadius was reëxamined, and he was acquitted, and restored to his see. Under the successor of Nicholas, Adrian II., a question arose as to the succession to the sovereignty of Lorraine on the death of King Lothaire, the Pope favoring the pretensions of the Emperor Louis II. in opposition to those of Charles the Bald of France. To the mandate which Adrian addressed to the subjects of Charles and to the nobles of Lorraine, accompanied by a menace of the censures of the Church, Hincmar offered a firm and persistent opposition. He was equally firm in resisting the undue extension of the royal prerogative in ecclesiastical affairs. Hincmar died at Epernay, whither he had fled from the Normans, December 21, 882. His works were collected by Sirmond (Paris, 1645), reprinted in Migne, *Patrol. Lat.*, cxxv.-cxxvi. Many others of his works are still in MSS. For his life, consult Schrörs (Freiburg, 1884).

HIND (AS., Icel. *hind*, OHG. *hinta*, Ger. *Hinde*, hind; probably connected with Goth. *hinpan*, to catch, related to AS. *hunting*, Eng. *hunt*, possibly connected with Gk. *κευdas*, *kemas*, gazelle). The female of the red deer, a correlative of 'stag' or 'hart' (q.v.). In strict use, accord-

ing to the ancient laws and customs of venery, it did not become the designation of a female red deer until the third year of its age. Latterly the word has become, outside of England, a synonym of doe.

HIND. A fish. See **GROUPEE**.

HIND, HENRY YOULE (1823—). A Canadian geologist, born in England. He was educated at Leipzig and at Cambridge, and went to Canada in 1846. As geologist for the Dominion Government, he explored large areas in British America and Labrador, and made a geological survey of New Brunswick. He afterwards became a professor in King's College, Nova Scotia. In 1860 he was elected a fellow of the Royal Geographical Society. He is the author of *Northwest Territory*, and of numerous reports on explorations of the British possessions in North America.

HIND, JOHN RUSSELL (1823-95). An English astronomer, born at Nottingham. When a mere boy he devoted himself to astronomy, and at the age of seventeen he was given a position in the Royal Observatory at Greenwich. In 1844 he was appointed member of the commission sent to determine the exact longitude of Valentia. On his return he was appointed observer in Bishop's Observatory, Regent's Park, London. He calculated the orbits of a number of planets and comets, noted many new variable stars and nebulae, and discovered ten new planetoids (q.v.), viz.: Iris and Flora in 1847; Victoria in 1850; Irene in 1851; Melpomene, Fortuna, Calliope, and Thalia, in 1852; Euterpe in 1853; and Urania in 1854. In 1851 Hind received from the Academy of Science in Paris the Lalande medal, and was elected a corresponding member. In 1852 he received the gold medal of the Astronomical Society of London, and obtained a pension of £200 a year from the British Government. He was superintendent of the *Nautical Almanac* in 1857-91. His scientific papers have generally been published in the *Transactions of the Astronomical Society*, the *Comptes Rendus* of Paris, and the *Astronomische Nachrichten*. His principal popular works are: *Astronomical Vocabulary* (1852); *The Comets* (1852); *The Solar System* (1846); and *Introduction to Astronomy* (1871). He was president of the Royal Astronomical Society in 1880.

HIND AND THE PANTHER, THE. A satirical poem by John Dryden (1687). It is a defense of the Roman Catholic Church in the form of an allegory, in which all characters are represented by animals. The Hind stands for the Roman, the Panther for the Anglican Church. Perhaps the most spirited satire is that on Burnet, represented by the Buzzard.

HINDENBURG, hīn'den-bōōrk, KARL FRIEDRICH (1741-1808). A German mathematician, born at Dresden. Educated at Leipzig, he became doцент (1771) and professor (1781) in the university there. He edited the *Magazin für reine und angewandte Mathematik*, with Bernoulli (1786-89), and the *Archiv der reinen und angewandten Mathematik* (1794-99); but he is best known as the discoverer of combinatory analysis and as author of *Kombinatorisch-analytische Abhandlungen* (1796 and 1800).

HINDLEY, hind'li. A town in Lancashire, England, three miles southeast of Wigan (Map: England, D 3). Coal-mining and cotton manufactures are important industries. Its chief buildings are the free grammar school and the

old parish church, which was desecrated by the Cavaliers during the Puritan Revolution. The municipality operates markets and remunerative gas and water works. Population, in 1891, 19,000; in 1901, 23,500.

HINDMAN, hind'man, THOMAS CARMICHAEL (1818-68). A Confederate officer in the War of Secession. He was born in Tennessee; was educated in the common schools, studied law and removed to Mississippi to practice his profession. As a lieutenant in a Mississippi regiment he took part in the Mexican War, and was a Democratic member of Congress from 1858 to 1861. He was appointed to the command of a brigade in the Confederate Army soon after the Civil War began, and first served under Gen. Simon Buckner in Kentucky. At Memphis he was in command, and was afterwards defeated at the battles of Newtontia and Prairie Grove. Promoted to be a major-general at the battle of Shiloh, he was transferred to Arkansas. After the close of the war he went to the City of Mexico, but finally returned and settled in Arkansas in 1867. The following year General Hindman was murdered by one of his former soldiers in revenge for some disciplinary act during the war.

HINDOOSTAN, hin'dōō-stān'. See **HINDUSTAN**.

HINDU KUSH, hin'dōō kōōsh, or INDIAN CAUCASUS. A range of mountains, forming the westward continuation of the Himalaya, being sometimes reckoned a part of that colossal range (Map: Afghanistan, L 3). It extends from the Upper Indus on the east to the Bamian Pass (beyond which the continuing range is generally designated Safed-Koh) on the west, stretching in latitude between 34° and 36° N., and in longitude between 68° and 74° 30' E., with a length of about 500 miles. Nearly the whole of it is contained in Afghanistan. The Oxus, or Amu-Darya, has its source in its northern ridges, and many tributaries of the Indus flow off from the south. For the first 100 miles west of the Pamirs, it is flat-topped, with passes ranging in altitude from 12,500 to 17,500 feet. Farther westward it becomes higher, and its plateau summit breaks up into peaks of which Tirach Mir, on the frontier of Chitral, is the loftiest, 25,400 feet in altitude. In this part are many passes over which trails or roads are in use. The range, which consists mainly of granites and schists, was probably uplifted in Tertiary time.

HINDU MUSIC. According to the ancient Hindu belief all arts were bestowed upon man by various gods, and music was the gift of Brahma. The early history of music in India is so beset with fables and reaches back to such remote antiquity that it is impossible to trace its real origin. We have, however, unmistakable evidence that several of the hymns of the *Rig-Veda* (about B.C. 1500) were intended to be sung to music. The hymns also mention flutes (*vāna*), cymbals (*karkari*), drums (*dundubhi*), and trumpets (*bakura*). Not only are the early accounts of the origin of music marked by an exuberance of the imagination, but the strictly scientific treatises on the subject of music are not free from this fault. The Hindu works on music are of uncertain date, but seem to be relatively late. Like much of Sanskrit literature, even when dealing with technical subjects, they are written in verse. They exist for the most part as

yet only in manuscript. The most important are the *Saṅgītarāpana* of Damodara, the *Saṅgītanārāyaṇa* by Narayana, the *Samgītaratnākara* of Sarṅgadeva (edited by Telang, Poona, 1897), the *Rāgavibōdha* of Somanatha (edited by Gharpure, Poona, 1895), the *Rāgamāta* of Kshemakara and many others of less value.

The oldest scale of the Hindus, the *Vēlāvati*, consists of only five tones, F, G, A, C, D, and is identical with that of the Chinese. In the course of time two tones were added, and A was taken as the starting-point. Thus a scale identical with our A major was obtained. A scale was known as *Svaragrāma* or *Saptaka*, and the different tones were designated by the syllables *Sa, Rī, Ga, Ma, Pa, Dhai, Nī*. Each of these syllables denoted not only the fundamental tone, but was applied equally to all its chromatic alterations. Within any scale three tones were designated by special names. These were the first, third, and fifth, known as *Ansa, Graha*, and *Nyāsa* respectively. Their function is stated in the *Samgītanārāyaṇa*: "The note *Graha* stands as the beginning and *Nyasa* at the end of a song. *Ansa* is the leading note; it gives to the melody its particular character and is used the most frequently, and the other notes are subordinated to it as to a ruler." The seven tones of the scale were repeated three times in succession, and thus a compass of three *Aṣtan* or octaves was obtained. The different tones were classified as major tones, minor tones, and semitones. Each major tone consisted of four quarter tones, each minor of three quarters, and each semitone of two quarters. These subdivisions were called *śrutis*, of which each octave had 22. Major tones were the first, fourth, and fifth, minor tones the second and sixth, semitones the third and seventh. The *Rāgavibōdha* admits the possibility of no less than 960 modes, but enumerates only 36. Even out of these only 23 are recognized as having practical value. These 36 modes were divided into 6 primary called *Rāgas*, and 30 secondary modes called *Rāginis*. The number of *Rāgas* was determined by the number of seasons, which in India is six. An attempt was made to have each *Raga* express, as closely as possible, the character of the season to which it corresponded. It also was improper to play a *Raga* at any other season than the one of which it was the expression. Musical notation by means of a staff was unknown to the Hindus. The different tones were represented by their initial consonants with lines drawn above or below to indicate to which *Aṣtan* or octave the particular tone belonged. Embellishments and marks of expression were represented quite definitely by means of small circles, ellipses, chains, curves, horizontal and perpendicular lines. The end of a phrase was indicated by a lotus-flower.

Of the musical instruments the *Vīna* (q.v.) was the principal one, and is still used to-day in India. The *Magoudi* was also a stringed instrument with four strings. Among the varied instruments the principal ones were the *Basarēe*, a flute with seven holes, and the *śankha*, a kind of trumpet made from a sea-shell. From the perfection of the *Vīna* it can easily be inferred that India was far in advance in the art of music over all other Asiatic countries of antiquity. In spite of the complicated theoretical system, composers employed chiefly the *śrīrāga*, our modern A major. The minor mode occurs also, but very

seldom. In the religious cult of the Hindus music was of primary importance. Music, both vocal and instrumental, was strictly regulated by laws. The former was called *Gāna*, the latter *Vādyā*. Pantomimes were known as *Nṛtya*; and a combination of all was designated by the term *Saṅgīta*. Consult: Jones, "On the Musical Modes of the Hindus," in *Asiatick Researches*, vol. iii. (Calcutta, 1792), reprinted in his *Works*, vol. iv. (London, 1807); Paterson, "On the Grāmas or Musical Scales of the Hindus," *ib.*, vol. ix. (*ib.*, 1807); Bird, *The Original Miscellany, Being a Collection of the Most Favorite Airs of Hindostan* (Calcutta, 1789); Tagore, *Hindu Music from Various Authors* (*ib.*, 1875); Schröder, *Indiens Litteratur und Cultur* (Leipzig, 1887); Day, *The Music and Musical Instruments of Southern India and the Deccan* (London, 1891).

What strikes a student of the original Hindu melodies is the great discrepancy between musical theory and actual practice. Evidently the composers disregarded theoretical speculations and wrote according to the dictates of their ear; for all the melodies are found to be written exactly in our major or minor modes, and can be harmonized accordingly without the least difficulty.

HINDUSTAN, hīn'dōō-stān', or **HINDOOSTAN**. The land of the Hindus. A portion of India situated north of the Vindhya Mountains in the valley of the Upper Ganges. The name has been used loosely as a designation of the Indian Peninsula. See **INDIA**.

HINDUSTANI (hīn'dōō-stā'nē) **LANGUAGE AND LITERATURE**. The *lingua franca* of Northern India. This is in structure an Indian language, descended from a sister dialect of the ancient Sanskrit through mediæval Prakrit vernaculars. Hindustani is divided into nearly sixty subdialects, which in the eastern portion of its district are approximate Bengali, and in the south and west closely resemble Marathi and Gujarati. The territory of Hindustani, which is the vernacular of nearly 100,000,000 people, covers some 248,000 square miles. The standard dialect is the Brāj Bhāsha, spoken in the districts of Delhi, Agra, and Mathura. Hindustani abounds in Turkish, Arabic, and Persian words, as well as in numerous borrowings from Dravidian and Kolarian dialects. In this form it is called Urdu, which in Turkish signifies 'camp.' This term is a relic of the Mohammedan invasions of the country around Delhi in the twelfth century, when conquerors and conquered sought to find a speech which they might each understand. During the nineteenth century the vocabulary of the language was purified to a great extent of the foreign element, and the usage of native words as far as possible has since been preferred. Hindustani without these non-Indian importations is called Hindi or High Hindi.

In structure the language is analytic. In this it resembles the other modern Indian languages, as well as Persian, and in many respects English. It forms cases, tenses, etc., by postpositions, periphrases, and the like. Thus from *ghar*, 'house' (Sanskrit *grha*), is formed the genitive *ghar kā*, ablative *ghar se*, instrumental *ghar nē*, while the plural of the same cases is *gharōn kā*, *gharōn se*, *gharōn nē*. There are two genders, two numbers, two voices, and nine tenses in common use, e.g. *main dekhā* 'I see,' *main dekhātā hūn* 'I am seeing,' *main dekhūngā* 'I am going to see,' *main nē*

dekhā hai 'I have seen' (lit. 'by me it has been seen'), and so forth. Hindi is written in the Devanagari alphabet, like Sanskrit and Marathi, while Urdu employs the Perso-Arabic script with three additional characters to represent specifically Indian sounds.

Hindustani literature is very abundant, although for the most part it rises little above mediocrity in character. It begins with the *Prithvirāj Rāsau*, by Chand Bardai (about A.D. 1200), who related in his long poem the history of Prithviraja II., the last Hindu King of Delhi. Much of the literature consists of translations from the Sanskrit, as well as from Persian and Arabic. The most noteworthy specimens of this particular class of work are the *Rāmāyan* of Tulsadas, begun A.D. 1575, and the *Bagh u Bahār*, "Garden and Spring," which Amman of Delhi translated from the Persian collection of stories called the "History of the Four Dervishes" at the beginning of the nineteenth century. History and the drama also find their place in this literature, which is the most important in modern India.

HINGE (ME. *henge*, from *hengen*, secondary form of *hangan*, to hang). The pivots or joints on which doors, shutters, etc., revolve. The simplest form of hinge is a projection cut upon the substance of which the door is made, and fitted into a hole. This is sometimes done with wooden shutters, and there are examples extant of stone shutters hinged in this manner. The cathedral of Torcello, near Venice, which dates from the eleventh century, still has the windows protected with shutters formed of large slabs of stone, hinged on stone pivots. During the Middle Ages hinges, as well as every other useful article, were made subjects of ornamentation. The earliest ornamental hinges date from about the tenth century. The first examples are cramped and stiff, and the scrolls are frequently terminated with animals' heads. In the Early English and Decorated styles, the hinges and other metal-work were very elaborate and beautiful in design, and frequently extended over the whole of the doors. In the Perpendicular style, hinges were usually very simple in form, the paneling of the woodwork not admitting of much ornamental ironwork. In modern times hinges are chiefly made of brass and iron, and unless intended for decorative effect are fitted on the edges of the doors and shutters, where they are concealed. The revival of mediæval architecture has given an impulse to the manufacture of ornamental metal-work, and hinges of varied and good design are produced.

HINGHAM, hing'am. A town in Plymouth County, Mass., comprising the villages of West Hingham, South Hingham, and Hingham Centre; 17 miles southeast of Boston; on Massachusetts Bay, and on the New York, New Haven and

Hartford Railroad (Map: Massachusetts, F 3). It has Derby Academy, a public library, and an old meeting-house which dates from 1681. The government is administered by town meetings. Population, in 1890, 4564; in 1900, 5059. Hingham was settled in 1633, and was known as Barecove until 1635, when it was incorporated under its present name. It was the home of Gen. Benjamin Lincoln, John A. Andrew, and John D. Long, and the birthplace of James Hall, the eminent geologist. Consult Lincoln (and others), *History of the Town of Hingham* (Cambridge, 1893).

HINK'SON, Mrs. KATHARINE (maiden name TYNAN), (1861—). An English novelist and verse-writer, born in Dublin, Ireland. She was educated at the Dominican Convent of Saint Catherine of Sienna at Drogheda, Ireland. In 1893 she married H. A. Hinkson, and took up her residence in London. She is favorably known for her verse contained in *Louise de la Vallière and Other Poems* (1885); *Shamrocks* (1887); *Cuckoo Songs* (1894); *Ballads and Lyrics* (1897); *The Wind in the Trees* (1898); and *Collected Poems* (1901). She also portrayed phases of Irish character in a series of pleasant novels, comprising chiefly: *A Cluster of Nuts*, short tales (1894); *The Way of a Maid* (1895); *O, What a Plague is Love* (1896); *The Handsome Brandons* (1898); *The Dear Irish Girl and She Walks in Beauty* (1899); *Three Fair Maids and A Daughter of the Fields* (1900); *A Girl of Galway* (1901); *The Handsome Quaker* (1902); *A King's Woman* (1902). For an appreciative estimate of Mrs. Hinkson as a poet, consult William Archer, *Poets of the Younger Generation* (New York, 1902).

HINLICHE, ên-l'ê'châ, 'Southern People.' A pastoral tribe of Araucania, wandering over the southern pampas of Argentina. They live in portable tents of skins and subsist entirely upon meat derived from their herds of horses, cattle, and sheep. They are skillful artificers in leather and iron, while the women make rugs of ostrich-skins and weave woolen blankets and ponchos of superior quality.

HINNOM, VALLEY OF. A ravine in or near Jerusalem. The precise location has not yet been determined. Scholars differ as to which of the three valleys, Kidron, Tyropœon, or Wady er-Rababi, is likely to have been called the Valley of Hinnom. Jewish and Arab tradition favor the first, which runs east of the temple elevation. A majority of recent investigators prefer the last, which is south of the present city. Much probability, however, seems to attach to the Tyropœon. In Enoch xxvi., the ravine over which the author marvels is evidently the Valley of Hinnom, and it is unquestionably identical with the Tyropœon, lying between Mount Zion and the western hill. Consequently a writer familiar with Jerusalem and living toward the end of the second century B.C. located the Valley of Hinnom in the Tyropœon. The chief objections are that if the city did not in præxilic times extend beyond the Tyropœon, there ought to be some remains of walls there, and that, if the Tyropœon was within the city, the sacrifices of the first-born to Moloch would have been made in the immediate neighborhood of the Yahweh temple. But whatever the extent of the city, it is highly improbable that important sanctuaries were left

unprotected outside the walls. That Solomon should build temples to Chemosh and Moloch, the gods of the conquered Moabitic and Ammonitic dependencies, was only natural (I. Kings xi. 7). These shrines would not be far from the royal sanctuary. When even kings like Ahaz and Manasseh offered their firstborn, and questions such as those in Micah vi. 6-7 could be asked in Judah touching the expediency of making similar sacrifices to Yahweh, there is no reason to suppose that the inhabitants of Jerusalem objected to having offerings of the firstborn made to Moloch near the Yahweh temple. A later addition to I. Kings xi. 7, found in the Greek version, states that Solomon also built a temple to Ash-taroath. (See *ASTARTE*.) This is not improbable, but it may simply reflect the memory of the actual existence of such a sanctuary in the valley. The sites had probably been occupied long before Solomon by Canaanitic shrines. The name of the valley is quite obscure. Its full title seems to have been either "Valley of the Sons of Hinnom" or "Valley of the Son of Hinnom." The former is found in II. Kings xxiii. 10, and often in the best manuscripts of the Greek version; the latter in Joshua xv. 8 and xviii. 16, where the abbreviated form Valley of Hinnom is also found, and in II. Chron. xxviii. 3, xxxiii. 6; Jer. vii. 31-32, xix. 2-6, xxxiii. 35. Hinnom was regarded by the Greek translators as a proper name, and many modern authors take the same view. But as the name is changed in Jer. vii. 32, xix. 6, to 'Valley of Slaughter,' it probably originally suggested a pleasant meaning. It has been conjectured that the name of the divinity worshipped in the valley was *Ben Naaman*, 'pleasant son,' which may have been a descriptive title of Tammuz. Another explanation, necessitating no alteration of the consonantal text, is that *hinam* meant in this connection 'sexual enjoyment,' and that the participants in the licentious rites practiced at the shrines and in the groves of this valley were called 'sons of joy.' In the Babylonian Talmud (*Erubin*, 19 a), Hinnom is connected with the word *hinam* used in the sense of levity, licentiousness. The meaning of the root is 'to be jocund,' and the word *hinnom* should probably be connected with it. At one of the sanctuaries in this valley children were passed through the altar-fire to Moloch. It is not evident whether the phrase implies a burnt-offering or an ordeal by fire. But Josiah defiled one of the chief sanctuaries, the Taphet, later pronounced Tophet to suggest *bosheth*, 'shame.' What basis there is for the mediæval rabbinic statement that perpetual fires were kept up in this valley for consuming dead bodies of criminals and carcases of animals, cannot be ascertained. If Tophet was at the southern end of the Τυροῶν, near Siloam, this cremation of refuse would be outside the city limits. The apocalyptic expectation in the second century of a final battle between the nations and Israel outside of the holy city seems to have rested upon this feature of the surroundings. Here the enemy would be consumed, and the pious who should go up to the temple in Jerusalem on Sabbaths and at new moons would look with satisfaction upon the carcases consumed by fire and worms (Is. lxvi. 23-24). The same idea is found in Enoch xxvii. Gradually the term *Ge Hinnom*, or Aramaized, *Gehenna*, came to be used, not of this valley in Jerusalem, but of the subterranean Tartarus to which it was the entrance;

of the unseen place of final punishment of the impenitent; of the sudden destruction of both soul and body; or figuratively, of the inner condemnation of spiritual loss. On the geographical question, consult: Warren's article "Hinnom," in the *Hastings Bible Dictionary*; Conder's article "Jerusalem," in the *Encyclopædia Biblica*; George Adam Smith, *Historical Geography of the Holy Land* (London, 1897). See *GEHENNA*; *HELL*; *JUDGMENT, FINAL*; *ESCHATOLOGY*.

HINNY (Lat. *hinna*, *hinnus*, Gk. *ἵνος*, or *ginnus*, Gk. *γῖνος*, mule from a stallion and a she-ass). The hybrid produced between a horse and a female ass. It is smaller than a mule, but the body is more bulky in proportion to the legs, and its strength is inferior. It is less valuable than the mule, although more docile. The hinny is rare. It was described by some of the earlier naturalists as a hybrid between the ox and the ass.

HINOYOSSA, hē'noi-ōs'sá, ALEXANDER D'. The director of Nieuw Amstel, a Dutch colony established on the east bank of the Delaware in 1656, and afterwards Governor of all the settlements on that river until the conquest of New Netherland by the English. Hinoyossa was born and died in Holland, and his activity in the Dutch settlements of America extended from 1656 to 1674. He came to New Amsterdam in 1656 as lieutenant in a small force of soldiers accompanying 150 Dutch emigrants, and succeeded Jacob Aldrichs as director of Nieuw Amstel in 1659. His position was a trying one on account of the conflicts of authority which were continually disturbing the colony, especially in regard to taxation. Appeals to Holland were frequent, and Hinoyossa refused to recognize the authority of Director Stuyvesant, of New Amsterdam, who had the supervision of the commissioners composing the government of the colony. As an investment the latter was not at first profitable, owing to sickness and dissension among its members; but Hinoyossa governed so vigorously and wisely that all attempts by the West India Company to secure control failed. Confident of his own ability and seeing the necessity of a single and undisputed authority, Hinoyossa went to Holland in 1663 to ask for the entire direction of all the Delaware settlements, which was finally given to him. Director Stuyvesant formally transferred his authority, and the Swedes, who had rival settlements there, after a fruitless effort to resist the change also became obedient, and accepted Hinoyossa's control. On the English conquest of New Netherland Hinoyossa returned to Holland and became a soldier in the Republican Army in the great war with Louis XIV.

HINSDALE, hīnz'dāl, BURKE AARON (1837-1900). An American educator. He was born in Ohio, and was educated at Hiram College, where he was a pupil of James A. Garfield. In 1861 he entered the Campbellite ministry, preaching in Cleveland and other places, and in 1866 was chosen assistant editor of the *Christian Standard*. Three years later he became professor of history and English literature in Hiram College, and from 1870 to 1882 was its president. After a few years' service as superintendent of schools at Cleveland, Ohio, he was appointed professor of the science and art of teaching in the University of Michigan in 1886. Among his publications

are: *Genuineness and Authenticity of the Gospels* (1870); *Jewish Christian Church* (1878); *Ecclesiastical Traditions* (1879); *The Republican Text-Book* (1880); *Garfield and Education* (1881); *The Old Northwest* (1888); *How to Study and Teach History* (1894); *Teaching the Language Arts* (1896); and *Horace Mann and the Common-School Revival in the United States* (1898). He also edited the *Life and Works of James A. Garfield* (2 vols., 1882-83).

HINTERLAND, hín'tér-lánt (Ger., back territory). A term that came into general use at the time of the partition of East Africa between Germany and England in 1890. The doctrine of the hinterland is the claim of German diplomats that when a power takes possession of a strip of seacoast, its rights extend inland indefinitely, or until its territory reaches the recognized boundary of some other power.

HINTON. A city and the county-seat of Summers County, W. Va., 100 miles southeast of Charleston; on the New River, and on the Chesapeake and Ohio Railroad (Map: West Virginia, C 4). It is a railroad division headquarters with repair-shops, etc., and has also sawmills and other industrial establishments. Population, in 1890, 2570; in 1900, 3763.

HINTON, JAMES (1822-75). An English aurist and metaphysician, born at Reading. He received his education at the Hospital of Saint Bartholomew, and began to practice in London about 1850 as an ear specialist. Besides lecturing upon his chosen subject in Guy's Hospital, from 1862 to 1874, he published: *Man and His Dwelling-Place* (1859); *Life in Nature* (1862); and *The Mystery of Pain* (1865). Two of his books upon similar subjects were issued posthumously. Elllice Hopkins edited his *Life and Letters* (1878).

HINZPETER, hín'ts'pā'tér, GEORG ERNST (1827—). A German educator, born at Bielefeld, where he taught after his university course at Halle and Berlin. The Crown Prince's tutor, Hinzpeter became a privy counselor and member of several governmental boards after Wilhelm II. came to the throne, strongly influenced the Emperor's educational policy, and in 1890 was prominent in the Berlin Conference on Higher Education. He wrote *Kaiser Wilhelm II.* (9th ed. 1889).

HIOGO, hyō'gō, or **FIOGO**. A part of the Japanese town of Kobe (q.v.).

HIONG-NU, hyōng'nōō'. By this name the Chinese chroniclers designate a people of Turkish or Tatar race who, some two centuries B.C., founded a powerful kingdom in Central Asia, conquered Turkestan, and made inroads into China. The kingdom of the Hiong-Nu lasted until the middle of the first century A.D., when it split into two sections, of which the northern soon disappeared from history. Some identify the Huns with the Hiong-Nu. The Chinese account of this people was published (in translation) in the *Journal of the Anthropological Institute* (London) for 1874. Many ethnologists see in the Hiong-Nu the ancestors of the Turks.

HIOUEN-THSANG, hé-wēn-tsāng'. A celebrated Chinese Buddhist traveler, who visited 110 places of India in the first half of the seventh century (629-645), and gave an account of the condition of Buddhism at that period

in India. His interests being chiefly religious, he did not enter much into details concerning the social and political condition of India. His narrative, however, gives many curious facts which he observed, and, possessing a high degree of trustworthiness, is one of the most important documents for the history of India at that time. Apparently he traveled alone, or with a few occasional companions, and wore the garb of a religious mendicant. It does not appear that the account of his travels was written by himself. The first of the two works relating to them is a biographical notice of him, in which his travels form a principal feature; it was composed by two of his pupils, Hœi-li and Yen-Thsong. The latter bears the title of *Ta-thang-si-yu-ki*, or "Memoirs of the Countries of the West, published under the Thang," and was edited by Pien-ki. Both works have been published in a French translation by the Chinese scholar M. Stanislaus Julien in his *Histoire de la vie de Hiuén-Thsang* (1853), and his *Mémoires sur les contrées occidentales, par Hiuén-Thsang* (1857-58). For his biography, consult Beal, *Life of Hiuén-Tsaing* (London, 1888).

HIP-JOINT. A ball-and-socket joint, formed by the reception of the globular head of the thigh-bone (or femur) into the deep pit or cup in the *os innominatum*, which is known as the *acetabulum* (so called from its resemblance to the vinegar cups used by the Romans). If the variety of the movements of this joint—viz., flexion, extension, abduction, adduction, and rotation inward and outward—and at the same time its great strength are considered, it may well claim to be regarded as the most perfect joint in the whole body.

The ligaments are usually described as five in number: (1) The capsular; (2) the ilio-femoral; (3) the teres or round; (4) the cotyloid; and (5) the transverse. The capsular ligament extends from the edge of the cup to the circumference of the neck upon which the ball is carried, inclosing the bony parts in a strong sheath. The ilio-femoral, or Y-ligament, is merely an accessory band of fibres which give increased thickness to the capsular ligament in front, where strength is specially required. The great use of the capsular ligament is to limit the extension of the hip-joint, and thus to give steadiness to the erect posture. The only other ligament requiring notice is the teres, or round ligament, which is in reality triangular rather than round, and has its apex attached to the head of the thigh-bone, while its base is connected with the cavity of the acetabulum. Its use is not very clearly known, but probably is to support and protect vessels giving blood-supply to the head of the bone. It is sometimes absent in cases in which no special weakness of the joint was observed during life, and is of by no means constant occurrence in mammals. The joint is much strengthened by a large number of surrounding muscles, some of which are of considerable power.

In such a joint as this, although the ligaments materially assist in preventing dislocation, it is obvious that the articular surfaces cannot, under ordinary circumstances, be kept in apposition by them, inasmuch as they must be loose in their whole circumference, to permit of the general movements of the joint. The experiments of Weber have shown that atmospheric pressure is

the real power by which the head of the femur is retained in the acetabulum when the muscles are at rest.

DISEASE OF THE HIP-JOINT. Hip-disease differs in so many points of importance from other joint-diseases, and is so serious an affection that it requires a special notice. Its connection with the serofulous or strumous diathesis is more distinctly marked than that of most other joint-diseases, and it almost always occurs before the age of puberty. It is essentially a tubercular inflammation of the hip-joint. Its beginning may be often associated with some trivial occurrence, such as over-exertion in a long walk, a sprain in jumping, or a fall.

In the early stage of the disease, the whole of the structures of the joint are inflamed, and by proper treatment at this period the morbid action may be sometimes subdued without any worse consequences than a more or less rigid joint. Usually, however, abscesses form around the joint, and often communicate with its interior; and the acetabulum, and the head and neck of the thigh-bone, become disintegrated, softened, and roughened. In a still more advanced stage, dislocation of the head of the thigh-bone commonly occurs, either from the capsular ligaments becoming more or less destroyed, and the head of the bone being drawn out of its cavity by the action of the surrounding muscles, or from a fungous mass sprouting up from the bottom of the cavity, and pushing the head of the bone before it. It is of extreme importance that the symptoms should be detected in an early stage of the disease, and surgical aid at once be sought.

As the disease advances, abscesses, as already mentioned, occur around the joint, which sometimes, from the tension they exert on the obturator nerve, occasion extreme pain in the inside of the thigh. True shortening of the limb now takes place, which at the same time becomes adducted and inverted. From this stage, if the general health is good, the patient may be so fortunate as to recover with an ankylosed (or immovable) hip-joint; but occasionally a condition of exhaustion comes on, the tubercular process exhibits itself in the lungs and elsewhere, and death finally supervenes from the prolonged septic processes. The duration of the disease may vary from two or three months to ten or more years. The essential factor in the treatment of these cases is complete immobilization of the joint for a protracted period by means of plaster splints or rigid metal braces. With this must be combined nourishing food, fresh air, and sunlight, with general exercise of the body as early as is practicable.

HIPPARCHUS, hip-pär'kūs (Lat., from Gk. Ἰππάρχος) (fl. between B.C. 161 and 126). A Greek astronomer and mathematician. He was born in Nicaea, Bithynia, but his astronomical work was done on the island of Rhodes, and possibly also in Alexandria. Of his personal history nothing is known. He was the founder of genuinely scientific astronomy, and also of a part of that science which lies on the border-land of astronomy and geometry, viz., trigonometry. In this field he computed a table of chords, which, although lost, is known to us through the works of Theon of Alexandria (q.v.), who wrote about A.D. 365. It is probable, too, that this is the Hipparchus who wrote on combinatory analysis, and that the Arabs were correct in attributing to

him a knowledge of the quadratic equation. Certain it is that Ptolemy was indebted to him for much of the *Almagest* (q.v.). According to Fabricius, Hipparchus wrote nine separate works; but of these only the *Commentary on Aratus* has come down to us. From the *Almagest* we learn that it was Hipparchus who first discovered the precession of the equinoxes, determined the place of the equinox among the stars, invented solar and lunar theories, invented the astrolabe (q.v.), and drew up a catalogue of upward of 1000 stars, determining the longitude and latitude of each (this catalogue has been preserved in the *Almagest*). As Ptolemy was also an astronomer, there is some difficulty in allotting to each his meed of praise for the discoveries mentioned in the *Almagest*, which difficulty has given rise to some discussion. Consult: Delambre, *Histoire de l'astronomie ancienne* (Paris, 1817); Berger, *Die geographischen Fragmente des Hipparch* (Leipzig, 1870); Wolf, *Geschichte der Astronomie* (Munich, 1877).

HIPPARCHUS (c.555-514 B.C.). The son and one of the successors of Pisistratus, tyrant of Athens. On the death of Pisistratus (B.C. 527), Hipparchus and his older brother, Hippias, kept the government of Athens in their hands. Hipparchus interested himself in art and literature, as his father had done. He was murdered by Harmodius and Aristogiton in 514, at the Panathenæa, probably in revenge for a personal insult, though the Greeks of the next century commonly considered the murderers as patriots and saviors of their country.

HIPPARION (Neo-Lat., from Gk. ἵππῆριον, pony, diminutive of ἵππος, *hippos*, horse). A fossil horse, somewhat smaller than the Asiatic ass, remains of which have been found in Upper Miocene rocks of North America and in the Pliocene deposits of North Africa, Asia, and Europe. See HORSE, FOSSIL.

HIPPEL, THEODOR GOTTLIEB VON (1741-96). A German humorist and satirist, born at Königsberg. After traveling in Russia, he settled in his birthplace as tutor and student of law, and in 1786 became Privy Councilor of War and president of the town. He published: *Ueber die Ehe* (1774, edited by Brenning, 1872); *Ueber die bürgerliche Verbesserung der Weiber* (1792); *Lebensläufe nach aufsteigender Linie, nebst Beilagen A. B. C.* (1778-81, edited by Ottingen, 1883); and *Ueber weibliche Bildung* (1801). In these works he attempted to express and popularize the philosophy of Kant's *Kritik*, then unpublished. Of a more satiric and political nature are: *Zimmermann I. und Friedrich II., von Johann Heinrich Friedrich Quittenbaum Bildschnitzer in Hannover* (1790), and *Kreuz und Querzüge des Ritters A. bis Z.* His other works include some hymns: the idyllic *Handzeichnungen nach der Natur* (1790); the drama *Der Mann nach der Uhr* (2d ed. 1771); and *Ueber das Königsberger Stapelrecht* (1791). His collected works were published at Berlin in fourteen volumes (1827-38). Consult his autobiography (Gotha, 1801).

HIPPIAS (Lat., from Gk. Ἰππίας) (?-c.490 B.C.). A tyrant of Athens, son of Pisistratus, upon whose death (B.C. 527) he assumed the government in conjunction with his brother Hipparchus. According to Thucydides, the government of the brothers was conducted on the same

principle as that of their father, and many distinguished poets, including Simonides of Ceos and Anacreon of Teos, lived at Athens under their patronage. After the assassination of Hipparchus, in B.C. 514, Hippias seized the reins of government alone, and avenged the death of his brother by imposing extraordinary taxes, selling offices, and putting to death all of whom he entertained the least suspicion. At length, however, his despotism was overthrown. The Delphic oracle was bribed to enjoin the Lacedæmonians to free Athens from the Pisistratidæ, and after one or two unsuccessful attempts the tyrant's old enemies, the Alcæonidæ, to whom Megacles belonged, supported by a Spartan force under Cleomenes, defeated Hippias in the field, captured his children, and compelled him and all his relatives to leave Attica (B.C. 510). As soon as they had departed, a decree was passed condemning the tyrant and his family to perpetual banishment, and a monument commemorative of their crimes and oppression was erected in the Acropolis. After spending some time at Sigeum, Hippias went to the Court of Darius, and incited the first war of the Persians against the European Greeks. He accompanied the expedition sent under Datis and Artaphernes, and persuaded the Persians to land at Marathon. It cannot be determined whether he was killed during the battle or whether he died at Lemnos on his return.

HIPPIAS OF E'LIS (c.460 B.C.-?). A Greek mathematician, writer, diplomat, and philosopher. He was a teacher of renown, a man of great pretense, but a scholar of little originality. His teaching, for which his pupils were compelled to pay heavily, was directed to the practical end of success in a worldly way, to display, and to ability in public address. It is probable that he is the Hippias mentioned by Proclus (on the authority of Geminus) as the inventor of the quadratrix, a curve originally designed, it is thought, for dividing an arc in a given ratio, but which also lends itself readily to the quadrature of the circle. (See QUADRATURE.) This curve, however, usually bears the name of Dinotratrus, since he studied it with so much care.

HIPPIDIUM. An extinct ancestor of the horse. See HORSE, FOSSIL.

HIP'PO (Lat., from Gk. ἵππων, *Hippōn*), or **HIPPO REGIUS.** A Phœnician colony in North Africa, later a favorite residence of Masinissa, King of Numidia, of which the scanty ruins are yet to be seen, near Bona, Algeria. Hippo was a flourishing trading city under the Roman rule, and in later years the see of Saint Augustine, who died here in A.D. 430, just before the destruction of the city by the Vandals.

HIP'POBOS'CIDÆ (Neo-Lat. nom. pl., from Gk. ἵπποβοσκός, *hippoboskos*, feeding horses, feeding on horses, from ἵππος, *hippos*, horse + βόσκειν, *boskein*, to feed). A strange and important family of dipterous insects which are parasitic upon birds and mammals, and which are popularly known by the name of 'bird-ticks.' This is misleading, since they are not ticks, and are not confined to birds, although the adults live and move quickly about among the feathers and hair of birds and mammals. Unlike most other external parasites of the higher animals, many of them possess wings, although they are otherwise modified as the result of their parasitic

life. Their development is very abnormal, and differs from that of all other insects. The eggs hatch and the larvæ develop within the mother, and are extruded only when ready to transform to pupæ. *Hippobosca equina* is a winged species which occurs on the horse, and is known in England as the 'forest fly.' *Melophagus ovinus* is a wingless form, and occurs on the sheep. One of the commonest of the North American species is *Olfersia Americana*, which is found upon certain birds, like the horned owl, certain hawks, and the ruffed grouse. The species of the genus *Lipoptena* may, while still winged, live on birds, but afterwards they lose their wings, and are then found on mammals.

HIP'POCAM'PUS. See SEA-HORSE.

HIP'POCRAS (from Fr. *hippocras*, *hypocras*, from Lat. *Hippocrates*, Gk. Ἱπποκράτης, *Hippokratēs*, a famous Greek physician). An aromatic medicated cordial, formerly much used in Great Britain. It was made of spiced wine, mixed with sugar, lemon, aromatic tincture, or other ingredients.

HIPPOCRATES (Lat., from Gk. Ἱπποκράτης, *Hippokratēs*) (c.460-357 B.C.). A Greek physician, the most celebrated of antiquity, and justly called 'the father of medicine.' He was the son of Heraclides, also a physician, and belonged to the family of the Aesclepiadæ, being either the nineteenth or seventeenth in descent from Æsculapius. His mother, Phænarete, was said to be descended from Hercules. He was born in the island of Cos. He is said to have been instructed in medicine by his father and by Herodicus, and in philosophy by Georgias of Leontini, the sophist, and Democritus of Abdera, whom he afterwards cured of insanity. After spending some time in traveling through different parts of Greece, he settled and practiced his profession at Cos, and finally died at Larissa, in Thessaly. He is said to have passed the age of a hundred. We know little more of his personal history than that he was highly esteemed as a physician and an author, and that he raised the medical school of Cos to a very high reputation. His works were studied and quoted by Plato. Various stories are recorded of him by Greek writers, which are undoubtedly fabulous; and legends regarding him are found in the works of Arabic writers, who term him Bukrat, while the European story-tellers of the Middle Ages celebrate him under the name of Ypocras. The works bearing the name of Hippocrates, and termed the Hippocratic collection, are 72 in number, and include many treatises by his sons, Thessalus and Draco, by his son-in-law, Polybus, and by others. The following are considered authentic: *Epidemics; Regimen in Acute Diseases on Air, Water, and Places; On Wounds of the Head*; parts of the *Aphorisms*; and parts of the *Prognostics*; the work on *Ancient Medicines; Joints; Fractures; The Use of the Lever; Law; Ulcers; Hæmorrhoids; The Sacred Disease; Fistulæ*; and *On the Duty of the Physician*, as well as the *Oath*. Hippocrates divides the causes of disease into two principal classes—the first consisting of the influence of seasons, climates, water, situation, etc., and the second of more personal causes, such as the food and exercise of the individual patient. His belief in the influence which different climates exert on the human constitution is very strongly expressed. He

ascribes to this influence both the conformation of the body and the disposition of the mind, and hence accounts for the difference between the Greek and the Asiatic. The four fluids or humors of the body (blood, phlegm, yellow bile, and black bile) were regarded by him as the primary seats of disease; health was the result of the due combination (or *crasis*) of these, and illness was the consequence of a disturbance of this case. When a disease was proceeding favorably, these humors underwent a certain change (or *coction*), which was the sign of returning health, as preparing the way for the expulsion of morbid matter, or *crisis*, these crises having a tendency to occur at definite periods, which were hence called 'critical days.' His treatment of diseases was cautious, and what we now term expectant; it consisted chiefly and solely in attention to diet and regimen. Thus he was the inventor of the humoral pathology, so long in vogue in medical schools. He must be judged by the standards of his day. A most careful and keen observer and exact chronicler of symptoms, he was also possessor of a remarkable mental equipment and a man of great nobility and morality.

The works of Hippocrates were translated at an early period into Arabic. They were first printed in a Latin translation in 1525 at Rome, Galen's commentaries on his works being of special value. The first Greek edition (the Aldine) appeared the following year at Venice; an edition by Mercurialis appeared in 1588, one by Foesius in 1595, and one by Van der Linden (still much esteemed) in 1665. An edition under the editorship of Kuhn appeared in three volumes at Leipzig, in 1825-27. The best French edition is that of Littré, in 10 volumes, the first of which appeared in 1839, and the last in 1861. An excellent English translation of *The Genuine Works of Hippocrates* was published in 1849 in 2 vols. by Dr. Adams.

HIPPOCRATES OF CHIOS, κίως (c.450 B.C.). A Greek geometer, possibly related to the family of the celebrated physician. His early life was devoted to maritime commerce, and the seizure of a vessel by the Athenian customs called him (c.430) to Athens to obtain redress. Failing in his mission, he betook himself to the study of philosophy and to teaching geometry. He wrote the first elementary text-book on geometry, but is known especially for the quadrature of certain

LINES OF HIPPOCRATES.

figures which are commonly called the lunes of Hippocrates. This is the first known instance of the quadrature of a curvilinear figure. One of the propositions in its simplest form asserts that if semicircles be described upon the three sides of an isosceles triangle, as shown in the accompanying figure, the area of the triangle equals the sum of the areas of the lunes—i.e. $T = A + B = 2A$. It is easily proved that $T = A + B$ even if the triangle is not isosceles. These propositions on the lunes are further interesting as being the old-

est extant specimens of geometric proofs by reasoning.

Hippocrates also attempted the problem of duplicating the cube, and reduced it to that of finding two means between one line and another of double its length. He is also credited by Proclus with inventing the process of geometric reduction, consisting in passing from one proposition to another, which being mastered, the one proposed necessarily follows.

HIPPOCRATIC FACE. See FACIES.

HIPPOCRATIC OATH. An oath taken by young men in the early days on entering upon the practice of medicine. In ancient times the oath was ascribed to Hippocrates, and is probably authentic. It runs as follows: "I swear by Apollo, the physician, by Æsculapius, by Hygieia, Panacea, and all the gods and goddesses, that according to my ability and judgment I will keep this oath and stipulation: to reckon him who teaches me this art equally dear with my parents; to share my substance with him and to relieve his necessities if required; to look upon his offspring upon the same footing as my own brothers; and to teach them this art if they shall wish to learn it, without fee or stipulation; and that by precept, lecture, and by every other mode of instruction I will impart a knowledge of this art to my own sons, to those of my teachers, and to disciples bound by a stipulation and oath, according to the law of medicine, but to no others. I will follow that system of regimen which, according to my best judgment, I consider best for my patients, and abstain from whatever is injurious. I will give no deadly medicine to any one if asked, nor suggest any such counsel. Furthermore, I will not give to a woman an instrument to procure abortion. With purity and holiness will I pass my life and practice my art. I will not cut a person who is suffering with stone, but will leave this to be done by those who are practitioners of such work. Into whatever houses I enter I will go for the advantage of the sick, and will abstain from every voluntary act of mischief and corruption, and, further, from the seduction of females or males, bond or free. Whatever in connection with my professional practice, or not in connection with it, I may see or hear, I will not divulge, holding that all such things should be kept secret. While I continue to keep this oath inviolate, may it be granted to me to enjoy life and the practice of my art, respected always by all men; but should I break through and violate this oath, may the reverse be my lot." It is said that a similar oath was used in the Middle Ages, after the discontinuance of the use of the Hippocratic oath. Some medical colleges of to-day impose a simpler obligation in the form of an admonition and an affirmation, to which the graduating class assents.

HIPPOCRENE, ἵπ'πό-κρέ'νῆ (Lat., from Gk. Ἴπποκρήνη, *Hippokrēnē*, from ἵππος, *hippos*, horse + κρήνη, *krēnē*, spring). A fountain on Mount Helicon, about 20 stadia above the Grove of the Muses, and, according to the mythical account, produced by a stroke from the hoof of the horse Pegasus (q.v.). It was sacred to the Muses. It is probably to be identified with the *Κρυοπέγαδι* ('cold spring'), on the north side of the southeast peak of Mount Helicon. See HELICON.

HIPPODAMIA, hip'pó-dá-mí'á (Lat., from Gk. Ἴπποδάμεια). Daughter of Enomaus, King of Pisa, in Elis, and the pleiad Sterope. As an oracle had declared that Enomaus should be killed by his son-in-law, the King required that each suitor should engage in a chariot-race. The suitor with Hippodamia in his chariot was allowed so much time as Enomaus needed for a sacrifice to Poseidon. As his horses were a gift of the god, the King always caught the luckless suitor, whom he slew in passing with his spear. Pelops bribed Myrtilus, the King's charioteer, to weaken the linch-pin, and Enomaus was dragged to death by his own horses. After his victory Pelops threw Myrtilus into the sea, and was cursed by the drowning man for his faithlessness. Hippodamia became the wife of Pelops and the mother of Atreus and Thyestes. She afterwards induced them to murder their half-brother, Chrysipus, and then fled to Midea, in Argolis, where she died. Her body was brought by Pelops to Olympia and interred in the sacred inclosure of the Altis, where she was worshiped in later times. The preparations for the chariot-race formed the subject of the sculptures in the east pediment of the great temple at Olympia, and Hippodamia appears not infrequently on vases.

Hippodamia was also the name of the wife of Pirithous, at whose wedding the conflict occurred between the Centaurs and Lapithæ (q.v.).

HIPPODROME (Lat. *hippodromus*, from Gk. ἵπποδρόμος, race-course, from ἵππος, *hippos*, horse + δρόμος, *dromos*, course, from δρᾶμειν, *dramein*, to run). The Greek name for the place set apart for horse and chariot races. The dimensions seem to have varied at different places. In construction and all important points of arrangement it was the counterpart of the Roman circus (q.v.). The dimensions (at Olympia) have recently come to light in a Greek MS. in Constantinople. The total circuit was eight stadia (about .95 mile), but the length of the actual race-course was only six. It is also said that pairs of colts made three circuits, pairs of grown horses or four colts made eight rounds, and the four-horse chariots twelve. As this would make the latter race cover about eight and a half miles, some modern scholars believe that not the circuit, but merely the length of the hippodrome, is meant, and that therefore the length of the contests should be reduced one-half. A race of over eight miles must have been a contest of endurance rather than of speed. The breadth at Olympia was about 350 feet. At Olympia the starting was effected by means of the *aphesis*, a system of stalls arranged along the two sides of a triangle, the apex of which was to the right of the centre line, and apparently so arranged that the distances from the turning-point to the angles at the base of the triangle were equal. The start was effected by setting free the chariots on the extreme right and left, and when they came abreast of the next two, by setting them free also, and so on till all were in motion. The number of starters seems at times to have been very large, as Pindar speaks of 41 chariots as competing at the Pythian games, and Alcibiades alone sent seven chariots to Olympia. The golden age of the hippodrome was during the Byzantine Empire. The blue and green factions in the hippodrome carried their animosity into all departments of the public service, and the Nika riots in Con-

stantinople threatened to dethrone Justinian. The site of the great hippodrome at Constantinople is still called Atoneidan (the horse-place) by the Turks, and the line of the central barrier is marked by the obelisk of Theodosius, the bronze serpents that supported the Plataean tripod, and the column erected by Constantine VII. Consult: Lehndorff, *Hippodromos* (Berlin, 1876); Pollack, *Hippodromica* (Leipzig, 1890); Wernicke and Schöne, in *Jahrbuch des archäologischen Instituts*, ix. (Berlin, 1894) and xii. (ib., 1897); and especially the elaborate article by A. Martin, "Hippodromos," in Daremberg and Saglio, *Dictionnaire des antiquités* (Paris, 1897).

HIPPOGRIF, or **HIPPOGRYPH** (from Gk. ἵππος, *hippos*, horse + Lat. *gryphus*, griffin, from Gk. γρύψ, *gryps*, from γρυπός, *grypos*, hook-nosed). A fabulous animal, represented as a winged horse, with the head of a griffin.

HIPPOLITA. (1) The Queen of the Amazons and the betrothed of Theseus, in Shakespeare's *Midsummer Night's Dream*. In *The Two Noble Kinsmen* she appears as Theseus's wife. (2) A merchant's daughter, the heroine of Wycherley's *Gentleman Dancing Master*.

HIPPOLYTUS (Lat., from Gk. Ἴππόλυτος). In Greek legend, the son of Theseus (q.v.) and the Amazon Antiope or Hippolyte, a mighty hunter and devoted servant of Artemis, but a despiser of Aphrodite, who wreaked a terrible vengeance on him. Brought up in Troezen, he was first seen by his stepmother Phædra when a young man. She fell in love with him, and when he repulsed her advances committed suicide, leaving a letter to Theseus accusing Hippolytus of an attempt upon her virtue. Theseus besought his father, Poseidon, to avenge him, and Poseidon sent a sea monster, who frightened the horses of Hippolytus so that they ran away and dragged him to his death. Hippolytus was worshiped at Troezen. One version told how Artemis persuaded Asclepius to restore her favorite to life, and this led the Romans to identify him with the deity Virbius of Aricia. The story is best known to us through the *Hippolytus* of Euripides, which has been imitated by Seneca in his *Hippolytus* and by Racine in his *Phèdre*. Consult: Euripides, *Hippolytos*, edited by Wilamowitz-Möllendorf (Berlin, 1891); Kalkmann, *De Hippolyto Euripidis* (Bonn, 1882). On the numerous representations, especially on sarcophagi, consult: Kalkmann, "Ueber Darstellungen der Hippolytos-Sage," in the *Archäologische Zeitung* (Berlin, 1883); Robert, *Antike Sarkophagreliefs*, ii. (Berlin, 1902).

HIPPOLYTUS. The name of several saints and martyrs of the early Church, of whom the most interesting flourished in the early part of the third century. Although a very prominent man in his day, the known facts of his life are few. He was of Greek ancestry and possibly born in Rome, became a presbyter of Rome under Bishop Zephyrinus (198-217), and attracted attention by his great learning. He headed a party in opposition to Zephyrinus, and especially to his successor Calixtus, and was chosen by it their bishop. But as his opposition was probably mostly personal and on questions of policy, when Urban I. succeeded Calixtus, he was reconciled with the Roman Church. However, in 235 he went into exile to Sardinia with Pontianus, Urban's successor, and died there. He

is a saint in the Roman calendar, and his day is August 13th. He was a voluminous author, but his works are now known only by fragments. Of these the most interesting is the so-called *Philosophoumena*, formerly attributed to Origen, but now thought to be the first book of a work by Hippolytus, *The Refutation of All the Heresies*. A manuscript giving books iv.-x., previously unknown, was discovered at Mount Athos in 1842. In them Hippolytus gave personal details which threw new light upon his life. It was first printed in its entirety by Emmanuel Miller (Oxford, 1851), who, however, attributed it to Origen. Baron Bunsen was the first (1852) to assign it to Hippolytus. Hippolytus's works are given in Migne, *Patrol. Græca*, x., and much better by Bonwetsch and Archelis (Leipzig, 1897 sqq.); they are translated in *Ante-Nicene Fathers*, v. Consult Neumann, *Hippolytus von Rom in seiner Stellung zu Staat und Welt* (Leipzig, 1901).

HIPPOMANE, hip-pōm'ā-nē. See MANCHINEEL.

HIPPOM'EDON (Lat., from Gk. Ἴππομέδων). In Greek mythology, the son of Aristomachus of Argos, and one of the seven leaders in the expedition against Thebes in which he was killed by Ismarus.

HIPPOM'ENES (Lat., from Gk. Ἴππομένης). The son of Magareus and descendant of Poseidon. He was the lover of the Bœotian damsel Atalanta, and won her, with Aphrodite's help, by surpassing her in the foot-race in which all suitors were obliged to take part. See ATALANTA.

HIPPO'NAX (Lat., from Gk. Ἴππώναξ). A Greek poet of the sixth century B.C.; after Archilochus and Simonides, the third of the great iambic poets of Greece. Expelled from Ephesus about B.C. 542 by the tyrant Athenagoras, he took refuge in Clazomenæ. There his deformed figure and malicious disposition exposed him to the caricature of the Chian sculptors Bupalus and Athenis; but he revenged himself by issuing against them a series of such bitter satires that tradition says they hanged themselves. These are in thought and execution inferior to the similar works of his predecessor, Archilochus. His coarseness of thought and feeling, his rude vocabulary, his want of charm and taste, and his numerous allusions to matters of merely local interest, make him a unique figure in Greek literature. He invented epic parody, and the four opening lines of a parody on the *Iliad* have been preserved in *Athenæus* (p. 698f.). He also invented the choliambic or Hipponactean measure, in which a trochee or spondee is substituted for the final iambus in an iambic trimeter. The fragments of his poems are edited by Bergk, *Poeta Lyrici Græci*, vol. ii. (Leipzig, 1882).

HIPPOPH'AGY (from Gk. ἵπποφάγος, *hipporhagos*, horse-eating, from ἵππος, *hippos*, horse + φαγεῖν, *phagein*, to eat). The eating of horse-flesh. That semi-civilized nations eat horse-flesh is well known. In Spain a banquet comprising roasted horse-flesh among the viands is given at the present day.

In 1855 and 1856 there was a good deal of discussion in Paris relative to the formal introduction of horse-flesh into the meat-markets, and some of the more enthusiastic advocates of the plan formed themselves into a society. French skill was exercised abundantly in dis-

guising the somewhat coarse taste and odor of horse-flesh.

In 1866 there was official recognition of the introduction of this kind of food into the market, under such restrictions as were deemed suitable. The prefect of the Seine issued an ordinance in June of that year, recognizing horse-flesh as human food, establishing special slaughter-houses or abattoirs for slaying horses under specific regulations. The animals were to be killed by those specially appointed in presence of a veterinary inspector, who was also to stamp or seal every joint of meat after inspection. All restaurateurs who used horse-flesh were to acquaint their customers with the fact. During the French International Exhibition of 1867 some of the humbler restaurants of Paris made great use of horse-flesh; and during the siege of Paris, in 1870-71, horse-flesh was extensively used as food. At the present time the eating of horse-flesh is not at all uncommon in European countries. It is very largely employed in the manufacture of sausages, and in Paris alone there are at least 193 places where the meat of horses, mules, and donkeys is for sale. The objection to the use of good horse-flesh for food is wholly sentimental, and its cheap price, six to ten cents per pound, is of great advantage for the poorer classes.

HIP'POPOT'AMUS (Lat., from Gk. ἵπποπόταμος, *hippopotamos*, river-horse, from ἵππος, *hippos*, horse + ποταμός, *potamos*, river). A huge, thick-skinned, almost aquatic, kind of mammal of tropical Africa, two living and many fossil species of which constitute the family Hippopotamidae. This family is closely allied to the swine, and it would be more nearly accurate to call them 'river-hogs' rather than 'river-horses.' They differ from the swine and peccaries, however, in having a broad rounded muzzle, with the nostrils superior and no trace of a terminal disk (see SWINE); in having all the toes touch the ground and nearly equal in size; in the continual growth of the lower incisor teeth; and in other anatomical details. The family seems always to have been confined to the Old World; but remains of various species have been found in the Upper Tertiary rocks of Burma and Algeria, and others, nearer the modern type, in the Pliocene and later formations of India and of Southern Europe. Within the historic period, at least, the hippopotami have been restricted to Africa (unless one may believe, from biblical references to the 'behemoth' (q.v.), that it has inhabited Palestine since the origin of tradition), where it seems to have occupied all the larger lakes and rivers until locally exterminated by man. Anciently it possessed the whole Nile, and was killed by the early Egyptians by means of harpoons; but for centuries none have been seen below the cataracts. When white settlements began at the Cape of Good Hope, 'hippos' lived in the most southern of African rivers, but gradually disappeared, until now the upper Limpopo marks the southern boundary of their habitat. They are likely to die out of the East African rivers speedily, but the endless marshes of the upper Nile and its tributaries, and the vast swamps and waterways of the Congo basin, will preserve the animal indefinitely. These remarks refer to the familiar species (*Hippopotamus amphibius*), in addition to which there exists on the Guinea coast a second species (*Hippopotamus Liberien-*

sis), a pygmy in size and more swine-like in habits.

THE COMMON HIPPOPOTAMUS. This is, next to the elephant, the bulkiest of land mammals. Old males are from 12 to 14 or more feet long, stand nearly four feet high at the shoulder, and weigh about four tons. The body is elongated, barrel-shaped, and the belly nearly touches the ground, while the swollen, ugly head seems too heavy even for the massive neck, and the animals, when out of the water, usually rest the chin upon each other or some support. The body is carried upon short pig-like legs, having four toes upon each foot, each covered with a round, black hoof, and resting flat upon the ground, but connected by webs. The skin is two inches thick in some places, is spongy, like that of a walrus, rough, warty, and covered with a network of fine wrinkles, and it varies in color in the male from dark leather-brown to bluish gray, more or less spotted. The females usually are of lighter tint, and both sexes are lighter on the belly. The skin is naked except for the bristles on the muzzle, and a few tufts of short hair upon the sides of the head and neck, and on the ears and tail. It contains a great quantity of an oily substance which exudes from the pores; and under excitement this flows out copiously and is tintured with blood, producing the 'bloody sweat' for which this beast is famous. The tail is short and laterally compressed.

HABITS AND FOOD. The hippopotamus is most at home in the water, and aquatic vegetation is its natural fare. To this its organization has become particularly adapted. It swims well, makes long excursions, sometimes into open water, and even goes some distance out into the salt estuaries of rivers. It is able to dive quickly, but its ordinary method of submergence is quietly to sink to the bottom, where it is said that it may walk about, browsing, for several minutes. To this end not only its nostrils, but its small ears are closed by sphincter muscles, keeping out the water; and its infolded lips prevent an inrush of water in feeding. The nostrils and eyes are so high that it need only expose an unnoticeable fraction of the face in order to breathe and look about, while its entire body is safely hidden beneath the surface. The peculiar dentition and digestive organs have reference to this manner of life, and to a diet of coarse herbage. The enormous mouth, which may open to the extent of four feet, is furnished with numerous ivory-capped grinders, and with powerful rooting and biting teeth in front. The larger teeth are

these teeth differ from the pig's, which form roots.

The hippopotamus cuts grass or corn as if it were done with a scythe, or bites with its strong teeth a stem of considerable thickness neatly through; it also tears up the marsh growth by means of its great tusks. Its food consists chiefly of the plants which grow in shallow waters and about the margins of lakes and rivers; and probably it renders no unimportant service in preventing slow streams from being choked up by the luxuriance of tropical vegetation. It often, however, leaves the water, chiefly by night, to feed on the banks, and makes inroads on cultivated fields, devouring and trampling the crops. As great quantities of such fare must be consumed in order to obtain sufficient nutrition, the hippopotamus now possesses an enormous stomach, the axial length of which is eleven feet, while the greater curvature measures fifteen feet. It fills nearly the entire length of the body, and is divided into three distinct compartments, of which the third is cylindrical, with the pylorus almost in the pelvis. It is mainly in this third compartment that assimilation occurs.

These beasts are gregarious; herds of a dozen or twenty gather where food is plentiful, and they seem to remain in one locality all their lives unless much disturbed. During the day they lie hidden, usually asleep, on some marshy islet, and betray their presence, if at all, by their snorting, coughing, or grunting, which in anger becomes a hoarse roar. It is at night that they are most active, feed most, and leave the water to graze on shore or invade neighboring fields of millet and the like. Their excursions sometimes extend seven or eight miles in a night, and regular paths are trodden through the waterside jungle, in which the negroes dig pits or arrange deadfalls for the capture of the animal. Usually only one offspring is born annually, after a gestation of $7\frac{1}{2}$ months. The mother takes it into the water immediately, but, as it is unable to swim, supports it upon her neck until it learns how to take care of itself; she also protects it most assiduously, not only from crocodiles and other enemies, but from the rage of the males, who will kill infants unless prevented. The young nurse under water, and continue to grow for five years, after which they may live twenty-five or more years.

Though the brain of this animal is very small and its life a dull one, it is by no means stupid. It quickly learns, when much hunted, not to expose itself, nor to indulge in a whale-like snort when it rises to breathe. Its scent apparently is very keen, and its vigilance great. Captives learn the names and faces, voices and customs of their keepers, and exhibit much general intelligence. They are naturally very timid, yet curious, and subject to fits of panic or rage. Hence small boats are always endangered by going near them; and even large steamboats have been attacked. A wounded or enraged hippopotamus is regarded by sportsmen as perhaps the most dangerous beast to be encountered. Pure malice seems frequently to dictate their actions. The natives more often get them by strategy than by bold attack. The negroes eat the flesh and fat, and make some use of the hide. By white men the animals are shot mainly for sport and near the coast for the sake of the hide, out of which coverings for handles (shrunk on), bull-whips, and polishing wheels are made; also for the

SKULL AND TEETH OF HIPPOPOTAMUS.

the tusks or canines, which are curved backward, and have their ends obliquely leveled off by mutual attrition. These tusks and the incisor teeth continue to grow during the life of the animal, and their points turn downward. In this respect

ivory of the great canine teeth, which sometimes exceed 30 inches in length; but this ivory is not as much valued now as it was early in the nineteenth century, when it was in demand for the making of artificial teeth.

THE PYGMY or LIBERIAN HIPPOPOTAMUS. Concerning this small species not much is known. It appears to be restricted to the Guinea coast, and to be much less aquatic than its large relative. It wanders and seeks its food in swampy woods, after the manner of a pig, but never gathers in herds. It is about $5\frac{1}{2}$ feet long, $2\frac{1}{2}$ feet tall, and weighs about 400 pounds. In color it is bluish black along the back, paling gradually to greenish white on the ventral parts. The fact that it has only one pair of incisor teeth, instead of two, in the lower jaw, led Leidy to classify it in a separate genus (*Chæropsis*).

FOSSILS. Remains of the hippopotamus have been found in the Pliocene and Pleistocene deposits of India, Burma, Algeria, and Europe. Hippopotami roamed in herds over England not very long before the period of the earliest human occupation, and the remains of individuals of all sizes have been found in the gravels near Cambridge. Remains of dwarf species, associated with those of dwarf elephants, are found in the cave and fissure deposits of the islands of Sicily and Malta. No remains of fossil hippopotami have yet been found in America.

BIBLIOGRAPHY. Consult general works, especially Wright, *Standard Natural History*, vol. v. (Boston, 1885); Oakley and Boyd-Dawkins in *Cassell's Natural History*, vol. ii. (New York, 1884). Consult also the writings of African explorers and sportsmen, especially the earlier ones, as Livingstone, Gordon-Cumming, and Speke; also Schweinfurth, *Heart of Africa* (London, 1873); Holub, *Seven Years in South Africa* (London, 1881); Baker, *Wild Beasts and Their Ways* (London, 1890).

See Plate of TAPIRS and HIPPOPOTAMUS; and Colored Plate of PACHYDERMS.

HIPPO RE'GIUS. See HIPPO.

HIPPOTH'OOON (Lat., from Gk. Ἴπποθόων), The hero of the Attic tribe Hippothoontis. He was the son of Poseidon and Alope, the daughter of Cereyon of Eleusis, and was exposed as a newborn infant, but was suckled by a mare and brought up by shepherds. When Theseus overcame and killed Cereyon, he transferred the government to Hippothoon.

HIPPU'RIC ACID (from Gk. ἵππος, *hippos*, horse + οὐρον, *ouron*, urine), $C_6H_5NO_2$. A compound of great interest, both to the chemist and to the physiologist. It derives its name from its having been first discovered in the urine of the horse, and that fluid, or the renal secretion of the cow, affords us the best and readiest means of obtaining it. The fresh urine is boiled with a slight excess of milk of lime and filtered; the filtrate is evaporated to a small volume, cooled, and acidified with hydrochloric acid, when hippuric acid separates out in the form of fine needle-like crystals. When obtained by a process of slow crystallization, the crystals of hippuric acid are moderately large, at first colorless, but subsequently becoming milk-white, four-sided prisms, which are devoid of odor, but have a faintly bitter taste. They dissolve readily in boiling water and in spirit, but are only sparingly soluble in cold water and in ether. Its chemi-

cal name is benzoyl-amido-acetic acid, $C_6H_5CO.NH.CH_2COOH$, and it may be prepared artificially from benzoic acid, C_6H_5COOH , and glycin, NH_2CH_2COOH . When boiled with strong mineral acids, hippuric acid takes up water and splits up again into its chemical components, benzoic acid and glycin. It is a normal constituent of the urine of the horse, cow, sheep, goat, hare, elephant, etc., and most probably is to be found in the urine of all vegetable feeders. In normal human urine, if the food is an ordinary mixed diet it occurs in very small quantity, but is increased by an exclusively vegetable diet, and in the well-known disease diabetes. Although hippuric acid usually occurs in mere traces in human urine, we can artificially produce it at will in the body, and cause it to be eliminated in comparatively large quantity. If we swallow benzoic acid, it seems to take up the elements of glycin in its passage through the system, and thus to form hippuric acid, which appears abundantly in the urine. Hippuric acid is formed in the animal body not only from benzoic acid itself, but from any substance (e.g. kinic acid) that may be readily transformed into benzoic acid. Some such substances are contained in grass, hay, and in many berries, and are also found among the products of the putrefaction of proteids, especially those of vegetable origin. In carnivora the formation of hippuric acid has been shown to take place chiefly in the kidneys; in the herbivora, however, benzoic acid is largely transformed into hippuric acid even if the kidneys have been removed. In birds the ingestion of benzoic acid causes the formation not of hippuric, but of œnanthyllic acid. The hippuric acid which occurs in the animal organism exists in combination with bases, chiefly as hippurate of soda and hippurate of lime. The last-named salt can be obtained by the mere evaporation of the urine of the horse.

HIPPURITES, hip'pū-rī'tēz (Neo-Lat. nom. pl., from Gk. ἵππουρις, *hippouiris*, horse-tailed, from ἵππος, *hippos*, horse + οὐρά, *oura*, tail). A remarkable fossil pelecypod in which one valve is a greatly elongated cone and the other a flattened lid. The lower conical valve was attached to the sea bottom by its apex. The upper lid-like valve is provided on its lower surface with elongated processes that project downward into pits in the cavity of the lower valve, and act as levers to raise the lid. Hippurites shells are exceedingly abundant in the shallow-water deposits of the Middle and Upper Cretaceous in the Mediterranean region of Europe. See RUDISTÆ.

HIPURINA, ĩ-pōō'rĕ-ná'. A cannibal tribe of the middle Purus of Western Brazil, one of the most warlike on the river, and estimated at perhaps 2500 souls. They live in long, low houses built of converging poles, and use poisoned arrows with heads notched so as to break off in the wound. They wear only the breech-cloth, but are clean and self-respecting.

HIRADO, hĕ-rá'dō (in old books FIRANDO). An island in the northwest of the entrance to the Bay of Omura, off the coast of Hizen, Japan, with a capital of the same name containing 10,600 inhabitants. It was made famous in the sixteenth century as the place of welcome to the Portuguese (the first foreigners to visit Japan), and later, in 1600, to the Dutch, and in 1609 to

the English. From 1609 to 1611 the English, and from 1609 to 1640 the Dutch had a trading station here, the latter in 1640 being transferred to the little artificial island of Deshima at Nagasaki. Consult *The Diary of Richard Cocks*, Hakluyt Society (London, 1883).

HIRAM (perhaps an abbreviation of *Ahiram*, brother of the High One, or, Ahi (a god?) is exalted). (1) King of Tyre. He is represented as David's friend and ally, and assisted him in the building of his palace by contributions of timber and labor (II. Sam. v. 11; I. Chron. xiv. 1). Upon Solomon's accession Hiram sent cedar and other timber and skilled workmen for the building of the temple, in return for which Solomon paid a yearly tribute (I. Kings v. 1-12). The two kings remained constant friends, and Hiram supplied Solomon with a navy (I. Kings ix. 26-28; x. 22). Hiram waged a successful war against Cyprus, and fortified the island of Tyre. The question has been raised whether the same King of Tyre could have been the contemporary of both David and Solomon, both of whom had long reigns. If we assume, however, that David undertook his building operations during the latter part of his reign, there is no reasonable ground for doubt; though it is, of course, possible that, for David's reign, we should substitute the name of Abibaa, the father of Hiram. (2) According to I. Kings vii. 13, seq., a Tyrian artificer who was sent by Hiram, the King of Tyre, to assist in the building of Solomon's temple.

HIRAM COLLEGE. An institution of learning at Hiram, Ohio, founded in 1850 as the Eclectic Institute. It became a college in 1870, and had in 1902 366 students, of whom 162 were enrolled in the college, 135 in the preparatory department, 60 in music, and 9 in oratory. The library contains about 6000 volumes. The value of the college property is \$275,000; and the annual income \$13,000.

HIR'EN. A prostitute in Peele's play *The Turkish Mahomet and Hiren, the Fair Greek*, and in William Barksteed's poem *Hiren, the Fair Greek* (1611). The character became proverbial among Elizabethan dramatists.

HIRING. A contract by which one employs, for a limited time, another's property or labor for some consideration or reward. See **BAILMENT**; also such titles as **AGENT**; **CARRIER**; **CHARTER PARTY**; **LEASE**; **MASTER AND SERVANT**; **SHIPPING**. Where the thing hired is land or houses, see **LANDLORD AND TENANT**.

HIRLAS HORN, THE. A long, blue, silver-rimmed drinking-horn, mentioned in a Welsh poem of the same name, written by Owain, Prince of Powys, in the twelfth century. Owain drains it to the health of his assembled chiefs on the night after a battle, as the exploits of each are rehearsed.

HIRN, ěrn, GUSTAVE ADOLPHE (1815-90). A French physicist, born at Logelbach, near Colmar. When he was nineteen he entered his grandfather's cotton factory as chemist; afterwards he acted as engineer, and began his valuable researches on mechanics, and especially on calorics. He was made a member of the French Academy of Science in 1867; in 1880 founded a meteorological observatory near Colmar; and later devoted himself to astronomy. Hirn was educated in the shop, and his works are marked

by much practical criticism of mere academic theory. They include: *Théorie mécanique de la chaleur* (3d ed. 1875-76); *Analyse de l'univers* (1869); *Mémoire sur les anneaux de Saturne* (1872); *Les pandynamomètres* (1876); *Etude sur une classe particulière de tourbillons* (1878); *Recherches expérimentales sur les relations entre la résistance de l'air et sa température* (1882); *La vie future et la science moderne* (1882); and *Constitution de l'espace céleste* (1889).

HIROSAKI, hē'rō-sū'kē. A town of Japan, situated in the northern part of Nippon, 22 miles by rail from Asmori (Map: Japan, G 3). It contains ruins of an old castle and a museum. The chief product is lacquered ware. Population, in 1898, 34,771.

HIROSHIMA, hē'rō-shē'mā. The capital of the Japanese Province of Aki and of the Prefecture of Hiroshima, situated at the southwestern end of Hondo, about three miles inland (Map: Japan, C 6). It lies in a beautiful region at the foot of a hill, and contains a number of fine temples, a park, and tea-houses. Opposite the city is situated the sacred island of Miyajima or Itsukushima, with its celebrated Shinto temple. Commercially, Hiroshima is considered the most important place west of Kobe, and forms the centre of the trade in lacquered ware, bronze, and other objects of art. Population, in 1898, 122,306.

HIRPINI, hēr-pī'nī (from Sabine *hirpus*, wolf). A people of ancient Italy, who inhabited the southern portion of Samnium. They have been considered by some authorities as merely a Samnite tribe, while by others they are looked upon as an independent nation. The country they inhabited was the wild and mountainous district traversed by the Sabatus, Calor, and Tamarus, tributaries of the Vulturnus, and on the east side of the Apennine ridge by the upper course of the Aufidus. In the early history of Rome the Hirpini are found identifying themselves with their Samnite neighbors against their common foes. They seem to have been subdued in the early part of the third century B.C., as in B.C. 268 Beneventum, the key of all their military positions, was colonized by Roman settlers. In the Second Punic War, revolting from their conquerors, they joined the Carthaginian invaders, and though they were unable to recapture their stronghold of Beneventum, they remained faithful to Hannibal till the defeat of Hasdrubal at the Metaurus restored the empire of Italy to his opponents. In the year of that event the Hirpini made peace with their old masters by betraying into their hands the garrisons of their allies. From this time till the outbreak of the Social War, the Hirpini seem to have continued steadfast in their allegiance. On that occasion, however, they set the example of revolt to the allies, and might have become formidable enemies had not the rapid successes of Sulla induced them to repair their error by a complete submission. At the close of this war the Hirpini obtained the franchise, and do not again appear in history as an independent people.

HIRSCH, hērsh, AUGUST (1817-94). A German physician, born at Danzig, where he practiced after studying at Berlin and Leipzig. In recognition of his studies on malarial fever and his work, *Handbuch der historisch-geographischen Pathologie* (2d ed. 1881-83), he

was in 1863 made professor at Berlin. In 1873 he was a member of the German Cholera Commission, studied the conditions of Posen and West Prussia, and published a valuable report (1874). He studied the plague in Astrakhan in 1879 and 1880, and in the latter year wrote a report to his Government. His more important writings are: *Die Meningitis Cerebro-spinalis Epidemica* (1866); *Geschichte der Augenheilkunde* (1877); *Geschichte der medizinischen Wissenschaften in Deutschland* (1893); a revision of Hecker's collected writings, under the title *Die grossen Volkskrankheiten des Mittelalters* (1865). He edited *Biographisches Lexikon der hervorragenden Aerzte aller Zeiten und Völker* (1884-88); and with Virchow the *Jahresbericht über die Fortschritte und Leistungen der Medizin* (1866 et seq.).

HIRSCH, CARL (1858—). A German composer, born at Wemding, Bavaria. When only eighteen he became a teacher in the Violin-Makers' School at Mittenwald, and from that time on held many important positions, among them: church music-director at Munich (1885-87); music-director at Mannheim (1887-92); at Cologne (1892-93); at Elberfeld (1893—); and director of the Gesangsschule, the Liedertafel, the Philharmonic concerts at Elberfeld. But it is as a composer that Hirsch is best known, his *a-cappella* choruses, which are very numerous, and his cantatas being widely known and used. Of the latter *Die Krone im Rhein* and *Landsknechtsleben* are representative. His songs and ballads are scarcely inferior to his male choruses.

HIRSCH, EMIL GUSTAV (1852—). An American rabbi, born in Luxemburg, the son of a prominent Jewish theologian who in 1866 became minister of the Reformed Congregation in Philadelphia. He studied at the University of Pennsylvania, and in 1872 went to Berlin for post-graduate work. He was rabbi in Baltimore (1877), and in Louisville, Ky. (1878-80), but did his greatest work in Chicago, whither he went in 1880 as minister of the Sinai Congregation. He took some part in politics as a member of the Republican Party; was president of the Chicago Public Library Board (1888-97); and in 1892 became professor of rabbinical literature in the University of Chicago. From 1880 to 1887 he edited the Milwaukee *Zeitgeist*, and then undertook the editorial charge of the *Reform Advocate*. As a lecturer and writer he is closely connected with advanced Judaism and with philanthropy.

HIRSCH, JENNY (1829-1902). A German author and reformer, born at Zerbst, where she was a tutor for several years. She went to Berlin in 1860; wrote for the *Bazar*, under the pseudonym J. N. Heynrichs, until 1864; and about that time became interested in woman's rights and female education. A member of the Women's Congress of 1865 at Leipzig, and for many years a leader in the Lette-Verein, she edited *Der Frauenwelt* (1870-82); and, with Lina Morgenstern, *Deutsche Hausfrauenzeitung* (1887-92); with Mary Wall wrote *Haus und Gesellschaft in England* (1878); in 1881 published *Fürstin Frau Mutter*, and after it many other tales. Among them are the following titles: *Die Erben* (1889); *Vermisst* (1894); *Löwenfelde* (1896); *Der Amtmann von Rapsahagen* (1890); *Schuldig* (1899); and *Camilla Feinberg* (1901). Under the title *Hörigkeit der Frau*

(3d ed. 1891), she translated into German Mill's *Subjection of Woman*, and wrote a *Geschichte der 25jährigen Wirksamkeit des Lette-Vereins* (1892).

HIRSCH, JOSEPH (1836-1901). A French engineer, of Jewish family, born at Lyons. Educated there, at the Ecole Polytechnique and the Ecole des Ponts et Chaussées, he worked on the canal at Sarrebourg (1866), and there invented the Mittersheim siphon for the automatic control of reservoirs. From 1876 to 1898 he was professor of steam machinery at the Ecole des Ponts et Chaussées, and from 1886 until his death at the Conservatoire des Arts et Métiers. He contributed to the *Annales* of the former school; as member of the juries of award at the Exposition of 1878 and 1889 and as president of the jury of 1900, he wrote valuable reports and lectured on the machinery exhibited at these expositions; and was the author of many treatises on machinery, including *Théorie des machines aéro-thermiques* (1874-75). His contributions to Lechalas's *Encyclopédie* should also be mentioned.

HIRSCH, MAURICE, Baron de (MAURICE DE HIRSCH DE GERUTH) (1831-96). An Austrian Jewish financier and philanthropist. He inherited his father's wealth in 1869, and greatly increased his fortunes by his marriage to the daughter of the senior partner of the banking firm of Bischoffsheim and Goldsmid, Brussels, with whom he had become associated. He also made large sums by building railways in Rumania and Turkey. His fortune was estimated at \$200,000,000, and his income at from \$15,000,000 to \$20,000,000 a year. He gave to charity about \$100,000,000 during his life, and the Baroness de Hirsch, on her death in 1899, bequeathed about \$15,000,000 to charities. These benefactions were chiefly for the alleviation of the condition of the Jews. He gave not less than \$50,000,000 to the Jewish Colonization Association, by which colonies were established in the Argentine Republic. He endowed the Galician schools with \$5,000,000, and in 1888 offered \$10,000,000 to the Russian Government for schools, provided no distinctions of race or religion should be made in its distribution. His offer was declined. He gave \$2,500,000 to establish a fund in New York for educating and Americanizing Russian and Rumanian Jews. The sum of \$1,200,000 was added to this fund by the Baroness.

HIRSCH, MAX (1832—). A German political economist and politician, born at Halberstadt, in Prussian Saxony. He studied political economy and jurisprudence at the universities of Tübingen, Heidelberg, and Berlin, and then traveled through France and North Africa. As the result of his observations during these travels he published: *Skizze der volkswirtschaftlichen Zustände in Algerien* (1857), and *Reise in das Innere von Algerien, durch die Kabylien und Sahara* (1862). After a later journey through England and Scotland he returned home to organize trades unions among his countrymen. These soon spread all over Germany and through them and their organ, *Der Gewerkverein*, he wielded great influence. He was several times a member of the Reichstag, and was the leading spirit in a number of societies for the benefit of the laboring classes. His publications include: *Was bezwecken die Gewerkvereine?* (15th ed. 1891)

and *Das Invaliditäts- und Altersversicherungs-gesetz* (3d ed. 1890).

HIRSCHBERG, hêrsh'bêrk. A manufacturing town in the Prussian Province of Silesia, situated at the foot of a mountain, 30 miles southwest of Liegnitz (Map: Prussia, F 3). The town is ancient, and is still girt about by a double line of walls. Its Protestant church, a Gothic edifice, is known for its magnitude and its excellent organ. Hirschberg has manufactures of linen, lace, machinery, paper, metal, and tobacco. The town was founded at the beginning of the eleventh century. Population, in 1890, 16,200; in 1900, 17,865, mostly Protestants.

HIRSCHFELD, hêrsh'felt, GUSTAV (1847-95). A German archaeologist, born at Pyritz, in Pomerania. He was educated at Tübingen, Leipzig, and Berlin, and was sent by the Prussian Archaeological Institute in 1870 to Greece, Italy, and Asia Minor. From 1875 to 1877 he had charge of the excavations at Olympia, and in 1882 traveled again in Asia Minor. He was appointed professor of archaeology at Königsberg in 1878. Besides many articles in the archaeological journals he wrote: *Tituli Statuariorum Sculptorumque Græcorum* (1871); *Athena und Marsyas* (1872); *Paphlagonische Felsengräber* (1885); *Berichte über alte Geographie* (1885); *Die Felsenreliefs in Kleinasien und das Volk der Hittiter* (1887); *Griechische Inschriften des Britischen Museums* (1893); and contributed to the first two volumes of *Ausgrabungen zu Olympia* (1877-78). *Aus dem Orient* was posthumously published (1897).

HIRSCHFELD, OTTO (1843—). An eminent German classical philologist and historian, born at Königsberg. After having taught at Göttingen, Prague, and Vienna, he was in 1885 appointed to the chair of ancient history in the University of Berlin. Of his historical writings the most important is his *Untersuchungen auf dem Gebiete der römischen Verwaltungsgeschichte* (1876). He rendered especial service to classical learning as editor of Latin inscriptions: *Inscriptiones Galliæ Narbonensis Latine* (1888); supplement to the *Corpus Inscriptionum Latinarum*, vol. iii. (ib., 1893); *Inscriptiones Aquitaniæ et Lugdunensis* (1899).

HIRT, HERMAN (1865—). A German philologist. He was born at Magdeburg, wrote on German metres (*Untersuchungen zur westgermanischen Verskunst*, 1889), edited *Schopenhauer Parerga* (1890), and then devoting himself to Indo-Germanic philology made special studies on accent, writing *Indogermanische Accent* (1895) and *Der indogerm. Ablaut, vornehmlich in seinem Verhältnis zur Betonung* (1900). Hirt, who became professor at Leipzig, made valuable contributions to Burgmann and Streitberg's *Indogermanische Forschungen* on the morphology of case endings. In 1902, he published *Handbuch der griechischen Laut- und Formenlehre*, the first volume of a series of Indo-Germanic text-books of which he is editor.

HIRTH, hêrt, FRIEDRICH (1845—). A German-American Chinese scholar, born at Gräfen-tonna. He was educated at the universities of Leipzig, Berlin, and Greifswald (Ph.D., 1869), and from 1870 to 1897 was in the Chinese maritime customs service. In 1902 he was appointed to the professorship of Chinese in Columbia University (New York City). A collection of Chi-

nese manuscripts and printed books made by him is in the Royal Library at Berlin, and another of porcelains of considerable historical importance in the Gotha Museum. As an investigator he conducted researches in Chinese literature by imitation of the methods of classical philology. His chief publications include: *China and the Roman Orient: Researches Into Their Ancient and Mediæval Relations as Represented in Old Chinese Records* (1885); *Ancient Porcelain: A Study in Chinese Mediæval Industry and Trade* (1888); *Text-Book of Documentary Chinese* (2 vols., 1885-88); *Chinesische Studien* (vol. i., 1890); *Ueber fremde Einflüsse in der chinesischen Kunst* (1896); and many papers on subjects connected with Chinese literature.

HIRTIUS, hêr'shi-tis, AULUS (B.C. 90-43). A personal friend of Julius Cæsar, under whom he served in Gaul, and who in B.C. 46 nominated him as one of the ten prætors. After the death of Cæsar he became consul, declared against Antony, and headed a reënforcement for Octavius. While leading an assault on Mutina (Modena) he was killed. It is said that he was the author of the eighth book of Cæsar's *Commentaries on the Gallic War*.

HIRUDO, hî-rôo'dô, HIRUDINEA. See LEECH.

HIRUNDINIDÆ (Neo-Lat. nom. pl., from *hirundo*, swallow). The swallow family. See SWALLOW.

HIRZEL, hêr'tsêl, SALOMON (1804-77). A German publisher and an authority on Goethe. He was born in Zürich, worked in the firm of Weidmann in Leipzig until 1853, and then with his brother-in-law, Karl Reimer, founded an independent publishing house, which brought out Freytag's works, Grimm's *Wörterbuch*, and the publications of the Saxon Academy, the Jablonski Association, and the Prussian archives. Hirzel made a valuable collection of Zwingliana, which he left to the University of Strassburg. His library on Goethe was willed to Leipzig University. Hirzel wrote: *Der junge Goethe, 1764-76* (with an introduction by Bernays, 1875), and *Verzeichnis einer Goethe-Bibliothek* (1874).

HIS, hês, WILHELM (1831—). A German anatomist. He was born in Basel, studied medicine there, in Berlin, Würzburg, and Vienna, and was professor at Basel (1857-72) and at Leipzig. His earlier researches were histological; afterwards he devoted himself to anatomy and, in a less degree, to embryology. He edited with Braune the *Zeitschrift für Anatomie und Entwicklungsgeschichte* (1875-92), and in 1877 took charge of the anatomical department of the *Archiv für Anatomie und Physiologie*. Among his more important publications are: *Crania Helvætica* (with Rüttimeyer, 1864); *Unsere Körperform* (1875); *Anatomie menschlicher Embryonen* (1880-85); *Die anatomische Nomenclatur* (1895); and a reconstruction of the physiognomy of Bach after the discovery of his remains (1895, with Seffner).

HISCOCK, FRANK (1834—). An American lawyer and legislator, born at Pompey, N. Y. He was admitted to the bar in 1855; served as District Attorney of Onondaga County in 1860-63, and was a member of the State Constitutional Convention in 1867. Elected to Congress as a Republican Representative in 1877, he won repute as a debater and leader. From 1887 to 1893 he was a member of the United States Senate.

HISHAM, hêsh-îm'. The name of several Ommiad rulers of Spain. HISHAM I. was Emir of Cordova from 788 to 796. He was a vigorous ruler and put down revolts with a firm hand. He also was successful in some expeditions against the Franks. He is, however, remembered chiefly for his personal habits. In disguise he wandered incognito about the capital, succoring the poor and oppressed, caring for the sick, and inquiring into the administration of justice. His charity and justice endeared him to his subjects.—HISHAM II., Ommiad Caliph of Cordova from 976 to 1009, succeeded to the throne before he was twelve. He had little ability and lived in seclusion, while his chief officer, Al Mansur (q.v.), made conquests from the Christians. Hisham was deposed and probably murdered.—With HISHAM III., who was deposed in 1031, and died in retirement in 1036, the Ommiad caliphate in Spain came to an end.

HISPANIA (probably connected with Heb. *shâpân*, rabbit, from *shâpan*, to hide). The name by which the Spanish Peninsula, including the modern Spain and Portugal, was known to the Romans. By the Greeks it was called Iberia, and by the Roman poets sometimes Hesperia, the Western Land. The earliest inhabitants of whom we have any knowledge were the Iberians, a race apparently unconnected ethnically or linguistically with any other race of Europe, and of which the modern representatives are the Basques of Northern Spain. But in very early times hordes of Celts crossed the Pyrenees and occupied almost the whole peninsula, pushing back or assimilating the Iberians, whence the natives were generally called Celtiberians by the ancients. The national wealth of the country—especially its silver deposits—early attracted traders and colonists. About the middle of the fourth century B.C. the Greek colony of Emporiæ (Ampurias) was founded on the northeast coast. Phœnician traders early made the circuit of the coasts, and Gades (Cadiz) was one of their permanent trading stations. The Carthaginians, driven from Sicily, Corsica, and Sardinia by the Romans, determined to conquer Spain both as a source of wealth and as a base of operations against Italy. Carthoga Nova (Cartagena) was their principal town, and they soon brought almost the entire country under their sway. From here Hannibal set out to cross the Alps (B.C. 218); but his downfall at the end of the Second Punic War lost the country to the Carthaginians and placed it under Roman control. For a century or two, however, the native tribes continued in a state of semi-independence, until in the time of Augustus, who founded many colonies in Spain, the country was finally Romanized. The peninsula was divided into three provinces: *Hispania Tarraconensis*, with its capital Tarraco (Tarragona) in the north and east; *Bætica* in the south; and *Lusitania*, corresponding nearly to the modern Portugal.

HISPANIOLA, his'pân-yô'lä. See SANTO DOMINGO; HAITI.

HISSAR, his-sâr'. The capital of a district of the Delhi division, Punjab, British India, on the West Jumna Canal. 89 miles northwest of Delhi by rail (Map: India, C 3). It is the seat of a governmental cattle farm with 43,287 acres devoted to pasturage. Hissar was founded in 1354 and has interesting archaeological and historical remains. Population, 17,000.

HISSAR/LIK. See TROY.

HISTIAEA, his'tî-ê'â (Lat., from Gk. *Ἰστιαία*, *Histiāia*, dialectic form of *Ἑστία*, *Hestia*, Lat. *Vesta*), or OREUS. An ancient and important city of Eubœa, on the north extremity of the island in the District of Hellopia. It was probably founded by settlers from the *Histiæotis* driven out by the advance of the Thessalians. In the period following the invasion of Xerxes it passed into the hands of the Athenian League, but in B.C. 446 joined the rest of Eubœa in a revolt. When the island was reduced by Pericles, the old inhabitants of the town were expelled, and Athenian colonists settled in the neighboring village of Oreus, which soon developed into a flourishing city, and gave the popular name to the colony, though officially it was still called *Histiæa*. At the end of the Peloponnesian War the descendants of the old inhabitants and other Eubœans replaced the expelled Athenians, and the city remained loyal to Sparta till after the battle of Leuctra, when it joined the second Athenian League. In the war between Philip and the Athenians, Oreus was one of the centres of Macedonian intrigue, and in the confusion after Alexander's death, and later during the Roman wars, it was of considerable strategic importance. In B.C. 200 it was stormed by the Romans. After this it fell into decay.

HISTIAEUS (Lat., from Gk. *Ἰστιαῖος*, *Histiaios*) (?-B.C. 494). A tyrant of Miletus, who guarded the bridge of boats by which the Persians had crossed the Danube when Darius invaded Scythia (B.C. 513). He refused to follow Miltiades's suggestion to destroy the bridge, and, in consequence, was rewarded by Darius with the rule of Mitylene, and with a district in Thrace. Afterwards, however, he was suspected of treason, and was detained at the Persian Court for thirteen years. Tired of this restraint, he secretly instigated the revolt of the Ionian Greeks, and was sent by Darius to suppress it. With his freedom thus recovered he openly made war against the Persians, but was defeated, and finally beheaded by Artaphernes. His head was sent to Darius, who received it with sorrow and buried it with honors.

HISTOIRE COMIQUE DE FRANCIEN, ê'stwâr' kô'mêk' de frân'syôn' (Fr., Comic History of Francien). A romance by Charles Sorel de Sauvigny (1622), published under the pseudonym of Nicolas du Moulinet. The chief interest of the story is in the information which it supplies of contemporary customs, and in the fact that it is one of the few realistic novels of the seventeenth century. It met with much success, but was always disavowed by its author.

HISTOLOGY (from Gk. *ἱστός*, *histos*, web, from *ἵσταναι*, *histanai*, to stand + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). That branch of biological science which treats of the microscopical structure of living organisms, both animal and vegetable. The histology of plants belongs to the domain of botany, that of animals to the domain of human and comparative anatomy. Just as gross anatomy is subdivided into normal anatomy and pathological anatomy, so histology may be subdivided into normal histology and pathological histology. The term histology when unqualified is usually accepted as referring to normal histology.

HISTORY. Although the study of the micro-

scopic structure of plants and animals may be traced to the times of Malpighi (1628-94), who discovered the blood-corpuscles, Robert Hooke, who was the first (1667) to describe plant cells, and Leeuwenhoek (1632-1723), who, with comparatively imperfect optical means, practically laid the foundations of our knowledge of the minute structure of the tissues, no definite progress in histology as a science was made until the beginning of the nineteenth century, when the compound microscope began to assume its present improved form. The great work of Bichat, entitled *Anatomie générale appliqué à la physiologie et à la médecine* (1801), marked an epoch in the development of the science of histology. Although he apparently did little actual work with the microscope, he brought to bear upon the achievements of other investigators the power of his generalizing mind, and was the first to classify tissues according to their structure. After Bichat came an epoch of histological research, during which the microscopic observations of Malpighi and Leeuwenhoek were extended in accordance with the general system of Bichat. The next great step forward was made by two botanists, Hugo von Mohl and Schleiden, who discovered the cellular basis of all plant structure. The discovery of the method of combining lenses so as to render them achromatic gave a new impulse to the study of histology, and a more perfect classification of the tissues of the body was the result, as it placed in the hands of Schwann an instrument which enabled him to demonstrate the law that all animal as well as plant tissues are composed of and develop from cells. Schleiden had already demonstrated this, which may be called the greatest discovery in histology, and therefore he and Schwann are often called the founders of the science of histogenesis, or the study of the origin of tissues, more recently pursued with great success by Reichert, Kölliker, Remak, and others. Then the microscopic anatomy of diseased structures and their mode of development came to be investigated, and the science of pathological histology took its rise. Johannes Müller is regarded as the father of this branch of histology, as he indicated the general direction in which the investigation of diseased growths should be pursued. Afterwards Virchow published his celebrated *Cellular Pathology*, and later the science was still further enriched by the labors of Billroth, Rindfleisch, Von Recklinghausen, Cohnheim, and others.

HISTOLOGY OF ANIMALS.

CELLS. The histological basis of the body structure is the cell. In general terms all tissues may be said to be composed of cells of one kind or another, and these cells are always combined with more or less intercellular substance. This intercellular substance may be very small in amount, as in the epithelial tissues, where it amounts to nothing more than a cementing material holding the cells together, or it may make up the greater part of the tissue, as in some forms of connective tissue. Cells differ in shape. They may be round, oval, cuboidal, spindle-shaped, or irregularly stellate. The intercellular substance differs greatly in structure, and it is upon the differences in density of the intercellular substance that the different degrees of hardness depend. Thus, in mucous tissue the intercellular substance is soft and gelatinous, in cartilage it is dense and firm, in bone it is in-

filtrated with lime salts, and is extremely hard. It was at first believed that a cell was a little bag filled with fluid, hence its name. Most animal cells are, however, small masses of living matter, called protoplasm, having as a rule no cell-wall. Cells may or may not have nuclei. It is probable that non-nucleated cells are incapable of performing certain of the higher functions of cells, e.g. that of reproduction.

All adult tissues and organs originate in the elementary layers of the embryo. What determines the lines of growth of these different cells, and why some develop to form one kind of tissue, others to form other kinds of tissues, is as yet beyond our knowledge. There are two modes of cell growth or reproduction, direct cell-division, and indirect cell-division or mitosis.

TISSUES. The tissues of the body fall into four great groups: (1) Epithelial tissue; (2) connective tissue; (3) muscular tissue; (4) nervous tissue. It is by combinations of these tissues that the different organs of the body are formed. The most widely distributed of the tissues is connective tissue, which in its various forms, as fibrous tissue, elastic tissue, cartilage, bone, etc., makes up the framework of the body. In combination with one or more of the other tissues it forms the various organs of the body, acting as their supporting framework. Thus, in the nervous system such organs as the brain and cord consist of nervous tissue held together and supported by the peculiar form of connective tissue known as neuroglia. A muscle consists of muscle-tissue bound together by connective tissue; and the various glands of the body, such as the liver or pancreas, consist of a glandular epithelium peculiar to the particular organ held together by connective tissue. See **CONNECTIVE TISSUE**.

Consult Delafield and Prudden, *Handbook of Pathological Anatomy and Histology* (New York, 1901). The histology of the different tissues and organs may be found described under such titles as **CONNECTIVE TISSUE**; **MUSCLE**; **EPITHELIUM**; **NERVOUS SYSTEM**; **LIVER**; **KIDNEY**, etc. See also **CELL**; and **BLOOD**.

HISTOLOGY OF PLANTS.

CELLS. Many plants consist of only a single cell; nevertheless such plants show almost infinite variety in form. The simplest are nearly spherical, but in the desmids and diatoms almost every conceivable shape is to be found and a high degree of differentiation is attained. When cells divide in only one plane and do not separate after each division a chain of cells results; when division takes place in two planes a plate of cells is formed; divisions in three planes give rise to a body several cells in thickness. In the last case considerable differentiation is likely to follow; the cells on the outside become adapted to the work of protection and absorption, some of those on the inside perform the nutritive functions, and others are specially modified for conducting materials. Even in the algae and fungi there is a division of labor, some cells being modified for the work of protection and absorption, others for conduction, still others for reproduction. In the liverworts and mosses the specialization is carried still further, but it is in the ferns and flowering plants that difference in structure and division of labor finds its highest expression. Such differentiation of cells in form and function gives rise to tissues.

TISSUES. A tissue is a group of connected cells

of like origin and structure. Tissues are therefore classified according to the form of their component cells, the thickness and chemical composition of the cell-walls, the character of their contents, etc. All cells of a very young plant are alike in having thin walls, abundant protoplasm, minute vacuoles or none, and relatively large nuclei. Such cells constitute embryonic, formative, or meristematic tissue, which is found in the higher plants in three places: (1) At the tips of the shoots and roots, where it constitutes the 'growing points,' protected in the shoot by overarching leaves which form a bud, and in the root by the root-cap; (2) one or more thin layers concentric with the stem, by which new layers of wood, cork, and bast are added to it internally; (3) where wounds are made, in which cases the meristem produces tissues that heal the wound.

In all the higher plants tissues are grouped in such a way as to form tissue systems, for which see ANATOMY. Those there described are reduced to three by some: viz. (1) the tegumentary (equivalent to the protective); (2) the vascular (equivalent to the conducting and in part the mechanical); (3) the fundamental, a sort of limbo to which are assigned all the tissues not included in the other two systems. Of all tissues it may be remarked that the cell-walls are subject to thickening as they grow older. This thickening consists of material added to the surface of the primary wall. The successive additions are frequently unlike, and in the mature wall are apt to be distinctly stratified. The thickening is seldom uniform. Sometimes minute regions escape thickening and remain as small pits in the added layers. These pits occur at points where the protoplasm of one cell has not been completely separated from that of the other by the formation of a partition wall, but remains connected there by many very slender strands. In other

FIG. 1. TRACHEÆ.
1, Annular; 2, pitted; 3, spiral.

cases the thickening is absent from wider areas. This leaves broader and shallower pits, which are symmetrically or irregularly distributed, and give the appearance of sculpturing of the wall (2, Fig. 1). When the thickening is restricted to spiral lines or rings, the thin walls seem to be merely supported by the thickened portions, as in spiral and annular vessels (1, 3, Fig. 1).

Only the more important kinds of tissues are here described. (1) *Parenchyma*: Cells of very various form, but mostly nearly equal in the three dimensions, usually with a thin cellulose wall containing (so long as they are functional) living protoplasm, and almost invariably separating more or less from one another to form intercellular spaces. In elongated organs parenchyma cells are likely to become elongated. The parenchyma of the leaf and the cortex of the stem may develop into very irregular forms (Fig. 2). In water plants and others in which the paren-

chyma develops extensive intercellular spaces (aërenchyma) the cells may become branched, some even being regularly stellate (Fig. 3). Parenchyma cells sometimes have thick walls, and thus form a transition to the sclerenchyma (see below), from which, however, they may be

distinguished by the presence of living cell contents and sometimes reserve food. Such parenchyma occurs in the rhizome of many ferns. Parenchyma forms the chief nutritive and storage regions of all plants, and is especially abundant in herbaceous plants. In fleshy leaves, fruits, stems, etc., the parenchyma is greatly developed at the expense of other sorts of tissue and is there used for storage of reserve food. The outer walls of parenchyma cells, which form the surface (i.e. the epidermis), undergo a peculiar change, being infiltrated with cutin, by which they are rendered almost impervious to water. Parenchyma cells of tabular form arise from the phellogen, which

have all their walls cutinized. They constitute a tissue known as cork (Fig. 4).

(2) *Collenchyma* differs from parenchyma, of which it is hardly more than a variety, in the

elongation of the cells, the absence of intercellular spaces, and the thickening of the angles of the cells where three or more walls join (Fig. 5). These thickened parts are more highly refractive than other parts of the wall, and have a very peculiar bluish-white lustre. *Collenchyma* occurs

FIG. 5. COLLENCHYMA.
1, Longitudinal section; 2, transverse section.

only in elongated organs (stems, petioles, etc.), where it forms a strengthening tissue beneath the epidermis.

(3) *Sclerenchyma* occurs in two forms, in one of which the cells have their three dimensions almost equal; in the other they are greatly elongated (Fig. 6). In both the wall is excessively thickened, sometimes so much so that the lumen is nearly obliterated. In all cases the protoplasm disappears at maturity, and the tissue is of use to the plant only by its mechanical strength. The short-celled sclerenchyma is common in the stone fruits (peach and cherry), in the shell of various nuts, in the gritty parts of the flesh of pears, quinces, etc., and in the hard portions of bark, many dry fruits, and seeds. Elongated sclerenchyma cells are most abundant in stems and leaves, in which they form continuous strands or

bands, closely associated with the vascular bundles. They are often called bast-fibres, but do not always belong to the bast or phloem bundles. The individual cells taper at each end, the ends of adjacent cells above and below overlap, and thus give to the strands great flexibility and a tensile strength which in many cases exceeds that of the best steel. The cells are relatively very

long, 1 to 4 millimeters in jute, 10 millimeters or more in hemp, 20 to 40 millimeters in flax, and as much as 220 millimeters in 'ramie,' with diameters from .01 to 0.4 millimeter. The strands of

sclerenchyma fibres constitute the so-called fibres of commerce, the finer ones of which are used for textile fabrics and the coarser for cordage, etc.

(4) *Tracheæ* and *tracheids*. Tracheids are usually elongated cells, whose walls have become lignified (by which they are made very pervious

to water) and thickened in spiral or annular lines or in reticulate patterns (Fig. 1). At maturity the protoplasm disappears, leaving only the cell-wall of service to the plants. Tracheæ are similar to tracheids in the sculpturing of their walls, but instead of being single cells they are formed by the fusion of a row of cells lying originally end to end, the end walls being resorbed as the lateral walls thicken and the protoplasm disappears. At maturity the long empty tubes thus formed show little trace of the cells from which they originated. In angiosperms they constitute the greater part of the xylem bundles, changing to tracheids as the bundles grow smaller and come to an end (Fig. 7b). But in gymnosperms (pines and their allies) tracheæ are formed only in the primary xylem, almost all the secondary xylem being tracheids with characteristic circular-bordered pits (Fig. 7a). Tracheæ and tracheids are the most efficient tissues for the transport of water in the larger plants.

(5) *Sieve tubes* are cell fusions formed by the partial resorption of the end walls of a row of young cells. The end partitions and sometimes the lateral walls which adjoin other sieve tubes become perforated, forming a so-called 'sieve

FIG. 8. SIEVE TUBE AND COMPANION CELL.

1, In longitudinal section; 2, in transverse section showing a sieve plate.

plate,' through which the contents of the sieve tubes (a slimy mixture of soluble proteids, carbohydrates, and other foods) pass freely. Sieve tubes are found in the phloem bundles, in which they constitute the most efficient tissue for the transport of foods (Fig. 8).

(6) *Lateæ tubes* are long, much-branched tubes, with free or anastomosing branches, which contain the milky or colored sap in certain plants. There are two sorts, articulated and non-articulated. A non-articulated tube arises by early differentiation of certain cells in the embryo, which push their way among the other developing tissues by independent growth. The articulated tubes arise by the fusion of rather indefinite rows of cells, either longitudinal or transverse, which form a network of irregular tubes. Lateæ tubes are found in the phloem bundles, or just outside these bundles in the cortex of stems, and accompany them into the leaves, where they ramify widely. Their terminals come into close relation with the nutritive cells. (See illustration

under LATEX.) They seem to constitute a transportation system for foods. See GROWTH; ANATOMY OF PLANTS; CELL; ROOT; STEM; CONDUCTION; LATEX.

HISTOLOGICAL TECHNIQUE.

The methods of histological observation were at first extremely crude, consisting merely in tearing apart the tissues and examining them under the microscope. Such handling, of course, largely destroyed the relations of the different elements of the tissues to one another. The cutting of thin sections of tissue with a razor was soon introduced, this being much facilitated by the previous hardening of the tissues in some suitable solution. Such sections were, however, difficult to study, owing to their transparency and the fact that the different tissue elements possess nearly the same index of refraction. The staining of sections was the next great improvement in technique. At first a single stain was used, the denser elements taking a darker shade than those of less dense structure. The discovery of what is known as differential staining, whereby the different tissue elements are stained different colors, and the introduction of an instrument for section cutting, known as the microtome (see further below), together with improvements in the microscope, have been the main factors in the recent rapid development of the art. At present the most commonly used technical procedures in the examination of tissues and organs is as follows:

The first step is *fixation*. By this is meant a rapid killing of the tissue in such a way as to allow it to retain as nearly as possible the same form and relation as in the living tissue. Among the more common fixatives may be mentioned alcohol of various strengths, formalin in from 5 per cent. to 20 per cent. solutions, osmic acid, usually in 1 per cent. solution, Müller's fluid (2.5 grams of potassium bichromate and 1 gram of sodium sulphate, dissolved in 100 cubic centimeters of water), Fleming's fluid (a mixture of osmic, chromic, and acetic acids in water), chromo-acetic acid (1 per cent. solution in water), and corrosive sublimate in saturated aqueous solution. Many other fixatives are used for special purposes; thus, osmic acid is employed for the demonstration of fat and myelin. The small slices of tissue employed are allowed to remain from 12 to 48 hours in a large amount of fixative. Fixed tissues which have been fixed by any other agent than alcohol are then subjected to prolonged washing with running water. The next step is *hardening*. The fixing agents also act as hardening agents if allowed to act sufficiently long. Many fixatives, however, have a detrimental effect upon the tissues if their action is too prolonged. It is, therefore, quite common to transfer the tissues after proper fixation to some new fluid for the purpose of hardening and preservation. The almost universal hardening and preserving agent is alcohol, but formalin, too, in from 5 per cent. to 10 per cent. aqueous solution, is now extensively used. The first alcohol bath for plant tissues should be 35 per cent. or weaker, while many animal tissues will stand 50 per cent. This should be followed consecutively by 50 per cent., 70 per cent., 90 per cent., and 97 per cent. alcohol. For long preservation 80 per cent. alcohol is the most satisfactory. Next in the process is *imbedding*. By this is meant the impregnation of the tissues with a liquid which afterwards hardens, thus holding the tissues in

a firm mass, which can be easily cut. For this purpose paraffin and celloidin are most commonly used. In paraffin imbedding, the tissue is first immersed in any pure solvent of paraffin, then passed to a warm solution of paraffin in the solvent, and finally left in pure melted paraffin, until thoroughly impregnated. In celloidin imbedding the tissue is transferred from alcohol to a mixture of alcohol and ether, and then placed in a solution of celloidin in a mixture of equal parts of alcohol and ether. After impregnation the paraffin is allowed to harden by cooling, or the celloidin to thicken by exposure to the air and consequent evaporation of the alcohol and ether, after which it is immersed in chloroform for hardening. The operator then proceeds to cut sections by means of the *microtome*. This instrument consists essentially of a knife-carrier, which can be made to slide back and forth past a clamp to which the specimen is attached. The imbedded specimen is fastened to a block, usually of wood, clamped in the microtome. The clamp is so arranged that the blocked specimen can be raised any desired fraction of a millimeter, thus bringing any thickness of it above the knife. In paraffin-cutting the knife is kept dry; in celloidin section-cutting it is kept flooded with alcohol. The sections are then stained for the purpose of bringing out sharply the different tissue elements. For staining the nuclei, carmine, hæmatoxylin, and various aniline dyes are commonly used. For demonstrating the other tissue elements other dyes may be used, eosin being much used. The procedure in staining celloidin sections with hæmatoxylin and eosin is as follows: The sections are first allowed to remain for several minutes in an aqueous solution of hæmatoxylin; then they are thoroughly washed with 97 per cent. alcohol, and placed for several minutes in an alcoholic solution of eosin; they are then again washed in alcohol and cleared in oil of origanum or bergamot containing a little eosin. From the clearing bath the specimen is lifted to a glass slide, the excess of oil is removed by means of blotting-paper, a drop of a solution of Canada balsam is placed upon the specimen, and the whole is covered with a thin glass, called the cover-glass. By the drying and hardening of the balsam a permanent 'mount' of the specimen is secured.

The above methods of procedure are illustrative of those applicable to general histological material. The examination of special tissues and organs requires the use of special methods of technique. This is especially true in regard to the nervous tissues, for the study of which some very elaborate methods have been devised, some of which will be found described in the article **NERVOUS SYSTEM**.

For histological methods as applied to plant tissues, consult Chamberlain, *Methods in Plant Histology* (Chicago, 1901); for methods in animal histology, consult Lee, *Microtomist's Vademecum* (London, 1890).

HISTORICAL ASSOCIATION, AMERICAN. A society of historical students and writers, founded at Saratoga, N. Y., in September, 1884, at the suggestion of Herbert B. Adams, of Johns Hopkins University. Its original membership was 40, but within a year it had increased to 250, and in 1889 it received a definite standing and recognition by an act of Congress incorporating it in the District of Columbia. The society

has exerted wide influence in directing and stimulating historical research, and its publications and monographs have covered a broad field of historical study. Allied with the society is the American Society of Church History. This organization, founded in March, 1888, became the Church History Section of the Historical Society in 1889. Another important branch of the society is the Historical Manuscripts Commission, which prepares valuable manuscripts for publication. The society holds annual meetings, and publishes an annual report through the Smithsonian Institution at Washington. These reports include historical articles and bibliographies, and the society publishes in addition many monographs. As examples of the latter may be mentioned: *Federal Land Grants in the United States*, by George W. Knights; *Church and State in the United States*, by Philip Schaff; *Willem Usseinx*, by J. F. Jameson; *The Continental Congress*, by Herbert Friedenwald; and *The Study of History in Schools*, by a special committee of seven, appointed by the society. The presidents of the society have included eminent American historians. They have been: Andrew D. White, George Baneroff, Justin Winsor, William F. Poole, James Schouler, George F. Hoar, Edward Eggleston, and Alfred T. Mahan. The membership is about 1400.

HISTORICAL SOCIETY, ROYAL. A learned association in London, founded in 1668, and incorporated July 31, 1889, with the object of promoting the study of history. Its membership, which is international, numbers about 600, divided into Fellows, Honorary Fellows, and Corresponding Members. On May 2, 1896, the Royal Historical Society amalgamated with the Camden Society (q.v.). The Royal Society publishes annual volumes of Transactions and Documents, which are distributed without charge to members.

HISTORIC GEOLOGY. See GEOLOGY.

HISTORY (Lat. *historia*, Gk. *ιστορία*, history, from *ἵστωρ*, *hístōr*, learned, from *εἰδέναι*, *eidenai*, Skt. *vid*, OHG. *wizzan*, Ger. *wissen*, to know). A systematic narrative of past events, or, in the light of modern historical scholarship, the science of the progressive development of human society. The social and economic conditions of peoples, their racial affinities and physical environment, exercise determining influences upon their history, and find expression in their thought, their art, and their politics. History deals with the social structure in its successive forms and recognizes as inseparable allies all sciences which contribute to a knowledge of man as a social being, and in his relation with the physical world. As a science, history is primarily inductive. It proceeds from a body of concrete facts, which critical study links together according to the sequences of time and causation. Afterwards deductive processes may be used, but always sparingly and cautiously.

Historical method comprises four processes: the collation of facts; the arrangement of these facts, according to the sequences of time and causation; criticism, by which the value of the facts is determined; and their interpretation in accordance with the results of arrangement and criticism. These processes are all simple; they are the ordinary processes of scientific research, but in carrying them out the human equation

becomes so large an element of the problem as to make it essentially different from the problems of the physical world, and for this reason history can never be an exact science.

History depends upon human evidence, and its investigation must follow the laws governing the reception of human evidence. These are found to a considerable extent in the body of principles developed by jurisprudence for the reception of evidence in the courts. The historical material is contained in several categories: (a) Remains—such as buildings, walls, roads, statues, pictures, medals, coins, implements—whatever, indeed, man has made and used and which may thus throw light upon his civilization and his deeds. These may be studied directly, when accessible, or through the reproductions easily obtainable by means of modern processes.

(b) Documents. Under this head are included official and business papers and letters written with an immediate practical purpose.

(c) Literatures. This class includes a great body of material of the highest value—the writings through which are expressed the ideas of the peoples, their philosophy, poetry, science, and religion.

(d) Traditions. Much of this class is preserved in the literatures; much of it must be gathered from other sources.

(e) Laws. These, especially public law, are found in codes and treatises, and are of great value in determining many questions.

(f) Contemporary writings with historical purpose—annals, chronicles, biographies. Under these heads can be classified the original material on which secondary historical work, the written history of a nation or an age, is based and by examination of which its accuracy must be tested.

This material may also be divided into two great classes of evidence—conscious and unconscious. It will be seen that some of this material must have been prepared consciously to influence the opinion of contemporary or succeeding generations. In this class are proclamations, statements, writings, narratives, told with intention concerning events within the narrator's own knowledge, or reported to him by others. Such evidence must be taken with qualifications attaching to all ex-parte testimony. On the other hand, the evidence may be given unconsciously, as in documents of record, writings or other remains, prepared with no other purpose beyond that of direct utility. A striking example of this class of evidence is found in the little cylinders and tablets of clay, preserving in the business records, impressed upon them in cuneiform characters, so much of the social history of the Babylonians of thousands of years before the Christian Era. All these materials of human history must be subjected to searching inquiry as to their original purpose, and the circumstances under which they were made. The development of history into scientific form has been the work of ages, and owes its final impulse to the great improvements in methods in the physical sciences during the eighteenth and nineteenth centuries, although it developed along with the development of the human society whose life it records. The historical idea requires for its existence a background and a consciousness on the part of society of itself and of its continuity; of its relations to a past

and a present. The growth of this social self-consciousness has been a matter of time. It is interesting to notice, on the other hand, how the study of their history has sometimes aroused in a people the consciousness of their own national life, which before was dormant. An example of this may be found in the Balkan States, which were roused not many years ago into determined revolt against Turkish rule by the teaching of their national history through the efforts of a few patriotic scholars.

The new outlook upon the natural world given by the physical sciences and the change in historical methods gave rise to a controversy in the last century, in which certain philosophical thinkers of the highest ability undertook to maintain that "human actions are governed by laws as fixed and regular as those which rule in the physical world." Auguste Comte, Henry Thomas Buckle, and Herbert Spencer are the distinguished sponsors of this theory. Buckle, in his *History of Civilization in England*, the first volume of which was published in 1857, elaborated this idea with a profundity of learning, but with much inconsistency of reasoning. Such literary historians as Charles Kingsley and James Anthony Froude entered the discussion on the other side, and John Stuart Mill, in his *System of Logic*, made a very sane and able contribution to it. The strongest and most extreme presentation of the opposite side of the controversy is, perhaps, that made by Froude in his lecture of 1864 on "The Science of History." He maintained with great eloquence that the determination of human movements upon any basis of scientific accuracy was impossible. This old controversy is closed now in the light of a better understanding of what the science and scientific method really are, but it is of interest historically as marking one stage in the development of the science of history.

The development of history down to the nineteenth century may be traced through the work of a very few writers and scholars. The first of all historians was the Greek Herodotus, who lived in the fifth century B.C. He was, however, only a narrative writer, recording with great accuracy those events which came within the scope of his personal knowledge, but mingling with his narratives much which came to him only by hearsay, and to which he applied no critical canons. Thucydides, the next of the great historians, is justly estimated as one of the greatest historians of all time. He recorded events with remarkable conciseness, and first applied philosophical reasoning to the historical narrative. Among narrative historians the accomplished Xenophon deserves a place. Polybius, with a wider outlook, followed in the footsteps of Thucydides. Of the Romans, Cæsar, Livy, and Tacitus show a high development of the historical sense, the two former confining themselves to the narrative field, and the last claiming a place in the class of historians like Thucydides, who endeavored to find the meaning of history beneath the mere sequence of events. The historians of the later Roman Empire were, for the most part, apologists for, or eulogists of, the emperors who were their masters, and establish no landmark of importance. During the Middle Ages there was no historical writing worthy of the name in Europe. The historical writing of the time is contained in the annals and chronicles preserved

in the monasteries, which were very little more than diaries from day to day, kept without any discrimination by men whose outlook upon the world was of the narrowest. Einhard, in the reign of Charlemagne, Otto of Freising, in that of Frederick Barbarossa, and a few others, alone rise a little above the dead level, which offers material for historical research, but no true history. The awakening of a broader and more vigorous scholarship in the period of the Renaissance produced a new school of political and historical thinkers, who built upon the revived classical models. They are found in Italy, where Machiavelli and Guicciardini wrote historical works that are admirable in thought and style, and in France, Spain, and England, where the example of Italy was followed as in other fields of culture. In the eighteenth century the Englishman Gibbon, who devoted his life to his great work, *The Decline and Fall of the Roman Empire*, left one of the masterpieces of historical scholarship—a work that stands to-day as the most thorough and scholarly presentation of the history of the later Empire and of the Middle Ages. Voltaire, Hume, Montesquieu, and Robertson are brilliant names in the progress of historical thought of the same century. It remained, however, for the nineteenth century to develop history into a systematic science. With Niebuhr began a rational study of classical history, which has been carried on by Mommsen and Curtius for Roman and Greek history respectively. The greatest impulse, however, for the study came from the class-rooms of Leopold von Ranke (1795-1886). Ranke grasped the fundamental idea of historical science with a rugged sincerity, both of theory and practice, and impressed his spirit upon a large body of enthusiastic students in Germany and America. Waitz, Droysen, von Sybel, von Holst, Treitschke, and others have followed with greater or less ability along the path over which he led the way. In France within the last half century historical work and instruction have developed with great rapidity, and Monod, Duruy, Henri Martin, Lavisse, Rambaud, and many others have exemplified the French genius for clear and scientific thinking, and for condensed lucidity of statement. In less degree the other Continental countries have contributed to the development of the science. In England, along with such brilliant literary historians as Macaulay, Kingsley, and Froude, we have a body of eminent scientific scholars, of whom Freeman, Green, Stubbs, Creighton, and Gardiner are distinguished representatives. In America, whose scholars have drawn largely from the German and French schools, there has also been a noticeable development in historical writing and in critical scholarship. Succeeding the earlier school, which included Bancroft, Prescott, and Motley, there has grown up in the United States a modern school, trained in the best university methods of research, and enrolling in different kinds of historical work hundreds of vigorous and enthusiastic scholars. Francis Parkman, Justin Winsor, and John Fiske left behind them a body of historical writings of a very high order. Henry Adams, James Schouler, Captain Mahan, John Bach McMaster, and James Ford Rhodes are contemporary American historians whose studies in the history of their own country are of permanent value, and many more names might

be added. From the lecture rooms and seminaries of Europe and America a constant impulse to wise and thorough study and use of historical material goes forth from earnest and able teachers. Numerous periodicals are devoted to the advancement of historical research. Most noteworthy of these are the *Historische Zeitschrift* in Germany, the *Revue Historique* in France, the *English Historical Review* in England, and the *American Historical Review* in the United States.

It is the tendency of the modern school of historical students to rely more upon the thorough study of true sources of history, rejecting the myths, traditions, and second-hand accounts, which have so often formed much of the material of writers of so-called history. Collections of written sources form a very considerable part of the historical publications of to-day, and guides and commentaries to these collections of sources are constantly being issued to enable the student to find his way intelligently through the mass of material which the source collections present. In this direction Germany, under the leadership of Ranke, led the way. The massive and constantly growing collection of sources of German history, known as the "Monumenta Germaniæ Historica," is in itself a monument of scholarship and research, and in France, England, and the United States similar collections have been published, and are in process of publication from year to year. The well-known Rolls Series in England is nearly as notable a collection as the German *Monumenta*. Even in historical instruction in the schools, the simpler and more interesting sources have been put in available form for elementary students, and are used with great success to enliven the historical narrative, and to give an appreciation of the true nature of historical research. This tendency to explore the actual evidence critically has done much to clear history of the fable, myths, and traditions which made much of it unreliable, and to render it real to the student.

DIVISIONS OF HISTORY. History is commonly divided chronologically into three great periods—Ancient, Mediæval, and Modern. While there is complete continuity in the course of history, each one of these periods has certain characteristics distinguishing it from the others, and making it convenient to treat each as a unit. In the first period the beginning and growth and decline of the great civilizations of antiquity are comprised. Here are considered the old East, Egypt, Mesopotamia, and Syria, Greece, and Rome. In these remote ages were laid the foundations of civilization, the elements of which were handed on from the valleys of the Nile and Euphrates to the Greeks and Romans, who fashioned them into instruments available for later generations. The Roman Empire welded together all the diverse elements of the ancient world. Ancient history is usually regarded as ending when the irruption of the Germanic barbarians from Northern and Central Europe into the highly developed Roman civilization caused the downfall of the old Empire in the fifth century of our era, and ushered in several centuries of confusion. The world that had been so thoroughly organized by the Roman was materially modified in its structure by the individualism for which the German stood, in contradistinction to the principle of imperial unity

emphasized in the Roman world. Out of this stormy mingling of conflicting ideas in the Middle Ages came modern Europe, which rests politically upon a combination of the German and Roman principles. The Middle Age is regarded as closing about the end of the fifteenth century, when the fall of Constantinople had removed the last shadow of the old Roman world, when the discoveries of Columbus had immeasurably widened the European horizon, and the revolt was beginning against ecclesiastical imperialism. The national idea slowly took form out of the feudalism of the Middle Ages, and modern nations gradually arose, with the result of bringing into being a legal code for the regulation of international relations. The internal confusion of the Middle Ages had separated Europe from the rest of the world, but with the revival of learning and the interest in new things, known in history as the Renaissance, came a larger acquaintance with that older world of the East which, while less progressive, had its own civilization, institutions, and history. The conflict of the religions and civilizations of the East and West produced the Eastern question, in which are contained so many of the most difficult problems of modern international politics. The opening of the New World in the period of discovery introduced a new factor of the greatest importance in the world's history—the future great power of the Western Hemisphere, which had as its heritage the civilization of Europe, but was unhampered by immemorial traditions and institutions, and by conflicting national interests. The same pregnant era that saw these new elements thrown into the world's life saw also the renewal of the old conflict between the German idea of liberty and the Roman idea of unity in the Protestant revolt against the control of the Roman Church. This conflict shaped much of the world's history for three centuries. The expansion of population in the older countries, the development of commerce, the increasing knowledge of the world, and the growing ambition of nations conscious of their own possibilities and increasing rapidly in power and wealth, together with the religious persecutions generated by the Protestant revolution, brought about the opening and settlement of new and hitherto inaccessible regions, resulting in the widening of national interests, enormous increase in the power and resources of the great nations, and a development of national rivalries on a scale hitherto unknown. There has also come an insistence on the part of civilized peoples that barbarian races shall submit to civilization and not obstruct the progress of world development. History has until recently concerned itself almost exclusively with the Occidental nations, regarding the Orient only as it has come in contact with the West. Now, however, the histories of India, China, Japan, and all other peoples that have enjoyed organized life have assumed importance in view of their bearing upon the larger problems of the age. Such has been the movement of the great current of history which has expanded in volume with the expansion of the race. Within these wide boundaries the histories of different countries may be studied in detail; and the study of history may be still further specialized along the lines of social, economic, political, or constitutional fields, or in those of art, literature, or thought. These special fields become in-

creasingly important as history grows in complexity, so that light is needed upon its phases in detail.

The true spirit of history is nowhere better expressed than in Ralph Waldo Emerson's essay on *History*. See also Frederic Harrison, *The Meaning of History* (London, 1894); Lord Acton's inaugural address as regius professor at Oxford (London, 1895); W. S. Lilly, "The New Spirit in History," in *Nineteenth Century* (October, 1895); White, "The Study of History," *Atlantic Monthly* (January, 1870); Freeman, *Methods of Historical Study* (London, 1886); Droysen, *Grundriss der Historik*, trans. by Andrews as *Outlines of the Principles of History* (Boston, 1893); Adams, *Manual of Historical Literature* (3d ed., New York, 1889); Bernheim, *Lehrbuch der historischen Methode* (Leipzig, 1894); Langlois and Seignobos, *Introduction to the Study of History*, trans. from the French by G. G. Berry (New York, 1898); Froude, *Short Studies on Great Subjects* (New York, 1893). On the pedagogical aspects of the subject, see Hall (ed.), *Methods of Teaching History* (Boston, 1883-85), a collection of papers by well-known educators: Channing and Hart, *Guide to the Study of American History* (Boston, 1896), very full bibliographies; Committee of Seven of the American Historical Association, *The Study of History in Schools* (New York, 1899); publications of the New England History Teachers' Association. The publications of the American Historical Association contain many papers relating to history in general in its different aspects.

HIS'TRIOMAS'TIX (Neo-Lat., from Lat. *histrío*, actor + Gk. μάστιξ, *mastix*, scourge). A comedy produced not later than 1599, of which John Marston was at least a collaborator, and printed in 1610.

HISTRÍOMASTIX, THE PLAYER'S SCOURGE, OR ACTOR'S TRAGÆDIE. A tract violently attacking the drama, by William Prynne, a Puritan, published in 1632. It gave great offense, and the author was fined, deprived of his Oxford degree, and, losing both his ears, was sentenced to life imprisonment.

HIT (Gk. ἴσ, *Is*). A town of Asiatic Turkey, situated among deserts and salt marshes on the right bank of the Euphrates, in the Vilayet of Bagdad, and 110 miles west-northwest of the city of that name (Map: Turkey in Asia, K 6). It is remarkable for the asphalt and naphtha pits in the neighborhood, from which asphalt is believed to have been obtained for the construction of the walls of Babylon. At present the chief products of the place are asphalt, naphtha, salt, and lime. Population, about 5000.

HITA, ἔ'τά, GINES PEREZ DE. See PEEZ DE HITA, GINES.

HITCH. See KNOTTING AND SPLICING.

HITCH'COCK, CHARLES HENRY (1836—). An American geologist, the son of Edward Hitchcock. He was born at Amherst, Mass. After graduating at Amherst College (1856), he was assistant to the Geological Survey of Vermont (1857-61); State Geologist of Maine (1861-62), and of New Hampshire (1868-78). His report on his work in New Hampshire, containing a folio atlas of maps, profiles, and sections, is considered his most important publication. Incidental to

the survey was the maintenance of a meteorological station throughout the year on the summit of Mount Washington, whence daily statements of the weather conditions were issued before the United States Signal Service had begun its weather predictions. Hitchcock's publications comprise more than one hundred and fifty papers, chiefly concerning New England geology, crystalline schists, and ichnology. He was appointed professor of geology at Dartmouth College in 1896, and in 1883 was president of the American Association for the Advancement of Science. He was made a member of the Imperial Geological Institution of Vienna, and was one of the original and most active members of the Geological Society of America. He was the first to suggest the locality of the great terminal glacier in the United States.

HITCHCOCK, EDWARD (1793-1864). A scientist and educator who contributed greatly to the development and popularizing of geological science in America. He was born in Deerfield, Mass., where for a time he served as principal of the academy. From 1814 to 1818 he published the *Country Almanac*, and in the latter year entered Yale Theological Seminary, from which he was graduated in 1820. After serving as pastor of the Congregational Church in Conway, Mass., he was appointed professor of chemistry and natural history in Amherst College. As president of that institution from 1845 to 1854 he improved its financial condition, and greatly extended its usefulness. When he resigned the presidency, he retained the professorship of natural theology and geology, holding this office until his death. Throughout the latter part of his life he devoted much time to geological research. In 1830 he was appointed State Geologist of Massachusetts, and under his direction the first geological survey of any extensive area was completed. The results of this work were published by the State Government in several voluminous reports. In 1836 he received the appointment of geologist of New York, but resigned the position. He served as geologist of Vermont from 1857 to 1861, and in 1850 was commissioned by the State of Massachusetts to examine the agricultural schools of Europe. He was one of the founders of the Massachusetts Agricultural College, and of Mount Holyoke Seminary, and was the first president of the American Geological Society. His extensive collection of fossil footprints of the Connecticut Valley was presented to Amherst College. The most important of his works are: *Economical Geology* (1832); *Report on the Geology, Mineralogy, Botany, and Zoölogy of Massachusetts* (1833); *Elementary Geology* (1840); *Geology of Massachusetts* (1841); *History of a Zoölogical Temperance Convention in Central Africa* (1850); *Religious Lectures on Peculiar Phenomena of the Four Seasons* (1850); *Religion of Geology and Its Connected Sciences* (1851); *Religious Truth, Illustrated from Science* (1857); *Ichnology of New England* (1858); *Report on the Geology of Vermont* (1861); and *Reminiscences of Amherst College* (1863).

HITCHCOCK, ETHAN ALLEN (1798-1870). An American soldier and mystic. He was a grandson of Ethan Allen, was born at Vergennes, Vt., and was educated at West Point. After garrison service, he was instructor in tactics at West Point (1824-27), and commandant there

(1827-29). He served against the Indians in Florida in 1836 and 1840, and in the last campaign of the Mexican War. For his service in Mexico he was brevetted brigadier-general (1847). He commanded the Pacific Division from 1851 to 1854, and in the next year resigned because of a quarrel with Jefferson Davis, then Secretary of War. At the outbreak of the Civil War he was appointed major-general, and served at first on special duty under the Secretary of War, and later as commissioner of exchange. He was also confidential adviser to the President. Hitchcock was a mystic, and wrote: *Remarks upon Alchemy and the Alchemists*, arguing that they were religious philosophers, and that truth was the philosopher's stone (1857); *Sveddenborg, a Hermetic Philosopher* (1858); *Christ, the Spirit*, in which the Gospels are treated as symbolical writings of the Essenes (1860); *Red Book of Appin, and Other Fairy Tales* (1863); *Remarks on the Sonnets of Shakespeare* (1865 and 1867); *Spenser's Colin Clout Explained* (1865); and *Notes on the Vita Nuova of Dante* (1866), in all of which he gives hermetic explanations of the matter of these books.

HITCHCOCK, ETHAN ALLEN (1835-). An American politician, born in Mobile. For several years he was in business in Saint Louis. In 1897 he was sent as United States Minister to Russia, and subsequently was made Ambassador upon a corresponding change in the Russian diplomatic service. In 1898, upon the retirement of Cornelius M. Bliss, he was appointed Secretary of the Interior. He entered upon the office in 1899.—His brother HENRY (1829-1902) was born near Mobile, Ala., and was one of the foremost lawyers and citizens of Saint Louis.

HITCHCOCK, ROSWELL DWIGHT (1817-87). An American clergyman and educator, born in East Machias, Me. He graduated at Amherst College in 1836, and at Andover Theological Seminary in 1838, and studied at the universities of Halle and Berlin in 1847. After his graduation from the theological school he was a tutor at Amherst until 1842. He preached a year in Waterville, Me., and in 1845 was installed over the First Congregational Church in Exeter, N. H. He resigned in 1852 to accept the professorship of revealed religion at Bowdoin College. Three years later he resigned at Bowdoin to become professor of Church history at Union Theological Seminary, of which he was elected president in 1880. He was on the editorial staff of the *American Theological Review* for seven years, traveled in Egypt and Palestine, and was elected president of the Palestine Exploration Society in 1871, and vice-president of the American Geological Society in 1880. He published: *The Life, Character, and Writings of Edward Robinson* (1863); *Complete Analysis of the Holy Bible* (1869); *Socialism* (1879); *Carmina Sanctorum*, with Dr. Zachary Eddy and Rev. Lewis W. Mudge (1885). A collection of sermons, *Eternal Atonement*, was published posthumously (1888).

HITCHIN, hich'in. A town in Hertfordshire, England, 14 miles northwest of Hertford (Map: England, F 5). It was the original seat of Gorton College; it has a free school, founded 1622; and its fine old parish church contains an historical crypt, interesting monuments, and an "Adoration of the Magi" by Rubens. Hitchin has large breweries, and a trade in corn, malt, and

flour. Straw-planting is carried on, and the cultivation of lavender for its essential oil, extensively used in perfumery, dates from 1568. Hitchin is recorded in the Domesday Book. It was given to Harold by Edward the Confessor, and came into the possession of William the Conqueror. Population, in 1891, 8860; in 1901, 10,072.

HITOPADESA, hê-tô'pâ-dâ'shâ (Skt., salutary instruction), or **BOOK OF GOOD COUNSEL**. The name of a celebrated Sanskrit collection of fables, the contents of which have passed into almost all the civilized literatures of the world. The collection itself, in the form in which we possess it, is founded on older works of a kindred nature; and its preface expressly mentions 'the *Panchatantra* and another work.' For a convenient list of editions and translations and a sketch of the subject, consult Lanman, *Sanskrit Reader* (Boston, 1884). Two good editions with English notes are published in India by Peterson (Bombay, 1895); and by Godbole and Parab (ib., 1896). See **PANCHATANTRA**; **SANSKRIT LITERATURE**.

HITTEREN, hêt'têr-en. An island off the west coast of Norway, situated at the entrance to the Thronhjemsfiord (Map: Norway, C 5). It covers an area of nearly 200 square miles (including some adjacent islets), and has a population of about 3000. It is covered with low but rugged hills, reaching 1000 feet, among which are numerous lakes and streams. The inhabitants are mostly engaged in fishing.

HITTITES. A name that properly designates a rather promiscuous group of nations whose settlements extended from the westerly portions of Asia Minor to Armenia, northward close to the Caspian Sea, and southward to the watershed between the Euphrates and the Orontes. Besides this we also find references in the Old Testament to Hittites in Southern Palestine around Hebron (Gen. xxiii.), and Hittites are likewise frequently mentioned among the pre-Israelitish inhabitants of Palestine, and alongside the Canaanites, Amorites, Hivites, Perizzites, and Girgashites. It is quite impossible, however, to determine absolutely whether the same group (or subdivision of the same group) is intended in all cases. The indications are in favor of separating the Hittites of Central Palestine from those in the south and from the Hittites of Northern Syria and Asia Minor. The geographical nomenclature of the Old Testament is frequently vague, and Hittite is a term which is variously used by different writers. So far as the Hittites, whom tradition places around Hebron, are concerned, we are limited in our knowledge to the account of Abraham's purchase of the field of Machpelah from the sons of Heth (Gen. xxiii.), and to incidental references, such as Gen. xxvi. 34, which point to scattered Hittite settlements as far south as Gerar and Beersheba. They are on friendly terms with Edomites and Hebrews, but there is nothing to indicate their ethnic relationship to those two groups. Equally unsatisfactory is our knowledge of the Hittites of Central Palestine. We encounter them merely as one in the confederated group of pre-Israelitish inhabitants of Canaan proper, and considering the uncertain character of Hebrew traditions when it comes to specific names of peoples, there is no special value to be attached to this group-

ing. When we reach the days of David we find ourselves on safer historical ground. The presence of Uriah the Hittite (husband of Bathsheba) in the army of David (II. Sam. xxiii. 39) is a valuable indication that at this period a group known as the Hittites was still recognized, and there is no valid objection against regarding these Hittites as descendants of those whom tradition places around Hebron, which, it will be recalled, is also the centre of David's political activity. In Solomon's days (I. Kings xi. 1) we learn of alliances with Hittites, and here at last we have the Hittites of the north whose historical importance far outranks those of the south. The 'kings of the Hittites' to whom the writer in II. Kings vii. 6 refers are powerful rulers who as early as 1600 B.C. had established themselves on the Orontes, and whom the Egyptians, when under Thothmes I. they began their series of Asiatic campaigns, found to be most formidable enemies. While obliged to submit to Egypt for a while, the Hittites maintained a spirit of independence, and centuries afterwards the Babylonians and Assyrians were checked in their advance toward the west by the Hittites gathered at Carchemish, Kadesh, Marash, Hamath, and elsewhere. It is not until the days of Sargon II. (B.C. 721-705) that these Hittites along the Orontes are finally subdued and disappear from the horizon of history. Hittites, however, are not limited to Northern Syria. Monuments have been found in Cappadocia, Paphlagonia, Lycaonia, and Phrygia which by their general art, costumes of the personages sculptured on them, and above all by the character of the inscriptions accompanying the monuments, are identical with numerous Hittite remains found at Carchemish, Marash, and Hamath. It is the existence of these monuments spread over so large a district that enables us to form an idea of the important part played in ancient history by the Hittites. The inscriptions themselves have not yet been fully deciphered, but a beginning has been made, and enough is now known to warrant the assumption that between c.1200 and 800 B.C. Hittites formed the controlling element in Central and Western Asia Minor; and it also appears quite certain that the spread was gradual from the region of Cilicia to the north, northeast, northwest, and west. These Hittites appear to have been of a mixed ethnic type, of Turanian and Semitic elements, with a general tendency toward the prevalence of the Semitic over the non-Semitic.

According to Jensen, indeed, the Hittite language is Aryan in character; but this view is open to serious objections, and it is more likely that the Hittite language will be found to be affiliated with the Semitic stock. There is also a possibility of a direct connection between Hittite characters and Egyptian hieroglyphics, though it is not possible to speak with certainty on this and numerous other points connected with the Hittites. Further researches and explorations in Hittite districts are needed, and above all the discovery of a key that will enable scholars satisfactorily to interpret the inscriptions. The Hittite script, it may be added, is partly pictorial and partly syllabic. By virtue of its pictorial character it is possible to determine the general meaning of a Hittite inscription much more readily than to determine how it is to be read.

(Paris, 1883); Sayce, *The Hittites* (London, 1888); Wright, *The Empire of the Hittites* (London, 1884); Lautsheere, *De la race et de la langue des Hittites* (Paris, 1891); Jensen, *Hittiter und Armenier* (Strassburg, 1898); Messerschmidt, *Bemerkungen zu den hethitischen Inschriften* (Berlin, 1898); id., *Corpus Inscriptionum Hetticarum* (ib., 1900). For Jensen's attempts at decipherment of the Hittite inscriptions, consult his articles in the *Zeitschrift der deutschen Morgenländischen Gesellschaft*, vol. xlviii. (Leipzig, 1894). See CARCHEMISH.

HITTORF, ê'tôrf', JACQUES IGNACE (1792-1867). A French architect, born in Cologne. He went to Paris in 1810 to study art, and from 1819 to 1830 was architect to the King. He was long engaged in the construction of public buildings, and at the embellishment of such public places as the Bois de Boulogne and the Champs Elysées. His chief work is the Church of Saint Vincent de Paul, in Paris. He published: *Architecture antique de la Sicile* (1826-30); *Architecture moderne de la Sicile* (1826-35); *Architecture polychrome chez les Grecs* (1851), all of which are still considered valuable contributions to the literature of architecture.

HITTORF, hit'tôrf', JOHANN WILHELM (1824—). A German physicist, born at Bonn. He has been since 1852 professor of chemistry and physics at Münster. Hittorf's earliest important researches were in electrolysis, and he was able to extend Faraday's work, his method of determining the mobility of ions being of the greatest importance to physical chemistry. In addition to his work in electrolysis, Hittorf made elaborate investigations of the various phenomena attending the passage of electricity through gases. In 1862 with Plücker he discovered that different spectra could be obtained from the same substances under different conditions of temperature. Later (1869), in studying the passage of electricity through tubes containing a rarefied gas, he observed that by increasing the exhaustion of the tube the dark space between the negative pole and the negative glow became wider, and that when the discharge from the cathode struck against the glass considerable fluorescence was produced. Hittorf also ascertained that these rays could be deflected by a magnet, and anticipated Crookes, who in 1878 published his famous researches with the vacuum or Crookes tubes and named the rays thus produced radiant matter. He investigated the allotropic occurrence of selenium and phosphorus, and in the case of the latter substance he was successful in producing a crystallized form, black in color and with a metallic lustre. Hittorf's many valuable papers on physics and chemistry are to be found for the most part in Poggendorff's and Wiedemann's *Annalen der Physik* (Leipzig, current).

HITZIG, hits'ik, EDUARD (1838—). A German alienist, grandson of the biographer and jurist Julius Eduard Hitzig. He was born in Berlin, studied medicine there and in Würzburg, and in 1875 became professor of psychiatry at Zürich. Four years afterwards he became professor in Halle, where he established an independent clinic for nervous and mental disorders, the first in Prussia. He wrote: *Untersuchungen über das*

Gehirn (1874), the result of long research on cerebral physiology and pathology, and especially on localization of the various functions; *Ueber traumatische Tabes* (1894); and *Der Querulantenwahnsinn* (1895).

HITZIG, FERDINAND (1807-75). A German biblical scholar. He was born June 23, 1807, at Hauingen, Baden, and educated at Heidelberg, Halle, and Göttingen. In 1833 he was called to Zürich as professor of theology, with a special view to the exegesis of the Old Testament; but his lectures embraced also the New Testament and the languages of the East. In 1861 Hitzig returned to Heidelberg as professor. The first work which established his fame was his *Der Prophet Jesaja übersetzt und ausgelegt* (1833). Besides a translation of the Psalms, with a commentary (1835-36), he furnished for the *Ezegetisches Handbuch zum alten Testament* the commentaries on the minor prophets (1838), on Jeremiah (1841), Ezekiel (1847), Ecclesiastes (1847), Daniel (1850), and the Song of Solomon (1855), with a translation of all the prophetic books as a supplement (1854). He died at Heidelberg, January 22, 1875. For his biography, consult Steiner (Zürich, 1882).

HITZIG, JULIUS EDUARD (1780-1849). A German criminal jurist and biographer. He was born in Berlin, studied law at Halle and Erlangen, and from 1799 to 1835 was connected more or less closely with the criminal courts of Warsaw and Berlin. To this period belong the *Zeitschrift für die preussische Kriminalrechtspflege* (1825) and *Annalen für deutsche und ausländische Kriminalrechtspflege* (1828), both founded by him. At Warsaw he had been intimate with the poets Mnioch and Werner, and in Berlin he was even more prominent in literary circles as founder of the 'Mittwochs-gesellschaft,' a literary club. Hitzig was editor of the *Presszeitung* (1840-44), and author of biographies of Werner (1823), of Hoffmann (1823, 3d ed. 1839), and of Chamisso (1839-40). With Häring, in 1842, he began to publish a *Neue Pitaval*; in 1826 he had brought out *Gelchrtes Berlin im J. 1825*.

HIVE-BEE. The honey-bee. See BEE.

HIVES. A name popularly given to the eruption known as urticaria or nettle-rash (q.v.). The eruption appears as white rounded elevations or long wheals, which turn red later, especially after scratching or rubbing, for the prurigo is intense. The use of lobsters or crabs has caused hives in some people. Certain drugs, such as the balsams, often cause it. After unloading the bowels, local treatment with dilute acids or bichloride of mercury will give relief. Alkalies and salicylates, taken internally, cut an attack short.

HIVE SYRUP, *Syrupus Scillæ compositus*. The compound syrup of squills, a plant growing on the northern coast of the Mediterranean Sea. The bulb is the official portion. It is generally dried for use, but is sometimes imported packed in sand, in a partially undried state. The syrup is prepared usually by taking of squill a moderately coarse powder; senega, a moderately fine powder; tartrate of antimony and potassa; sugar; diluted alcohol; and water. The whole is carefully mixed according to formulæ laid down in the Pharmacopœia. In its action it is an emetic, and combines the virtues of senega,

squill, and tartar emetic, of the last of which it contains but one grain to the fluid ounce. It is also diaphoretic, expectorant, and in large doses cathartic. It was originally devised for the treatment of spasmodic croup and hives, whence comes its popular name. Great care must be taken, in employing it, not to allow its sedative operation to proceed too far. In overdoses it has been known to produce a fatal inflammation of the stomach and bowels, since tartar emetic is highly poisonous.

HIVITES (probably connected with Ar. *hayy*, family, or Heb. *Hawwah*, Eve, or else from *haw-wah*, serpent, in allusion to the clan-totem). 'One of the peoples driven out of Palestine by the Hebrews (Ex. iii. 8 et al.) and placed in the list (Gen. x. 17) among the sons of Canaan. Several of the biblical passages in which Hivites are mentioned present an uncertain text, as e.g. Joshua ix. 7, xi. 3; II. Sam. xxiv. 7. Hebrew writers seem to have confused Hivites, Horites (q.v.), and Hittites (q.v.), so that we cannot be quite certain even whether such a people as the Hivites ever existed.

HIZEN, hē'zen. One of the nine provinces of the island of Kiushiu, Japan, famous in history and for its kaolin and the production of porcelain. It is rich in tea, tobacco, vegetable wax, and coal, but not in cereals, though in quality its rice is reckoned the best. Its chief towns are Saga and Nagasaki (q.v.). Arita and Imari, both situated in this province, are famed for their ceramic ware. It was formerly divided among ten daimios (q.v.). It is now mostly within the Nagasaki ken. Consult: Rein, *Japan* (London, 1884), and for the ceramic industries of the province, Brinkley, *Japan: Its History, Arts, and Literature*, vol. viii. (Boston, 1901-02).

HJÄRNE, yär'ne, HARALD GABRIEL (1848—). A Swedish historian, born at Klatorp. He was educated at Upsala, where he became docent (1872) and professor (1889). His studies on the relations between Russia and Sweden are of particular importance. He wrote: *Polens nordiska politik närmast före kongressen i Stettin 1570* (1884); *De äldsta svensk-ryska legationsakterna* (1884); *Från Moskva till Petersburg*, a sketch of Russian civilization (1888-89); *Unionsfrågan* (1892); *Sveriges statsskick under reformationstiden 1520-1611* (1893); *Medeltidens statsskick* (1895); and *Svensk-ryska förhandlingar 1564-72* (1897).

HOACTZIN, hō-äkt'sin (South American name), or HANNA. A bird (*Opisthocomus cristatus*) of Guiana and Brazil, possessing many conflicting characteristics of structure, so that its place in classification has been greatly in dispute. Some writers have regarded it as nearly related to the plantain-eaters; others to the curassows. Most recent writers have placed it with or very near the Gallinae, but generally as a separate order, the Opisthocomi. It has the general shape of a curassow, but in size is much smaller; is olive-color, varied with white above and deep bay below; and has a long pendent crest of loose yellow feathers. The tail is long and broadly tipped with yellow. It lives in bands in the forest, frequents the borders of streams, feeds upon leaves and fruits, rarely leaving the lower trees and bushes, flying weakly, and uttering a 'sharp grating hiss' as a call note. It feeds largely on a species of arum,

which gives its flesh and whole body a vile musky odor, so that it is known in British Guiana as 'stink-bird.' On the Amazon it is called *cigano*, or 'gypsy.' Its nest is rudely built of sticks on

THE HOACTZIN.

some low bush, and the eggs, three or four in number, are whitish with reddish-brown blotches. The character and actions of the young are, however, the most remarkable thing about this extraordinary bird. They are hatched naked, and possess at birth well-developed claws on both

YOUNG HOACTZIN.

Showing hand-like use of immature wings.

the index (forefinger) and pollex (thumb) digits of the fore limb. Soon after hatching, the nestlings begin to crawl about by hooking these claws about twigs or any object accessible, and so use their wings precisely as feet, holding on also by the bill. This is an interesting reminder of the condition of the wing in the most ancient of birds (see ARCHAEOPTERYX), which used its anterior digits in much the same way. The young hoactzin, however, sheds its claws after a few days. Consult Newton, *Dictionary of Birds* (London and New York, 1896), where many further references are given.

HOADLEY, hōd'li, GEORGE (1826-1902). An American lawyer, and Governor of Ohio, born in New Haven, Conn. He was educated in the public schools of Cleveland, where his father had settled in 1830, and at Western Reserve College, then at Hudson, Ohio, where he graduated in 1844. He studied law at the Harvard Law School, was admitted to the bar in 1847, and two years later became a partner in the law firm of Chase & Bull at Cincinnati, in which Salmon P. Chase was the senior member. In 1851 he was chosen by the Legislature judge of the Superior Court of Cincinnati; in 1855 became city solicitor; and in 1859, upon the reorganization of the Superior Court, was elected judge, and was re-elected in 1864. Originally a Democrat, he took a prominent part in the 'Barnburner' movement, was a War Democrat, and finally during the war allied himself with the Republican Party. He resigned from the bench in 1866 to resume his law practice. In 1872 he was active in the Liberal Republican revolt, but dissatisfaction with the nomination of Greeley caused him to remain in the party. In 1876, however, he allied himself with the Democratic Party on the tariff issue, and was one of the counsel for Tilden before the Electoral Commission. In 1883 he was the party's candidate for Governor of Ohio, being elected over Joseph B. Foraker by 12,000. Two years later he was in turn defeated by Foraker for reelection to the same office. From 1887 until his death he practiced law in New York City.

HOADLY, BENJAMIN (1676-1761). A Church of England prelate. He was born at Westerham, Kent, November 14, 1676. He graduated B.A. at Cambridge 1696, became preacher in London in 1701, Bishop of Bangor in 1715, of Hereford in 1721, of Salisbury in 1723, and of Winchester in 1734. He attracted attention by controversies with the Nonconformists, and with the High-Church Party of the Church of England. His principles were developed in his *Essay on the Origin of Civil Government* (1709). The accession of George I. in 1714 brought Hoadly's views into favor with the Court, and he received advancement. In 1717 the so-called *Bangorian Controversy* arose. It began by Hoadly's publication of his views on the text, "My kingdom is not of this world;" in regard to which he maintained that Christ had left behind Him no such authority as that claimed by churches, and that this was the best way of answering the pretensions of the Church of Rome. These views gave great offense both to High Church and Dissenters. He was attacked from all quarters, and the controversy raged for three years. He died at Chelsea, London, April 17, 1761. His works were published with a life by his son, John Hoadly (London, 1773).

HOANG-HO, HWANG-HO, hwāng'hō', or **YELLOW RIVER**. Next to the Yang-tse-kiang, the largest river of China. It rises in a marshy plain in the District of Kuku-nor, Tibet, west of Lake Charing-nor and only a short distance north of the upper course of the Yang-tse-kiang. Its course is exceptionally tortuous. After flowing eastward to near the boundary of Tibet, it changes its direction first to the northwest and then to the northeast, in which latter direction it flows through the Chinese Province of Kan-su. Leaving the Province of Kan-su, it crosses the

Great Wall into Mongolia. There it flows at first northeast and then east as far as the western boundary of the Chinese Province of Shan-si, where it turns sharply to the south, and, passing the Great Wall again, flows between the provinces of Shen-si and Shan-si, forming their boundary line. At about latitude 35° N. it turns sharply east, which direction it maintains as far as the city of Kai-fung, in the Province of Ho-nan. From that point it flows in a north-eastern direction until it falls into the Gulf of Pe-chi-li about latitude 38° N. Its total length is probably over 2500 miles, and its basin is estimated at 400,000 square miles. The chief tributaries of the Hoang-ho are the Tao-ho from the south, the Wei-ho from the west, and the Ta-tung-ho from the north. The Hoang-ho is navigable for small vessels for a short distance from its mouth and in some parts of its middle course. The course of the river has changed repeatedly, and the present mouth was that of the Ta-tsin until 1853. Prior to that time the course of the river below K'ai-fung was south-easterly, and its mouth in the Province of Kiang-su in about latitude 34° N. The sediment which is transported in large quantities by the Hoang-ho raises its bed, thereby causing inundations. These have been so frequent and so disastrous that the river has come to be known as 'China's sorrow.' In order to guard against the inundations, a vast system of dams and dikes has been maintained from time immemorial.

HOAR, hōr, EBENEZER ROCKWOOD (1816-95). An American jurist. He was born at Concord, Mass., the son of Samuel Hoar, graduated at Harvard in 1835, and was admitted to the bar. He was a judge of the Court of Common Pleas from 1849 to 1855, and of the State Supreme Court from 1859 to 1869. In 1869-70 he was Attorney-General of the United States. He was a member of the Joint High Commission that framed the Treaty of Washington in 1871, and was a Republican member of Congress in 1873-75.

HOAR, GEORGE FRISBIE (1826—). An American legislator, born at Concord, Mass. He graduated at Harvard in 1846, studied law in the Dane Law School, Harvard, and then opened an office in Worcester. He was an ardent member of the Free Soil Party, and later of the Republican Party, almost from the time of its organization; and in 1852 he was elected one of its representatives in the Massachusetts Legislature. Though his ambition at this time was for a legal rather than a political career, he was induced to accept other nominations, which resulted in his serving in both branches of the State Legislature and in the United States House of Representatives, of which he was a member from 1869 until 1877, when he was chosen Senator by his State. During his last year in the House he was a member of the Electoral Commission (q.v.), chosen in 1876, which decided that Hayes had been elected President over Tilden. He presided over the Republican National Convention of 1880, which nominated Garfield and thus ended the bitter contest between Grant and Blaine. He was always a consistent opponent of 'imperialism' from the days when he aided Sumner in his opposition to the annexation of Santo Domingo; and, though he supported President McKinley for reelection, he strongly opposed his policy in the Philippines, which he considered subversive of

American ideals. During his service in the House Mr. Hoar was one of the managers of the Belknap impeachment trial, and after his election to the Senate he was chairman of the committees on the judiciary and on privileges and elections, and a member of the committees on engineering bills, civil service and retrenchment, library claims, Nicaragua claims, and rules, as well as chairman of the select committees on woman suffrage, and relations with Canada. Among the non-political offices to which he was appointed are: Regent of the Smithsonian Institution (1880), president of the American Antiquarian Society, president of the American Historical Association, president of the Board of Trustees of Clark University (1900), and trustee of the Peabody Fund.

HOAR, SAMUEL (1778-1856). An American lawyer and legislator. He was born at Lincoln, Mass.; graduated at Harvard in 1802; was admitted to the bar in 1805, and soon became a prominent lawyer. He was a State Senator in 1825 and again in 1833, and was a Whig member of Congress from 1835 to 1837. In 1844 he was sent by the Massachusetts Legislature to South Carolina to dispute before the courts the constitutionality of certain laws of that State authorizing the imprisonment of free negroes coming into it. He was, however, not allowed to plead, but was forcibly expelled from Charleston by the public authorities, the South Carolina Legislature by special act authorizing the expulsion.

HOARE, Sir RICHARD COLT (1758-1838). An English antiquary, born at Stourhead, in Wiltshire. At twenty-five he married Lord Lyttelton's eldest daughter, and, after her death, two years later, traveled extensively over Europe. He wrote descriptions of his travels in Ireland and in Italy; a translation of Giraldus Cambrensis (1808); and, most important among his works, a *History of Ancient Wiltshire* (1821), succeeded by an incomplete *History of Modern Wiltshire*, dealing with the southern section only (1822 and 1843).

HOAR FROST. See FROST.

HOARHOUND. See HOREHOUND.

HOARSENES. See THROAT, DISEASES OF.

HOBART. The capital of Tasmania, situated on the Derwent, near its entrance into Storm Bay, on the south coast of the island (Map: Tasmania, D3). Besides the Government official buildings, Hobart has a college, a technical school, two cathedrals, hospitals, a free library, museum, and art gallery. Its naturally excellent harbor and quay with three patent slips accommodate ships of the largest size. It has considerable manufactures, a large export and import trade, railway communication with Launceston, and steamship communication with Sydney, Melbourne, New Zealand, and London. It is the seat of a United States consul and the see of Anglican and Catholic bishops. With Mount Wellington as a picturesque background, regularly laid out and well-lighted streets, a good spring-water supply, street railroads, fine parks and drives, Hobart is a favorite summer resort for Australians. The mean temperature for the year is 52.3°, being 42.1° in winter, and 63.1° in summer. Population, 1891, 30,608; 1901, 31,317. It was founded in 1804.

HOBART, GARRET AUGUSTUS (1844-99). An American lawyer and politician, Vice-President of the United States. He was born at Long Branch, N. J.; graduated at Rutgers College in 1863; was admitted to the bar three years later, and practiced his profession with success at Paterson, N. J., where he made his home until death. He was city counsel there in 1871; was a member of the State Assembly from 1873 to 1878, and of the State Senate from 1879 to 1885, presiding over both of those bodies. He was five times successively delegate-at-large from New Jersey to the Republican National Convention; was nominated at Saint Louis in 1896 for Vice-President on the ticket with William McKinley, and was elected to that office. To a greater extent, perhaps, than any of his predecessors in the Vice-Presidency, he made that office one of real influence and power. He was the intimate friend and counselor of President McKinley, and exercised a strong influence on the conduct of public affairs. He was interested in many banking and other business corporations, and accumulated a large fortune. He died before the expiration of his term of office, on November 2, 1899.

HOBART, JOHN HENRY (1775-1830). A Protestant Episcopal bishop of New York. He was born in Philadelphia, Pa., and was the descendant in the fifth generation of a Puritan family of New England, originally established by Joshua Hobart at Hingham, Mass. He was left fatherless in his first year and was carefully trained by his mother. He graduated at Princeton in 1793, and was tutor from 1795 to 1798, when he took orders in the Episcopal ministry. His first charges were in Philadelphia, New Brunswick, N. J., and Hempstead, L. I. In 1800 he was appointed curate of Trinity Church, New York; in 1801 was ordained priest, and after showing marked ability in parish work, in various official capacities, and as the author of several ecclesiastical manuals, was elected Assistant Bishop of New York in 1811, and assistant rector of Trinity Parish in the following year. In 1816 he became rector of Trinity and Bishop of the diocese. In 1821 he was appointed professor of pastoral theology and oratory in the New York General Theological Seminary of the Protestant Episcopal Church, of which institution he was one of the founders. Ill health caused a suspension of his labors, and he spent the years 1824-25 in Europe, studying social, moral, and religious conditions. His return in 1826 was marked by renewed literary and pastoral activity, and on his annual visitation he traveled 3000 miles, heedless of the scanty transportation facilities, in his anxious watchfulness over the growing institutions of his ever-increasing diocese. The labors of his visitations, however, at length proved too much for his declining health, and a sudden failure of his powers was followed by his death at Auburn, N. Y., September 12, 1830. His writings, which went through many editions, include: *Companion for the Altar* (1804); *Festivals and Fasts* (1804); *Clergyman's Companion* (1805); *Controversial Essays* (1806); *Apology for Apostolic Order* (1807); *The Christian's Manual* (1814); *The State of the Departed* (1814); and *A Comparison of the United States With England* (1826). He also edited D'Oyley and Mant's "Family Bible" (2

HOBBEWA

"THE AVENUE OF MIDDLEHARNIS," FROM THE PAINTING IN THE NATIONAL GALLERY, LONDON

vols., 1818-20). Consult: Berrian, "Memoir," attached to the *Posthumous Works of Bishop Hobart* (New York, 1833); McVickar, *The Early Professional and Closing Years of Bishop Hobart* (New York, 1836).

HOBERT, JOHN HENRY (1817-89). An American Episcopal clergyman and author, the youngest son of John Henry Hobart (q.v.). He was born in New York City, graduated at Columbia College, and was ordained in 1841. After having a charge at Baltimore, he was assistant in Trinity Church, in New York City, for fifteen years, and afterwards became rector of Trinity Church, Fishkill, N. Y. He published: *Instruction and Encouragement for Lent* (1859); *Mediævalism* (1877); and *Church Reform in Mexico* (1877).

HOBERT COLLEGE. A college, situated at Geneva, N. Y., under Episcopal auspices. It was projected in 1812, and named after Bishop Hobart, through whose efforts it was organized. A provisional charter was secured in 1821, and a full charter in 1825, under the title of Geneva College. In 1852 the name was changed to Hobart Free College, and in 1860 to Hobart College. The college offers academic courses leading to the degrees of Bachelor of Arts, of Philosophy, and of Letters. It had, in 1902, 19 instructors, 100 students, a library of about 40,000 volumes, property valued at \$676,895, including grounds and buildings worth \$167,480, and an annual income of \$31,670.

HOBERT PASHA, pä'shä' (AUGUSTUS CHARLES HOBERT-HAMPDEN) (1822-86). An English admiral in the Turkish service. He entered the British Navy in 1835; distinguished himself in the Crimean War, and when he retired in 1863 was captain. During the American Civil War he was a blockade-runner, and had many narrow escapes. In 1867 Hobart entered the Turkish service as naval adviser to the Sultan. His first service was in suppressing the Cretan rebellion, for which he was promoted an admiral with the title of pasha. He reorganized the Turkish fleet, which he commanded on the Black Sea against Russia, in the War of 1877-78, and in 1881 was appointed marshal of the Empire. Although his name was twice struck from the British navy list for operating against powers friendly to Great Britain, in disregard of the Foreign Enlistment Act, he was finally restored in 1885 with the rank of vice-admiral. His book, *Sketches of My Life* (1887), published posthumously, is a mixture of fact and fiction.

HOBBEMA, hōb'bā-mā, MEINDERT (1638-1709). A Dutch landscape painter. His birthplace is unknown, although seven towns, Amsterdam among them, claim the honor. The date of birth, 1638, is verified by the statement in the record of his marriage at Amsterdam, October 2, 1668, that he was thirty years old at that time. Hobbema passed most of his life at Amsterdam, where he seems to have been a pupil of Ruysdael (q.v.). As such well-known contemporaries as Berchen, Vanderveelde, and Lingelbach are said to have painted the figures in his landscapes, it seems likely that he was appreciated by the artists of his day. The general public, however, ignored his work, and he died at Amsterdam in poverty, December 14, 1709.

Hobbema and Ruysdael are the greatest landscape painters of the Dutch school; their art

marks its consummation. Ruysdael is usually considered the greater of the two because his subjects are grander; he painted rocky gorges, torrents rushing through ravines, stormy autumn scenes, while Hobbema preferred the gentler aspects of nature, such as quiet woodland scenes, pools of water with subtle sunlight effects, romantic water-mills and streams. In subtlety of technique he was the equal, probably the superior, of Ruysdael. His pictures are rich in warm and golden tones, and his color has a transparent quality, with brilliant effects reflected in sky and water. His technique is bold in touch, but careful in finish of details. No one has better portrayed the magical effects of sunlight. He is more absolutely true to nature than Ruysdael; his trees are more individual, with greater variety of foliage and color. It was not until the eighteenth century that his merit was appreciated. The English were the first to acknowledge it, and therefore far the greater number of his best works are now in the private collections of England. Hobbema also exercised great influence upon the English landscape painters of the latter eighteenth century, especially upon Old Crome. At present his works are much sought after, and their high value has caused forgeries of signatures and dates upon his paintings. It is therefore impossible to date them with accuracy.

Of all public collections the National Gallery is richest in works of Hobbema, possessing five of his landscapes. The best known of these is the "Avenue Near Middelharnis, Holland," one of the towns claiming to be his birthplace. The effect of its aerial perspective is very remarkable, as is also the glowing light from the sky. Another fine picture in the National Gallery is the "Ruins of Breberode Castle," faithfully rendered, just as it now stands on the road to Haarlem. The Glasgow Gallery is rich in his pictures, and Amsterdam has several, including the famous "Water-Mill." There are also good examples in the Louvre, and in the galleries at Brussels, Berlin, Dresden, Frankfurt, and Vienna. The Metropolitan Museum, New York, possesses a "Landscape View in Holland." Consult Michel, *Hobbema et les paysagistes de son temps en Hollande* (Paris, 1890).

HOBBES, hōbz, JOHN OLIVER (PEARL RICHARDS CRAIGIE) (1867—). An English novelist, born in Boston, Mass. Her father removed to England while she was very young, and she was educated there by private tutors and later in Paris and at University College, London. She was married in 1887 to Reginald W. Craigie, but the marriage proved an unhappy one, and she secured a divorce in 1895. Among her publications are the novels: *Some Emotions and a Moral* (1891); *The Sinner's Comedy* (1892); *A Study in Temptations* (1893); *The Gods, Some Mortals, and Lord Wickenham* (1895); *A Bundle of Life* (1894); *Robert Orange* (1900); *The Serious Wooing* (1901); and *Love and the Soul Hunters* (1902); and the plays, *Journeys End in Lovers' Meeting*, for Miss Ellen Terry (1894); *The Ambassador* (1898); and *A Repentance* (1899). Her style is cynical, brilliant, and epigrammatic, especially in dialogue.

HOBBES, THOMAS (1588-1679). An English philosopher and political theorist. He was born at Malmesbury, on April 5, 1588, the son of a

clergyman. At the age of fifteen he went to Oxford and studied the usual course of Aristotelian logic and physics. At the age of twenty, having taken his degree and quitted Oxford, he was recommended to Lord Cavendish, afterwards Earl of Devonshire, as tutor to his eldest son. Thus began an intimate connection with that great family which lasted through his long life.

In 1610 he went abroad with his pupil, and made the tour of France and Italy. After his return he still continued to live with the Earl of Devonshire's family, and his residence in London afforded him opportunities of becoming acquainted with Bacon, Ben Jonson, and the other distinguished men of the time. Meantime he was occupied with classical, political, and philosophical studies, and prepared for publication his first work, a translation of Thucydides, which came out in 1628. His interest in Thucydides was largely political. For many years he still derived his income from tutorial work, but gave his leisure to study. The political disturbances of the time made him desirous of political stability and order, which he believed could but be obtained by unquestioning recognition of the absolute power of the sovereign. This power, according to Hobbes, is neither original nor divine, but was delegated by the subjects in a compact which created the State and gave rise to all moral and political obligation. Primitive man did not live in any social or political organization. Every one was at first bent on securing his own selfish ends, but came to see that the warfare which inevitably resulted from the clash of unregulated interests was suicidal. A contract was made whereby this war of each against all—*bellum omnium contra omnes*—was brought to a close, a civil government established, and loyalty pledged to the sovereign power thus constituted. Whatever laws this power lays down are the measure of right and wrong. These views were published in various works: *De Cive* (1642); *Humane Nature* (1650); *De Corpore Politico* (1650); *Leviathan, or the Matter, Form, and Power of a Commonwealth* (1651).

After the meeting of the Long Parliament in 1640 Hobbes had returned to Paris, from his dread of the civil troubles. In 1647 he was appointed mathematical tutor to the Prince of Wales, afterwards Charles II.; but the character of his writings, especially after the publication of the *Leviathan*, so offended the Royalist clergy, in common with all other sects, that Charles was induced to part with him, and he took alarm for his personal safety and abruptly fled in 1651 to Paris; but after a short stay there, knowing that he had caused much irritation in France by his bitter attacks on the Papacy, he returned to England, where he was allowed to live quietly. Very different was his position after the Restoration; for although Charles granted him a pension of £100 a year, the dislike to his views was so general that they were condemned by the House of Commons in 1666, and he was in danger of still severer measures. His connection with the Earl of Devonshire, with whom he lived in the latter part of his life, was no doubt a powerful protection to him. His old age was fruitful in additions to his writings, and was marked by some sharp controversies. His last works were a translation of Homer and a history of the civil wars. He died on December 4, 1679.

All his Latin works were collected and pub-

lished by himself (Amsterdam, 1668), and by Molesworth (5 vols., London, 1839-45). His English works were, edited by Molesworth (11 volumes, including index, London, 1839-45). F. Tönnies edited and published *Behemoth, or the Long Parliament* (London, 1889).

In philosophy and psychology Hobbes was a sensationalist, and, at least at times, a materialist. All change for him is motion, hence sensuous perception is motion, and pleasure is also motion. Just why motion should appear in the form of consciousness is an inexplicable mystery. Sense-impressions, in their combinations and transformations, give rise to memory and thought. This takes place according to definite laws. The order of succession of memory-idea is that of the original sense-impressions, while the impressions originally in combination tend to reappear in the same combination; this fact he called the law of contiguity. Indeed, Hobbes is commonly regarded as the 'father of associational psychology.' Hobbes's ethics was hedonistic. It is man's desire for pleasure that made him in the first instance establish civil authority, but it is the supremacy of that authority which makes it binding now. Consult: Tönnies, "Anmerkungen über die Philosophie des Hobbes," four articles in *Vierteljahrsschrift für wissenschaftliche Philosophie* (Leipzig, 1879-81); Robertson, *Hobbes* (Edinburgh, 1886); Wille, *Der Phänomenalismus des Thomas Hobbes* (Kiel, 1888); Lewis, *Ueber den Individualismus bei Hobbes* (Halle, 1892); Sneath, *The Ethics of Hobbes* (Boston, 1898); Stephen, *Hobbes* (London, 1903); Graham, *English Political Philosophy from Hobbes to Maine* (New York, 1900).

HOBBY (OF. *hobe*, from *hober*, to move, from ODutch *hobben*, to toss, *hoppen*, to hop, AS. *hoppian*, Ger. *hoppen*, to hop). A small European falcon (*Falco subbuteo*), formerly trained in falconry to fly at pigeons and partridges. The nearest North American species is the pigeon-hawk.

HOBHOUSE, JOHN CAM. See BROUGHTON, Baron.

HOBKIRK'S HILL, BATTLE OF. A battle fought at Hobkirk's Hill, about two miles north of Camden, S. C., on April 25, 1781, during the American Revolution, between an American force of about 1400, under General Greene, and an English and Tory force of about 950, under Lord Rawdon. The latter, leaving his strong position at Camden, attacked the Americans with great gallantry, and after some stubborn fighting gradually forced them from the field, Greene's plan of battle being deranged by the unexpected retreat of a brigade upon which he had placed implicit reliance. The victory gave no strategic advantage to Rawdon, who on May 10th evacuated Camden and retreated toward Charleston. The loss of the Americans in killed, wounded, and missing was 271; that of the English and Tories, 258. This engagement is also known as the second battle of Camden. Consult: Carrington, *Battles of the American Revolution* (New York, 1877), and Dawson, *Battles of the United States* (New York, 1858).

HO'BOKEN. A city in Hudson County, N. J., on the Hudson River, opposite New York, of which it is a suburb, and adjoining Jersey City. It is the terminus of the Hamburg-American, North German Lloyd, Netherlands-American, and

Thingvalla steamship lines, and of the Delaware, Lackawanna and Western Railroad (Map: New Jersey, D 2.) The city lies at the base of the Palisades, the principal streets running north and south, parallel to the river. In the eastern section rises a hill. The site of Stevens Institute of Technology (q.v.) is fronted by Hudson Park. In the latter is a soldiers' monument; and in Church Square Park are situated the public library and a firemen's monument. Saint Mary's Hospital is a noteworthy structure. Hoboken is a great shipping place for coal. The most important manufactures comprise foundry and machine-shop products, lead pencils, leather goods, silk, wall-paper, and caskets. The government is administered by a mayor, elected every two years, who appoints assessors, and school, health, fire, and library commissioners, and, with the consent of the council, police commissioners, of which board he is the president. The council is unicameral and elects the city clerk and assistants, and inspectors. All other administrative officials are chosen by popular vote. The municipal income and expenditures annually amount to about \$1,910,000 and \$1,810,000, respectively, the main items of expense being \$75,000 for the fire department, \$115,000 for the police department, \$150,000 for operation of the water-works, and \$175,000 for schools. Population, in 1870, 20,297; in 1890, 43,648; in 1900, 59,364, including 21,400 persons of foreign birth and 100 of negro descent.

The land on which Hoboken stands was part of the patroonship granted to Michael Pauw in 1630, and was then called Hobocan Hacking, 'the land of the tobacco-pipe,' in allusion to the fact that Indians carved pipes from a kind of stone found here. A house was built about 1640 by Arendt Teunisson Van Putten, and a straggling settlement grew up; but the present city really dates from 1804, when John Stevens, 'the founder of Hoboken,' bought the land and laid out a town. During the first quarter of the nineteenth century the Elysian Fields in Hoboken were the favorite pleasure resort for New Yorkers, and became noted as the meeting-place of Federalist politicians. Hoboken was incorporated as a town in 1849, its population then being about 2000, and in 1855, with a population of about 6700, it was chartered as a city. In 1900 a fire at the wharves of the North German Lloyd Steamship Company caused the loss of about 200 lives, and destroyed property, including three steamers, valued at \$5,000,000. Consult Winfield, *History of the County of Hudson* (New York, 1874).

HOBSON, JOHN ATKINSON (1858—). An English educator and author, born at Derby. He was educated at Lincoln College, Oxford; from 1880 to 1887 was classical master in schools at Faversham (Kent) and Exeter, and from 1887 to 1897 was lecturer in English literature and economics for the University Extension Delegacy and the London Society for the Extension of University Teaching. From the time of the appearance of his *Problems of Poverty* (1891, No. 2 in the "Social Questions of To-day" series) he became known as one of the more prominent British economists of the recent school, and a very effective writer. His other publications include: *The Physiology of Industry: Being an Exposure of Certain Fallacies in Existing*

Theories of Economics (1889; with A. F. Mumery); *The Evolution of Modern Capitalism* (1894); *Coöperative Labour upon the Land, and Other Papers* (1895); *The Problem of the Unemployed: an Enquiry and an Economic Policy* (1896); *John Ruskin, Social Reformer* (1898), a very careful and interesting analytical treatise in vindication of Ruskin's humanization of political economy, and containing also valuable accounts of the industrial experiments furthered and directed by Ruskin; *The War in South Africa: Its Causes and Effects* (1900); *The Economics of Distribution* (1900), an important attempt to reconcile and systematize the various theories of price and value; *Capitalism and Imperialism in South Africa* (1900; a monograph reprinted from the *Contemporary Review*); *The Psychology of Jingoism* (1901); and *The Social Problem; Life and Work* (1901), in which he develops socialistic theories to the extent of maintaining the necessity of the acquisition of monopolies by municipalities, commonwealths, or nations. He also contributed extensively to technical and popular reviews.

HOBSON, RICHMOND PEARSON (1870—). An American naval constructor, born in Greensboro, Ala. He entered the Southern University in 1882, but three years afterwards accepted an appointment to the United States Naval Academy, where he graduated in 1889, and then took a post-graduate course at the Ecole Nationale Supérieure des Mines and the Ecole d'Application du Génie Maritime, in Paris. He served on various naval stations and at the New York and the Newport News navy-yards, and in 1897 he was ordered to Annapolis to organize a post-graduate course for those officers who intended to enter the construction corps. During the war with Spain he was present at the bombardment of Matanzas, and took part in the expedition against San Juan de Puerto Rico; but his great achievement was the sinking of the collier *Merrimac* across the entrance to Santiago Harbor before daylight, on June 3, 1898, in order to 'bottle up' Cervera's fleet. He did not succeed in accomplishing the desired result, but the daring of the exploit made popular heroes of all concerned in it. After the war he raised and refitted several of the Spanish war-ships which had been sunk in Cuban and Philippine waters. He resigned from the Navy in 1903. Among his publications are *The Disappearing Gun Afloat*, and *The Sinking of the Merrimac*.

HOBSON'S CHOICE. A term used to signify that a person must take what is offered or go without, i.e. 'This or none.' The phrase arose at Cambridge, in Milton's time, where one Tobias Hobson kept stables and used to let out horses to the students. Every customer was courteously given his choice of horses, but he invariably found that he was obliged to take the horse which happened to be nearest the door or go without.

HOC/CLEVE, or OCCLEVE, THOMAS (1370?-1450?). An English poet. Concerning his life very little is known. For twenty-four years he was clerk in the Privy Seal Office, London. His principal work, *De Regimine Principum* (Concerning the Duties of Kings), mainly a digest of a Latin treatise under the same title by Ægidius Colonna, consists of 5488 lines in Chaucer's seven-line stanza. In the prologue, which comprises about a third of the work, Hoccleve men-

tions some incidents of his life. He says he was poor and his pension not paid; and laments the death of Chaucer, who is called the "fleur of eloquence." The rest of the long poem is devoted mainly to moral reflections on the manners of the time. On the margin of one of the MSS. Hoccleve drew in colors the well-known portrait of Chaucer, his 'maister dere.' Hoccleve also wrote several other poems, among which is the beautiful orison to the Virgin, beginning "Mother of God and Virgin undefouled." This last poem may be only a copy from Chaucer. Consult *Works*, ed. F. J. Furnivall for the Early English Text Society (London, 1892-97).

HOC'CO (native name in Guiana). A native name applied by Buffon to curassows in general, but apparently applicable and now restricted especially to the Mexican species (*Crax alector*), also called 'royal pheasant' by the Mexicans. Consult Sumichrast, "Native Birds . . . of Vera Cruz," in *Memoirs of the Boston Society of Natural History*, vol. i., pt. iv. (Boston, 1869). See CURASSOW.

HOCHBERG, hōč'bĕrk, BOLKO, Count von (1843—). A German patron of music and dramatic composer, whose earlier music appeared under the pseudonym 'J. H. Franz.' He was born at Castle Fürstenstein, in Silesia; studied law at Bonn and Berlin, and soon gave up the diplomatic service to devote himself to music. Hochberg founded in 1870 the Silesian musical festivals, to the success of which he greatly contributed. In 1886 he was appointed general superintendent of the Court theatre of Berlin, and in 1897 he was made an hereditary member of the Prussian House of Lords. Besides symphonies, songs, and string quartets, he composed *Claudine von Villabella* (1864) and *Der Wärwolf* (1876).

HOCHÉ, ôsh, LAZARE (1768-97). A general of the French Revolution. He was born June 25, 1768, at Montreuil, near Versailles. In 1784 he entered the Army, but joined the National Guard at Paris in 1792 as a sergeant of grenadiers. Owing to his military experience and soldierly qualities, he rapidly obtained promotion. In 1793, after distinguishing himself under Leveneur, he was made Adjutant-General of the Army of the North. Some hasty words, caused by the arrest of his chief, Leveneur, brought about Hoche's arrest, but he was acquitted by the revolutionary tribunal at Douai and restored to his command, and aided Souham in the defense of Dunkirk. Having succeeded in repulsing the Duke of York, Hoche was made a general of division and given the command of the French forces on the Moselle, and in spite of the numerical superiority of the enemy succeeded in driving the Austrians out of Alsace, after defeating them at Weissenburg (December 26, 1793). His important services were required, however, by suspicion and arrest, and had it not been for the downfall of Robespierre Hoche would probably have perished on the guillotine. On being set at liberty he received the command of the army operating in the west, and completely defeated the émigré army of invasion near Quiberon Bay in July, 1795. He was next intrusted with the task of suppressing the royalist revolt in La Vendée, and at the head of an army of 100,000 men succeeded in pacifying the country in less than a year. In December, 1796, he commanded the army destined for the invasion of Ireland, but adverse condi-

tions of wind and weather scattered his ships and made the expedition a failure, though a part of the fleet succeeded in reaching the Irish coast. Hoche was then made commander of the Army of the Sambre and Meuse, and in the spring of 1797 won several victories over the Austrians. The preliminaries of Leoben put an end to his activity, and on September 19, 1797, he died very suddenly at his camp at Wetzlar, though not by poison, as some have supposed. There are numerous biographies of Hoche, the best being: Desprez, *Lazare Hoche, d'après sa correspondance* (Paris, 1858); Dutemple, *Vie politique et militaire du général Hoche* (Paris, 1879); Font-Réaulx, *Le général Hoche* (Paris, 1890); Griffiths, *French Revolutionary Generals* (London, 1891).

HOCHKIRCH, hōč'kĕrk, or **HOCHKIRCHEN**. A village in the District of Bautzen, in Saxony. It was the scene of a battle between the Austrians and Prussians (October 14, 1758) during the Seven Years' War. Frederick the Great of Prussia, with an army 30,000 to 40,000 strong, having taken up an almost untenable position at Hochkirch, was surprised in the night-time, under cover of a thick fog, by Marshal Daun, with 65,000 Austrians, and compelled to retire to the heights of Drehsa. Here he was again attacked by the Duke of Aremberg, and after a conflict of five hours' duration, again retired. He lost 9000 men killed and wounded, and 100 guns. He himself and almost all his generals were wounded. The Austrians lost 6000 men. On May 21, 1813, a battle took place here between the French and the Allies. See BAUTZEN.

HÖCHST, hĕst. A town in the Prussian Province of Hesse-Nassau, at the confluence of the Nidda and the Main, 7½ miles northwest of Frankfurt (Map: Germany, C 3). Höchst has one of the largest paint-factories in Germany, employing about 2500 men. There are also large porcelain-works, established in 1740, and manufactures of tobacco, gas, and water-mains, machinery, oilcloth, gelatin, and furniture. Höchst was made a city in 1400. Population, in 1890, 8455; in 1900, 14,121.

HÖCHSTÄDT, hōč'stĕt. See BLENHEIM.

HOCHSTETTER, hōč'stĕt-tĕr, FERDINAND VON (1829-84). An Austrian geologist, born at Esslingen, Württemberg. He was a member of the *Novara* expedition in 1857, and made a special study of the geology of New Zealand and the gold-fields of Australia, the results of which were published in the account of the expedition and in a small work on New Zealand. After his return to Europe he was appointed a professor at the Vienna Imperial Polytechnic Institute, and afterwards director of the Imperial Museum of Natural History. He wrote an authoritative work on the geology of Turkey and the Ural region, and published, together with Hann and Pakorny, the *Allgemeine Erdkunde*.

HOCK'DAY (from AS. *hĕah*, high + *dæg*, day). The second Tuesday after Easter; formerly a popular festival in England observed as late as the sixteenth century. Hockday and Michaelmas (q.v.) were the rent-days in rural England. Hocktide or Hockdays included Hock-Tuesday and the day before. The origin of the festival is uncertain.

HOCK, HOUGH (AS. *hōh*, OHG. *hahsa*, Ger. *Hechse*, hock; ultimately connected with Lat. *coxa*, thigh, Skt. *kakṣa*, armpit). The joint between the knee and the fetlock in a horse's hind leg. *Hock-joint*, the hinge formed by tibia and astragalus.

HÖCKERT, hēk'ērt, JOHANN FREDRIK (1826-66). A Swedish genre and historical painter, born at Jönköping. He studied art at Stockholm, went with Boklund to Munich (1846-49), from 1851 to 1857 studied in Paris, and traveled extensively in the Netherlands, Spain, Italy, and Northern Africa. His importance in Swedish art lies especially in his coloring. He was styled the 'Swedish Delacroix,' and in this point must be held one of the greatest artists of his country during the century. Höckert's best pictures are scenes of life in Lapland, where he had traveled in 1849 with the botanist Andersson. Besides, he painted a few portraits and many historical pictures such as "Christina Ordering the Execution of Monaldeschi" (1853); "The Rescue of Gustavus Vasa" (1858); and the uncompleted canvas "Burning of a Palace in Stockholm, 1697." Better known are: "Service in a Lapland Chapel," which received a gold medal at the Exposition of 1855, and is now at Lille; "Interior of a Hut in Lapland" (1858), at the Stockholm Museum; and the "Rättoiks Maiden," a Swedish genre canvas, now at Göteborg.

HOCK'ET (OF. *hoquet*, *hocquet*, *houquet*, hicough; so called from the broken effect). One of the very oldest forms of composition, much in vogue during the twelfth and thirteenth centuries. After the fourteenth century the hocket seems to have disappeared entirely. It was a composition for two or three voices where one voice suddenly, and at irregular intervals, interrupted the other voices. It really was more contrapuntal trickery than a serious art-form. The English *catch* (q.v.) is very much like the hocket.

HOCKEY (also *hawkey*, *hookey*, apparently from *hook*, in allusion to the hooked club with which the game is played). A game played by opposing teams of eleven each, now divided into five forwards, three half-backs, two backs, and a goal-keeper, on a ground one hundred yards long by fifty or sixty wide. The playing space is indicated by white side lines and end or goal lines. The goals, one at each end, consist of two upright posts twelve feet apart and a horizontal bar seven feet from the ground. In front of each goal is a semicircular white line fifteen yards from it, curving back to a point twelve feet from each goal-post. No goal counts unless the ball was last hit, by one of the attacking side, inside this semicircle. The shape of the hockey-stick is not regulated, except that it must have no sharp edges or metal on it, and it must be able to be passed through a ring two inches in diameter. It is usually curved at the bottom end, and weighs in the neighborhood of 25 ounces. The ball is an ordinary cricket-ball painted white. The play is started from the centre of the ground by a bully, i.e. one player of each side takes position on opposite sides of the ball. Each strikes the ground on his side of the ball, and then each strikes his opponent's stick three times, alternately, over the ball. Either of the two can then strike the ball. When it is driven over the end lines by the attacking party, it is brought back to within 25 yards of the goal-line and

started by another bully. When a defending party hits it over the goal-lines the penalty is a free hit by the attacking party from the corner flag. There are various penalty bullies. A goal is scored when the ball has been driven in a lawful manner, i.e. by a stroke in which the stick does not rise above the shoulder, and from within the prescribed 'striking circle' between the goal-posts and under the cross-bar. The ball may be caught and immediately dropped, or stopped with any part of the body; but must not be carried, or kicked, or knocked, except with the stick. When a ball passes the side lines it is rolled along the ground from the spot where it crossed by one of the opposite side to that of the player who last touched it. The game is usually played for seventy minutes in two halves, the players changing ends at the interval.

The game remained in an unorganized condition in England, its original home, until 1883, when the first modern rules were reduced to definite shape by the Wimbledon Club. In 1886 the Hockey Association was organized, followed in rapid succession by many county associations. Ireland and Wales also have national associations, and since 1894 international matches have been played yearly. In the United States, except as played on the ice, the game still remains imperfectly organized.

ICE HOCKEY. The old winter game of hockey, or shinney, is the basis of the modern game of ice hockey, but the modern game is more scientific than its English and Scotch predecessors. The old game was played on more or less frozen ground, and the players cared more about action than rules, and, in the beginning, no restrictions existed as to the number on each side, the shape or proportion of the sticks, the size or material of the ball, the size of the playing space, or even the manner of making a goal. Order was brought out of chaos by the McGill University team and the Victorias of Montreal, and by other clubs co-operating with them, between 1881 and 1884. In 1887 the Hockey Association of Canada was formed, and the game fairly entered on a new career. Since then various local associations have been formed, among which the most prominent are the Manitoba and Northwest Amateur Hockey Association and the Ontario Hockey Association. The emblem of supremacy among the various leagues is 'the Stanley Cup,' presented by Lord Stanley, a former Governor-General of Canada. The game was introduced in the United States by a Canadian studying in Baltimore: thence it spread to Yale, Cornell, and other colleges, in a zone limited by natural conditions or by the presence of rinks of artificial ice. Around New York the important teams have combined to form 'the Amateur Hockey League,' whose series of matches may be considered the special feature of the season's play. The Western Pennsylvania League centres around Pittsburg; and the game flourishes also in Chicago, Baltimore, Philadelphia, Washington, and other large cities.

Though among the first to play the game, the colleges have not until recently taken up the sport as an intercollegiate one. Now, however, it occupies an important position in the winter games of the larger Eastern colleges. Wherever there is a possibility of sufficient practice, college teams rival in excellence the best of the clubs. In England and Scotland ice hockey found

a ready field, but it is sadly limited there by the absence of adequate rinks. The rules of the game vary slightly with the various local associations, and the rules of each must be consulted in actual play. Consult Heathcote and Trebutt, *Skating, Curling, and Ice Sports* (London, 1892).

HOCKING. A river in Ohio, rising near Lancaster, Fairfield County (Map: Ohio, F 7). It flows southeast through a picturesque region, and empties into the Ohio River below Parkersburg, West Virginia, after a course of 80 miles. Boat navigation is possible for about 70 miles, and can be continued through the Hocking Canal, which passes along its shore.

HOCKING, SILAS KITTO (1850—). An English novelist, born at Saint Stephen's, Cornwall. He entered the Wesleyan ministry and held several pastorates, but resigned in 1896. His novels, beginning with *Alec Green* (1878), which have a strong flavor of Methodism, have been very popular. The hero of *God's Outcast* (1898) is a Methodist minister who married the wrong woman. *Israel Pendray* (1899) is an account of Wesley's preaching in Cornwall. *Mistress Nancy Molesworth* (1899) is a story of adventure in Cornwall in 1745. Among his other novels are *The Awakening of Anthony Weir* (1901) and *Gripped* (1902).

HODEIDA, hō-dē'i-dā. An important seaport of Yemen, Arabia, situated on the coast of the Red Sea, about 100 miles north of Mocha (Map: Turkey in Asia, Q 13). Its roadstead is somewhat obstructed by coral reefs, but its commerce is nevertheless very important, it being the chief centre of the Arabian coffee trade. Hodeida is the chief landing-place for Mecca pilgrims from Africa. Population, estimated at 25,000.

HODELL, hō'dél, FRANS OSCAR LEONARD (1840-90). A Swedish dramatist and poet, born at Stockholm. He was in early life an actor, then editor (1870) and proprietor of the *Söndagsnisse*, a humorous journal. He was the author of a number of plays, such as the popular *Andersson, Petersson, och Lundström* (1866), and wrote also some verses and ballads, under the title, *Visor och kupletter* (1873).

HODGE. (1) In *Gammer Gurton's Needle*, the husband of Gammer Gurton, whose breeches she was mending when the needle was lost. (2) The conventional class name for the English farmer or countryman.

HODGE, ARCHIBALD ALEXANDER (1823-86). An American Presbyterian theologian and author, the son of Charles Hodge (q.v.). He was born at Princeton, N. J.; graduated at Princeton in 1841, and was an assistant professor there from 1844 to 1846. In 1847 he graduated at the Princeton Theological Seminary, and for three years was missionary at Allahabad, India, under the auspices of the American Presbyterian Missionary Society. After 1851 he held pastorates in Maryland, Virginia, and Pennsylvania, and in 1864 was called to a church in Allegheny, Pa., where, until 1877, he was also professor of didactic theology in the Western Theological Seminary. In 1878 he succeeded to the chair of didactic, exegetical, and polemic theology at Princeton, made vacant by the death of his father, to whom he had been appointed assistant professor the year before. He was a trustee of Princeton College, and edited for a period the *Presbyterian Review*. His

published works include: *Outlines of Theology* (1860; new ed. 1879); *The Atonement* (1868; new ed. 1886); *Life of Charles Hodge, Professor in the Theological Seminary, Princeton* (1880); *Manual of Forms, Conformed to the Doctrine and Discipline of the Presbyterian Church* (1883); and *Popular Lectures on Theological Themes* (1887).

HODGE, CHARLES (1797-1878). An American Presbyterian theologian and historian, of Scotch-Irish descent. He was born in Philadelphia; graduated at Princeton in 1815, and at the theological seminary there in 1819, became assistant professor in his alma mater the following year, and with the exception of an interval of two years (1826-27) in Europe, studying at the universities of Paris, Halle, and Berlin, was connected with its faculty until his death. From 1822 he was professor of Oriental and biblical literature, and from 1840 professor of didactic and exegetical theology, polemic theology being added in 1852. In 1872 the semi-centennial anniversary of his professional life was commemorated at Princeton by the foundation of the 'Charles Hodge professorship,' with an endowment of \$50,000. He was also the recipient of a gift of \$15,000. In 1846 he was moderator of the Presbyterian General Assembly, and in 1858 was one of the revisers of the *Book of Discipline*. He was editor of the *Biblical Repertory*, which he founded in 1825, expanding the title four years later to *The Biblical Repertory and Princeton Review*. It was the organ of the old school of Presbyterian theology until 1871, when the journal became the *Presbyterian Quarterly and Princeton Review* of the new Presbyterian School, and Professor Hodge retired from the editorship. His chief work, *Systematic Theology* (3 vols., 1871-72), is still considered one of the best interpretations of the Calvinistic doctrine. Other important works are: *A Constitutional History of the Presbyterian Church in the United States* (2 vols., 1840-41); *The Way of Life* (1842); and *What is Darwinism?* (1874). He also published several commentaries. Consult: *The Semi-Centennial Commemoration of the Professorship of Charles Hodge, D.D., LL.D., September 24, 1872* (Philadelphia, 1872); and Hodge, *Life of Charles Hodge, Professor in the Theological Seminary, Princeton* (New York, 1880).

HODGE, FREDERICK WEBB (1864—). An American ethnologist, long connected with the Smithsonian Institution. He was born at Plymouth, England, but came to America in 1871, and was educated in the public schools and in Columbian University. In 1886 he was made secretary of the Hemenway Archæological Expedition, and in this position he traveled through Arizona and New Mexico until 1889, when he joined the Bureau of Ethnology of the Smithsonian Institution. His work here was the preparation of a *Cyclopedia of Indian Tribes*. In 1895, 1897, and 1899 he explored New Mexico and Arizona again, and on the second trip he scaled the Enchanted Mesa. In 1901 he became executive officer of the Smithsonian Institution. His more important works are: *List of Publications of the Bureau of Ethnology*, written while he was librarian of that department (1894); *The First Discovered City of Cibola* (1895); a pamphlet on *Coronado's Route from Culiacan to Quivira* (1899); and his contributions to the *American Anthropologist*, of which he was managing editor.

HODGE, HUGH LENOX (1796-1873). An American physician, born in Philadelphia, the brother of Charles Hodge. He graduated at Princeton in 1814, studied medicine, and began to practice in 1820. During the cholera epidemic of 1838 he successfully employed a system of treatment largely based on observations made during a two years' residence in India. In 1835 he was appointed professor in the University of Pennsylvania, and retained his connection there until 1863.

HODGES, JOHN SEBASTIAN BACH. An American clergyman of the Protestant Episcopal Church, born in Bristol, England (son of Dr. Edward H. Hodges, organist of Trinity Church, New York City). He came to this country in 1845, and was educated in Columbia College and at the General Theological Seminary of New York. After short periods of ministerial service in Newark, N. J., and in the West, he became rector of Saint Paul's Church, Baltimore, in 1870. His musical compositions, which include chants, anthems, and hymn tunes, are widely known. His chief work is the *Book of Common Praise* (1886), compiled as a companion to the *Book of Common Prayer*.

HODGINS, hōj'inz, JOHN GEORGE (1821—). A Canadian educator. He was born in Dublin, but was brought to Canada as a child and was educated there. He graduated at Victoria College, Coburg, and studied law afterwards at Toronto University. In 1844 he became connected with public education, and in 1876 was made Deputy Minister for Ontario. His publications include a number of school books.

HODGKIN, hōj'kīn, THOMAS (1831—). An English banker and historian. He was born at Tottenham, studied at the Friends' Grove House School there and at University College, London. He studied law, but poor health forbade him to practice, so he busied himself at banking and built up a large firm, Hodgkin, Barnett & Co., with offices throughout England. In 1874 he gave himself up to literary work. His more important writings are: the extremely valuable *Italy and Her Invaders* (1880-99); *Letters of Cassiodorus* (1886); *The Dynasty of Theodosius* (1889); *Life of Theodoric* (1891); *Life of George Fox* (1896); and *Life of Charles the Great* (1897).

HODGKINSON, hōj'kīn-son, EATON (1789-1861). An English civil engineer, born at Anderton, Cheshire. After a rather desultory schooling in which he displayed an aptitude for mathematics, he undertook a course of scientific investigation that soon won him distinction. His first important work was on strains and the strength of materials, on which subject he read a paper before the Literary and Philosophical Society of Manchester in 1822. In 1828 and in 1830, respectively, he gave to the same society the results of his researches on the forms of the catenary in suspension bridges, and on the strength and best forms of iron beams. In 1847 he was appointed professor of the mechanical principles of engineering at University College, London. From 1847 to 1849 he was one of the royal commissioners engaged in inquiring into the application of iron in railroad structures. From 1848 to 1850 he was president of the Manchester Literary and Philosophical Society. He was a member of the Geological Society, of the Royal

Irish Academy, and an honorary member of the Institute of Civil Engineers. He made investigations as to the temperature of the earth in deep mines which were of especial interest. His experiments on the strength of materials, and especially his determination of the 'neutral line' in the section of fracture, with the resultant designs for beams, mark an important step in the science of modern engineering. He published *Researches on the Strength and Other Properties of Cast Iron* (1846). Consult the "Life of Eaton Hodgkinson," in the *Memoirs of the Manchester Literary and Philosophical Society*, third series, No. ii. (Manchester, 1862).

HODG'SON, BRIAN HOUGHTON (1800-94). An English Orientalist and zoölogist, born at Lower Beeches, and educated at Haileybury. He entered the English civil service at Calcutta in 1818, and remained in it until 1843, when he was removed, apparently without cause, by Lord Ellenborough. Hodgson then lived for a few months in Europe, but soon returned to India, and lived practically alone at Darjiling (1845-58), where he made important additions to the classified fauna of India. Besides his zoölogical specimens he made valuable collections of Indian manuscripts and of ethnological material. These collections he distributed generously among European museums, giving especially to the British Museum. His written studies were on the ancient texts of India, especially the literature of Buddhism, on the modern vernacular and the subject of 'national education,' on the ethnology of the hill tribes, on Hindu law and practice, especially in Nepal, and on zoölogy. Among his works, besides scores of articles in reviews and governmental bulletins, may be mentioned: *Literature and Religion of the Buddhists of the North* (1841); *Letters on National Education for the People of India* (last ed. 1847); *Aborigines of India* (1847); *Essays on the Language, Literature, and Religion of Nepal and Tibet* (1874); and *Miscellaneous Essays Relating to Indian Subjects* (1880). Consult Hunter, *Life of Brian Houghton Hodgson* (London, 1896).

HODGSON, JOHN EVAN (1831-95). An English painter. He was born in London, and educated at Rugby. He spent some years in Russia before entering the Royal Academy in 1855. His first picture, "The Notice of Ejection," was exhibited in 1856. He first painted domestic and historical pictures, but in 1868 a visit to Northern Africa interested him in subjects of Moorish life, to which he chiefly confined himself from this time on. Among his earlier pictures are: "Arrest of a Poacher," "Canvassing for a Vote," "A Rehearsal of Music in a Farmhouse," "Return of Sir Francis Drake from Cadiz," "First Sight of the Armada," and "Queen Elizabeth at Purfleet." His later works include an "Arab Story-Teller" (1869); "A Tunisian Bird-seller" (1873); "An Eastern Question." "A Shipwrecked Sailor" (1881); "Robert Burns at the Plough" (1887). In 1879 he was elected member of the Royal Academy, and in 1882 he was appointed its librarian and professor of painting. He died June 19, 1895, at Cobleskill, Buckinghamshire.

HODGSON, SHADWORTH HOLLOWAY (1832—). An English metaphysician, born in Boston, Lincolnshire, and educated at Rugby and Oxford. In 1880 he became president of the Aristotelian Society for the systematic study of philosophy,

was frequently reëlected, and in his addresses to the society and its proceedings gave much of his best work. Besides these, various contributions to *Mind* and the miscellaneous works, *The Principles of Reform in Suffrage* (1866), and *Outcast Essays and Verse Translations* (1881), mention should be made of the preliminary studies entitled: *Time and Space* (1865); *The Theory of Practice* (1870); and *The Philosophy of Reflection* (1878); and of the summing up of his metaphysic, *The Metaphysic of Experience* (1898), the most forcible and valuable of his works, in which he claims that "metaphysic like pure mathematics is fontal and preinductive," and as a phenomenist takes a strong stand against the *Noumenon*.

HÓDMEZŐ - VÁSÁRHELY, hód'mě-zě-vü'shär-hély'. A city in the Province of Csongrád, Hungary, on the Hód (Moon) Lake, 16 miles northeast of Szegedin (Map: Hungary, G 3). Among its principal buildings are the town hall, hospitals, and a gymnasium. It has risen into considerable prominence as an agricultural and trading centre, the inhabitants of the city and neighborhood being actively engaged in stock-raising and the cultivation of wine and tobacco. The industrial establishments include breweries and an oil-factory. Population, in 1890, 55,475; in 1900, 60,883; mostly Magyars.

HOD'OGRAPH (from Gk. *ὁδός*, *hodos*, way + *γράφειν*, *graphēin*, to write). A velocity curve, representing the acceleration of a given motion. In Fig. 1, $V_1, V_2, V_3 \dots$ represent the velocities

FIG. 1.

FIG. 2.

of a point P, which moves along the curve C, at the various positions $P_1, P_2, P_3 \dots$. In Fig. 2, $OV_1, OV_2, OV_3 \dots$ are drawn parallel and equal to $V_1, V_2, V_3 \dots$. The curve H, formed by joining the points $V_1, V_2, V_3 \dots$, is called the hodograph of the motion of P. If V describes the curve H, while P describes the curve C, then the velocity of V at any point, laid off on the tangent of the curve H at that point, represents the acceleration of the point P both in magnitude and direction. Thus the velocity of the hodograph is the acceleration of the original motion.

HOD'SON, WILLIAM STEPHEN RAIKES (1821-58). An English soldier, born near Gloucester. In 1845 he joined the army in India and participated in the Sikh War. Two years afterwards he had command of native troops, and distinguished himself during the mutiny as leader of the irregular cavalry called Hodson's Horse. He held a civil office in 1849-52, but was more successful as a soldier, and died the death of one at Lucknow.

HOD'Y, HUMPHREY (1659-1707). A Church of England divine. He was born at Odecombe, Somersetshire, January 1, 1659; graduated B.A. at Oxford, 1679; became fellow of Wadham Col-

lege there, and in 1697-98 regius professor of Greek. He died near Bath, January 20, 1707. He participated on the Government side in the controversy over the bishops and their followers who refused to accept William and Mary as their legal sovereigns—the so-called Nonjurors; and also in that about the rights and powers of Convocation, contributing the valuable *History of English Councils and Convocations and of the Clergy's Sitting in Parliament* (London, 1701). But his lasting reputation rests upon his work on the Hebrew text, the Septuagint, and Vulgate version of the Bible, *De Bibliorum Textibus* (1705). His life, written largely by himself, appears in Jebb's edition of his *De Græcis Illustribus* (London, 1742).

HOE (from OF. *houe*, *hoe*, from OHG. *houwa*, Ger. *Hauc*, *hoe*, from OHG. *houwan*, Ger. *hauen*, AS. *hēawan*, Eng. *hew*). An agricultural implement used for stirring the soil, drawing up earth to plants, thinning plants in drills, clearing the ground of weeds, etc. There are two classes of hoes—*draw-hoes* and *thrust-hoes*. In the former the blade is almost at right angles to the handle; in the latter, almost in the same plane with it. The thrust-hoe, or Dutch hoe, is chiefly used for killing weeds, and for stirring ground to a very slight depth. The draw-hoe is much used in gardening, and is, in some countries, very extensively used in place of the spade in agriculture. It is always employed in the thinning (singling) of turnips. Hoes intended for tilling the ground, instead of the plow and spade, are much larger and heavier than those ordinarily used, are raised much higher, and brought down to the ground with greater force, somewhat like the pickaxe. Hoes for stirring very stiff soils are sometimes made with prongs instead of a blade.

HOE. The name of a family prominently identified with the manufacture and improvement of the printing-press in America.—**ROBERT** (1784-1833) was born in Leicestershire, England. He was indentured to a joiner, in 1803 emigrated to the United States, worked for a time at his trade, and subsequently was an associate of his brothers-in-law, Peter and Matthew Smith, in the manufacture of a hand printing-press invented by the former. In 1823 he became sole proprietor of the business. A skillful mechanic, he constructed and introduced the original Hoe press, and was, it is thought, the earliest American machinist to utilize steam as a motive power in his plant.—**RICHARD MARCH** (1812-86), son of the foregoing. He began the practical study of printing-press manufacture in 1827, and in 1833 became the senior partner of the Hoe firm. He devised numerous ingenious improvements in the presses, and also produced a fine quality of steel saw. In 1841 he, in connection with his brothers, Peter Smith Hoe and Robert Hoe, took over the entire direction of the business. A rotary press, widely known as 'Hoe's lightning press,' was brought out by him in 1846, and forthwith was very extensively adopted for newspaper work. (See PRINTING.) Afterwards he invented the web perfecting press, which superseded his former invention and prints upon both sides of the sheet, and includes complicated apparatus for cutting and folding. (See PRINTING.) Constant improvements were made by him in the output of his works.—**ROBERT** (1839—), a son of Robert Hoe, 2d, succeeded to the headship of the firm, which

retains its preëminence among printing-press makers. He was one of the organizers and first president of the Grolier Club, the well-known New York organization for the promotion of book-making as an art. He edited Maberley's *Print Collector* (1880). See PRINTING.

HOE, RICHARD (1825—). A widely known Dutch pianist, organist, and composer, born at Amsterdam. A brilliant exponent of the modern romantic German school, he received many decorations and foreign orders for his services to the cause of music. In 1856 he was director of the Amstels Männerchor; 1857, director of the Society for the Promotion of Music; 1862, city musical director of Utrecht; 1869, cathedral organist; 1875, director of the School of Music. He was elected officer of the French Academy in 1878. Hoe is perhaps better known in America as a composer of part songs for male or female voices. His compositions include an oratorio, two operas, two symphonies, masses, songs, chamber music, orchestral music, etc. His male choral works are standard with all the leading männerchor.

HOEFER, hō'fēr, EDMUND (1819-82). A German novelist. He was born at Greifswald, was educated there, and in the universities of Heidelberg and Berlin. His first stories appeared in 1845, and from that time onward he wrote many novels marked by excellence of characterization, such as: *Schwanwiek* (1856); *Bewegtes Leben* (1856); *Norien. Erinnerungen einer alten Frau* (1858); *Die Honoratiorentochter* (1861); *Altermann Ryke* (1865); *Ein Findling* (1868); *Der Junker* (1878); and *In der letzten Stunde* (1881). The eighth edition of his *Wie das Volk spricht* was published in 1876.

HOEFNAGEL, hōf'nä'gēl, JOORIS (1545-1618). A Dutch miniature painter, born at Antwerp. He was a pupil of Jan Bol at Mechlin, and for some time was at the Court of Bavaria. He then went to Prague, and finally to Vienna. His masterpiece is in the museum there, a Roman missal done for the Archduke Ferdinand. It is elaborately ornamented, and he worked on it for eight years (1582-90). Another fine work of Hoefnagel's is a miniature view of Seville (1573), in the Brussels Museum.—His son **JAKOBUS** (1575-?) was Court painter to the Emperor Rudolph II.

HOENSBROECH, hēns'brēk, PAUL, Count (1852—). A German theologian, born at Castle Haag, in the District of Geldern. When nine years old he entered the Jesuit school in Feldkirch. Afterwards he attended the Jesuit college at Stonyhurst, in England, and then studied law and history at the universities of Bonn, Würzburg, and Göttingen. In 1876 he set out on his travels through France, Portugal, Spain, Northern Africa, and Italy, and in 1878 entered the Society of Jesus. While a member of the Society he wrote: *Der Kirchenstaat in seiner dogmatischen und historischen Bedeutung* (1889), and *Christ und Widerchrist. Ein Beitrag zur Verteidigung der Gottheit Christi und zur Charakteristik des Unglaubens in der protestantischen Theologie* (1892). In 1893 he left the Jesuit Order, and published a work entitled *Mein Austritt aus dem Jesuitenorden* (1893), which led to a bitter attack upon him by the Ultramontane press. Two years later he joined the Evangelical Church. His later writings include:

Moderner Jesuitismus (1893); *Der konfessionelle Friede und die deutschen Jesuiten der Gegenwart* (1896); and *Das Papsttum in seiner social-kulturellen Wirksamkeit* (vol. i., 3d ed., 1901; vol. ii. 1902).

HOERNLE, hērn'le, RUDOLF AUGUSTUS FREDERIC (1841—). An English Orientalist and prominent authority on Indian antiquities and languages. He was born at Agra, in East India; was educated at Esslingen, Stuttgart, Basel, and Tübingen; became a missionary of the English Church at Mirat in 1865; and taught for four years at the Jay Narain's College in Benares. He entered the governmental educational service in 1881, after several years as principal of the mission college at Calcutta, and until 1899, when he retired and returned to England, was principal of the Calcutta Madrasah. He edited: *Chanda's Grammar of the Ancient Prākṛit* (1880); *The Prithirāj Rāsan* (1886); and *The Uvāsagadasāo with Abhayadeva's Commentary* (1888-90); translated *The Sāsrutasamhitā, or the Hindu System of Medicine* (1897 sqq.); and wrote, among other linguistic works of considerable importance, *A Comparative Grammar of the Gaudian Languages* (1880), and with Grierson, the incomplete *Comparative Dictionary of the Behāri Language* (1885 sqq.).

HOEVĒLL, hōō'vĕl, WALTER ROBERT VAN, Baron (1812-79). A Dutch author and colonial statesman, born at Deventer. He studied theology at Groningen, and in 1836 went to Bavaria, where in the following year, he founded the *Tijdschrift van Nederlandsch-Indië*. For the emancipation of the slaves and for the spread of Christianity in the Dutch Indies van Hoëvell accomplished much, especially by his writings. He also edited and translated various Malaysian poems, among which *Sjair Bidasari* (1843) deserves mention. But his greatest work was in colonial politics. From 1849 to 1854 he published *Reis over Java, Madura en Babi*, which joined a keen criticism of governmental methods of the time with a brilliant description of East Indian scenery and life. Returning to Holland in 1848, he was elected to the House of Deputies, where for thirteen years he was leader of the Liberal Colonial Party. His parliamentary speeches delivered during this period (published 1862-66) are models. Van Hoëvell was named Councilor of State in 1862. His sketches, *Uit het Indische leven* (1860, 2d ed., 1865), met with immense success, and in 1868 were published in German.

HOEVEN, hōō'ven (HOOF'EN), JAN VAN DER (1802-68). A distinguished Dutch naturalist. He was born in Rotterdam; studied medicine and natural history at Leyden and Paris; became professor of zoölogy at Leyden in 1826, and held this position until his death. His most important work is his *Handboek der Dierkunde* (2 vols., 1827-33). An English translation, by Professor Clark of Cambridge, under the title *Handbook of Zoölogy*, was issued, with important additions by both the author and the editor, in 1856-58.—His elder brother, **CORNELIS PRUYS** (1792-1871), was professor of medicine in the University of Leyden, and author of several important works, including: *De Historia Medicinæ* (1842); *De Historia Morborum* (1846); and *De Historia Medicamentorum* (1847).

HOF, hōf. A town of Bavaria, situated on the Saale, in Upper Franconia, 32 miles north-east of Bayreuth (Map: Germany, D 3). It has an attractive thirteenth-century church, recently restored, with some interesting contents, and an old Gothic Rathaus. There are a gymnasium, opened in 1546, and a hospital dating from 1260. The numerous textile manufacturing establishments produce chiefly cotton and woolen goods. There are also exported machinery and other iron and steel products, chemicals, vinegar, pottery, and leather. Hof, with its industrial activities, is well equipped with commercial unions and banks. It has electric lights, water-works, and canal communication. The town was founded about the end of the eleventh century. The original name was Regnitzhof. It was almost destroyed by fire in 1823. Population, in 1890, 24,455; in 1900, 32,781; mostly Protestants.

HOFDIJK, hōf'dik, WILLEM JACOBSZON (1816-88). A Dutch poet and author, born at Alkmaar. His first work, a romantic poem, *Rosamunde* (1839), attracted the attention of van Lennep, who obtained for him a clerk's position in the Government offices at Alkmaar. Afterwards he taught Dutch history and literature in the gymnasium at Amsterdam. His works, which are in verse and prose, include the studies in Dutch history: *Geschiedenis der Nederlandsche Letterkunde* (1856); *Historische Landschappen* (1856); *Geschiedenis des Nederlandschen Volks* (1865-72); *Willem Frederik Hendrik, Prins der Nederlanden* (1880); and the poems: *De Bruidsdans* (1842); *De Jonker van Brederode* (1849); and *Kenne merland. Balladen* (1850-52). He also wrote some poetical dramas, without much success.

HOFER, hōf'ēr, ANDREAS (1767-1810). A patriot leader of Tyrol. He was born at Sankt Leonhard, in the valley of Passeier, November 22, 1767. His father was landlord of the inn 'Am Sand,' and the son carried on the business, becoming known as the 'Sandwirt.' In 1796 Hofer led a body of sharpshooters against the French on Lake Garda; in 1805 he fought against Ney in the valley of Passeier, and after Tyrol had been abandoned to France by the Peace of Pressburg he was chosen as one of the secret deputation which was sent to Vienna to represent to the Archduke John the sufferings of the people, and their wish to be reunited to Austria. But Austria was powerless, and in virtue of Napoleon's decree Tyrol was made part of Bavaria. The patriots, however, did not lose heart, and at the desire of the Archduke, Baron von Hormayr prepared for them a plan of insurrection. The rising took place in 1809, on the renewal of war between Napoleon and Austria. On April 11th Hofer defeated the Bavarian allies of France at Sterzing, and after they had rallied during the early part of May, he beat them again in the neighborhood of Innsbruck, forcing them to evacuate Tyrol. Napoleon, however, dispatched three armies to subdue the rebellious peasantry, who had been abandoned by the Austrians by the armistice of Znaim (July 12, 1809). At first Hofer concealed himself in the valley of Passeier; but later speedily renewed the defense of Tyrol, and defeated the combined French and Bavarian forces under Lefebvre at Berg Isel (August 13, 1809), driving them from the country. For two months

Tyrol was free, and Hofer acted as head of the Government, but the Treaty of Vienna (October 14, 1809) resulted in a fresh invasion. The French and Bavarians poured into the country, and, after an heroic struggle, Hofer was obliged to take refuge in the mountains. Two months later (January 28, 1810) he was betrayed into the hands of the French, conveyed to Mantua, and there shot, by order of Napoleon, after a summary trial. His family were indemnified for the loss of their property by the Emperor of Austria in 1818, and his son was ennobled. Hofer has been made the hero of tragedies by Auerbach and Immermann, and there are numerous patriotic songs about him in Tyrol. Consult: Hormayr, *Das Land Tyrol und der Tyroler-krieg von 1809* (Leipzig, 1845); Heigel, *Andreas Hofer* (Munich, 1874); Egger, *Geschichte Tyrols* (Innsbruck, 1870-80); Stampfer, *Sandwirt Andreas Hofer* (Freiburg, 1891).

HOFF, hōf, JAKOBUS HENDRIKUS VAN 'T (1852—). A Dutch chemist and coeditor of the *Zeitschrift für physikalische Chemie*, born at Rotterdam. He studied at the universities of Delft, Leyden, Bonn, Paris, and Utrecht, and in 1876 became a teacher in the veterinary school at Utrecht. Two years later he was made a professor at the University of Amsterdam, and in 1896 was called to the University of Berlin. He was the founder of stereochemistry, and one of the most prominent investigators in the new physical chemistry. Among his publications are: *La chimie dans l'espace* (1875), translated by Arnold Eiloart as *The Arrangement of Atoms in Space* (1898); *Vorlesungen über theoretische und physikalische Chemie* (1898-1900; vol. i., 2d ed. 1901), translated by R. A. Leffeld under the title *Lectures on Theoretical and Physical Chemistry* (1898-99); and *Acht Vorträge über physikalische Chemie gehalten auf Einladung der Universität Chicago* (1902). In 1901 he received the Nobel prize for the most important contribution to chemistry.

HÖFFDING, hēf'dīng, HARALD (1843—). A Danish philosopher, born and educated in Copenhagen. He was a school-teacher between 1861 and 1871, in the latter year became instructor, and in 1883 professor in the University of Copenhagen. He was early influenced by Kierkegaard and held to a distinction between knowledge and belief; but later became a positivist, though he joins with the views of that school the methods of critical philosophy and the results of psychological study. In ethics he is a utilitarian of a moderate type, not holding that self-interest is the motive of action. His principal works are: *Den engelske Filosofi i vor Tid* (1874); *Etik* (last ed. 1879); *Psychologi i Omrids paa Grundlag af Erfaring* (last ed. 1892); *Formal Logik til Brug ved Forelæsninger* (last ed. 1890); *Psykologiske Undersøgelser* (1889); *Kontinuiteten i Kants filosofiske Udviklingsgang* (1893); *Den nyere Filosofs Historie* (1894); *Rousseau und seine Philosophie* (1901); *Det psykologiske Grundlag for logiske Domme* (1899); *Religionsfilosofi* (1901); and *Mindre Arbejder* (1899).

HOFFMAN, CHARLES FENNO (1806-84). An American poet and novelist, born in New York City. In early youth he had his leg crushed and amputated, but was not deterred thereby from athletics and an open-air life. Educated, but

not graduated, at Columbia College, he was admitted to the bar at twenty-one and practiced three years, after which he devoted himself to literature. In 1833 he established the *Knickerbocker Magazine*, but soon gave it up and became editor of the *American Monthly*, which he conducted for several years. Afterwards he edited for short periods the *Mirror* and the *Literary World*. His first book was *A Winter in the West* (1835), which was followed by *Wild Scenes in Forest and Prairie* (1837)—both based upon actual experiences in search of health. He now wrote a few novels, the most important being *Greyslaer* (1840), founded upon the murder of Colonel Sharpe by Beauchamp, a theme which a little later attracted Simms (q.v.). But his fame rested chiefly upon his poems, first collected in *The Vigil of Faith* (1842), and especially his songs, which were once deservedly popular. Among them may be named "Rosalic Clare" and "Monterey." A complete edition of his poems appeared in 1873. In 1849 he became insane, and for the remainder of his life was confined in an asylum.

HOFFMAN, DAVID (1784-1854). An American lawyer and author. He was professor of law in the University of Maryland from 1817 to 1836; traveled much abroad, and received honorary degrees from Oxford and Göttingen. Among his publications are: *A Course of Legal Studies* (1817); *Legal Outlines* (1836); *Miscellaneous Thoughts on Men, Manners, and Things*, by 'Anthony Grumbler' (1837); and *Chronicles Selected from the Originals of Cartaphilus, the Wandering Jew* (1853).

HOFFMAN, EUGENE AUGUSTUS (1829-1902). An American clergyman of the Protestant Episcopal Church. He was born in New York City, and was educated at Rutgers and Harvard Colleges and at the General Theological Seminary. He was rector successively of Christ Church, Elizabeth, N. J.; Saint Mary's Church, Burlington, N. J.; Grace Church, Brooklyn Heights; and Saint Mark's Church, Philadelphia. In 1879 he was appointed dean of the General Theological Seminary, New York, and in connection with his family heavily endowed that institution. Dr. Hoffman built Christ Church and rectory at Elizabeth, and churches at Milburn and Woodbridge, N. J. He wrote *Free Churches* (1858), and *The Eucharistic Week* (1859 and 1893).

HOFFMAN, RICHARD (1831—). An American pianist, composer, and teacher. He was born in Manchester, Lancashire, England, but after his sixteenth year resided in New York City. His earliest instruction was received from his father, and subsequently from Meyer, Pleyel, Moscheles, Rubinstein, Thalberg, Döbler, and Liszt. Within a year of his arrival in America he made a tour of the country, and later accompanied Jenny Lind on her tours. He was an exceedingly popular concert pianist, and played with Gottschalk, and afterwards with Von Bülow (New York, 1875). He settled down to teaching, and has been one of the most important factors in American musical life. His compositions consist of pianoforte music, part songs, ballads, anthems, and Church music generally.

HOFFMAN, WALTER JAMES (1846—). An American ethnologist. He was born at Weidaville, studied medicine at Jefferson College, Philadelphia, and practiced it in Reading, Pa., till

1870, when he went to the Franco-Prussian War as a surgeon with the German Army. On his return he took a similar position with the United States troops, and thus obtained opportunities for natural history researches in Arizona, Nevada, and Dakota. In 1877 Hoffman was attached to the Geological Survey, and two years afterwards became assistant in the Bureau of Ethnology at its formation.

HOFFMAN, OR, THE REVENGE FOR A FATHER. A tragedy by Henry Chettle, performed in 1602; the only play written wholly by this author that has been preserved. It exists in a very corrupt quarto, printed in 1631 without the author's name.

HOFFMANN, hōf'mān, AUGUST HEINRICH, called **HOFFMAN VON FALLERSLEBEN, fōn fäl'ers-läben** (1798-1874). A German poet, philologist, and literary historian, born at Fallersleben. He was educated at Göttingen and Bonn, and from 1823 to 1838 was librarian at the University of Breslau, where he was also professor from 1830 till his dismissal (1842) for his *Unpolitische Lieder* (1841-42). He was restored to his rights as a Russian citizen in 1848, having passed the intervening years in Mecklenburg. He married in 1849 and afterwards lived at Bingerbrück, Neuwied, and Weimar, where he was an editor of the *Weimarische Jahrbuch*. From 1860 till his death he was librarian of the Duke of Ratibor. Popular at first as a liberal political poet, he is cherished still for the ease, simplicity, and grace of songs of common life, for many of which he also composed melodies. Hoffmann was a diligent editor of early German classics (*Reineke Vos, Monumenta Elnonensia, Theophilus*), made valuable contributions to philology now of antiquarian interest only, and to literary history. In 1868-70 Hoffmann published *Mein Leben*, an autobiography in six volumes. Hoffmann's *Works* are still uncollected, but the *Poems* (incomplete) have been often reëdited. His *Briefe an Ferdinand Wolf* were published in 1874. There is a *Life* by Wagner (Vienna and Dresden, 1869). Consult also Kreyenberg, in *Preussische Jahrbücher* (Berlin, 1891).

HOFFMANN, ERNST THEODOR AMADEUS (originally **WILHELM**) (1776-1822). An eccentric German romantic novelist of cosmopolitan reputation and influence, born at Königsberg. His foremost characteristic is his wayward yet keen fancy, suggesting at once Hawthorne and Poe. He dealt by preference with the grotesque, startling, and marvelous, until toward the close of his life morbidity verged on madness. After a joyless childhood, he prepared for the law, let his wit run away with his prudence in some witty caricatures, and finding his career thus blocked, suffered from penury and dissipation. He eked out a living by scene and portrait painting and musical composition and criticism in Posen, Warsaw, Bamberg, Leipzig, Dresden, and Berlin, where in 1816 he became counselor of the Court of Appeals. For short intervals he was manager and musical director also. His first book was a collection of musical criticisms with illustrations, *Phantasiestücke in Callot's Manier* (1814). In 1816 appeared *Die Elizire des Teufels*, which, with *Lebensansichten des Katers Murr* (1820-22), is the most famous of his works. Other noteworthy volumes are *Die Scrapionsbrüder* (1819-21) and

Nachtstücke (1817). All are alike characterized by a lyric swing and an erratic imagination that is mentally disquieting and yet blended with shrewd satire, wit, and even wisdom. He died of disease induced by dissipation, his mind at times clear, and clinging tenaciously to a life that ebbed inch by inch away. Hoffmann's *Works* are in fifteen volumes (1879-83). Of the more popular, there are many editions. The *Élisaire des Teufels* has been translated into English (1824), also *Der goldene Topf* (The Golden Pot), one of the *Phantasiestücke*, by Carlyle in his *German Romance* (Edinburgh, 1827), where also is a biographical sketch. Other translations are by Gillies (London, 1826); Bealby (New York, 1885); and Ewing (London, 1886). Consult: Hitzig, *Hoffmann's Leben und Nachlass* (Stuttgart, 1839), and *Erinnerungen*, by Funck (Leipzig, 1836).

HOFFMANN, FRIEDRICH (1660-1742). A German physician, one of the most celebrated of the eighteenth century. He was born at Halle, and received his medical degree in 1681 at Jena. He then studied chemistry at Erfurt, under Kaspar Cramer; practiced at Minden and Halberstadt with great success, and was professor of medicine in the University of Halle from 1693 to 1742. In 1708 he became physician to the King of Prussia at Berlin, and subsequently enjoyed a European reputation second only to that of Boerhaave. His name is perpetuated in the title Hoffmann's anodyne. (See ETHER.) His greatest work was *Medicina Rationalis Systematica* (1718-40); *Opera Omnia Physico-Medica Denuo Revisa, Correcta et Aucta* (1740) and *Medicini Consultatoria* (1721-39) were also celebrated, together with the *Opuscula*, published after his death and reprinted at Venice in seventeen volumes, in 1745, and subsequently at Naples.

HOFFMANN, GUSTAV (known as GRABEN-HOFFMANN) (1820-1900). A German composer, born at Bnin, near Posen. He was the pupil of Stümer in Berlin, and afterwards of Hauptmann at Leipzig in singing, and acquired a reputation in barytone parts in concert and oratorio. He also taught vocal music, and was the composer of nearly a hundred books of songs and choral music, besides publishing several text-books on voice-training. His best-known song is *Fünfmahlhunderttausend Teufel*. In 1885 he settled at Potsdam, where he founded a singing-school for women.

HOFFMANN, HANS (1848—). A German novelist, born in Stettin. He studied at the universities of Bonn, Berlin, and Halle, and made a long visit to Italy and Greece. He is one of the most gifted of the modern German novelists, and unites with an uncommon talent for vivid descriptions of landscapes a poetical and delightful humor. Among his works are: *Iwan der Schreckliche und sein Hund* (1889); *Von Frühling zu Frühling* (1889, 3d ed. 1898); *Geschichten aus Hinterpommern* (1891, 2d ed. 1894); and *Irrrende Mutterliebe* (1900).

HOFFMANN, or HOFFMANN-DONNER, dōn'ēr, HEINRICH (1809-94). A German humorous poet, born in Frankfort-on-the-Main. At his marriage he added his wife's name (Donner) to his own. He studied at the universities of Heidelberg, Halle, and Paris; then became a teacher of anatomy in the Senckenberg Institution in Frankfort-on-the-Main, and from 1851 till 1889

was directing physician of the municipal insane asylum. He wrote on medical subjects, but is far better known through his children's books, which he illustrated himself. The most famous of these, *Struwwelpeter* (1845), has gone through several hundred editions, and has been translated into nearly all the languages of Europe. Among his other publications are: *König Nussknacker*, and a volume of poems, entitled *Auf heiterm Pfaden* (1873).

HOFFMANN'S ANODYNE. See ETHER.

HOFFORY, hō'fō-rē, (JOHN PETER) JULIUS (1855-97). A Danish-German philologist, phonetician, and Germanic scholar, born at Aarhus. He was educated at Copenhagen and Berlin. In 1886 he was made professor of Norse philology and phonetics at the University of Berlin. He wrote: *Eddastudien* (1889); "Phonetische Streitfragen," in *die Zeitschrift für vergleichende Sprachforschung*, vol. xxiii.; and *Professor Sievers und die Principien der Sprachphysiologie* (1884), both attacks on Sievers. He edited and translated into German some of Holberg's comedies under the title of *Dänische Schaubühne* (1885-87) and translated other Danish writings in *Nordische Bibliothek* (1889-91). His personality was a strong one, and he did much toward the introduction of Ibsen in Germany.

HOFHAIMER, hōf'hī'mēr, or **HOFHAI-NER**, PAULUS VON (1459-1537). An Austrian composer, born in Salzburg. He was an excellent organist, and filled the position of Court organist and composer in Vienna. He received numerous honors, and was especially distinguished as a teacher. As a composer he ranked among the foremost of his time. His best work was *Harmonia Poeticæ* (1839, republished 1868), which consisted of Latin poems set for four voices. In addition, he composed many German songs and considerable later music.

HOFHUF, hō-fōof'. A town of Arabia, near the Persian Gulf. See EL-HOFUF.

HÖFLER, hōf'lēr, KARL ADOLF KONSTANTIN, von (1811-97). A German-Austrian historian. He was born at Memmingen, and studied philosophy and history at the universities of Munich and Göttingen. For two years (1834-36) he was in Rome and Florence, making historical researches. When he returned to Munich he undertook the direction of the *Münchener Zeitung*, the official journal of Bavaria. Three years afterwards he was made a professor at the university there. He became involved in the political troubles of Bavaria, and the publication of his book, *Konkordat und Konstitutionseid der Katholiken in Bayern* (1847), lost him his Munich chair; but after being archivist at Bamberg for a time, he was made professor of history in the University of Prague (1851). In the controversy between the Czechs and the Germans, Höfler sided conspicuously with the Czechs, and in 1872 he was called into the Austrian House of Peers. His numerous publications upon historical subjects include: *Die deutschen Päpste* (1839); *Lehrbuch der allgemeinen Geschichte* (1850-56); *Papst Adrian VI.* (1880); *Monumenta Hispanica* (1881-82); and *Die Aera der Bastarden am Schlusse des Mittelalters* (1891).

HOFMANN, hōf'mán, AUGUST WILHELM VON (1818-92). A distinguished German chemist, born at Giessen. After obtaining the degree of

doctor of philosophy, he became assistant to Liebig in the Giessen laboratory, and in 1845 became professor of chemistry in the University of Bonn. In the same year the Royal College of Chemistry was established in London, and Hofmann was recommended by Liebig as highly qualified for the post of superintendent to the new institution. This college, which subsequently became part of the Royal School of Mines, owes much of its high reputation to Hofmann's activity as teacher and investigator. On the promotion of Thomas Graham from the post of chemist to the mint to the office of master of that institution, Hofmann was appointed his successor. In 1861 he was elected president of the London Chemical Society. In 1863 Hofmann accepted an appointment to the chair of chemistry in the University of Berlin, and in 1868 founded the German Chemical Society. He was ennobled in 1888. He served as judge at several industrial expositions, of which he published admirable accounts, and was a member of many scientific bodies, both at home and abroad. His name justly figures among those of the greatest chemists of the nineteenth century.

The results of his brilliant researches have formed entire departments in organic chemistry, and have had an important influence on the development of chemical theory. He investigated the organic bases obtained from coal-tar, and discovered a new and important class of compounds which are derived from ammonia by the substitution of organic radicals for hydrogen atoms. Among his most important discoveries is that of aniline among the products of destructive distillation of bituminous coal, and the discovery of methods for the artificial preparation of beautiful coloring substances from aniline. He obtained the colorless base known as *rosanilin* and its colored salts, such as *fuchsin*, *dahlia* ('Hofmann's violet'), etc., which are the most important of the colors derived from aniline. These discoveries have contributed greatly to the development of the color industry, and have practically revolutionized the art of dyeing. Among his contributions to physical chemistry may be mentioned his method of determining the vapor densities of chemical substances for the purpose of obtaining their molecular weights, and a method of demonstrating the dissociation of gases, such as carbonic-acid gas and water-vapor, by the action of electric sparks. Hofmann was a brilliant teacher, and his *Introduction to Modern Chemistry* (1865, and several later editions) has brought about important reforms in the methods of teaching chemistry. He also wrote: *A Handbook of Organic Analysis* (1853); *The Life Work of Liebig in Experimental and Philosophic Chemistry* (1876); *Zur Erinnerung an vorangegangene Freunde* (3 vols., 1889), etc. His statue may be seen at the National Gallery of Berlin.

HOFMANN, FRANZ ADOLF (1843—). A German hygienist. He was born in Munich, studied medicine there, and was assistant in the physiological institute of the university until 1872, when he went to Leipzig as head of the university laboratory of pathological chemistry. Six years afterwards Hofmann was appointed to the management of the hygienic institute of the same university. An editor of the *Archiv für Hygiene*, he contributed to that journal, to the *Zeitschrift für Biologie*, and to the *Vierteljahrsschrift für*

öffentliche Gesundheitspflege on pathological chemistry, on the properties of subterranean waters, and on disinfection, refrigeration, and various methods of preservation of foods, especially meats.

HOFMANN, HEINRICH (1842-1902). A German composer, born in Berlin. As a pupil of Kullak's Akademie he studied under Grell, Dehn, and Wüerst, and became a well-known pianist. In 1869 his opera, *Cartouche*, was produced in Berlin, and thereafter he devoted himself entirely to composition. Hofmann was considered one of the foremost of contemporary composers, and was elected a member of the Berlin Royal Academy of Arts. Among his many compositions are: an *Ungarische Suite* (1873); the symphony *Frithjof* (1874); the operas *Der Matador* (1872), *Armin* (1872), *Wilhelm von Oranien* (1882), *Lully* (1889); the secular oratorio *Prometheus* (1896); numerous choral works, cantatas, and songs; and a series of exquisite pianoforte duets.

HOFMANN, JOHANN CHRISTIAN KONRAD VON (1810-77). A German Lutheran theologian and historian, born in Nuremberg. He studied history and theology at the universities of Erlangen and Berlin, and in 1833 was appointed a teacher in the gymnasium at Erlangen. Two years later he became a tutor in the theological faculty of the university and rose to the position of professor extraordinarius in 1841. The next year he accepted a call as full professor to Rostock, but in 1845 returned to Erlangen. In 1857 he was ennobled. He was the head of the so-called Erlangen school, which developed the theological ideas of Bengel, and in the end conformed in all essential respects with the doctrines of the Lutheran Church. As a member of the Second Chamber of the Bavarian Legislature he labored for the union of Germany, and was, despite his clerical conservatism, a member of the Progressist Party. His writings include: *Lehrbuch der Weltgeschichte* (2d ed. 1843); *Weissagung und Erfüllung* (2d ed., 3 vols., 1857-60); *Die Heilige Schrift Neuen Testaments, zusammenhängend untersucht* (1862-86, the latter part edited by Vlock); and *Der Schriftbeweis* (2d ed. 1857-60). Consult *Grau, Johann Christian Konrad von Hofmann. Erinnerungen* (Gütersloh, 1879).

HOFMANN, JOSEF (1877—). A celebrated Polish concert pianist, born in Cracow, Galicia. His father was a leading musician of Warsaw, in which city he held the position of professor of harmony and composition at the conservatory, and also the directorship of the opera. Josef studied with his father until he was fifteen years of age, after which he spent two years with Rubinstein. As a child he was one of the most remarkable musical prodigies ever known; at the age of six years he had made his public debut, and by the time he was nine had toured Continental Europe and Great Britain, and in 1887-88 he visited America. On the conclusion of the last-named tour he went into retirement for further study and preparation, and in 1894 made his reappearance as a full-fledged concert virtuoso at Dresden, and subsequently toured every civilized country on the globe. On his reappearance in New York in 1901 he showed a vastly improved technique and great interpretative ability.

He is the composer of several attractive numbers for the piano.

HOFMANN, KONRAD (1819-90). A German philologist, born near Bamberg. After studying medicine at Munich and Erlangen, he turned his attention to philology at Munich, Leipzig, Berlin, and Paris. In 1852 he was put in charge of the materials gathered by Schmeller in the library of Munich. In the following year he succeeded Schmeller as professor of Germanic philology, assuming in 1869 also the chair of Romance philology. Most of his writings were for journals, especially the publications of the Munich Academy, *Romanische Forschungen*, and Pfeiffer's *Germania*. His other works are: Editions of the *Hildebrandlied* (with Vollmar, 1850); *Amis et Amiles, Jourdain de Blaivies* (last ed. 1882); *Primavera y Flor de Romances* (with Wolf, 1856); *Karls des Grossen Pilgerfahrt* (1866); *Jouffrois* (1880); *Lutwin's Adam und Eva* (with Meyer, 1881); and *Chanson de Roland* (not published); and the critical works: *Ueber die Gründung der Wissenschaft altdeutscher Sprache und Litteratur* (1857), and *Zur Textkritik der Nibelungen* (1872).

HOFMANNSWALDAU, hōf'māns-vāl'dou, CHRISTIAN HOFMANN VON (1617-79). A German poet, born in Breslau; the chief representative of the so-called second Silesian school. He studied at Leyden, and then traveled through the Netherlands, England, France, and Italy. On his return, and before he had reached the required age, he was made a member of the council in his native city. In his poetry he was greatly influenced by the Italians Guarini and Marino, and departed more and more from the somewhat insipid and tasteless style of the previously authoritative Martin Opitz (q.v.). Witty and endowed with considerable literary skill, he was much admired; his love lyrics were often imitated, and many editions of them were published. Consult Ettlinger, *Christian Hofmann von Hofmannswaldau* (Halle, 1891).

HOFMEISTER, hōf'mī-stēr, WILHELM (1824-77). A German botanist, born at Leipzig. He became professor of botany at Heidelberg in 1863, and at Tübingen in 1872. His researches in botany resulted in contributions of the greatest importance, especially to the department of botany dealing with the reproduction of plants. He published *Die Entstehung des Embryo der Phanerogamen* (1849), and *Vergleichende Untersuchungen höherer Kryptogamen und der Koniferen* (1851).

HOFSTEDE DE GROOT, hōf'stā-de de grōt, PETRUS (1802-86). A Dutch theologian and reformer, born at Leer in East Friesland. In 1826 he became pastor at Ulrum, and in 1829 professor in and preacher to the university at Groningen. He was the head of the so-called Groningen school, the members of which style themselves the Evangelicals and form a middle Church party between the moderns and the orthodox. The organ of the party was a publication entitled *Vaarheid en Liefde*, of which Hofstede was an editor. Among his voluminous writings may be mentioned: *Oppoeding der Menschheid* (2d ed. 1855); *Institutio Theologiæ Naturalis* (4th ed. 1861); *Die Groninger Theologen* (1854); *Over de evangelisch-catholieke godgeleerheid als de godgeleerheid der toekomst* (1856); *Die moderne Theologie in den Nederlanden* (1870).

Consult Heerspink, *Dr. Petrus Hofstedes leven en werken* (Groningen, 1897).

HOG, THE DOMESTIC (probably from *hog*, *hag*, to cut, Icel. *hoggva*, Swed. *hugga*, AS. *hēawan*, OHG. *houwan*, Ger. *hauen*, to hew; connected with OChurch Slav. *kovati*, Lith. *kauti*, to strike, to forge; referring ordinarily to a castrated boar). All the known breeds of domestic swine (see SWINE, for the general natural history of the race) may be divided into two groups: The European hog (*Sus scrofa*), which is sprung from and resembles the wild boar; and the Asiatic pigs, regarded as descended from the

DENTITION OF THE WILD BOAR.

Right upper and lower jaws, with their teeth and their nerves, exposed from the inside: *i*, *i*, incisors; *c*, *c*, canines (tusks); *pm*, premolars; *m*, molars.

Indian wild boar (*Sus cristatus*). The common hog (*Sus scrofa*) appears to be a native of most parts of Europe and Asia, and domesticated swine were found by the first navigators in many of the islands of the southern seas. Although the use of its flesh was prohibited to the Jews, and the prohibition has been adopted in the Mohammedan law, the hog has been a domesticated animal from a very early period, and its flesh constitutes a large part of the food of many nations. The fecundity of the hog is great; with proper treatment, it will produce two litters annually, generally of four to eight pigs each, although sometimes there are as many as fourteen in a litter. The period of gestation is usually 16 weeks. Great quantities of the flesh and fat are consumed in various forms as pork, fresh or salted, bacon, ham, lard, and so on. Brawn is an English luxury. The skin of the hog is made into leather, which is particularly esteemed for saddles. The bristles are much used for brush-making.

BREEDS. Numerous breeds of the domestic hog have resulted from selection and crossing and from conditions of environment favorable to improvement. Apparently there were two original or native breeds in Great Britain, the old English hog and a breed found in the Highlands of Scotland. From these our modern improved breeds have been developed by crossing the native breeds with foreign hogs, principally the Chinese and Neapolitans. The modern white breeds, with fine bone, thin skin, short legs, a tendency to fatten at an early age, take these qualities from the Chinese hog, which is said by some writers to be a more refined and highly developed animal; while the black breeds, of which the Essex is a type, get their qualities from the Neapolitan stock.

The *Yorkshire* is the principal of the English white breeds and is divided into three subvarieties, the Large Whites, or Large Yorks, the Middle Whites, represented by the Cheshires, and the Small Whites or Small Yorkshires, which are considered the smallest and finest of the white breeds. They mature early and fatten quickly.

STANDARD BREEDS OF HOGS

1

2

6

5

- 1. KANSAS BERKSHIRE SOW
- 2. TAMWORTH BOAR
- 3. LARGE YORKSHIRE OR "WHITE"

- 4. CHESTER WHITE BOAR
- 5. KANSAS ESSEX BOAR
- 6. KANSAS POLAND-CHINA SOW

The Large Whites are characterized by immense size, although the best are rather fine boned and not coarse. The Yorkshires are very popular in England, and white swine generally are preferred in that country. It is said that from this source came the American breed of Chester Whites, which was originated in Chester County, Pa. Pigs of this breed are among the largest, and individuals have attained a weight of 1300 pounds. They are said to be lacking in hardiness and to have a tendency to degenerate under careless treatment or neglect.

The *Berkshires* are probably the most universally popular and widely disseminated of all the breeds. This breed is of English origin, and takes its name from the county whence it came. It is of large size, black in color with white on the face, and occasional splashes elsewhere, and fattens readily at any age. Great improvement has been made in its size and symmetry in recent years. The quality of the pork is unexcelled.

The *Poland-Chinas* divide honors with the Berkshires in the great pork-producing sections of the United States. This is also a black breed, and is a purely American one, originating in Ohio. It is not generally believed that any Polish cross was ever introduced in its development, in spite of its name. As now bred, the Poland-Chinas are similar to the Berkshires, but show rather more white in their markings. They are among the largest of hogs, but have been much improved in fineness of bone, early maturity, and tendency to fatten at an early age.

The *Jersey Reds* or *Durocs* are a breed of unknown origin, which has long been quite extensively bred in New Jersey. They are also known as Red Berkshires. They are rather coarse, but are considered much harder than the finer boned breeds. The *Tamworth* is a large, coarse, 'leggy' hog, of a dark chestnut color, more or less spotted with black. This animal has been widely exploited as a bacon hog. The *Victorias* are a white breed of medium size, not widely raised in the United States; and the *Essex* is a black English breed, classed among the smaller breeds. It has not become popular in the United States. Record books or registers are published in the United States for the Berkshire, Poland-China, Yorkshire, Chester White, and Duroc-Jersey breeds.

CARE AND TREATMENT. Although hogs are raised to some extent in every section of the country, the great pork-producing section is in the Mississippi Valley, where corn is abundant and cheap. The northern part of this valley is said to be the greatest hog-raising section in the world. The hogs are commonly pastured during the earlier stages of growth. Frequently a herd of swine are put with steers which are being fed whole corn, and the hogs feed upon the corn voided in the manure. Alfalfa pasturage is used for hogs in some sections. In the South, cow-peas, peanuts, chufas, and a variety of other crops are grown for hog-pasture. Corn is the great hog feed of the middle West; sometimes it is ground, but it is largely fed on the ear. As corn contains only a small percentage of ash, the hogs fed upon it exclusively become weak-boned, and can hardly walk about. This is corrected by giving wood-ashes, which they eat greedily. Skim milk and buttermilk from creameries constitute excellent food for pigs of all ages; and if corn-meal is added, a pork of the fin-

est quality is obtained. The large, over-fattened hog, weighing 400 or 500 pounds, has given way to a quickly maturing hog of from 200 to 300 pounds. This animal is produced more economically and is preferred by the packing houses. The gains in proportion to the food eaten diminish as the animal grows, and experiments have shown that it is most profitable to market the hogs when they have reached 200 or 250 pounds. Packers prefer a hog weighing about 250 pounds. See PORK; SWINE.

BIBLIOGRAPHY. Consult: Long, *The Book of the Pig* (London, 1889); Coburn, *Swine Husbandry* (New York, 1888); Harris, *On the Pig* (New York, latest ed., 1896); Spencer, *Pigs, Breeds and Management* (London, 1897); Wallace, *Farm Live Stock of Great Britain* (Edinburgh, 1889).

HOG (so called as resembling in outline the back of a hog). This nautical term implies the opposite of *sag*. A ship is *hogged* when through weakness her ends droop in such a manner as to cause her keel to curve upward amidships. In lightly built or shallow vessels a tendency to *hog* is prevented by a truss frame arranged to support the ends and called the hog-frame. Most wood-built and many iron paddle-wheel river steamers have such frames rising well above the hull, and sometimes above the deck-houses. Instead of a framework extending from end to end, it may be located only amidships, and the strain transmitted to it by *hog-chains* extending to the ends.

HOG-APE. The mandrill. See BABOON.

HOG-APPLE. See PODOPHYLLUM.

HOGARTH, hō'gärth, GEORGE (1783-1870). A Scottish journalist and musical critic, born in Edinburgh. He studied law and music there, played the violoncello, wrote criticisms for the *Courant*, and associated with Sir Walter Scott's clique. When about fifty years of age, he went to London to live, and became a member of the editorial staff of the *Morning Chronicle*, then of the *Daily Telegraph* (1846-66), of which his son-in-law, Charles Dickens, was editor. The novelist was indebted to the journalist for the insertion of some of his earlier work in the *Evening Chronicle*. He was musical critic of the *Illustrated London News*, and also secretary of the Philharmonic Society (1850-64), and wrote its history, as well as a general *Musical History, Bibliography and Criticism* (1835); *Memoirs of the Musical Drama* (2 vols., 1838; 2d ed. 1851); and other works on his specialty, besides editing and harmonizing collections of hymns and songs.

HOGARTH, WILLIAM (1697-1764). An English painter and engraver, born in London, November 10, 1697. His father was an unsuccessful schoolmaster, who was also a hack writer and corrector for the press. At the age of seventeen, Hogarth was apprenticed to a silversmith for whom he made designs for plate, which are now much prized by collectors. In 1718 he entered business on his own account, and besides engraving arms and shop bills, he began to design copper plates for the booksellers. During the years 1721-26 he designed a number of engravings, the most important of which were "Masquerades and Operas" (1724), which struck the keynote of his future satire, and his illustrations to Butler's *Hudibras*, which brought him into public notice. At first Hogarth's ambition was

to be a line-engraver, but about 1724 he began to attend the private art school of Sir James Thornhill, in Saint Martin's Lane, with a view to painting. In 1728-29 he painted a series of small conversation pieces, groups of family portraits connected by some common interest or occupation, besides others of a political and social character. Between 1727 and 1732 he engraved a large number of frontispieces for well-known books. In 1729 he ran away with his former master's daughter, Jane Thornhill, who made him an excellent wife.

Soon after his marriage he began the first of the series of paintings, "The Harlot's Progress," reproduced also as engravings, which made him famous. It represented in six plates the story of a country girl who came innocent to town to seek a situation. The original paintings, except one, are lost, but the plates are well known. The shameless piracy of these plates resulted in the Parliamentary act of 1735 vesting in artists the exclusive rights to their designs. In the same year appeared "A Rake's Progress," eight plates, representing the career of a profligate young man of means, who ends in the madhouse, the original paintings for which are in the Soane Museum, London. The third and most famous series, the "Marriage à la Mode," was not completed till 1745. It represents in six plates the story of a fashionable marriage between the son of an impoverished lord and the daughter of a wealthy city alderman. The original paintings are in the National Gallery, and are Hogarth's greatest work. Another prominent series was "Industry and Idleness" (12 sheets, 1747), executed as engravings only. They represent the respective careers of an idle and an industrious apprentice, and were intended for the working class. Besides these he executed briefer series, and many single plates.

Hogarth's art was essentially of a literary character, and he has well been called the Molière of painting. His constant endeavor was to point out the vices and follies of society, with the strict moral purpose of reforming. His great importance in the development of art lies in the fact that he was the first to turn his back on traditional practices, and to go directly to nature for the figures he painted. He is free from all foreign and ancient influence. In his portraits he is a technician of high order. His pictures are strongly and broadly painted, and are equally excellent in drawing and in color. His paintings excel his engravings, which are hastily executed and lack finish, although they are always spirited and intelligible.

He succeeded especially well in his portraits, the best of which is one of himself with his dog Trump (1745), in the National Gallery. This collection also contains portraits of his sister, Mary Hogarth (1746), Polly Peachum, David Garrick as Richard III., the Earl of Feverham, and the inimitable "Shrimp Girl." Among his other paintings of a didactic character, painted for engraving, were: "Southwark Fair" (1733); "Midnight Modern Conversation" (1734); the "Distressed Poet" (1735); the "Enraged Musician" (1741); "March to Finchley," and the "Election;" the two latter in the Soane Museum. He also attempted a few historical pictures on a large scale, but not with equal success.

Hogarth took a prominent part in the art con-

troversies of his day, being the uncompromising foe of the imitation of the old masters—the 'black masters' as he called them, because of their darkened colors. In 1753 he published his *Analysis of Beauty*, setting forth his views on art; it was not a success, and brought ridicule upon him. After the death of his father-in-law in 1734, Hogarth converted his art school into a sort of life class, in which thirty or forty artists drew after the nude. In 1757 he was appointed sergeant-painter of all His Majesty's works, succeeding his brother-in-law, John Thornhill. His last days were marred by the ill success of his "Sigismunda Weeping Over the Heart of Her Husband," the harsh criticism of which was especially painful to Hogarth, as Sigismunda bore the features of his wife. An ill-advised effort in behalf of Lord Bute's Ministry in 1762 brought down upon him the terrible satire of Wilkes and Churchill, until then his intimate friends. Though much grieved, Hogarth retaliated by two prints: a hideous portrait of Wilkes, with a satyr's leer and squint, and "The Bruiser, C. Churchill." He died at London, October 25, 1764.

BIBLIOGRAPHY. Among the commentaries to Hogarth's works are: Trusler, *Hogarth Moralized* (London, 1768); Walpole, *Anecdotes of Painting*, vol. iv. (ib., 1771); Nichols and Stevens, *Genuine Works of Hogarth* (ib., 1808-17); Ireland, *Hogarth Illustrated* (ib., 1791-98), and *Graphic Illustrations of Hogarth* (ib., 1794-99); Lichtenberg, *Ausführliche Erklärung der Hogarth'schen Kupferstiche* (Göttingen, 1794); Clerk, *Works of Hogarth* (London, 1806). Among the numerous editions of his *Works* are those of Nichols (London, 1820-22); of Monkhouse and Dobson (ib., 1872); and of Ireland and Nichols (ib., 1883). For his life, compare the biographies by Nichols (London, 1785), Sala (ib., 1866), and Dobson (ib., 1879).

HOGARTH CLUB. An artists' club in London, with headquarters at 36 Dover Street.

HOG CHOLERA. A virulent contagious disease of hogs, due to the presence of a pathogenic bacillus in the alimentary tract. The term has been used to cover at least two diseases, true hog cholera and swine plague (q.v.). Some authors have attempted to distinguish four or five diseases of the hog-cholera group, but the present tendency is to recognize only two.

The chief symptoms of hog cholera are a rise in body temperature, loss of appetite, a discharge from the eyes, watery at first but later yellowish and viscid, a purplish coloration of the skin, giving rise to a common name, blue sickness, occurring especially on the ears, chest, and abdomen, the under side of the neck, and on the inside of the thighs. Constipation is an early symptom, but diarrhœa soon sets in and persists until the death of the animal. The excrement is dark-colored, and possesses a fetid odor. The body temperature may rise from one to three degrees above the normal, but the elevation of temperature is frequently absent. The animals are dull and indifferent to surroundings, lie down a great part of the time and hide their heads under straw or litter, often have a dry cough, and sometimes squall from intestinal pain. As the disease progresses they become gaunt with arching backs. The mortality from hog cholera under ordinary conditions is from 80 to 90 per cent. Acute

WILLIAM HOGARTH
"AFTER THE MARRIAGE" (FROM "MARRIAGE À LA MODE")
FROM THE ORIGINAL IN THE NATIONAL GALLERY, LONDON

cases may last from two to five days; chronic ones, a month. The characteristic pathological changes are enlargement of the spleen and a hemorrhagic condition of the large intestines and lymphatic glands. In chronic cases, ulcers are formed in the large intestines or the whole wall may become effused with blood.

Hog cholera and swine plague have been frequently confounded, but in typical cases they may be distinguished by clinical symptoms and post-mortem lesions. In most outbreaks of contagious hog diseases, hog cholera and swine plague occur in combination in the same animal. In general, however, the seat of infection in hog cholera is in the intestines; that of swine plague is in the lungs and secondarily in the intestines. A reddening of the skin is an indication of hog cholera, while coughing is more pronounced in cases of swine plague. For a reliable differential diagnosis of the two diseases it is necessary to make pure cultures of the micro-organisms which are concerned.

No satisfactory medicinal treatment has been devised for hog cholera. Recognized tonics which assist in keeping hogs in good physical condition may render them less susceptible to disease. A mixture containing sodium salts, sulphur, sulphide of antimony, and charcoal has proved as effective as any remedy. Serum therapy for hog cholera is still in the experimental stage, but has given promising results. The serum treatments devised by Pasteur and Lorenz have proved satisfactory in Europe. Experiments in the United States have demonstrated that serum used alone confers only a partial and temporary immunity to hog cholera. On the other hand, when antitoxic serum was used in combination with a virulent culture of the hog-cholera bacillus in the proportion of ten to one, a complete and lasting immunity was produced in more than 50 per cent. of cases.

It has been found practically impossible to disinfect hog pens and yards after an outbreak of hog cholera. Infected pens should be burned, and the surrounding ground should be cultivated to some crop for at least a year before again using as a hog-yard. Pens should be kept as clean as possible, and treated from time to time with lime or whitewash. By observing these precautions, preventing infection of the water-supply, and quarantining imported hogs before allowing them to run with the herd, the liability to infection from hog cholera will be much reduced. Consult: Nocard and Leclainche, *Les maladies microbiennes des animaux* (Paris, 1898); de Schweinitz, "Hog Cholera," and "Swine Plague," in *United States Department of Agriculture, Bureau of Animal Industry Reports* (Washington, 1889-92).

HOG-DEER. The 'para' or smallest of the East Indian rusine deer (*Cervus porcinus*), which takes its name from its habit of darting through the tall grass like a startled boar. It stands only two feet high at the withers. Its legs are comparatively short, and its antlers, having given off a brow tine, are nearly straight to the small terminal fork, and are mounted upon remarkably high pedicels. The general color is rufous brown, paler in summer and somewhat spotted. This deer ranges through Northern India, and down the coasts of Assam and Burma. It is very numerous, not gregarious, and

forms a favorite object of jungle sport, sometimes by spearing.

HOGGE, HÖG, MOSES DRURY (1819—). An American Presbyterian minister. He was born in Hampden-Sidney, Va., was educated there, and was made assistant in a Richmond church in 1844. When a second Presbyterian church grew out of the first, Dr. Hoge became its pastor (1845-85), and during the Civil War he succeeded in sailing to England from the blockaded port of Charleston to secure from the British and Foreign Bible Society a very large number of volumes for the use of Confederate soldiers. He was joint editor of the *Central Presbyterian* (1862-67).

HOGFISH, or HOGMOLLY. (1) See LOG-PERCH. (2) See STONE-ROLLER.

HOGG, JAMES (1770-1835). A Scottish poet, known as the 'Ettrick Shepherd,' born in the parish of Ettrick, Selkirkshire, in 1770. His father was a poor farmer. The boy's education was slight, for he was taken from school to herd ewes. But from his mother he learned many folk-tales of giants, fairies, and brownies. Beginning to make songs for lasses to sing in chorus, he next wrote them out with great labor. His first poem was published anonymously in 1800. Going to Edinburgh, in 1801, to sell his employer's sheep, he wrote out from memory a little collection of his songs and published them roughly as *Scottish Pastorals, Poems, Songs, etc.* The next year he made the acquaintance of Scott, who was visiting the Ettrick forest in search of material for the *Minstrelsy of the Scottish Border*. Several ballads which Hogg and his mother furnished Scott appeared in the third volume of the *Minstrelsy* (1803). In 1807 Hogg published *The Mountain Bard*, original ballads suggested by Scott. With the proceeds of this volume and a treatise on sheep, amounting to £300, Hogg took a farm, which proved a disastrous venture. In 1810 he went to Edinburgh and began as professional author. Three years later appeared his most imaginative poem, *The Queen's Wake*. By this time he was becoming acquainted, directly or through correspondence, with some of the most eminent men of letters, who admired him greatly. He married in 1820, and retired to the farm of Eltrive Lake, in the valley of the Yarrow. He died November 21, 1835, and was buried in the Ettrick churchyard. In 1860 a monument was erected to his memory, overlooking Saint Mary's Lake. Hogg was immortalized as the Ettrick Shepherd by Wilson in the *Noctes Ambrosianæ*. Among his poems not cited above are *Madoc of the Moor, The Pilgrims of the Sun, The Jacobite Relics of Scotland, Queen Hyde, and The Border Garland*. These and other poems place Hogg, after Burns, among the greatest of the peasant poets of Scotland. Well known are such songs as "When the Kye comes Hame" and "Flora Macdonald's Farewell." Hogg also wrote many tales of uneven quality. The most remarkable is entitled *Confessions of a Fanatic*. Interesting, too, is the volume called *Winter Evening Tales*, depicting the manners of the border. Consult: *Works*, edited with memoirs by T. Thomson (London, 1865); "Poems," selected, in *Canterbury Poets* (London, 1886); and *Memorials of J. Hogg*, by his daughter, Mrs. Garden (London, 1885).

HOGNOSE. A harmless American serpent, remarkable for its blunt snout and curious man-

ners. Three species form the colubrine genus *Heterodon*, all confined to North America, exclusive of the Pacific Coast and Mexico. The best known species (*Heterodon platyrhinus*) is one of our most common and widespread snakes. It is usually about two, but may be three, feet long, and is normally reddish-brown above, heavily blotched or obscurely barred with a darker tint; and underneath is greenish-white. Great variety in color and markings exist, however, and many seem sooty black or dark slate all over. It is

HEADS OF HOGNOSE SNAKES.

1. *Heterodon platyrhinus*. 2. Face of same. 3. *Heterodon nasicus*. 4. *Heterodon simus*.

always to be recognized by its pig-like snout and its extraordinary behavior when disturbed. It is timid and will hide or escape when possible; but if surprised or cornered it will throw itself into vigorous contortions, and perhaps soon tumble over on its back as if dead; or, more probably, it will inflate its long lung until its body swells up like a sausage, and at the same time extend its anterior ribs until its neck is surprisingly broad and flat, and then, opening wide its great mouth, will blow and hiss loudly. This alarming menace is meant to terrify its foes, and has led to the popular names of 'blowing viper,' 'spreading adder,' etc., and to the general belief that it must be very poisonous. Its blotched back, easily mistaken by the unobserving for that of a copperhead, adds to its evil reputation. Nevertheless, this snake is entirely harmless, and when handled is found to be so gentle that it can hardly be forced to bite.

It feeds on mice, frogs, insects, birds' eggs, and so on, all obtained on the ground, for it is unable to climb trees. It lays a number of eggs, about an inch in length, in loose soil, into which it burrows for this purpose. The eggs are covered with a tough parchment-like coat, and probably hatch in a few days. There seems to be no precise time of laying; young have been reported from May until September. The young just issued from the egg will go through their contortions and hissing when molested, as do the adults. Much interesting information as to their breeding and other habits, collected by Abbott, Hay, and others, will be found summarized in Cope, *Crocodilians, Lizards, and Snakes*, published by the Smithsonian Institution (Washington, 1900).

The Southern States have a second species (*Heterodon simus*), and Texas and the Mexican border a third (*Heterodon nasicus*), in which the point of the snout is long and more upturned than in the Northern forms.

HOG-PLUM, **SPANISH PLUM**, and **BRAZILIAN PLUM**. Names given in the West Indies and other tropical countries to the fruit of certain species

of *Spondias*, a genus which belongs to the natural order Anacardiaceæ. The species are trees and shrubs with pinnate leaves, with terminal leaflets, and flowers in racemes or panicles. Some of them produce very pleasant fruits, among which may be mentioned *Spondias purpurea* and *Spondias lutea*, which are generally called hog-plum in the West Indies, because the fruits are a common food of hogs. *Spondias purpurea* has fruit about an inch in length, ovate or oblong, purple or variegated with yellow; yellow pulp with a peculiar but agreeable acid and aromatic taste. The fruit of *Spondias tuberosa*, called imbuzeiro in the north of Brazil, is about twice the size of a large gooseberry, oblong, yellowish, with a leathery skin and sweetish-acid pulp. A much-esteemed Brazilian dish is prepared of milk, curds, sugar, and the pulp of this fruit, from which also a refreshing beverage is made for use in fevers. The tree is remarkable for the numerous round black tubes, about 18 inches in diameter, which it produces on its widely spreading roots, and which are very cellular, and full of water. They are evidently intended for the wants of the tree in the dry season, and are often dug out by travelers for the sake of the water, of which each full-grown tuber yields about a pint. An important species is the ti or tahiti apple (*Spondias dulcis*), a very fine fruit of the South Sea Islands. This tree often attains a height of 50 to 60 feet, and, according to Seeman, is laden with fruits averaging a pound each.

HOG-RAT. See HUTIA.

HOGSHEAD. An old English measure of capacity. For wine, it was equivalent to 63 gallons; for ale and beer, to 54 gallons. In the United States it is still used as a measure for liquids, equivalent to 63 gallons; but when used for tobacco, it varies in different States from about 750 to 1200 pounds. See WEIGHTS AND MEASURES.

HOGUE, ðg, or **HOUGUE**, oög, LA. A roadstead near the northeast extremity of the Peninsula of Cotentin, Normandy, a few miles south of Barfleur. It gives its name to the naval battle of May 29 (old style May 19), 1692, when the combined English and Dutch fleets, under Admiral Russell, defeated the French fleet commanded by Tourville. The name of La Hogue is often confounded with La Hague, the name of the cape at the northwest extremity of Cotentin.

HOGUET, ð'gá', KARL (1821-70). A German painter, born in Berlin. He studied first under Krause, and then went to Paris, where he was a pupil of Ciceri, and afterwards of Isabey. His works are marine and genre, and belong to the French school. Among them are: "Rue Pirouette in Paris," "From Normandy," "Last Windmill on Montmartre," "The Wreck" (1864, Berlin Museum), "Market Scene at Rouen," and "Lighthouse Near Boulogne."

HOHENHEIM, hō'en-him, PHILIPPUS, A. P. VON. See PARACELUS.

HOHENLINDEN, hō'en-lin'den (Ger., Tall Lindens). A village in Upper Bavaria, 19 miles east of Munich, celebrated for the victory gained there by the French, under Moreau, over the Austrians under Archduke John, December 3, 1800. Moreau's army was posted on the plateau between the Isar and the Inn, and barred the way to Mu-

nich, which was the Archduke's objective point. In three columns the Austrians advanced to the attack through forest and ravines in a blinding snow-storm. Moreau contented himself with holding them in check until Richepanse, whom he had sent around the enemy's flank, reached the Austrian rear. Then he hurled Ney against their front. Richepanse delivered his attack from the rear, and the Austrian army was destroyed between the two French forces. The Austrians lost 20,000 men and 100 guns, while Moreau's loss amounted to only 5000. The battle hastened the conclusion of peace at Lunéville, February 9, 1801.

HOHENLOHE, hō'en-lō'e. Formerly an earldom, later a principality, in Franconia, Germany. It was mediatised in 1806, the main portion being assigned to Württemberg and a part to Bavaria.

HOHENLOHE. A princely family of Germany, claiming descent from Eberhard, one of the early dukes of Franconia. The family first appears in history in the early part of the twelfth century in possession of the Castle of Holloch, near Uffenheim. The first count we hear of is Heinrich, who lived in the twelfth century. He left two sons, Konrad and Gottfried, who followed the fortunes of the Hohenstaufen, and founded, respectively, the lines of Hohenlohe-Brauneck and Hohenlohe-Holloch. The former became subdivided into the Haltenbergstetten and Brauneck branches, both of which were extinct in 1390; the latter into the Weikersheim and Uffenheim, or Speckfeld, branches, of which the latter became extinct in 1412. In 1551 a new division in the Weikersheim line gave rise to the branches of Hohenlohe-Neuenstein and Hohenlohe-Waldenburg, which still continue. In the Reformation the Neuenstein branch became Protestant, while the Waldenburg counts remained Catholic. Princely rank was conferred upon the latter branch in 1744, and on the former in 1764. Of the Neuenstein branch there were two lines: Oehringen, extinct in 1805, and Langenburg, the latter being further subdivided into the Hohenlohe-Ingelfingen (Oehringen after 1805), and Hohenlohe-Kirchberg, extinct in 1861. The Waldenburg branch formed two lines: Bartenstein, with the cadet branch of Jagstberg, and Schillingsfürst, to which was added the Duchy of Ratibor. Among the prominent members of the Hohenlohe family are:

FRIEDRICH LUDWIG, PRINCE OF HOHENLOHE-INGELFINGEN (1746-1818). He distinguished himself at the storming of Weissenburg (1793), and won the battle of Kaiserslautern (September 20, 1794). After the defeat of Jena, in which he shared, he succeeded the Duke of Brunswick in command and capitulated at Prenzlau with 17,000 men (October 28, 1806). For this he was severely censured and forced to retire from further participation in the campaign.—**KRAFT KARL AUGUST EDUARD FRIEDRICH, PRINCE OF HOHENLOHE-INGELFINGEN** (1827-92). A Prussian general of artillery. He received a thorough training for the artillery service, and was placed in several positions of responsibility. In 1866 he held an important command at Sadowa, and in 1870 he commanded the artillery of the Guards in all its engagements, including Saint-Privat and Sedan. He was chief of artillery at the siege of Paris. He was made a lieutenant-general

in 1873, adjutant-general in 1875, general of infantry in 1883, and general of artillery in 1889. He died in Dresden, January 16, 1892. He was the author of several works on military science: *Militärische Briefe* (1887-90); *Strategische Briefe* (1887); *Die Feldartillerie in ihrer Unterstellung unter die Generalkommandos* (1889); *Ideen über Befestigungen* (1888); also, *Gespräche über Reiterei* (1887).—**CHLUDWIG KARL VICTOR, PRINCE OF HOHENLOHE-SCHILLINGSFÜRST**, of RATIBOR and KORVEI (1819-1901). Chancellor of the German Empire from 1894 to 1900. He was born March 31, 1819, at Rotenburg-an-der-Fulda. His mother was a princess of Hohenlohe-Langenburg. He studied political science and jurisprudence at Heidelberg, Göttingen, and Bonn. Before he came to his title of Duke of Ratibor and of Korvei, in 1845, he held offices in connection with the law courts at Ehrenbreitstein and Potsdam. In the Bavarian Diet he opposed the Ultramontane policy, and in 1866 he strove to bring over Bavaria to the side of Prussia. At the close of the year he became Bavarian Minister of Foreign Affairs and president of the Ministerial Council, holding office till March, 1870. His efforts in behalf of a united Germany long met with fierce opposition, but he saw clearly the triumph of the cause for which he had worked, and entered the First German Reichstag as a member of the *Reichspartei*. In 1874 he was appointed German Ambassador to Paris, and in 1878 he was the third German Plenipotentiary at the Congress of Berlin. In 1885 he became Governor of Alsace-Lorraine, in which position he displayed conspicuous tact. On the resignation of Count Caprivi, in 1894, Prince Hohenlohe was created Imperial Chancellor. This office he resigned in 1900, being succeeded by Count von Bülow. During his long career in German politics Prince Hohenlohe did much to promote German unity. He had to face the hostility of the anti-Unionists in Bavaria, and was one of Bismarck's chief supporters in that statesman's Imperial policy. As Governor of Alsace-Lorraine, Hohenlohe aided greatly in Teutonizing the provinces. As Chancellor he promoted the colonial policy, and favored the creation of a powerful navy. He was a favorite with William II., whose masterful policy he did not oppose, and with whom he was on the best of terms up to the time of his resignation, in October, 1900. It was said that the cause of his resigning the Chancellorship was dissatisfaction with the advanced or 'forward' policy favored by the Emperor, especially in so far as it related to China. He died at Ragatz, Switzerland, July 6, 1901.—**GUSTAV ADOLF** (1823-96), **PRINCE OF HOHENLOHE-SCHILLINGSFÜRST**. A brother of the Chancellor. He took holy orders in 1849, and became in 1857 Bishop of Edessa in *partibus*, and almoner to Pius IX. He was made a cardinal in 1866. He was opposed to Jesuit influence in Rome, and endeavored to prevent the Kulturkampf (q.v.). He was sent to Rome in 1872 as Ambassador to the Holy See, but his appointment was rejected by Pius IX. He returned to Rome in 1876, and subsequently gained the favor of Leo XIII. From 1879 to 1884 he was Bishop of Albano, and became subsequently Archpriest of Santa Maria Maggiore in Rome. He died in Rome, October 30, 1896.—**HERMANN, PRINCE OF HOHENLOHE-LANGENBURG** (1832—). He entered the Württemberg army, was in the Austrian service from

1854 to 1860, and was a general in the army of Baden from 1862 to 1871. He has been a member of the Upper Chamber of Württemberg since 1860, and was elected its vice-president in 1893. He was a member of the Imperial Reichstag from 1871 to 1880, and acted with the *Reichs-partei*. (See POLITICAL PARTIES, paragraph on *Germany*.) In 1894 he became Governor of Alsace-Lorraine. He was the founder and president (1883-94) of the Deutsche Kolonialgesellschaft. He holds the military rank of general of cavalry in the Prussian Army.

HOHENSTAUFEN, hō'en-stou'fen. A princely house of Swabia, in Germany, which held possession of the German Imperial throne from 1138 to 1254. The family traced its descent from Frederick of Büren, who lived about the middle of the eleventh century, and whose son, Frederick of Staufen, built the castle from which the family derived its name, some vestiges of which are still to be seen on the summit of the Hohenstaufen, one of the peaks of the Raube Alb, close to the town of Göppingen, Württemberg. The son, Frederick of Staufen, was a faithful partisan of the Emperor Henry IV., and in return received Henry's daughter and the Duchy of Swabia in 1079. Duke Frederick, at his death in 1105, left two sons—Frederick II., the One-Eyed, and Conrad; the former was immediately confirmed in the possession of Swabia by Henry V., and in 1112 the latter received the Duchy of Franconia. Upon the death of Henry V. in 1125 his family estates fell to the House of Hohenstaufen. It seemed, too, as if the Imperial dignity would be conferred upon Frederick on account of his talents and popularity; but Lothair of Saxony, his rival and enemy, was elected as Henry V.'s successor. On Lothair's accession, he demanded the Imperial possessions held by the House of Hohenstaufen, and a war ensued between him and the Hohenstaufen princes, in which Lothair was supported by the House of Welf (Guelph). In the course of this struggle Conrad was crowned King of Italy in 1128; but the two brothers were forced to make peace with Lothair in 1135, and afterwards lent him their support. After Lothair's death, Conrad was elected King of Germany, in 1138, as Conrad III. (q.v.). Under Conrad III. the House of Hohenstaufen waged war against the House of Guelph, which for a brief time was weakened by the loss of Bavaria.

On Conrad's death, in 1152, his nephew, Frederick I. Barbarossa, became Emperor. As he was the offspring of a Hohenstaufen father and a Guelph mother, it was hoped that the struggle between the two houses might be ended by his accession. But the defiant attitude of Henry the Lion, Duke of Saxony and Bavaria, the powerful representative of the Guelph family, caused the conflict to break out afresh in 1180. Henry the Lion was conquered and deprived of most of his possessions. Frederick went on the Third Crusade, but died in 1190, before reaching Jerusalem. His son, Henry VI., succeeded to the throne without opposition. By a marriage with the heiress of Sicily and by conquest he added Southern Italy and Sicily to the Empire. He exercised the most far-reaching power of any of the Hohenstaufen, and dreamed of a world-wide empire. Richard the Lion-Hearted of England was obliged to become his vassal in order to be freed from captivity. Some of the Christian rulers

in the East had sought protection from Henry, and he sent an army to the Holy Land, 'the German Crusade' (see CRUSADES) to establish his own supremacy. His plans were frustrated by his early death, in 1197. His son Frederick II. had already been crowned King of Germany, but as he was only a child of three, his rights were passed over. The Guelphs chose Otho of Brunswick, son of Henry the Lion, and the choice of the partisans of the Hohenstaufen fell upon Philip of Swabia, uncle of Frederick II. Civil war followed, the contest terminating with the assassination of Philip in 1208 by Otho of Wittelsbach. For a time Otho of Brunswick (Otho IV.) was recognized as ruler; then his opponents rallied about Frederick II., who in the meanwhile had been ruling his Kingdom of Sicily, which he had inherited from his mother. Frederick was crowned, and by 1215 was recognized by all except a few obstinate partisans of Otho IV. He ruled over Germany, Italy, and Sicily, and also became King of Jerusalem. His reign was spent to a great extent in a struggle with the Papacy. The partisans of the Hohenstaufen in Italy and the opponents of the Imperial power, in general the supporters of the Papacy, were known respectively as Ghibellines and Guelphs. (See GUELPHS AND Ghibellines.) After Frederick's death, in 1250, the inveterate animosity of the Guelphs followed his son, Conrad IV., who abandoned Germany for his hereditary Italian possessions, and died in 1254. After Conrad's death his half-brother Manfred fought for the Hohenstaufen interests until he was defeated and killed at the battle of Benevento, in 1266, against Charles of Anjou, who at the invitation of the Pope, had undertaken the conquest of the Two Sicilies. Manfred's sons were kept in prison until his death. His daughter married Peter III. of Aragon, who later avenged the destruction of the Hohenstaufen by expelling their foes from the Kingdom of Sicily. Conrad's young son, Conradin, in an attempt to reconquer the Two Sicilies, was taken captive by Charles of Anjou at the battle of Tagliacozzo, and executed at Naples on October 29, 1268. Enzo, an illegitimate son of Frederick II., who had been made King of Sardinia, died in prison four years later. Thus all of the male descendants of Frederick II. perished. The emperors of this family rank among the ablest rulers of Germany, and hold the first place in popular German tradition today, just as they held the first place in the affections of the people during their lifetime. They appear in general as men possessed of great virtues and of great faults, and impressive by reason of both. Frederick Barbarossa, according to the legend, is not dead, but asleep, and will wake to help his people in time of need. Frederick II. is one of the most remarkable figures of the Middle Ages in his character as ruler, knight, scholar, and free-thinker. Consult Raumer, *Geschichte der Hohenstaufen* (5th ed., Leipzig, 1878). See, also, articles on the individual emperors.

HOHENSTEIN, hō'en-stin. A manufacturing town in the Kingdom of Saxony, 12 miles northeast of Zwickau (Map: Prussia, E 3). It produces chiefly textiles and knit goods; in the neighborhood are mines of sulphur, arsenic, and gold. Population, in 1890, 7546; in 1900 (with the neighboring town of Ernstthal annexed in 1898), 13,397.

HOHENWART, hō'en-värt, KARL, Count (1824-99). An Austrian statesman, leader of the Federalist party. In 1868 he became Governor of Upper Austria, and three years afterwards succeeded Potocki as president of the Ministry. In his Cabinet he held the portfolio of the Interior. His federalist policy met with such opposition on the part of the Hungarian Ministry and the German Liberals that he was forced to resign after holding office for less than a year. He was elected to the Lower House in 1873, and became a leader of the Right Centre. In 1885 Hohenwart was appointed president of the Supreme Court of Accounts, and in 1891 he formed the Hohenwart Club, consisting of German Conservatives, Slovenes, Croats, and Rumanians, as well as the great landed proprietors of Bohemia. But this party broke in 1895, through the defection of the German members, and in 1897, on the appointment of its leader to the House of Lords, it disintegrated entirely.

HOHENZOLLERN, hō'en-tsól'lern. A province of Prussia, consisting of a narrow strip of land entirely surrounded by Württemberg and Baden, and covering, together with its nine exclaves, an area of about 440 square miles (Map: Prussia, C 4). It extends from the Neckar in the northwest to the vicinity of Lake Constance. It is divided by the Rauhe Alb, which rises in places to 3000 feet. The Danube crosses the province, which is well watered. The mountain valleys are productive, and yield grain, fruit, hops, etc. The Alb chain yields some iron, and in other mountains some deposits of rock salt are found. Mineral springs abound. Some manufacturing is done in the way of cotton-spinning, the production of iron of superior quality, etc. Administratively the province is divided into the four districts of Sigmaringen, Gammertingen, Haigerloch, and Hechingen. Since 1873 it has had a Landtag sitting at Sigmaringen. It sends one Deputy to the Reichstag. The population numbered, in 1900, 66,783. The inhabitants are nearly all Roman Catholics, and the province forms a dependency of the Archbishop of Freiburg. On a steep eminence near Hechingen stands the magnificent Castle of Hohenzollern, erected in the second half of the nineteenth century, in the style of the fourteenth century, on the ruins of the mediæval stronghold, the cradle of the reigning Hohenzollern dynasty of Prussia.

HOHENZOLLERN. The family name of the royal house of Prussia, in which has been vested also, since January 18, 1871, the dignity of German Emperor. The name is derived from the ancestral Castle Zollern, or Hohenzollern, in Swabia (see preceding article). The origin of the house is involved in obscurity, and the story of its descent from Count Thassilo, a Swabian noble of the time of Charles the Great, is a fiction of the sixteenth century. The family name occurs as early as the eleventh century in the persons of Burchard and Wezel of Zolre, who were killed in 1061, but whether there is any relationship between these and the succeeding Hohenzollern family is a matter of doubt. The House of Hohenzollern occupied a prominent position among the petty princely families of Swabia as early as the first half of the twelfth century, and at the close of that century we find Count Frederick of Zolre invested with the Burggraviate of Nuremberg, an

Imperial office, which descended to his posterity. His sons, Frederick and Conrad, divided the possessions of the house in 1227, founding the Swabian and Franconian lines. From the close of the sixteenth century the elder or Swabian branch of the House of Hohenzollern existed in the two lines of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen. In 1695 a pact of inheritance was made between these branches and that of Brandenburg (see below). In 1821 a new covenant was drawn up and confirmed by the King of Prussia, as head of the Hohenzollern family, by which it was provided that in case of failure of male issue in either line possession should pass to the other, and on the extinction of both lines should vest in the royal family of Prussia. But before the prospect of extinction presented itself the princes of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen, after the commotions of the revolutionary year 1848, decided to abdicate in favor of the King of Prussia. The act of renunciation took place at the close of 1849, and in accordance with the covenant of 1821 the King of Prussia took possession of the two principalities in the following year, the two princes being given annual pensions. Leopold of Hohenzollern, the prince who was offered the crown of Spain in 1870, was the eldest son of the last ruler of Hohenzollern-Sigmaringen. The second son, Charles, became Prince and King of Rumania.

The great destiny of the family was reserved for the cadet branch, the Franconian line. They attached themselves to the Hohenstaufen until that great house became extinct, when they gave their support to Rudolph of Hapsburg. During the civil war which followed the double election of 1314 they sided with Louis of Bavaria against the House of Austria, but subsequently they became once more faithful supporters of the Hapsburgs. Acquisitiveness and a capacity to hold what was once obtained and to administer it with thrift seem to have characterized to a greater or less degree all the Franconian Hohenzollern princes. From the founder of the line, Conrad III. (died 1261), there was a steady gain in territory and influence under Frederick III. (1261-97), Frederick IV. (1297-1332), John II. (1332-57), and Frederick V. (1357-98). The possessions of the house, in which was vested the Burggraviate of Nuremberg, were constituted into the two margraviates of Bayreuth (originally Culmbach) and Anspach. The sons of Frederick V., John III. and Frederick VI., possessed respectively Bayreuth and Anspach, the latter inheriting his brother's possessions in 1420. Frederick VI. in 1411 received the Margraviate of Brandenburg as a pledge for a loan to the Emperor Sigismund, and in 1415 it was granted to him as an hereditary possession, together with the dignity of Elector. This was the foundation of the real greatness of the House of Hohenzollern.

The Elector Albert Achilles of Brandenburg by the so-called *Dispositio Achillea* of 1473 decreed that the Franconian margraviates (Anspach and Bayreuth) should be separated from Brandenburg and ruled as secundogenitures. The last Margrave of Bayreuth died in 1769, when the State was united with Anspach. In 1791 the Margrave of Anspach and Bayreuth sold his principalities to Prussia, which, however, retained them only a few years.

The succession of electors of Brandenburg was as follows:

Frederick I. (the Frederick VI. mentioned above).	(1415-1440)
Frederick II.	(1440-1470)
Albert Achilles.	(1470-1486)
John Cicero.	(1486-1499)
Joachim I. Nestor.	(1499-1535)
Joachim II. Hector.	(1535-1571)
John George.	(1571-1598)
Joachim Frederick.	(1598-1608)
John Sigismund.	(1608-1619)
George William.	(1619-1640)
Frederick William, the Great Elector.	(1640-1688)
Frederick III.	(1688-1713) after 1701, King Frederick I. of Prussia.

The Hohenzollern kings of Prussia since Frederick I. have been as follows:

Frederick William I.	(1713-1740)
Frederick II. the Great.	(1740-1786)
Frederick William II.	(1786-1797)
Frederick William III.	(1797-1840)
Frederick William IV.	(1840-1861)
William I.	(1861-1888), after 1871, German Emperor
Frederick III.	(1888)
William II.	(1888—)

The history of the Hohenzollern family from the fifteenth century is that of BRANDENBURG, PRUSSIA, and GERMANY. Consult: Stillfried-Alcantara and Kugler, *Die Hohenzollern und das deutsche Vaterland* (Munich, 1881), a well-ordered account in luxurious folio volumes, dedicated to Emperor William I., and presumably having a semi-official standing; Waddington, *L'acquisition de la couronne royale de Prusse par les Hohenzollern* (Paris, 1888), a valuable study of Hohenzollern history in the seventeenth and eighteenth centuries, with many documents; Berner, *Die Abstammung und älteste Genealogie der Hohenzollern* (Berlin, 1893); Seidel, *Hohenzollern-Jahrbuch, Forschungen zur Geschichte der Hohenzollern in Brandenburg-Preussen* (Leipzig, 1897, et seq.); Tuttle, *History of Prussia* (Boston, 1884-96), one of the best products of American historical scholarship, cut short at 1757 by the death of the author.

HÖHNEL, hē'nel, LUDWIG VON (1857—). An Austrian explorer, born at Pressburg and educated at the Naval Academy of Fiume. In 1887 he accompanied Count Teleki in the journey from Zanzibar, on which Lakes Rudolph and Stephanie were discovered, and a large area, before unknown, carefully plotted on Höhnel's maps. The expeditions proved the connection between the Abyssinian plateau and the Rand. Lieutenant Höhnel described the results of his journey in his book, *Zum Rudolfsee und Stefaniesee* (1892). In 1892-93 he made a journey of exploration with an American traveler, William Astor Chanler (q.v.), in the country between the rivers Tana and Juba. Consult Chanler, *Through Jungle and Desert* (New York, 1896).

HÖHSCHIED, hē'shit. A town of the Prussian Rhine Province, situated on the Wupper, 17 miles east-southeast of Düsseldorf (Map: Prussia, B 3). It has extensive manufactures of steel products and machinery. Population, in 1890, 12,593; in 1900, 14,172.

HOI-HAU, hoi'hou'. The seaport of Kiungchow (q.v.).

HOJEDA, ô-hā'da, ALONZO DE. A Spanish pioneer in America. See OJEDA.

HÖJŌ, hō'jō. The name of five towns in Japan, from one of which, in Idzu (q.v.), arose the celebrated family of regents known as the Hōjō,

which, during the era of the puppet Shoguns at Kamakura (A.D. 1219-1333), ruled the Empire. Of the twelve, several were of marked ability. During their régime Buddhism developed rapidly, and the Mongol invaders under Kublai Khan were driven off and their armada destroyed. The Hōjō were overthrown by one Nitta Yoshisada in 1333. Consult: Griffin, *The Mikado's Empire* (New York, 1900); Adams, *History of Japan*, vol. i. (London, 1884); Brinkley, *Japan, Its History, Arts, and Literature* (Boston, 1901-02).

HOK-CHIN, hōk'chēn'. See FU-KIEN.

HOKITIKA, hō'kē-tē'kā. The capital of Westland County, on the northwest coast of South Island, New Zealand (Map: New Zealand, C 5). It lies 24 miles southwest of Greymouth, with which and with Nelson it is connected by rail. It has thriving agricultural industries, while gold-mining, which was formerly of great importance, is still carried on. Population, in 1901, 1951.

HOKKAIDO, hōk'kī'dō. See YEZO.

HO-KOW, hō'kou'. The name of a number of towns in China, the most important of which are the following: (1) A town situated in the Province of Kiang-si, on the right bank of the Poyang-hu Lake, opposite Kiu-kiang (Map: China, E 6). It has an extensive trade in black tea, and an estimated population of 300,000. (2) A treaty port, situated in the northern part of the Province of Yun-nan, on the left bank of the Red River, nearly opposite the town of Lao-kai in Tonking, with which it is connected by a suspension bridge, completed in 1900. It is only a short distance from the treaty port of Meng-tsze. It is a small village of about 4000 inhabitants, and the seat of a French vice-consulate. It was opened for foreign trade in accordance with a supplementary convention between China and France of June 20, 1895. The trade of the port is as yet insignificant. (3) A small town in the northern part of the Province of Shan-si, at the confluence of the Hei-shui River with the Hoang-ho. It has important soda-works, and lies near the starting-point of the highway to Peking.

HOKUSAI, hōk'ōō-sī (1760-1849). A noted Japanese artist. He was born at Honjō, in Yedo (now Tokio), son of an artisan named Nakashima Ise, a maker of metal mirrors in the employ of the Shogun of the time. Little is known of his life beyond what he himself tells in the prefaces to his numerous works. At thirteen he left home and apprenticed himself to an engraver. Five years afterwards he gave up engraving to study with Shunsho, the most noted designer of the time, but was expelled in 1786 for persistently indulging in a style that was displeasing to his master. He tried to make a living by illustrating comic books, but not meeting with success, he became a peddler, continuing to draw and paint as he had opportunity. In order to attract attention and raise money, he in 1804 exhibited his dexterity by painting in public a colored figure of a Buddhist saint on a sheet of paper 18 yards long and 11 yards wide, using brooms for brushes and buckets to hold his liquid India ink. Three years later he became associated with Bakin, the novelist, and collaborated with him in illustrating a work translated from the Chinese by Bakin, and containing 108 portraits of Chinese heroes. This

appeared in 1828. His connection with Bakin lasted only four years, and he was again adrift. His public career really did not begin until 1810, when he became an industrial artist and a teacher of drawing. Pupils flocked to him in numbers so great that he could not supply them with original drawings of his own as models, so he began wood-engraving in order to furnish the needed number. In this way his *Mangwa*, or album of "Ten Thousand Sketches," took form, and his fame spread as volume after volume and edition after edition appeared. The later volumes of this series appeared in 1836, a year after the issue of his *Fugakū Hiyakūkei*, or *Hiakke* ("A Hundred Views of Fujisan"). His industry was great, and his works numerous. Thirty thousand drawings of his have been counted up, yet he was always in poverty. He died April 13 (some say May 10), 1849, at Asakusa, a district of Yedo, the ninety-third place in which he had lived. Money for his funeral was provided by his pupils and admirers. He was twice married, and had five children.

Hokusai was a man of the people to the end. He never rose above his class, and never made any attempt to do so. His talent lay in producing *Uki-o-ye* ('pictures of this passing world'), free from the conventionalities of his predecessors and his contemporaries. His influence on modern art has been very great. His whole life was spent in perfecting himself; yet when he came to die his last words were, "If Heaven would only grant me ten more years!" and a moment later, "If Heaven had only granted me five years more, I could have been a thorough artist." His signatures were numerous. In 1798 he appears under the name of 'Sori,' in the following year he changed this to 'Sori, who has changed his name to Hokūsai.' In 1800 he called himself simply 'Hokusai' ('North Studio'). A favorite signature was 'Hokusai Gwa-Kio Rōjin' ('Hokusai, the old man crazy about drawing'). His latest name was 'Manji' (the Swastika), and the inscription over his grave is the one he loved most to use—'Manji Gwa-Kio Rōjin.' A full list of his works (with a bibliography) is given in Anderson's *Descriptive and Historical Catalogue of Chinese and Japanese Art* (London, 1886).

BIBLIOGRAPHY. *Hokusai*, a paper read by John La Farge before the Century Club (New York, 1897); Holmes, *Hokusai* (London, 1899); Fenollosa, *Hokusai and His School* (Boston, 1893); Anderson, *History of Japanese Art* (London, 1886); and *Fuji Hiakke* ('A Hundred Views of Fujisan') (London, 1880). HOL'ABIRD, SAMUEL BECKLEY (1826—). An American soldier, born in Canaan, Conn. He graduated at West Point in 1849, served with the Army of the Potomac (1861-62), and continued to rise in his profession till he became brigadier and quartermaster general (1883), as well as translator for the army. His chief work in that connection was General Jomini's *Treatise on the Grand Military Operations of Frederick the Great* (1865).

HOLARCTIC REGION (from Gk. ὅλος, *holos*, entire + ἄρκτικός, *arktikos*, northern, from ἄρκτος, *arktos*, bear). A division in zoögeography, defined in two senses: (1) *Arctogæa*.—In the

larger sense the term is used, unhappily, as a synonym for 'Arctogæa.' (See DISTRIBUTION OF ANIMALS and NOTOGÆA.) This 'region' embraces all of the Northern Hemisphere except the hot coast regions of Central America, all of Africa and Madagascar, and an indefinite extent of the Malayan and Polynesian islands, where its boundaries vary in different classes of animals; in other words, it is a combination of the Nearctic, Palearctic, Palæotropical, and Oriental regions of Selater and Wallace, as opposed to the combined Neotropical and Australasian regions (Notogæa). The fundamental difference between Arctogæa and Notogæa reaches back to an early geological period, while many of the present distinctions between their subdivisions disappear when traced back to the Tertiary, when the distribution of animal life was very different from now. It is this broad historical view, rather than the modern aspect, which has led naturalists to the generalizations of Arctogæa and Notogæa. Limiting the comparison to vertebrate animals, the characteristics of Arctogæa are in outline as follows: Among fishes, the perches, carps, salmons, and sturgeons are present as whole tribes, together with many lesser groups, especially of fresh-water or coast fishes, while the lungfishes are conspicuous absentees. In the class Amphibia, the line is drawn at the frog family Cystignathidæ, which is entirely Arctogæan. Gadow also points out the predominance of Arcifera, which constitute nine-tenths of the anurous population, and are hardly represented in Notogæa. Of turtles, the presence of Trionychoidea and the absence of Chelydida are distinctive. Of lizards, exclusively Arctogæal groups are the Lacertidæ, Zomoridæ, Gerrhosauridæ, and Anellidæ. Among the snakes, the viper family is entirely Arctogæal, and the crotaline tribe mainly so. Lesser exclusive groups are the Uropeltidæ, Xenopeltidæ, and many genera. Ornithological distinctions may be most easily sketched by saying that Arctogæa possesses no emus or cassowaries; no mound-birds, birds of paradise, lyre-birds, cockatoos, tinamous, curassows, hoatzins, toucans, cotingas, or many others, although it is rich in game birds, finches, woodpeckers, wood-warblers, and the like. But perhaps the most striking difference is the presence of the large Arctic tribe of auks, and the like, and the absence of penguins. Among mammals, also, the most notable feature is the entire absence of edentates, of monotremes, of marsupials (except one opossum), of eebine monkeys, and of marmosets. The northern region, on the other hand, has all the lemurs, all the insectivores with the exception of the West Indian Solenodon, all the elephants, rhinoceroses, hyraces, horses, deer, giraffes, bovines, hyenas, hares, and a variety of other important families; it is, in fact, as Beddard points out, the headquarters of all the Eutheria except edentates and marsupials.

(2) *Holarctic, or Periarctic, Province*.—In a more restricted and perhaps more usual sense, the term 'holarctic' in zoögeography denotes a circumpolar district formed by the union of the Palearctic and Nearctic provinces of Selater and Wallace, elsewhere described. It was long ago felt that the faunal characteristics of North America and the northern part of the Old World were not sufficiently distinct to justify their separation into two provinces. Their union under one name was first made by A. Heilprin,

who proposed 'Triarctic' as the new designation. For this A. Newton suggested the substitution of 'Holarctic,' which Heilprin at once adopted. More recently Gadow has used 'Periarctic' as a synonym, on the ground that it is more precise. Its faunal characteristics are those sketched in the first paragraph, with the omission of such forms as are exclusively Ethiopian (Africa, south of the Sahara) or Oriental (the Asiatic coast and islands south of the Himalayan watershed). The faunal agreement between North America and the northern part of the Old World is greater than any differences. There are few families not represented in both, and the distinctive animals are mainly local genera or species, while a great many apparently identical forms occur on both continents, having a circumpolar distribution due either to their powers of travel or to ancient land connections. Consult: Heilprin, *Geographical and Geological Distribution of Animals* (New York, 1887); Newton, *Dictionary of Birds* (New York, 1896); and the authorities referred to under DISTRIBUTION OF ANIMALS. See also NEARCTIC REGION; PALÆARCTIC REGION.

HOLBACH, ð'läg, PAUL HENRI THYRY D', Baron (1723-89). A French philosopher of the eighteenth century, and one of the Encyclopædists. (See ENCYCLOPÉDIE.) He was born of wealthy parents, at Heidesheim, in the Palatinate, in 1723. At an early age he went to Paris, where he continued to reside during the remainder of his life. As Holbach was remarkable for his agreeable social qualities, and kept a good table, the most eminent thinkers and writers of the day, such as Condorcet, Diderot, Duclos, Helvétius, Raynal, Rousseau, Buffon, etc., were in the habit of assembling at his house. The witty Abbé Galiani called Holbach the *maître d'hôtel* of philosophy. Here speculation, it is said, was carried to such daring lengths that Buffon, D'Alembert, and Rousseau were compelled to withdraw from the circle. Holbach was the zealous champion of naturalism, and contended not only against Christianity, but against all positive religion. His principal work, the *Système de la nature* (published anonymously in 1770), has been called the "Bible of Naturalism." In this work the author endeavors to expound the principles of morality upon a sensualistic, materialistic, deterministic, egoistic, and atheistic basis. For him God is only an ideal being, created by kings and priests. The work is in no sense original, but gives voice to the materialism of the French *philosophes* of the eighteenth century, which is nowhere more openly advocated than in the writings of Holbach. He was a man of good heart, and, in spite of his theory, of most unselfish benevolence. When the Jesuits fell into disgrace during the reign of Louis XV., Holbach, though he hated their system and had written against them in the days of their prosperity, made his house an asylum for his old foes when the clouds gathered around them. Many anonymous works besides the *Système* have been attributed to Holbach. Consult: Avezac-Lavigne, *Diderot et la société du baron d'Holbach* (Paris, 1878); Morley, "Three Works of the Eighteenth Century, I. Holbach's System of Nature," in *Fortnightly Review* (London, 1877); id., *Diderot and the Encyclopædists* (London, 1878; 2d ed. 1886).

HOLBEIN, hól'bín, HANS, the Elder (c. 1460-1524). A noted German painter, whose reputation was for a long time overshadowed by that of his celebrated son, Hans the Younger, to whom most of the elder master's finest productions were formerly attributed. But little is known of his life. He was born at Augsburg, the son of the tanner Michael Holbein, and resided there at intervals for many years, alternately prosperous and in want, first mentioned in the rate-books of the city in 1494. He became a citizen of Ulm in 1499, and two years later visited Frankfort. After 1516 he lived at a short distance from Augsburg, and in 1517 wandered off to paint an altarpiece at Isenheim, in Alsace, where he died. The name of his master is not known; that he worked for some time in the studio of Martin Schongauer at Colmar is a mere surmise suggested by a certain resemblance of style, especially in the types of his heads. Undoubtedly Holbein formed his style on the models of the early Flemish school, and subsequently modified it by yielding to local tradition and Italian influences. In his early pictures slender figures, mild and regular features, staidness of attitude, and a clear transparency of tone unrelieved by depth of shadow, are the prevailing characteristics. To this class belong the "Virgin and Child, with Two Angels," in Sankt Moritz Chapel, Nuremberg, and a "Virgin and Child Enthroned, with Angels," in the Landauer Brüderhaus in that city. Of a similar stamp are four altar panels (1493), representing "Joachim's Sacrifice," "Birth and Presentation of Mary," and "Presentation of Christ," in the Cathedral of Augsburg. Somewhat less marked is the Flemish origin of the master's manner in a series of "Scenes from the Passion" (1499), and the altarpiece (1499) with the "Basilica of Santa Maria Maggiore" in the centre, "Coronation of the Virgin" above it, the "Nativity" and "Martyrdom of Saint Dorothea" in the wings, both in the gallery at Augsburg. To the year 1499 belongs also the "Death of the Virgin" in the Basel Museum. In Frankfort he painted for the Dominicans a composite altarpiece (1501), comprising the "Last Supper," "Entry of Christ Into Jerusalem," "Expulsion of the Jews from the Temple," etc., and "Seven Scenes from the Passion," now all in the Städel Institute at Frankfort. Of the same period are the "Crucifixion," "Descent from the Cross," and "Entombment," also "Sixteen Scenes from the Life of Mary," all parts of a large altarpiece (1502) in the Old Pinakothek at Munich; a "Transfiguration" (1502) and "Christ Crowned with Thorns," both in the Augsburg Gallery. A marked progress in the master's manner is to be noticed in the "Life of Saint Paul" (1504), in its more ideal conception, correct drawing, and delicate execution, and of traditional interest as containing the portraits of the artist and his two sons, Ambrosius and Hans. The influence of the Italian Renaissance is still more apparent in the greater expressiveness and beauty of coloring displayed in the "Saint Catharine Altar" (1512), this and the preceding also in the Augsburg Gallery; but his maturest work is the "Martyrdom of Saint Sebastian" (1515-16), in the Pinakothek at Munich, a composition full of dramatic power, far transcending any of his previous efforts. His last important work was probably the "Fountain of Life" (1519), in the royal palace at Lisbon.

Holbein the Elder also excelled as a portrait painter, and his rare gift for characterization is apparent especially in the numerous head studies, mostly in silver point, distributed in various collections, among which those in Berlin, Copenhagen, and Basel are the richest. The museum at Basel also possesses a number of sketches for his religious paintings.

His brother SIGISMUND (?-1540) first appears on the rate-books of Augsburg in 1504, and in 1519 removed to Bern, where he died, making his nephew, Hans the Younger, his heir. There is very little doubt that he assisted the elder master in several of his most important works, although no single picture can be traced to him directly.—AMBROSIUS (c.1494-c.1519), son and pupil of Hans the Elder, was born in Augsburg, and, with his brother, Hans the Younger, was sent to Basel about 1515, when both were engaged chiefly in designing title-pages, initials, and other illustrations for books. In 1517 he was admitted into the guild 'Zum Himmel,' and acquired the freedom of the city in the year following, but all trace of him is lost after 1519. The museum at Basel preserves three authenticated paintings by him: "Christ Crowned with Thorns" and two "Bust Portraits of Boys," besides which the portrait of the goldsmith Georg Schweiger, of Augsburg, may also be attributed to him with tolerable certainty. A portrait of a young man (1518) is in the Hermitage at Saint Petersburg. Consult: The biography of Holbein the Elder, by Stödtner (Berlin, 1896 et seq.); also Woltmann, *Holbein und seine Zeit* (Leipzig, 1873-76).

HOLBEIN, HANS, the Younger (1497-1543). A German painter and designer, one of the chief masters of the German Renaissance. He was a son of Hans Holbein the Elder, and was born at Augsburg, where he studied with his father and with Hans Burgkmair. Two of the works which he probably painted in his father's workshop survive: a "Madonna" (1514), in the Museum of Basel, and "Christ Dragg'd to the Crucifixion," in the Gallery at Karlsruhe. Both resemble the work of his father, to whom the latter picture has also been ascribed.

About 1515 we find Holbein at Basel, where he and his elder brother Ambrosius had probably come to make illustrations for books; Basel was then an important centre of the book trade. Here Hans was introduced into the classic world, especially through his association with Beatus Rhenanus, corrector for the printer Froben. This influence is revealed in the table-plate in the Museum of Zurich, which he painted for the family Baer, with scenes of hunting, fishing, and knightly tournaments, and in his eighty-three pen drawings for Erasmus's *Praise of Folly*, which are in the Museum of Basel. These drawings are a curious mixture of the coarse style of the fifteenth century and the finer finish of the sixteenth. They show a great master at the beginning of his powers. The Museum of Basel also contains other characteristic works of 1516: a sign for a school-master, on which are painted two school scenes; the portraits of Burgomaster Jakob Meyer, of his wife, and of Hans Herbst, the painter in whose workshop Holbein worked before he became a member of the painters' guild.

In 1517 he went to Lucerne to decorate the façade and interior of the house of Jakob Herten-

stein. These paintings have perished, but the original pen design in the Museum of Basel shows that the façade was decorated with classical subjects, completely in the style of the sixteenth century, and that he was influenced by the study of Mantegna's prints. In 1518 he probably traveled in Lombardy, visiting Milan. The influence of the Lombard school may be seen in Holbein's treatment of form after 1518, and in his "Last Supper" (Basel Museum), which closely resembles Leonardo's masterpiece at Milan.

In 1519 Holbein entered the painters' guild of Basel, and in the following year he became a citizen. During the next few years he decorated the façades of a number of houses at Basel, chief among which was the "Hans zum Tanz," of which the original pen design is in the Museum, with architectural decorations, and a representation of peasants dancing. He also began his extensive decorations of the council chamber, with antique historical subjects representing civic virtue and justice, and with allegorical figures. On the organ doors of the Minster of Basel he painted, in brown monochrome, grandiose figures of saints and angels singing. Among his panel pictures is an altarpiece of "Passion Scenes" of great dramatic power and fine effects of light and shade, and the "Dead Body of Christ" (1521), of striking, almost repulsive realism—all in the Museum of Basel. Among other works of this period is the "Madonna with Saints Ursus and Martin" (1522), in the Museum of Solothurn.

Holbein's best-known work is the "Madonna of Burgomaster Meyer," painted in 1525 or 1526, which holds the same rank in German painting as the "Sistine Madonna" in Italian. The original is in the Gallery of Darmstadt, the Dresden example having been proved to be an excellent copy by a Netherlander of the seventeenth century. Especially fine, in this picture, are the portraits of the kneeling Burgomaster and his family, and the nude figure of his youngest son—a cherub worthy of Correggio.

His portraits of this period include the refined face of Bonifazius Amerbach (1519), the first great German art collector, and three likenesses of Erasmus, who was then a resident of Basel—two in profile, at Basel and in the Louvre, and a larger three-quarter view in Longford Castle. Holbein's mastery of female portraiture is shown in his two allegorical representations of Dorothea Offenburg in the Basel Museum—"The Lais Corinthiaca" (1526), and another portrait in which she is represented with Cupid.

At the same time Holbein was occupied with other forms of design. Among his drawings of the period are two admirable youths, one a pencil, supposed to represent Holbein himself, the other a chalk drawing in the Museum of Basel. One of his favorite subjects was the contemporary German "Lanzknechte" (soldiers), in various actions and attitudes. To the same period belong his drawings of Basler female costumes, which may have been designs for actual use. His designs for glass-painting in the Basel Museum include ten wash drawings of "Passion Scenes," the equals of the painted series mentioned above. Madonnas and other biblical subjects, and coats of arms—all in beautiful Renaissance framing. As a designer for wood-cuts Holbein is second only to Dürer. He left over three hundred blocks, the best of which were cut by Hans Lützelburger. His illustrated Luther's Bible, and his "Histori-

arum Veteris Instrumenti Icones" ("Pictures from the Old Testament"), ninety-one plates, were first published together at Lyons in 1538. Best known of all is his "Dance of Death," fifty-eight plates in all, replete with humor and satire upon the ecclesiastical and social conditions of the day. It was published in book form at Lyons in 1538, and has been often republished; a good modern edition is that of Lippmann (Berlin, 1878).

The advent of the Reformation and the consequent disturbances in Basel were the chief cause of Holbein's journey to England in 1526. Equipped with recommendations from his friend Erasmus, he found a ready welcome in the house of Sir Thomas More at Southwark. His activity during his stay there, which lasted two years, may best be studied in the fine series of chalk drawings at Windsor Castle (published in London, 1884). In 1527 he painted Sir Thomas More, now in possession of Henry Huth, London; Sir Henry Guildford, in Windsor Castle; and Archbishop Warham, of Canterbury, in Lambeth Palace (replica in the Louvre), the best of all—a wonderful piece of realism and strength. Among his portraits of 1528 are those of Nicholas Kratzer, the King's astrologer, in the Louvre, and of Thomas Godsalve and his son John, at Dresden. His famous picture of More and his family is lost, but the studies for the heads are at Windsor, and the pen sketch which he took for Erasmus is still at Basel.

He returned to Basel in 1529 and purchased a house. But during his stay the storm of iconoclasm broke over the city, and the demand for religious pictures ceased. Holbein, indeed, finished his frescoes in the Council Chamber, adding two large subjects from the Old Testament, "Samuel Reproving Saul" and "Rehoboam's Pride." Both paintings are lost, but the sketches in the Museum of Basel, masterly in composition and dramatic action, show Holbein as a great historical painter. In 1529 he painted a highly realistic portrait of his wife and two children on paper (Basel Museum), two portraits of Erasmus (Parma and Basel), and one of Melancthon (Hanover). In 1532, notwithstanding the efforts of the Burgomaster and Council of Basel to retain him, he returned to England.

On his arrival at London he resided with the German merchants of the Steelyard, with whom he found occupation. In 1532 and in the following years he painted a number of portraits of these merchants, of which examples survive at Vienna, Windsor, Munich, Brunswick, and Petworth. The best is that of George Gysse (1532), in the Museum of Berlin, remarkable for strong character and the detailed finish of the accessories. On the occasion of Anne Boleyn's coronation he designed for the German merchants an allegorical pageant of Parnassus; he decorated their guild-hall with two large paintings, of which there are sketches in the Louvre, "Triumph of Riches" and "Triumph of Poverty." It is not known when he first entered Henry VIII.'s service, but in 1536 we find him mentioned as the King's painter. In 1537 he was sent to Brussels to portray Christina of Denmark, Duchess of Milan, whom the King thought of marrying, and in 1539 to portray Anne of Cleves, whose portrait, now in the Louvre, had much to do with the King's marrying her. His chief work for Henry VIII. was a group painted on the wall

of the Privy Chamber at Whitehall, in 1537, representing the King with his father and mother and Jane Seymour. This painting was destroyed in the fire of 1698, but the cartoon of the King is at Hardwick Hall, and there are several copies of the portrait, the best known of which is at Windsor Castle. Holbein painted another excellent portrait of Jane Seymour, now in the Gallery of Vienna, and of Edward, Prince of Wales, at Hanover. The King also commissioned him to design various decorations, especially in the goldsmith's art, in which he acquitted himself with great taste and ability, as is evident from the original designs in the British Museum and elsewhere. In 1538 he visited Basel, where he was banqueted by the council, and he promised to return after two years, which promise, however, he did not keep.

His principal portraits, executed during his last stay in England, besides those mentioned above, are "The Ambassadors" (1533), in the National Gallery; Robert Cheeseman (1533), the King's falconer, at The Hague; Thomas Cromwell, at Tittenhanger; Hubert Morett, at Dresden; Thomas Howard, Duke of Norfolk, at Windsor; two "Unknown Men" at Berlin and Vienna, and an "Unknown Woman" at Vienna; Melchior Maag (1543), in the Huybrecht collection, Antwerp; Dr. John Chambers, the King's physician, at Windsor. He also painted a number of miniatures, among which is that of Queen Catharine Howard in the library at Windsor, and executed a number of important designs for wood-engravings, including the title-page of Coverdale's Bible, illustrations of Cranmer's catechism, and "King Henry in Council," the title-page of Hall's *Chronicle*.

Holbein died of the pestilence in London in the autumn of 1543. He is chiefly known as a portrait painter, but his religious pictures, and especially his mural decorations, show that, had the opportunity presented itself, he might have been one of the greatest historical painters of all times. His portraits are absolutely true to nature, yet show a wonderful interpretation of character. The excellence of his drawing is attested by his large number of chalk and other drawings, especially in the Museum of Basel and in Windsor Castle. His method in portraiture seems to have been to make a careful chalk drawing of the sitter, which he afterwards transferred to the canvas. Holbein is by far the greatest colorist of the German school, and although the details of his portraits are highly finished, they in no wise interfere with the general effect. As a designer for wood-engraving he showed a thorough understanding of the art, combined with a fantasy and humor which have seldom been surpassed.

Consult: Woltmann, *Hans Holbein und seine Zeit* (Leipzig, 1874-76); Wornum, *Life and Works of Holbein* (London, 1866); A. Schmid, *Holbein des Jüngeren Entwicklung 1515-26* (Basel, 1892). See also the biographies of Cundall (London, 1879); Knackfuss (Bielefeld, 1897); and of Wessely, in Dohme's *Kunst und Künstler Deutschlands* (Leipzig, 1877). For reproductions of Holbein's works, compare Mantz, *Hans Holbein* (Paris, 1879); Hiis, *Dessins d'ornements de Hans Holbein* (ib., 1886).

HOLBERG, hól'bærk, LUVVIG, Baron (1684-1754). A Danish poet, novelist, and historian, born at Bergen, Norway. He is called the 'father

HOLBEIN

"THE MADONNA OF THE BURGOMASTER MEYER," FROM THE PAINTING IN THE DARMSTADT GALLERY.

of Danish comedy.' Left an orphan in childhood, he proved an eager student in spite of poverty and discouragements, and supported himself precariously as tutor for some years, in the course of which he visited Holland, Germany, and England, and studied for two years at Oxford. He lectured in the University at Copenhagen, where his scholarship was recognized, though not remunerated. Some historical studies in manuscript attracted the attention of King Frederick IV., and Holberg received a traveling scholarship that took him through a great part of Europe, largely on foot. He returned to Denmark in 1716, and in 1718 published *An Introduction to Natural and Popular Law*, which brought him a professorship in the University of Copenhagen and a modest competence. Thus eased, his genius welled up in the serio-comic epic *Peder Paars* (1719), a brilliant satire on contemporary manners, followed by five others, hardly less successful. In 1721 he was made director of the first Danish theatre in Copenhagen, for which he wrote during 1722 five classic comedies and in 1723 ten others. His best comedy, *Henrik and Pernille*, belongs to 1724. The theatre failed, and Holberg closed his dramatic career by publishing his collected comedies in 1731. Adapting himself to a change in the national spirit, he turned to history, philosophy and satire, writing much that is now forgotten, and also the famous satire, *Subterranean Journey of Niels Klim* (*Nicolai Klimii Iter Subterraneum*, 1741), which was thrice translated from Latin into Danish, ten times into German, three times into Swedish, English, and Dutch, twice into French and Russian, and once into Hungarian. He published also five volumes of *Letters* (1748-54). He shares with Voltaire the preëminence in European literature in his generation. He made Danish a literary language, and wrung for it aristocratic recognition. His influence has endured for two centuries. Editions of his works are countless; the best edition of the *Comedies* is by Lichtenberg (Copenhagen, 1884 et seq.). The Holberg Society, founded at Copenhagen in 1842, oversaw (1848-54) a critical edition of Holberg's comedies in eight volumes. There are biographies by Prutz (Stuttgart, 1857); Smith (Copenhagen, 1858); and Horn (ib., 1884). Consult also: Løgrelle, *Holberg considéré comme imitateur de Molière* (Paris, 1864); Brandes, *Holberg und seine Zeitgenossen* (Berlin, 1885).

HOLBORN, hō'būrn. A district and street in London. The name is derived from Old or Hole Bourne, the former name for a part of the Fleet, which ran through a valley. The depression is now crossed by the famous Holborn Viaduct, an iron structure 27 yards wide and 657 long, built in 1869 to facilitate communication by avoiding the ascent of Holborn Hill. Criminals formerly passed through Holborn on their way to execution, and according to an old custom received a nose-gay at Saint Sepulchre's Church, near Newgate Prison, from which the thoroughfare leads west to New Oxford street. On Holborn are Barnard's, Furnivall's, and Staple Inn, and near it are Ely Chapel, Gray's Inn, and Lincoln's Inn. Milton at one time lived on the western portion of the street, called High Holborn. A number of picturesque old houses stand on this street, which survived the Great Fire.

HOLBROOK, JOHN EDWARDS (1794-1871). An American naturalist, born in Beaufort, S. C. He graduated at Brown in 1815, and in medicine at the Pennsylvania University three years later, studied afterwards in Europe, and began practice in Charleston in 1822. In 1824 he was made professor of anatomy in the South Carolina College. This position he retained for more than thirty years. The outbreak of the Civil War put an end to the publication of his *Ichthyology of South Carolina*, begun in 1854. His previous work upon *American Herpetology* (5 vols., 1842) was highly commended by Agassiz and others.

HOLBROOKIA (named in honor of the American naturalist J. E. Holbrook). A genus of iguanid lizards of the South-western United States and Northern Mexico, especially characteristic of the Rio Grande Valley. The four species

HOLBROOKIA MACULATA.
a, top of head; b, profile.

are of moderate size, with short legs, squat depressed bodies, covered with minute scales, and long tails. The general color is gray, and all are blotched, spotted, and barred (on the tail) with darker tints, but the colors are highly variable; hence they are popularly known as 'spotted lizards.' They prefer rocky ground, and run swiftly with their tails curved over their backs. They subsist mainly on insects, worms, and the like, but also take vegetable food. They make interesting pets. When placed in a fly-trap they pick out the very large, black, and bright-colored flies before eating the house-flies. See IGUANA.

HOLCROFT, hōl'krōft, THOMAS (1745-1809). An English dramatist and novelist, born in London. The son of a shoemaker, he learned his father's trade; later he was a stable boy, a schoolmaster, an actor, and lastly a playwright. He wrote thirty plays, the best and most successful of which is *The Road to Ruin* (1792), still occasionally acted. During the French Revolution he became a member of the Society for Constitutional Information, and was indicted for high treason, imprisoned, and finally discharged without trial. He was a man of great industry. He learned French, German, and Italian, and translated many works, including Goethe's *Hermann and Dorothea*, Lavater's *Physiognomische Fragmente*, and some of the works of Frederick the Great. He was also the author of four novels and numerous poems. His *Memoirs*, written by himself or compiled from his diary and other papers, by William Hazlitt, were published after his death (3 vols., 1816).

HOLCUS. See SOFT GRASS.

HOLD (older form *hole*, from Dutch *hol*, hole, hold; connected with AS., OHG. *helan*, Ger. *hehlen*, Lat. *celare*, Gk. *καλύπτειν*, *kalyptein*, to hide, OIr. *celim*, I hide; confused in popular etymology with *hold*, to contain). That portion of the interior of the ship which is below the upper deck. This part of a ship may be divided into

several parts, as the *fore-peak*, the *fore-hold*, the *main-hold*, the *after-hold*, the *engine* and *boiler rooms*, *coal-bunkers*, *store-rooms*, etc. To *stow* a hold is to put things in it and arrange them properly; to *break out* a hold is to remove the contents of it.

HOLD. In music, a sign placed above (\frown) or below (\smile) a note or rest to indicate that its time-value is increased. The length of a hold is governed by the rhythm of the music, and is left to the performer's discretion. See GENERAL PAUSE.

HOLDEFLEISS, hól'de-flis, FRIEDRICH WILHELM (1846—). A German agricultural chemist. He was born at Bennstedt, and studied at Halle, where for several years he acted as assistant in the Agricultural Experiment Station and in the Agricultural Institute of the university. In 1878 he was appointed director of the agricultural station of the Central Silesian Agricultural Society at Breslau. In 1881 he became professor extraordinary and in 1882 ordinary professor of agricultural chemistry in the Agricultural Institute of the University of Breslau. After filling this position with distinction for ten years he was appointed director of the Institute. During his incumbency he was actively engaged in the preparation of numerous works dealing with his specialty. Among these may be mentioned: *Untersuchungen über den Stallmist* (Breslau, 1889); *Das Knochenmehl* (Berlin, 1890); *Die Rinderzucht Schlesiens* (Breslau, 1896); *Schatzkästlein des praktischen Landwirts* (Berlin, 1896).

HOLD'EN, ALBERT J. (1841—). An American organist and composer of Church music. He was born in Boston, studied music in New York, where he made his home in 1855, and became organist in the Universalist Church of the Divine Paternity and the Church of the Puritans (Congregationalist). His musical compositions include ballads and secular as well as sacred part-songs and choruses, but he is best known as the composer of more than three hundred hymn tunes, anthems, and the like. He also edited collections of music.

HOLDEN, EDWARD SINGLETON (1846—). An American educator. He was born in Saint Louis, Mo., and received his education at Washington University, Saint Louis, and at West Point, where he graduated in 1870. He occupied successively the positions of professor of mathematics, United States Navy; astronomer at the United States Naval Observatory, Washington, D. C.; director of the Washburn Observatory, Madison, Wis.; president of the University of California; and director of the Lick Observatory. His most important work was that done at the Lick Observatory, Cal., with which he was connected for twenty-eight years, and most of the buildings and instruments of which were designed and built under his direction. He founded the Astronomical Society of the Pacific, and wrote several works on astronomy, history, and education. In recognition of his services, numerous honors were bestowed upon him, both in this country and by the governments of several European States.

HOLDEN, Sir ISAAC (1807-97). A British inventor, who produced lucifer matches and improved wool-carding machinery. He was born in Hurler, Renfrewshire, of English parents, and

from being a draw-boy to hand-weavers, he went into a Paisley cotton-mill, educating himself meanwhile till he was able to teach school. In the course of experimenting for a chemistry class, he discovered the efficiency of lucifer for matches (1829), but, as he took out no patent, others reaped the benefit of his invention. He was next bookkeeper, then manager, then owner of a wool-combing mill, and made such important improvements in its machinery that he became a wealthy manufacturer. He was also a member of Parliament, but in neither position did he forget the interests of the working men from whose ranks he had sprung.

HOLDER, CHARLES FREDERICK (1851—). An American naturalist. Born in Lynn, Mass., of Quaker parents, he was sent to the Friends' School in Providence, R. I., afterwards to a seminary near Boston, thence to the United States Naval Academy, at Annapolis, but followed his natural bent toward science, and became assistant curator of zoölogy in the American Museum of Natural History, New York City (1871-75). He spent some time collecting specimens in different parts of the country for the Aquarium at New York City, and was lecturer in the city schools as well as a writer upon scientific subjects for young people. After his removal to California, he took a prominent part in educational affairs, was made president of the Pasadena (Cal.) board of education, and trustee of, and professor of zoölogy in, Throop University. His publications include: *Marvels of Animal Life* (1880); *Elements of Zoölogy* (1885); *Living Lights* (1887); *The Ivory King* (1888); *A Frozen Dragon* (1888); *A Strange Company* (1889); *Around Pasadena* (1889); *The Pasadena Highlands* (1889); *Santa Catalina Island, Its Sports* (1889); *Louis Agassiz, His Life* (1892); *Charles Darwin's Life and Work* (1893); *The Treasure Divers* (1889); *Stories of Animal Life* (1900); *Big Game at Sea* (1901); and *Half Hours with Nature* (5 vols., 1901).

HÖLDER, hël'dër, EDUARD OTTO (1847—). A German jurist, especially versed in Roman law. Born at Stuttgart, he studied at Tübingen, and became professor at Zürich (1872), Greifswald (1874), Erlangen (1880), and Leipzig (1893). His works include: *Institutionen des römischen Rechtes* (3d ed. 1893); *Zum allgemeinen Teil des Entwurfs eines deutschen bürgerlichen Gesetzbuchs* (1888); *Pandekten* (1886-91); *Ueber objektives und subjektives Recht* (1893); *Die Stellung des römischen Erben* (1895); with Schollmeyer and others, he undertook the preparation of the *Kommentar zum deutschen bürgerlichen Gesetzbuch* (1899 et seq.).

HÖLDERLIN, hël'dër-lèn, JOHANN CHRISTIAN FRIEDRICH (1770-1843). A German poet, born at Lauffen, and educated at Tübingen, where he knew Hegel and Schelling. He was private tutor in the house of Schiller's friend, Charlotte von Kalb (1793-94), and then at Frankfurt, where the mother of his young charges, Frau Gontard, inspired him with a platonic passion, which led him to celebrate her under the name of Diotima in his *Hyperion*. But from this time on his mind began to fail, and, save for intervals of sanity, he never recovered. His style was classic; his thought, in his best work, deep and full. He wrote: *Hyperion, oder der Eremit in Griechenland*, a romance in epistolary form (1797-99);

an incomplete drama, *Empedokles*; translations from Sophocles's *Edipus* and *Antigone* (1804); and the *Lyrische Gedichte*, mostly elegiac in tone, edited by Uhland and Schwab (4th ed. 1878; in 1899, by Linke). A complete edition of his works, with his letters and biography by Schwab, appeared at Stuttgart (1846). Consult: Milbrandt, *Friedrich Hölderlin* (Berlin, 1896); Müller-Rastatt, *Hölderlin, sein Leben und sein Dichten* (Bremen, 1894); and Klein-Hattingen, *Das Liebesleben Hölderlins, Lenaus, Heines* (Berlin, 1900).

HOLDING (Lat. *tenementum*, a tenement, something held, from *tenere*, to hold). In Scotch law, an estate held of a superior, under the feudal system of land tenure. It corresponds to the terms 'tenement' and 'tenure' in English and American law. See also ESTATE; FEE; FREEHOLD.

HOLE, WILLIAM (1846—). An English painter and engraver. He was born at Salisbury, and was educated for an engineer at the Edinburgh Academy and University, but an Italian journey having inspired him with a desire to be an artist, he studied at the Edinburgh school, and became associate (1878), and full member (1889) of the Royal Scottish Academy. Aside from portraits, Hole's best paintings are: "The End of the Forty-Five" (1879); "The Eve of Culloden" (1880); "If Thou Hadst Known" (1884); "News of Flodden" (1886); but he is more famous as an etcher, having made excellent reproductions of the masterpieces of Millet, Constable, Velazquez, Millais, Thomson of Duddingston, and others. In his later years he turned to fresco painting, and his work is to be seen in Saint James Church, and in the National Portrait Gallery, Edinburgh.

HOLGUIN, òl-gèn'. A city of Cuba, in the Province of Santiago de Cuba, and capital of the department of the same name, about 25 miles by rail from Gibara, its port (Map: Cuba, J 6). It is regularly built with several open squares and streets crossing at right angles, and it has a number of fine buildings. It exports tobacco, timber, corn, and cattle. It was founded in 1720, and received the title of city in 1751. Population, in 1899, 34,056.

HOLIBUT. See HALIBUT.

HOLIDAY (AS. *hālig dæg*, holy day). A day set apart as a religious anniversary, or for the purpose of commemorating some extraordinary event, or of honoring the memory of a distinguished person. As a rule, holidays are occasions for rejoicing. People are expected to observe them "with the voice of joy and praise." (Ps. xlii. 4.) At times, however, they are accompanied by fasts rather than feasts. Of this character are days of humiliation and prayer, such as Fast Day, formerly observed in Massachusetts and other New England States, and days specially appointed from time to time by proclamation of Government authorities or of ecclesiastical dignitaries.

During the Middle Ages holidays became so numerous, in many parts of Europe, as to interfere seriously with industrial pursuits. One of the most important results of the religious reformation of the sixteenth century was the abolition of excessive holidays with its consequent increase in the volume of secular labor. The present

tendency in this country appears to be toward the multiplication of legal holidays.

Many occasions are observed by Church or social or political organizations as holidays which are not declared holidays by law. A legal holiday is one set apart, either by common or by statute law, as a day of rest, or of cessation in whole or in part from ordinary business activities. Sunday is the only common-law holiday in this country, although Good Friday has been recognized as such in England for centuries. Legal holidays are of two kinds, general or public, and special or limited. On a public holiday, such as Sunday or the Fourth of July, public offices are closed, and persons under contract to render services are not bound to work for their employers. If they do labor at the request of their employers, they are entitled to extra pay. In England, and in many of our States, persons are prohibited from carrying on secular business or making contracts during Sunday. (See SUNDAY LAWS.) On special or limited holidays, such as some of the bank holidays (q.v.), exemption from labor and from the performance of contracts generally is confined to a particular class of employees or to a designated section of the community, or to specified contracts.

As a nation, we have no legal holiday, although Congress has appointed special holidays from time to time, and in the District of Columbia has made Labor Day a public holiday. It is customary for the President to appoint annually the last Thursday of November as a day of thanksgiving, but its observance as a legal holiday is dependent upon State and Territorial legislation. At present there are about thirty different legal holidays recognized by our various States. Some of them, like the anniversary of the battle of New Orleans (Louisiana), Bennington battle day (Vermont), Patriots' Day (Massachusetts), and Lincoln's Birthday (New York), are confined to a single commonwealth; while others, like Christmas Day and the Fourth of July, are observed throughout the Union. Consult: *Brooklyn Daily Eagle Almanac* (1902, p. 52); *Thoughts for the Occasion* (New York, E. B. Treat, 1894); "Origin of Holidays," 34, *Popular Science Monthly*, 516 (1889); "American Holidays," 62, *Saturday Review*, 19 (1886); Manners, *A Plea for National Holy Days* (London, 1843); "The Holidays," 32, *Harper's Magazine*, 164, 358 (1866); "Bank Holidays," 22, *Journal of the Institute of Bankers* (London, 1901); "What Should Our National Holidays Commemorate?" 15, *Massachusetts Historical Society*, second series, 506 (1902).

HOLINSHED, or HOLLINGSHEAD, hōl'-inz-hād, RAPHAEL (?-1580). An English chronicler. Little is known of his life save that he was of a Cheshire family, probably the son of Ralph Holinshed of Cophurst, in the township of Sutton Downes. He is celebrated as the author of a history of England, Scotland, and Ireland, which the Elizabethan dramatists drew upon for material in the construction of their historical plays. The work had been started originally by Wolfe, who, however, died in 1573 before its completion. Thereupon Holinshed undertook the work, and in 1578 appeared *Raphael Hollingshead's Cronycle*, in two folio volumes. Holinshed had been assisted by William Harrison, who wrote the historical descriptions of England

and Scotland, and by Richard Stanihurst, who contributed a part of the history of Ireland. All copies of the work were printed by Henry Byneman. The publishers were George Bishop, John Harrison, and Luke Harrison. A second edition appeared in 1587, after Holinshed's death. This edition was chiefly revised by Hooker, and contained some passages disagreeable to Elizabeth, who immediately ordered them cut out. A modern edition in six volumes was published in London (1807-08), with the 'disagreeable passages' restored. But after all Holingshed's *Chronicle*, though popular in its day, would be seldom recalled to-day were it not for Shakespeare's indebtedness to it. From it the data for most of the great historical plays were probably derived; and in *Macbeth*, *Lear*, and *Cymbeline* most of the borrowed action and dialogue can be illustrated by excerpts from Holinshed. Consult: Cooper, *Athenæ Cantabrigienses* (Cambridge, Eng., 1858); Boswell-Stone, *Shakespeare's Holinshed* (New York, 1896).

HOLI-SHIN, hō'lē'shēn'. See FUSAN.

HOLKAR, hōl'kār. The name of a powerful Mahratta family, later adopted as a title by the rulers of Indore, one of the native States of Central India. The founder of the family was Mulhar Rao Holkar, who was born in the Deccan in 1693, and having gained by his valor the favor of the Peishwa (q.v.), obtained from him the western half of Malwa, with Indore for his capital. In 1761 he joined the great league of the princes of Hindustan, formed to bar the progress of Ahmed Shah Durrani, and was present at the battle of Panipat, January 6, 1761; but as he fled shortly after the battle began, he was suspected of treason. Holkar was the only Mahratta chief of note who escaped the slaughter. He died in 1768, and was succeeded by his grandson Malli Rao, who died soon after. The government then passed to Aylah Bade, the mother of Malli Rao, who resigned the military power to Toghaki Holkar. On his death in 1797 his natural son, Jeswunt Rao Holkar, a man able, brave, and unscrupulous, seized Indore, but was driven out by Scindia (q.v.). Such, however, was Holkar's reputation for energy and ability that part of the victorious army deserted to him, with whose aid he obtained a signal victory over Scindia and the Peishwa (October, 1802). After fighting a long time against the British with varying success, he was compelled to conclude peace. He died insane October 20, 1811. His son, Mulhar Rao Holkar II., a minor, succeeded, and in 1817 declared war against the British, but his army was totally routed at Mahedpore, December 21st; whereupon he sent offers of peace, which were accepted, and an English residency was established at Indore in January, 1818. He died in 1833. Martund Rao Holkar, Hurri Rao Holkar, and Kundi Rao Holkar successively ruled after him. The last of these died without heirs in 1843, and the East India Company assumed the right of nominating Tukagi Rao Holkar, who did not belong to the Holkar family. He was educated under the auspices of the British Government, and displayed great ability, and always remained on the most friendly terms with the British. In 1886 he was succeeded by his eldest son, Shiraji Rao Holkar.

HOLL, FRANK (1845-88). An English painter. He was born in London, July 4, 1845, a

son of a well-known engraver. He was admitted as a student at the Royal Academy, 1860. He received a prize for the best drawing from the antique, 1862, and another for the best historical painting, "Abraham's Sacrifice" (1863). He exhibited at the Royal Academy: "Turned Out of Church" (1864); "A Fern Gatherer" (1865); "The Ordeal" (1866); "Convalescent" (1867). His picture "The Lord Gave and the Lord Hath Taken Away" gained him the two years' traveling studentship for painting, 1869. Among his other works exhibited are: "No Tidings from the Sea" (1871), which was painted for Queen Victoria; "I am the Resurrection and the Life" (1872); "Deserted" (1874); "Her First-Born" (1876); "Committed for Trial" (1878); "The Gifts of the Fairies" (1879); "Ordered to the Front" (1880); "Home Again" (1881); and "Millicent" (1883). In 1879 he took up portrait painting, in which he achieved high success, being excelled only by Sir John Millais (q.v.) among his contemporaries. He united strong characterization with brilliancy of color. Among his sitters were the Prince of Wales, Lord Wolesley, the Duke of Cambridge, John Bright, the Marquis of Dufferin, Joseph Chamberlain, Sir John Millais, William Ewart Gladstone. Holl was elected academician in 1883, and received medals at Philadelphia in 1876, and at Melbourne. He died in London, July 14, 1888.

HOLLAND. A mediæval county, whose territories now form the provinces of North and South Holland (qq.v.), in the Kingdom of the Netherlands. The hereditary counts of Holland, whose dominions were included within the limits of the Holy Roman Empire, appear in history as early as the tenth century. Count William II. was elected Roman Emperor in 1247 in opposition to Frederick II. He contested the Imperial crown with Conrad IV., Frederick's successor, and on the death of Conrad in 1254 was recognized by the German princes. He was slain in a war with the Frisians in 1256. In 1299 Holland passed to the counts of Hainault. Soon after Zealand was permanently united with Holland. In 1433 Countess Jacqueline made over Hainault, Holland, and Zealand to Philip the Good of Burgundy. Holland shared the fortunes of the united Netherlands and was one of the provinces which achieved their liberation from Spain and constituted themselves into the Dutch Republic. See BURGUNDY; NETHERLANDS.

HOLLAND. A city in Ottawa County, Mich., 25 miles southwest of Grand Rapids; at the head of Black Lake, which affords a good harbor, having regular steamboat lines to Milwaukee and Chicago, and also on the Père Marquette Railroad (Map: Michigan, G 6). It is the seat of Hope College, opened in 1865, and of the Western Theological Seminary, both under the control of the Reformed Church in America, and has a public library. There are several summer resorts on the shore of Black Lake that enjoy considerable popularity. Holland carries on an extensive grain trade, and is a manufacturing centre of importance, its industries including flour and planing mills, tanneries, furniture, veneer, tub, and basket factories, a beet-sugar factory, a large pickling plant, and establishments for the manufacture of wood-working machinery, and electric and steam launches. The water-works and elec-

tric-light plant are owned by the municipality. Founded in 1847 by Dutch settlers, Holland was chartered as a city in 1867. Its inhabitants are still largely of Dutch descent. Population, in 1890, 3945; in 1900, 7790.

HOLLAND. A variety of unbleached linen cloth used largely for window-shades and in upholstery for covering furniture. The name is derived from the fact that it was first manufactured in Holland. See LINEN.

HOLLAND, EDMUND MILTON (1848—). An American comedian, born in New York City, the son of George Holland, who was also a well-known actor. He appeared upon the stage in childhood, but his regular professional career began in 1866 at Barnum's Museum. The next year, under the name of Mr. E. Milton, he became a member of Wallack's company, with which he played successfully in *The Road to Ruin*, *Caste*, and other pieces till 1880. After an interval, during which he made a tour in England, he was engaged in 1882 at the Madison Square Theatre. Among his characters in the years that followed were Pittacus Green in *Hazel Kirke*, Old Rogers in *Esmeralda*, Captain Redwood in *Jim the Penman*, and Colonel Carter in *Colonel Carter of Cartersville*, the last-named at Palmer's Theatre. Beginning in 1895 he and his brother Joseph starred for about two years in *A Social Highwayman*, and other plays. Two of his more recent rôles were those of Leopold Kolditz in *Hearts are Trumps* (1900), and *Eben Holden* (1901). Consult: McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); Strang, *Famous Actors of the Day in America* (Boston, 1900).

HOLLAND, Sir HENRY (1788-1873). An English physician, natural philosopher, and author, born at Knutsford, England. He was educated at London and Edinburgh, receiving his medical degree at the University of Edinburgh in 1811. He traveled extensively during his life; practiced medicine from 1815 till his death; was elected fellow of the Royal College of Physicians in 1828; physician-in-ordinary to the Prince Consort in 1840, and in 1852 to Queen Victoria; was made a baronet in 1853; and was very prominent medically, socially, and in literary circles. He was the author of *Medical Notes and Reflections* (1840); *Chapters on Mental Physiology* (1852); *Essays on Scientific Subjects* (1862); and *Recollections of a Past Life* (1871).

HOLLAND, HENRY FOX, Baron (1705-74). An English politician. He was the younger son of Sir Stephen Fox. He was elected to Parliament as a Whig in 1735, and two years later was appointed surveyor-general of works by Walpole. After his chief's fall he was Lord of the Treasury (1743), and Secretary of War (1746). In 1755 he was bribed by a seat in the Cabinet to back George II.'s measures, and quickly became leader of the House. But in 1756 he resigned, and a year later he entered upon the lucrative office of Paymaster-General. Grenville's resignation in 1762 made him again leader of the House of Commons. The task of getting the Peace of Paris approved he accomplished by wholesale corruption and browbeating (1763); but made himself so unpopular that he gladly resigned. He kept the Paymaster-Generalship until 1765. The Court of Exchequer brought

proceedings against him, and the Mayor of London (1769) spoke of him in a petition to George III. as "the public defaulter of millions," but he had served the King so well that all attacks were unsuccessful even when he was out of favor at Court.

HOLLAND, HENRY RICHARD VASSAL FOX, Lord (1773-1840). An English politician, son of Stephen, second Lord Holland, and nephew of Charles James Fox. He entered the House of Lords in 1798, and won especial fame by his protests, later collected by Moylan: *The Opinions of Lord Holland, 1797-1840* (1841). He was soon recognized as a power in the Whig Party, and fought against suspension of the Habeas Corpus Act, against the union with Ireland, and for the repeal of the Test and Corporation Acts. He was a commissioner (1806) to negotiate a treaty with America. When his uncle died he was a member of the privy council, and was a member of the Cabinet of 1806 as Lord Privy Seal. When his party was restored to power in 1830 he became chancellor of the Duchy of Lancaster. He is best known, perhaps, as the host of Holland House, and the centre with Lady Holland of the brilliant company that gathered there. Besides his important *History of the Whig Party During My Time*, edited by his son (1852), he wrote: *Some Account of the Life and Writings of Lope Felix de Vega Carpio* (1806). His *Foreign Reminiscences* (1850) gives vivid, but not entirely trustworthy, pictures of his times.

HOLLAND, HENRY SCOTT (1847—). An English preacher and theologian, born at Ledbury in Herefordshire. He was educated at Eton and Oxford, was made canon (1844), and precentor (1886) of Saint Paul's Cathedral, London. His publications include several volumes of sermons, such as *Logic and Life* (1882).

HOLLAND, JOSIAH GILBERT (1819-81). An American journalist and author, born at Belchertown, Mass., July 24, 1819. He graduated at Berkshire Medical College, Pittsfield, Mass., in 1844, practiced medicine three years, was made school superintendent at Vicksburg, Miss., became assistant editor of the *Springfield Republican* (1849-66), and made that journal attain great influence in New England. Here he published his *History of Western Massachusetts* (1855), and during these years gained distinction as a popular lecturer. On his return from two years in Europe (1868-70), he founded *Scribner's Monthly*, which absorbed successively *Hours at Home*, *Putnam's Magazine*, and *Old and New*, and, under changed ownership, is the present *Century Magazine*. Of this he remained editor till his death in New York, October 12, 1881. Of his many volumes of fiction and verse, the earlier were published under the assumed name of Timothy Titeomb. The more noteworthy of the novels are: *The Bay Path* (1857); *Miss Gilbert's Career* (1860); *Arthur Bonnicastle* (1873); *The Story of Seven Oaks* (1875); and *Nicholas Minturn* (1876). Of the poems the most popular are: *Bittersweet* (1858); *Kathrina* (1867); and *Garnered Sheaves* (1873). Noteworthy also are *Letters to Young People* (1858); *Letters to the Joneses* (1863); *Plain Talk on Familiar Subjects* (1865); *Life of Lincoln* (1865); and *The Mistress of the Manse* (1874). His prose and verse are alike clean in diction and thought,

pure and sweet in feeling, earnest in moral tone, and appeal to a wide circle of readers. For his *Life*, consult Plunkett (New York, 1894).

HOLLAND, PHILEMON (1552-1637). A native of Chelmsford, England, called by his contemporaries 'the translator-general of his age.' He was educated at Trinity College, of which he became a fellow. On being appointed to the rectorship of the free grammar-school of Coventry, he began a long series of translations from the classics. He also found time to carry on practice as a physician. By distribution of his time he reconciled his three professions of schoolmaster, doctor, and translator, fulfilling the functions of all three till his eightieth year. His chief translations are those of Livy, Pliny's *Natural History*, Plutarch's *Morals*, Suetonius, Amianus Marcellinus, and the *Cyropædia* of Xenophon. He also did good service to literature by his edition of Camden's *Britannica*, to which he made some valuable additions.

HOLLAND, THOMAS ERSKINE (1835—). An English jurist of prominence. He was born at Brighton, studied there and at Balliol and Magdalen Colleges, Oxford, where he won high honors, and entered practice in 1863. In 1874 Holland became Vinerian reader of English law at Oxford, and immediately afterwards was appointed Chieele professor of international law and diplomacy. The wide recognition of his merits in this field may be seen from the fact that Holland was given the degrees of D.C.L. from Oxford and LL.D. from Bologna, Glasgow, and Dublin, and from his membership in the University of Saint Petersburg and an honorary professorship at Perugia. His best known work, *Elements of Jurisprudence* (1880, 9th ed. 1900), is a standard in England and America. He also wrote: *The Institutes of Justinian* (1873-81); *The European Concert in the Eastern Question* (1885); and *Studies in International Law* (1898).

HOLLANDER, JACOB HARRY (1871—). An American economist, born in Baltimore, and educated at Johns Hopkins University. He was appointed secretary to the Bimetallic Commission of 1897; in 1900 the Secretary of War made him special commissioner on the revision of law in Porto Rico, and a few months afterwards he was named treasurer of the island by President McKinley. He served as associate professor of finance in Johns Hopkins, and recording secretary of the American Jewish Historical Society. His publications include: *The Cincinnati Southern Railway, a Study in Municipal Activity* (1894); *The Financial History of Baltimore* (1899); and *Studies in State Taxation* (1900); and he edited the *Letters of David Ricardo to J. R. McCulloch* (1895), and to *Hutches Trower* (1899).

HOLLAND HOUSE. A London mansion of Tudor architecture, on a hill near Kensington Gardens, built in 1607 for Sir Walter Cope. Its name is derived from an early owner, Henry Rich, Earl of Holland. The house is famous for its associations with the names of those who have occupied it. After Lord Holland's execution it passed into the hands of the Parliamentary generals Fairfax and Lambert, but was later restored to Lady Holland. Addison lived in it from 1716 to his death in 1719. Henry Fox, father of Charles James Fox, purchased it in 1762, and it is still in the possession of his line. Among its

other inmates have been Cromwell, Ireton, William Penn, William III. and Mary, Moore, and Macaulay.

HOLLAND PURCHASE. See NEW YORK.

HOLLAND SOCIETY. A patriotic society, founded in New York City on April 6, 1885. Its objects are to collect information respecting the early history and settlement of the city and State of New York by the Dutch, and to discover and preserve all existing documents, mementos, etc., relating to their genealogy and history, as well as to publish material for a memorial history of the Dutch in America, in which shall be particularly set forth the part belonging to that element in the growth and development of American character, institutions, and progress. The society admits to membership descendants, in the male line only, of a Dutchman who was a native or resident of New York, or of the American Colonies, prior to the year 1675. The insignia is an oval medallion with the head of William the Silent in relief. The society has marked various historical localities in New York City by inscribed brass plates; and publishes volumes containing historical information. Its membership is upwards of 1000.

HOLLAR, hól'lär, WENCESLAS (in Bohemian, VACLAV HOLAR) (1607-77). A celebrated etcher and engraver. He was born at Prague, June 13, 1607, the son of a lawyer, and received a good education. He studied engraving under Matthew Marian, a pupil of Rubens and Van Dyck. He was only eighteen when he published his first works, consisting of the "Virgin," the "Ecco Homo," and some other subjects. Leaving Prague, he began a wandering life through Germany, taking views of the chief towns and of the most striking scenery of the Danube, Rhine, and other streams. He lived two years at Frankfurt, and afterwards in Cologne and Antwerp. At Cologne in 1635 he fell in with the Earl of Arundel, the English Ambassador to the German Emperor, who attached him to his service. Soon after reaching England with his patron he was appointed to instruct the Prince of Wales in drawing; and in 1640 published his *Ornatus Muliebris Anglicanus*, a description of the customs of the contemporary Englishwomen, followed in 1643 by *Theatrum Mulierum*, a similar production for the women of the remaining parts of Europe. During the Civil War he enlisted as a Royalist, and in 1645 he joined Lord Arundel at Antwerp. After Arundel's death he became very poor. He worked by time, fixing his tariff at fourpence an hour, which he marked by a sand-glass. During this period, however, he produced his best work. He returned to England in 1652, and worked with the same unflagging industry, and with no more profitable result. His plates in Dugdale's *Monasticon* and *History of Saint Paul's* and in other works attest his diligence. After the Restoration he was made designer to the King, and in 1669 he was commissioned by Charles II. to take plans and perspective drawings of Tangier and its fortifications, in payment for which work he received a very paltry sum. In 1673 he traveled through Northern England, etching the principal cities there. He died in great poverty in London, January 19, 1677.

He left over 2700 plates on a great variety of subjects. They include views of cities, such as Strassburg, Frankfort, Cologne, Oxford, Lin-

coln, and York, Albury, Windsor, Tangier, etc.; architectural drawings, like Antwerp Cathedral, Saint George's Chapel, Windsor; tomb of Edward IV., Windsor; and other subjects, like "Trial of Archbishop Laud," "Coronation of Charles II.," "Engagement with the Algerian Pirates," the "Four Seasons." His portraits were largely after Holbein, and especially Van Dyck. Among the best-known are those of Charles I. and his Queen after the latter, and his original engravings of the Duke of York (afterwards James II.), Oliver Cromwell, Hobbes, and Lady Venetia Digby. While most of his work was original, he executed with equal facility engravings after the old masters. Some of the best known are an "Ecce Homo," after Titian; "Esther Before Ahasuerus," after Veronese; "Cupid Riding a Lion," after Giulio Romano; and especially a beautiful goblet after Mantegna's pen drawing. There are almost complete collections of his works in the British Museum and in the library of Windsor Castle.

Hollar's work unites, in a remarkable fashion, accuracy and the pictorial quality. He endeavored to render detail rather than character; but his technical excellence was unsurpassed in his day. His process was peculiar, being mostly done with the etching needle.

Consult: The catalogue of Hollar's plates by Vertue (London, 1759), and by Parthey (Berlin, 1853, supplement 1858). The former contains valuable biographical notices; the latter is an excellent and exhaustive treatise.

HOLLAZ, hö'läts, DAVID (1648-1713). A German dogmatic theologian, born in Pomerania. He studied at Erfurt and Wittenberg; became preacher at Pützerlin in 1670, assistant rector at Stargard in 1680, and afterwards was situated at Kolberg and at Jakobs-hagen. His great work, *Examen Theologicum Aeroamaticum Universam Theologiam Thetico-plemicam Complectens* (1707), passed through many editions, and surpassed preceding works in clearness and simplicity rather than scientific knowledge. It may be considered the best expression of Lutheran orthodoxy of the period. He is not to be confused with David Hollaz, his son, who preached at Günthersberg, and was the author of *Beschreibung der Wiedergeburt* (1737); *Anweisung zum Gebet* (1747); *Evangelische Gnadennordnung* (1751), and *Pilgerstrasse nach Zion* (1771).

HOLLEBEN, hö'läben, THEODOR VON (1838—). A German diplomat. He was born in Stettin, and in 1872 left the Hussars for the diplomatic service. He was Minister to Argentina (1875-85), Envoy to Japan (1885-91), to Washington (1891-93), to Stuttgart (1893-97); and then again to Washington, where he received the rank of Ambassador. After the failure of the German effort to induce President Roosevelt to act as arbitrator in the Venezuelan dispute, von Holleben resigned because of failing health.

HOLLES, hölz, DENZIL, Lord (1599-1680). An English statesman, born at Haughton, Nottinghamshire. He was a member of Parliament for Saint Michael, Cornwall, in 1624, and five years afterwards was one of two members who forced the Speaker to keep his seat when he strove to obey Charles I. by adjourning the House before it could pass certain acts upon taxation and religion obnoxious to the King. Holles was fined

and imprisoned in the Tower for nearly a year, but made his escape abroad, and returned to represent Dorchester in the Long Parliament (1640). Two years afterwards he was one of the famous five members whom King Charles tried unsuccessfully to arrest, and while the Civil War was in progress held Bristol for the Parliament, and raised a regiment of foot that made its mark at Edgehill and Brentford. He was most anxious to effect a reconciliation with the King, because, being a leader of the Presbyterian, as opposed to the Independent Party, he feared military even more than royal supremacy. When he proposed the disbandment of the army in 1647, its leaders accused him of high treason, and he was once again obliged to seek an asylum on the Continent, and remained in France until the close of the Protectorate. Though he worked for the restoration of the Stuarts after his return, he was ever watchful that Charles II. did not encroach upon the public liberties, dearer to him than the King who had made him a peer (1661), and in whose Privy Council he sat (1679), and he exercised his great influence toward the disbanding of the army lest the restored monarch should attempt to use it for his own purposes. Lord Holles was one of the commissioners of the Treaty of Breda (1667), and wrote a number of political pamphlets of little present interest.

HOLLEY, ALEXANDER LYMAN (1832-82). An American metallurgist, born at Lakeville, Conn., where his father, Alexander H. Holley, later Governor of the State, had a cutlery factory, in which the boy became an adept as a machinist. He took a scientific course at Brown University (1850-53); entered the Corliss and Nightingale shops at Providence, R. I.; worked in the Jersey City locomotive-works; and in 1854 became editor and partner with Zerah Colburn of the *Railroad Advocate*. Four years later he and Colburn wrote *The Permanent Way and Coal-Burning Locomotive Boilers of European Railways*, which did much to reform American railroad management. He was an editor of the *New York Times* and of *Webster's Dictionary*; traveled in Europe in 1862, and wrote a *Treatise on Ordnance and Armor* (1864). In 1863 he went to England, purchased the Bessemer patents, and two years later started the Bessemer plant at Troy. He was closely connected with the building of steel-works at Harrisburg, North Chicago, Joliet, Pittsburg, Saint Louis, Cambria, Bethlehem, and Scranton, and made many improvements on the old Bessemer plant. He was a trustee of the Rensselaer Polytechnic Institute (1865-82), and in 1875 he became president of the Institute of Mining Engineers and a member of the Government board for testing structural materials.

HOLLEY, MYRON (1779-1841). An American reformer and editor, born in Salisbury, Conn. A graduate of Williams College, he began the practice of law in 1802, but left it for a book-selling business in Canandaigua, N. Y., and was a leading promoter of the Erie Canal. Afterwards he was prominent in the anti-Masonic and the anti-slavery movements. He was editor first of the *Countryman* (1831-34), then of the *Hartford Free Elector*, and of the *Rochester Freeman*.

HOLLIDAYSBURG. A borough and the county-seat of Blair County, Pa., six miles south of Altoona; on the Juniata River and on branches of the Pennsylvania Railroad (Map: Pennsyl-

vania, C 3). It is the seat of the Hollidaysburg Female Seminary. Coal, iron ore, and limestone are found in the vicinity; and the borough has nail-factories, foundries, and machine-shops, rolling-mills, boiler-works, etc. Population, in 1890, 2975; in 1900, 2998.

HOLLINS, ALFRED (1865—). An English musician, born at Hull. He was blind from his birth, and at nine years of age entered the Wilberforce Institution for the Blind at York, where he remained three years, studying music under William Barnby. In 1878 he entered the Royal Normal College for the Blind, at Upper Norwood, making the piano his chief study, his teacher being Fritz Hartvigson. Through the kindness of the principal of the institution he secured organ lessons from E. J. Hopkins, who took a special interest in him, and who helped him considerably in the mastery of orchestration, which was later a conspicuous feature of his compositions. At the age of sixteen he had given recitals before the Courts of England and Germany, and was a special favorite with Queen Victoria and the Empress Frederick of Germany. In furtherance of his equipment as a pianist he studied piano with Von Bülow in Berlin, and in 1887 became a pupil at the Raff Conservatory, studying in addition under Max Schwartz. He visited America twice, in 1886 as a member of Dr. Campbell's party, and in 1888 as a concert organist. His most important engagement was as organist of United Free Saint George's Church, Edinburgh. His organ compositions are universally known, and are very popular in the United States. The following are among his better-known works: Two concert overtures (in C major and C minor); andante in D; grand *chœur* in G minor; two preludes; intermezzo in D-flat; and a nocturne in B flat.

HOLLINS, GEORGE NICHOLS (1799-1878). An American naval officer. A native of Baltimore, Md., he was midshipman at the age of fifteen, and being aboard a frigate taken by the English, he was held a prisoner by them till the end of the War of 1812. Ten years later he had exchanged the naval for the merchant service, and by 1844 was captain of an armed vessel which he subsequently employed to enforce the rights of Americans living in Nicaragua, thereby causing international complications with Great Britain. This was in 1855. At the outbreak of the Civil War he sided with the Confederates and became a commodore in their navy, rendering important service, but at the peace he turned landsman and was court crier in Baltimore.

HOLLISTER. A town and the county-seat of San Benito County, Cal., 94 miles southeast of San Francisco; on a branch of the Southern Pacific Railroad (Map: California, C 3). It is the centre of farming, fruit-growing, dairying, and stock-raising interests. The town has a public library. Population, in 1890, 1234; in 1900, 1315.

HOLLISTER, GIDEON HIRAM (1817-81). An American author, born in Washington, Conn. After graduating at Yale (1840), he studied and practiced law in Litchfield, with digressions to other towns in Connecticut, and a year in Haiti as United States consul (1863-69). In 1880 he was sent to Congress. His literary work consists of an historical novel, *Mount Hope* (1851); *His-*

tory of Connecticut (2 vols., 1854); *Thomas à Becket: A Tragedy, and Other Poems* (1866), and *Kinley Hollow* (1882), published posthumously.

HOLLMANN, hól'mán, FRIEDRICH (1842—). A German admiral, born in Berlin. He entered the Russian Navy in 1857, served in the Asiatic expedition of 1859-62, commanded a gunboat in 1864, and, after service on schoolship and at the Kiel Naval Academy, fought at the battle of Grille in the Franco-Prussian War. His advance was rapid; in 1889 he arranged the trip of the German Emperor and Empress to Greece and Turkey; and in the following year he was made Secretary of State for the Navy, a post which he held until June, 1897, when he resigned because of his inability to pass the naval budget. He had been promoted to admiral in 1896.

HOLLOWAY, LAURA CARTER (afterwards Mrs. LANGFORD) (1848—). An American author, twice married, whose maiden name was Carter. She was born in Nashville, Tenn., and was educated at the Female Academy there. She was president of the Seidl Musical Society in Brooklyn and a collaborator with Anton Seidl himself in the musical work for the *Standard Dictionary*. She published *Ladies of the White House* (1870); *An Hour with Charlotte Brontë* (1883); *The Mothers of Great Men and Women* (1884); *Chinese Gordon* (1885); and *The Buddhist Diet Book* (1887).

HOLLOWAY COLLEGE. An institution founded in 1883, in Mount Lee, Egham, Surrey, England, by Thomas Holloway, for the purpose of supplying higher education to women, particularly of the middle class. The building is very handsome in the French Renaissance style, and was opened by Queen Victoria in 1886. Twelve trustees look after the management.

HOLLOW-WARE. There are two classes of iron goods so called, viz. cast-iron hollow-ware and wrought-iron hollow-ware. Both kinds include cooking and other vessels for domestic use, and comprise also some other articles, such as coffee-mills, which are molded and finished in a similar way. Wrought-iron hollow-ware is largely made by the process of stamping. (See DIES AND DIE-SINKING.) Hollow-ware is finished in three ways; some of it is enameled, some tinned, and some of it is left black, or untinned. See ENAMEL.

HOLLS, GEORGE FREDERICK WILLIAM (1857—). An American lawyer. He was born at Zelenople, Pa., graduated at Columbia (1878) and at Columbia Law School (1880), and gained a large German-American practice in New York City. He was a Republican delegate-at-large to the State Constitutional Convention in 1894, and was commissioner on government of cities of the third class (1895). In 1898 he did much in Germany to better feeling toward the United States, and in the following year was appointed secretary and counsel of the American delegation to the Peace Conference at The Hague. In the treaty there concluded, Holls wrote the article *Special Mediation*. He wrote: *Franz Lieber* (1884, in German); *Sancta Sophia and Troitzza*, a sketch of travel in Russia and the East (1888); *Compulsory Voting* (1891); and *The Peace Conference at The Hague and Its Bearings on International Law and Polity* (1900).

HOLLY (older *hollen*, from AS. *holen*; connected with Ir. *cuilenn*, Gael. *cuiloun*, Welsh

celyn, holly, and also with OHG. *hulis*, *huls*, Ger. *Hülse*, holly, Skt. *śala*, staff), *Ilex*. A genus of trees and shrubs of the natural order Ilicineæ, chiefly natives of temperate climates; with evergreen, leathery, shining, and generally spinous leaves. The common holly (*Ilex Aquifolium*), the only European species, and a native also of some parts of Asia, is a well-known ornament of parks and shrubberies in Great Britain, where it sometimes attains a height of fifty feet upon suitably light soils. Numerous varieties of holly have been produced, or at least perpetuated, by cultivation, which exhibit great diversity in the leaves. The flowers of the holly are whitish, axillary, nearly umbellate; the fruit small, scarlet, rarely yellow or white. Medicinal properties are attributed to the leaves, berries, and roots. Bird-lime is made from the inner bark. The wood is almost as white as ivory, very hard and fine-grained, and is used by cabinet-makers, turners, musical-instrument makers, etc., and sometimes for wood-engraving. The holly is often planted for hedges, since it bears clipping well. The name holly is said to be derived from the use of the branches and berries to decorate churches at Christmas, from which the tree was called holy-tree. Numerous species of holly are found in North America, most of them in swampy situations; in South America, Nepal, Japan, and other parts of the

ward into bracts; and large axillary flowers, almost without stalks, which on the upper part of the stem form a spike; the petals are hairy at their bases. Its flowers vary much in color, and

HOLLYHOCK (*Althæa rosea*).

double and semi-double varieties are common. It is an ornamental autumnal flower, which continues till frost. It is propagated either by seed or cuttings.

The plant is frequently attacked by a fungus, a rust, *Puccinia malvacearum*, which has greatly reduced its culture in many parts of the United States and Europe. Its presence may be first noticed in May or June by small yellow spots on the leaves and stems. Soon the leaves become dry and dead, as though scorched by fire. Any standard fungicide applied frequently from early spring until flowering time will keep the disease in check. Washing the leaves with a solution of two tablespoonfuls of potassium permanganate in a quart of water is a common remedy employed in Europe. The hollyhock is sometimes attacked by blight (*Colletotrichum malvarum*), and a leaf-spot disease (*Cercospora althæina*), both of which may be prevented by the use of some good fungicide (q.v.).

HOLLY (*Ilex Aquifolium*).

world. Some of these have been introduced as ornamental trees and shrubs. Maté (q.v.), or Paraguay tea, is the leaf of a South American species of holly (*Ilex Paraguensis*). In the United States there are a dozen species of *Ilex*, the finest of which, American holly (*Ilex quercifolia*), is a small tree 20 to 40 feet tall, extensively used as a Christmas decoration, though the leaves are less glossy and the berries not so bright a red as the European species. *Ilex cassine* is a shrub which occurs from Virginia southward. Its leaves are used for tea, and it furnished the 'black drink' of the North Carolina Indians.

HOLLYHOCK (ME. *holihoc*, holy hoek., from *holi*, AS. *hālig*, holy + *hoc*, AS. *hoc*, leaf), *Althæa rosea*. A plant of the natural order Malvaceæ, native of India and south of Europe, etc., and common in gardens through the world. It has a tall, straight, hairy, unbranched stem, 8 to 15 feet tall, heart-shaped crenate, wrinkled, five to seven angled leaves, which diminish up-

HOLLY SPRINGS. A city and the county-seat of Marshall County, Miss., 45 miles southeast of Memphis, Tenn., at the junction of the Illinois Central and the Kansas City, Memphis and Birmingham railroads (Map: Mississippi, G 1). It has a public library, Rust University for negroes (Methodist Episcopal), opened in 1868, a colored State Normal School, founded in 1870, the North Mississippi Presbyterian College for young ladies, the Holly Springs Normal Institute, and other educational institutions: The city is principally engaged in the cotton trade, and has a cotton compress and gin, a cottonseed-oil mill, stone-jug factories, etc. Holly Springs is governed under a charter of 1896, which provides for a mayor, elected biennially, and a city council. The water-works and electric-light plant are owned and operated by the municipality. In December, 1862, during the Civil War, General Grant established here a depot of supplies, protected by a small garrison under Col. R. C. Murphy, preparatory to moving forward against Vicksburg. On December 20th the Confederate General Van Dorn by a rapid movement captured

the post, taking about 1500 prisoners, and destroyed supplies valued by Grant at \$400,000. This, together with a raid by Forrest into Tennessee, forced Grant to abandon for a time his forward movement. Population, in 1890, 2246; in 1900, 2815.

HOLM, SAXE. The nom-de-plume signed to a series of short stories, first published in *Scribner's Monthly Magazine*, and then in a volume (New York, 1873; second series, 1878). They have been attributed to Mrs. H. M. F. Jackson (at the time of publication, Mrs. Helen Hunt).

HOLMAN, JOSEPH GEORGE (1764-1817). An English actor and dramatist. Educated in London and at Oxford, he made his début, when twenty years of age, as Romeo at Covent Garden, and continued to present Shakespearean and other rôles there till the end of the eighteenth century. In 1806 he played in Dublin, then at the Haymarket, London. He went in 1812 to America, where he had the support of his daughter in performances at New York City and Philadelphia. He made two attempts at theatrical management in the United States, but was more successful as a writer of comedies and comic operas, such as: *Abroad and at Home* (1796); *Red Cross Knights* (1799); *Volary of Wealth* (1799); and *What a Blunder* (1800).

HOLMAN, SILAS WHITCOMB (1856-1900). An American physicist, born at Harvard, Mass. He graduated at the Massachusetts Institute of Technology in 1876, was appointed an instructor in that institution in 1881, assistant professor in 1882, associate professor in 1885, and professor in 1893. In 1897 ill health and failing eyesight compelled him to retire with the title of professor emeritus. He was particularly interested in the methods of laboratory instruction, and published investigations on *The Effect of Temperature on the Viscosity of Air* (1876), and on *The Viscosity of Gases*; and other works, including *Physical Laboratory Notes* (1885-95); *Computation Rules and Logarithms* (1896); and *Matter, Energy, Force, and Work* (1898).

HOLMAN, WILLIAM STEELE (1822-97). An American jurist and politician. He was born in Dearborn County, Ind., and was educated at Franklin College, became a lawyer, and held several judicial positions; was a member of the Indiana Constitutional Convention in 1850, and of the Indiana Legislature in 1851. With the exception of eight years he was a Democratic Representative in Congress from 1859 till his death, in 1897; and from his opposition to extravagant appropriations was known as 'the great objector' and 'the watch-dog of the Treasury.'

HOLMBOE, hólmb'ë, KRISTOFFER ANDREAS (1796-1882). A Norwegian Orientalist and numismatist, brother of Bernt Michael Holmboe (1795-1850), the mathematician. He was born at Vang; studied at Christiania, and made a specialty of Oriental languages, especially Persian, under De Sacy, in Paris (1821-22). In 1822 he became lektor in Oriental languages at Christiania, and in 1825 professor. Besides being a pioneer in philology he took an active interest in education. He founded (1834) the *Norske Universitets og Skole-Annaler*. His more important works are: *De Re Prisca Monetaria Norvegia* (1841); *Sanskrit og Oldnorsk* (1846); *Det Oldnorske Verbum* (1848); *Det Oldnorske Sprogs væsentligste*

Ordforraad, sammenlignet med Sanskrit (1852); *Norsk og Keltisk* (1854); and the very valuable *Bibelsk Real-Ordbok* (1868).

HOLM'BY HOUSE. A mansion near Northampton, England, erected by Sir Christopher Hatton during the reign of Elizabeth, and later purchased by James I. It was here that Charles I. was imprisoned by the Parliamentary commissioners from the time he was surrendered by the Scots until removed to Newmarket by Cornet Joyce (February-June, 1647). Five years thereafter the house was dismantled. See Gardiner, *History of the Great Civil War*, vol. iii. (new ed., London, 1893).

HOLMES, hómz, ABIEL (1763-1837). An American Unitarian clergyman and historian, born at Woodstock, Conn. He graduated at Yale in 1783, and for a time was a tutor and a student of theology there. His first pastorate was at Midway, Ga., in a district settled largely by New Englanders. There he remained from 1785 till 1791, when he accepted a call to the First Congregational Church of Cambridge, Mass., where he continued during the next forty years. His first wife was a daughter of President Stiles, of Yale College; his second was the daughter of Oliver Wendell, and became the mother of Oliver Wendell Holmes (q.v.). His publications include: *A Life of President Stiles* (1798); *Annals of America* (2d ed. 1829), his best-known work, characterized by the minutest accuracy and still standard for the period covered; *Historical Sketch of the English Translation of the Bible* (1815); and a number of sermons, addresses, and memoirs.

HOLMÈS, ô'mès', AUGUSTA MARY ANNE (1847-1903). A French song composer, born in Paris of English-Irish parents. Her father was Captain Dalkeith Holmes, of the British Army, and her mother was a member of an old Hampshire (England) family. She studied under Lambert, Klosé, and César Franck, and although a brilliant pianist (in her childhood regarded as a prodigy), she attained distinction entirely through her compositions. In 1879 she won the third prize with her *Lutèce* in an open competition instituted by the city of Paris. Her other important compositions are a psalm, *In exitu* (1873); the symphony *Héro et Léandre* (1874); an *Andante pastoral* (1877); the symphonies *Les Argonautes* (1880) and *Irlande* (1885); and over a hundred songs, besides other orchestral works.

HOLMES, hómz, GEORGE FREDERICK (1820-97). An American educator. He was born in British Guiana; was educated at Durham University, England; came to America in 1838, and taught in Virginia, South Carolina, and Georgia. He was for a time one of the editors of the *Southern Quarterly Review*, and in 1846 was president of the University of Mississippi. From 1847 to 1857 he was professor of history, political economy, and international law in William and Mary College. From that time until his death he was professor of history and literature in the University of Virginia. He prepared a series of text-books for the use of schools in the Southern States, in which the sentiments and selections were made with reference to the justification of slavery.

HOLMES, MARY JANE (c.1839—). An American novelist. Her maiden name was Hawes, and

she was born in Brookfield, Mass., but moved at her marriage to Versailles, Ky., and afterwards Brookport, N. Y. She was at first a district school-teacher, and the didactic tendency is perceptible throughout her works, which were favorites of the young person of a past generation. Her first novel, *Tempest and Sunshine* (1854), was followed by a book almost every year, and the circulation of her books has exceeded two millions.

HOLMES, NATHANIEL (1815—). An American jurist and author, born in Peterborough, N. H. He graduated at Harvard, began legal practice in 1839 at Saint Louis, and was judge of the Missouri Supreme Court from 1865 to 1868. From that time until 1872 he was law professor at Harvard, but he retired altogether from public life in 1883. In *The Authorship of Shakespeare* (1866) he credits Francis Bacon with the dramas, and he published also *Realistic Idealism in Philosophy Itself* (2 vols., 1888), and an *Historical Address* (1890).

HOLMES, OLIVER WENDELL (1809-94). An American man of letters, born at Cambridge, Mass., August 29, 1809, son of the Rev. Abiel Holmes (q.v.). Holmes was brought up in the orthodox faith, was sent to Phillips Academy, Andover, Mass., for his preliminary education, and graduated from Harvard College in 1829. He at once entered the Law School of that institution, but, finding the law uncongenial, he gave it up for medicine. While a law student he wrote and published in the *Boston Advertiser*, in 1830, his well-known and stirring verses, "Old Ironsides," which were an effective and popular protest against the proposed breaking up of the famous frigate *Constitution*. After three years in the Harvard Medical School, Holmes, in 1833, sailed for Europe, where he studied two years, chiefly in Paris, and on his return began the practice of medicine in Boston in 1836. The same year witnessed the publication of his first volume of poems. In 1838 he was appointed to the professorship of anatomy at Dartmouth College, a post which he held for two years. Thenceforth he passed his life almost wholly in Boston, with which city his name became very intimately associated. On June 15, 1840, he married Miss Amelia Lee Jackson of Boston. His only important contribution to medical science was made in 1843, when he published his essay on the *Contagiousness of Puerperal Fever*, though he wrote numerous other scientific papers. From 1847 to 1882 he was Parkman professor of anatomy and physiology in the Harvard Medical School. He was, however, not really eminent in his profession. His literary gift was marked, and he was less renowned in Boston as a practitioner than as a writer of very facile, witty verse, collections of which appeared in 1836, 1846, 1849, 1850, and later.

Until 1857, however, his reputation was almost wholly local. The establishment in that year of the *Atlantic Monthly*, under the editorship of Lowell, brought him a national and almost worldwide vogue through the serial publication in that magazine of the *Autocrat of the Breakfast Table*, which appeared in book form in 1858. These delightfully egotistical talks, full of brilliant wit and buoyant seriousness, essentially of New England and Boston, had had their origin in two forgotten essays by Holmes in the *New England*

Magazine in 1833. The success of *The Autocrat* was remarkable, and Holmes has been likened to almost every famous essayist from Montaigne to Lamb. Among orthodox Calvinists the sketches met with disfavor, since the ideas and the manner were those of an essential rationalist. They were followed in the next year by a series scarcely less delightful, *The Professor at the Breakfast Table* (pub. 1860 in book form), and after a lapse of more than a decade, in 1871-72, by the third and last volume of the series, *The Poet at the Breakfast Table*. *The Autocrat*, however, is the best, most original, and most popular of the works of Holmes, who is often called 'The Autocrat.'

In 1861 Holmes published his first novel, *Elsie Venner*. Though rather formless and uneven in quality, and inartistic in method, it is interesting, and full of power. More commonplace in idea than *Elsie Venner*, but equally interesting in its delineation, often rather contemptuous, of New England character, was *The Guardian Angel* (1867). In the interval between these two novels appeared *Songs in Many Keys* (1861) and *Humorous Poems* (1865), and a volume of prose, *Soundings from the Atlantic* (1863). His remaining literary work contained nothing very new or striking. The chief titles are: *Mechanism in Thought and Morals* (1871); *Songs of Many Seasons* (1874); *John Lothrop Motley* (1878), a memoir; *The School-Boy* (1878); *The Iron Gate, and Other Poems* (1880); *Pages from an Old Volume of Life* (1883); *Medical Essays* (1883); *Ralph Waldo Emerson* (1884), a life; *A Mortal Antipathy* (1885), his last novel, inferior to the two former; *The New Portfolio* (1885-86) in the *Atlantic*; *Our Hundred Days in Europe* (1887), an account of a voyage taken with his wife and daughter; *Before the Curfew, and Other Poems* (1888); and *Over the Tea-Cups* (1890), in the vein of *The Autocrat*. His death occurred in his eighty-sixth year, in Boston, October 7, 1894.

Dr. Holmes was slight in stature and fastidious as to his personal appearance. In temper he was humane and kindly, particularly gracious to his numerous correspondents when confident of their sincerity, and genial in all his writing. His social accomplishments were unusual; he is said to have been the best talker in Boston. His style, at its best, is the style of spoken discourse—light, intimate, and winning, but not flippant. His verse, which is almost wholly of an occasional character, such as poems read at reunions of his college class or scattered throughout the pages of *The Autocrat*, is, like that prose work, sparkling with wit, or a graceful compound of gravity and humor. He is a prince among writers of *vers de société*. Among the best known of his poems are "Old Ironsides," "The Chambered Nautilus," "The Last Leaf," "Dorothy Q.," "The Voiceless," "The Deacon's Masterpiece; or, the Wonderful One-Hoss Shay," a satire against the doctrines of Jonathan Edwards.

BIBLIOGRAPHY. Consult Morse, *Life and Letters of Holmes*, vols. xiv. and xv. of the *Collected Works*. Sketches are to be found in Higginson, *Old Cambridge* (New York, 1900), and Howells, *Literary Friends and Acquaintance* (New York, 1899). The literary historians, as Stedman, Richardson, and Wendell, discuss at some length his general position in the history of American

letters. The standard edition of his works is the Riverside, in fifteen volumes (Boston, 1892).

HOLMES, OLIVER WENDELL, JR. (1841—). An American jurist, son of Dr. O. W. Holmes. He was born in Boston; was educated at Harvard; served in the Civil War, and was three times wounded—at Ball's Bluff, at Antietam, and at Fredericksburg. He practiced law in Boston; edited the *American Law Review* (1870-73); became professor of law at Harvard in 1882; and in the same year entered the Massachusetts Supreme Court, of which he became Chief Justice in 1899. In 1902 he was named to succeed Justice Gray in the United States Supreme Court. Holmes edited the twelfth edition of Kent's *Commentaries* and published his own Lowell Institute lectures, *The Common Law* (1881).

HOLMES, THEOPHILUS HUNTER (1804-80). An American soldier, prominent on the Confederate side in the Civil War. He was born in Sampson County, N. C., graduated at West Point in 1829, served in the Florida War and the War with Mexico, and at the outbreak of the Civil War was acting as superintendent of the general recruiting service, with the rank of major. In April, 1861, he resigned his commission in the United States Army, and for a time was engaged in organizing the State troops of North Carolina. He became a brigadier-general in the Confederate service soon after the secession of his State, commanded the Confederates in the engagement at Aquia Creek, was promoted to be major-general, and from September, 1862, to March, 1863, was in command of the Trans-Mississippi Department, attaining the rank of lieutenant-general. On July 3, 1863, he made an unsuccessful attack on Helena, Ark.

HOLMES, WILLIAM HENRY (1846—). An American geologist. He was born near Cadiz, Ohio, and after graduating at the McNeely Normal College (1870), was assistant on the United States Geological Survey (1872-80). During that period he accompanied Dr. F. V. Hayden's explorations in the Rocky Mountain region, and superintended the survey of the San Juan territory until the reorganization of the survey (1880) when he was appointed geologist in charge of the department of illustrations; had charge of the archaeological explorations of the Bureau of Ethnology in 1889-93; in 1894-98 was professor of archaeologic geology at the University of Chicago; and in 1898 was made curator of the United States National Museum. He edited geological publications, including Hayden's *Atlas of Colorado* and the eleventh and twelfth reports of the Geological Survey, and published reports on the cliff ruins of the San Juan country, and on aboriginal American art and archaeology. He is a fellow of the American Association for the Advancement of Science.

HOLMGREN, hölm'grën, ALARIK FRITHIOF (1831-97). A Swedish physiologist, born in Vestra Ny (East Gotland), and educated at the University of Upsala, at the University of Berlin under DuBois-Reymond and Helmholtz, and under Brücke and Ludwig in Vienna. In 1864 he became professor of physiology at Upsala, the first chair in that subject in Sweden, and soon afterwards founded a physiological laboratory. His medical studies were mostly in the field of ophthalmology, and he was an author-

ity on color-blindness; his work on this subject, *Om färgblindheten i dess förhållande till järnvägstrafiken och sjöväsendet* (1877) has been translated into many languages. Holmgren was a firm believer in the hygienic value of Swedish gymnastics. He edited the *Skandinavisches Archiv für Physiologie* (1889 sqq.).—His wife, ANN MARGRETA TERSEMEDEN (1850—), under the pseudonym Märta Bolle, wrote the novels *Fru Stråle* (1894) and *När Kiadar Alf suckar* (1896).—His brother, AUGUST EMIL HOLMGREN (1829—), is a naturalist of much ability. He wrote: *Ichneumonologia Suecica* (1864); *Handbok i Zoologi* (1865-71); *Om Småfåglarne* (1869); and *Om skadeinseketer inomhus* (1879), besides other works on entomology and ornithology.

HOL'OCEPH'ALI (Neo-Lat. nom. pl., from Gk. ὄλος, *holos*, entire + κεφαλή, *kephalē*, head). A subclass of cartilaginous fishes (q.v.), including the single living family Chimæridæ. The number of living species is small, but in the remote past they were a dominant group, numerous in species. See CHIMÆRA.

HOLOFERNES, hōl'ō-fēr'nēs, or **HOLOPHERNES**. (1) The stock pedant in Italian comedy. (2) The tutor of Gargantua, in Rabelais's *Gargantua and Pantagruel*, who teaches his pupils to say the alphabet backward. (3) A pedantic schoolmaster in Shakespeare's *Love's Labour's Lost*, said to have been meant for John Florio, author of a dictionary.

HOL'OGRAPH (Lat. *holographus*, from Gk. ὁλόγραφος, written entirely by the author's hand, from ὄλος, *holos*, entire + γράφειν, *graphein*, to write). A deed or writing wholly by the hand of the maker or author. In those countries which derive their legal systems mainly from the civil, or Roman, law, a holographic writing is deemed to prove itself; that is, proof of the handwriting of the person whose instrument it purports to be is in itself sufficient to authenticate the document, without formal attestation by subscribing witnesses, notarial seals, and the like. This is true of Scotland, Quebec, and Louisiana, as well as of most Continental States. In the common-law system, however, of England and America, no distinction of superior validity attaches to holographic writings, and they require the same formal attestation and the same proof of validity as other writings. See EVIDENCE; HANDWRITING, and the authorities there cited.

HOLOPTYCHIUS, hōl'ōp-tik'ī-ūs (Neo-Lat., from Gk. ὄλος, *holos*, entire + πτυχή, *ptychē*, πτύξ, *ptyx*, fold). A genus of fossil ganoid fish of the order Crossopterygii, remains of which are found commonly in the Catskill sandstones of North America and in the Old Red Sandstone of the British Devonian system. Some of the species were thirty inches long, with rounded tapering bodies, and heterocercal tails. There are two dorsal fins, a pair of long, stout, pointed pectoral fins, and short pelvic and anal fins. The body was covered with large, rounded (cycloid) scales, the surfaces of which are marked by prominent ridges of ganoine, a structureless enamel. These scales, of gray or bluish-white color and one to three inches in diameter, are very abundant in some parts of the Catskill formation in New York and Pennsylvania. See CATSKILL GROUP; DEVONIAN SYSTEM; GANOIDEI; FOSSIL.

HOLOSTELI, hōl-ōs'tē-ī (Neo-Lat. nom. pl., from Gk. ὅλος, *holos*, entire + ὀστέον, *osteon*, bone). A group of bony ganoids, embracing the garkikes and bowfins (q.v.).

HOL'OTHURIAN (from Lat. *holothurium*, Gk. ὀλοθύριον, water-polyp; probably from ὅλος, *holos*, entire + θούριος, *thourios*, θούρος, *thouros*, impetuous). An echinoderm of the class Holothuroidea, easily recognized by the soft body, generally worm-like form, and circle of tentacles about the mouth. The madreporic plate is internal. 'Sea-cucumber,' 'sea-squirt,' and 'sea-slug' are some of the popular names of these animals, whose dried bodies form the Oriental 'trepan' (q.v.). The class have not the covering of calcareous plates characteristic of the more typical Echinodermata, but a tough leathery muscular integument, in some genera strengthened by minute or rather large calcareous plates or hooks, very irritable, and capable of great distention and contraction. Some of them are almost globose, some truly worm-like; but the same individual is often capable of extending itself to several times the length which it has in a state of repose. In locomotion the body is extended and contracted in the annelids, and in the apodous forms this is the only means of locomotion, except such aid as is given by the tentacles. In the pedate forms the principal organs of locomotion, as in starfishes and sea-urchins, are the ambulacral feet, of which there are sometimes five double rows, while sometimes they are distributed over the whole surface of the body; but some of the species have the feet developed only on the ventral side, and the body

then presents an upper and an under surface. When the feet are furnished with suckers and are very extensible they are called 'pedicels,' but when they end in a blunt point and their function seems to be chiefly respiratory, or to serve as organs of touch, they are called 'papillæ.' Sometimes all the feet are pedicels; sometimes there are pedicels on the ventral side and papillæ

20 are the usual numbers. They are very rarely short, simple, and unbranched; generally they are provided with branches which may be arranged along the sides, clustered at the top, or irregularly scattered. The tentacles are very sensitive and are the most important sense-organs of the animal; upon them are occasionally found special sense-cups, supposed to be olfactory, or there may be at the base pigment eyes or positional organs. The nervous system is perfectly radiate in structure and very simple in organization. The mouth opens into an alimentary canal, usually much longer than the body, and therefore more or less looped or coiled. An œsophagus, stomach, intestine, and cloaca can usually be distinguished. Arising from the cloaca, there are often two irregularly branched organs, known as the 'respiratory trees.' These are hollow, very thin-walled, and capable of containing a great deal of water, which they receive through the anus. They are excretory, and perhaps respiratory in function. In many species there arise from the wall of the cloaca, and extend into the body-cavity of the animal, numerous glandular tubules, known as Cuvier's organs. These can be ejected from the anus as long, sticky threads, and thus seem to be protective. The blood system is well developed in most holothurians, especially along the intestine. In those forms which have a respiratory tree one branch of it is often closely bound up with a network of blood-vessels, arising from the principal vessel on the intestine. The sexes are generally separate, hermaphrodite forms being quite unusual; but there is no external difference between male and female, save in a very few forms. The eggs are generally thrown out into the water, where they are fertilized, but several viviparous forms are known, in which the eggs fall into the body-cavity of the mother and the young develop there. In such cases the development is direct, but in species whose eggs develop in the water the young assume a peculiar larval form, known as the *auricularia*, from which the adults develop by a more or less complicated metamorphosis. Several cases are known of female holothurians which brood their eggs and care for the young.

THE COMMON NORTH ATLANTIC HOLOTHURIAN. (*Pentacta frondosa*.)

The radiate structure is apparent at the mouth, which is surrounded with tentacles, in number frequently a multiple of five, exhibiting considerable variety of form, and capable of being more or less retracted. These tentacles vary in number from 8 to 30, but 10, 12, 15, and

on the dorsal; rarely all the feet are papillæ. In two families the feet are completely wanting.

SYNAPTA.

a, free-swimming young; b, adult synapta.

The holothurians are capable of the most extraordinary regeneration of parts, even of the most important organs. In direct relation with this is their curious and noteworthy habit of evisceration. Many species when alarmed or irritated expel from the anal opening (or less commonly the mouth) the viscera, either wholly or in part. They thus lose their entire digestive, reproductive, respiratory, and excretory systems and a large part of the blood system; but if not disturbed further, they will, in the course of a few weeks, replace all they lost with an entirely new set.

Holothurians are found in all seas, but particularly abundant in the West Indies and between Asia and Australia. The largest American species is *Holothuria Floridana*, which abounds just below low-water mark on the Florida reefs. Another large one, *Cucumaria frondosa*, inhabiting the North Atlantic, and probably circumpolar, is about a foot in length, and is yellowish-brown. Many of the tropical species exhibit attractive colors, and are among the creatures which make the bottom of the sea, particularly among coral reefs and islands, extraordinarily interesting.

The holothurians (Holothuroidea) are classified in two orders according to the point of origin of the tentacles. In the *Actinopoda* they arise from the radial vessels of the water-vascular system, while in the *Paractinopoda* they arise from the circumoral ring. The *Actinopoda* include more than five-sixths of the species, and are grouped in five very distinct families. Of these, the *Elasipoda* are the most remarkable. They are all deep-sea forms and occur in all parts of the world. Many of them assume the most grotesque shapes, and some reach a large size. The *Paractinopoda* are all footless forms, of a single family. The best-known genus is *Synapta*, containing more than fifty species found in all parts of the world. About six hundred species of holothurians are known, varying in size from those half an inch long up to certain tropical species two or even three feet in length. The colors vary from white, or almost transparent, to jet-black, but as a rule the colors are more or less in correspondence with the bottom on which the animal lives. They chiefly feed on Foraminifera. Their movements are generally very sluggish, and they seem to have few enemies. All are harmless, but the only ones of any use to man are the larger forms, from which *bêche-de-mer*, or *trepang*, a great delicacy with the Chinese, is prepared.

Consult: Ludwig, "Die Seewalzen," in Bronn, *Klassen und Ordnungen des Tierreichs: Echinodermen*, vol. i. (Berlin, 1889-92), the standard work on holothurians; Lampert, *Die Seewalzen* (Wiesbaden, 1885); the best work in English is Theél, "Report on the Holothuroidea," in *Challenger Reports: Zoölogy*, vol. iv., part 13, and vol. xiv., part 39 (London, 1882 and 1886).

HOL'OTHURO'IDEA. A class of echinoderms. See ECHINODERMATA and HOLOTHURIAN.

HOLST, hólst, HANS PETER (1811-93). A Danish poet and novelist, born at Copenhagen. From 1875 until his death he was dramaturgist for the Royal Theatre, Copenhagen. His first work to attract attention was a memorial poem on Frederick VI. (1839). This was followed by *Ude og Hjemme*, prose and verse (1843), and *Den lille Hornblæser* (1849) a collection of patriotic poems. He also wrote a number of plays, vaudevilles and novels, and translated *Much Ado About Nothing* (1880).

HOLST, HERMANN EDUARD VON (1841-). A German-American historian and educator, born at Fellin, in Livonia, of German parentage. He studied at Dorpat from 1860 to 1863, and at Heidelberg from 1863 to 1865, and became a tutor at Saint Petersburg in 1866; but was excluded from the Russian dominions in the following year for publishing a pamphlet of which the Russian Government disapproved, and emigrated to America. Settling in New York, he taught modern languages for a time in a small

private school, made a number of political speeches in the Presidential campaign of 1868, and was an assistant editor of Schem's *Deutsch-Amerikanisches Konversations-Lexikon*. He then returned to Germany, was professor of history in the University of Strassburg from 1872 to 1874, and in the University of Freiburg from 1874 to 1892, visited America in 1878-79 and in 1884, served for a number of years in the Baden Diet, for the last two sessions as vice-president, and in 1892 became head of the department of history in the newly founded University of Chicago. In 1900 ill health compelled his retirement, and he returned to his home in Freiburg. Von Holst's works are almost altogether on American topics. His *Verfassung und Demokratie der Vereinigten Staaten von Amerika* (5 vols., 1873-91), English translation by Lalor and Mason, *The Constitutional and Political History of the United States* (8 vols., 1876-92), is his best-known work, and contains a remarkably able presentation of the Federalist and anti-slavery view of American political history. Among his other publications are: *Das Staatsrecht der Vereinigten Staaten von Amerika* (1885), English translation, *The Constitutional Law of the United States of America* (1887); *John C. Calhoun*, in the "American Statesmen Series" (1882); *John Brown* (1888); and *The French Revolution Tested by Mirabeau's Career* (1894). Consult Hart, "Hermann von Holst," in the *Political Science Quarterly*, vol. v. (New York, 1890).

HOLSTEIN, hól'stín. Formerly a duchy belonging to Denmark, and at the same time a member of the Holy Roman Empire and of the Germanic Confederation (Map: Prussia, C 1). It was annexed in 1866 to Prussia, and now forms the southern part of the Province of Schleswig-Holstein (q.v.).

HOLSTEIN, or **HOLSTEIN-FRIESIAN**. A breed of dairy cattle. See CATTLE.

HOLSTEIN, FRANZ VON (1826-78). A German composer, born at Brunswick. He entered a military school, and became an officer in the German Army, but at the same time studied music with Richter. In 1853 he resigned from the army and became one of Hauptmann's pupils at the Leipzig Conservatory. After traveling extensively he settled in Leipzig as a composer. His operas, of which he wrote both words and music, include: *Der Haideschacht* (1868); *Der Erbe von Morley* (1872); and *Die Hochländer* (1876). He also composed considerable vocal and instrumental music.

HOLSTEIN-GOTTORP, gót'tórp. See OLDENBURG, HOUSE OF.

HOLSTON RIVER. One of the two rivers, the Clinch being the other, which unite at Kingston, Roane Co., Tenn., to form the Tennessee River (Map: Tennessee, H 4). The Holston itself is formed by two forks rising in the Alleghanies in southwestern Virginia and uniting at Kingsport in Sullivan County, Tenn. With the north fork it is over 300 miles long, and is navigable to Knoxville at all seasons, and in winter to Kingston.

HOLT, Sir JOHN (1642-1710). An English jurist. After receiving his education at Oxford, he was called to the bar, 1663, from Gray's Inn, to which he had been admitted when only ten years of age. He soon displayed a decided talent for law, and became an able advocate, well

versed in the constitutional law of England. In 1685-86 he was Recorder of London, and about this time was appointed Sergeant-at-Law and King's Sergeant. Afterwards he fell into disfavor with King James II., but the ability which he displayed in the Convention Parliament raised him so high in the estimation of the Prince of Orange, that, upon the accession of the latter to the English throne, Holt was made Lord Chief Justice of the King's Bench. As a judge he was noted for the fairness and even kindness with which he treated accused persons, and for his opposition to prosecutions for witchcraft. He was also opposed to standing armies and to the use of military power for the preservation of domestic peace. Consult: *Report of All the Cases Determined by Sir John Holt, Kt. from 1688 to 1710, etc.* (in the Savoy, 1738); *Report of Cases Argued, etc., in Blanco R[eginæ] in the Time of Queen Anne* (ib., 1737); Foss, *Judges of England: with Sketches of Their Lives, etc.* (London, 1848-64); Burnet, *History of His Own Time* (6 vols., London, 1838).

HOLT, JOSEPH (1807-94). An American jurist, born in Breckinridge County, Ky., and educated at Saint Joseph's College and Centre College in the same State. He studied law; practiced in Elizabethtown, then in Louisville; lived for a time after 1835 in Mississippi, where he contested several suits with Sergeant S. Prentiss, among them the case as to the ownership of some public land, claimed by the heirs of Newit Vick, for whom Prentiss was counsel. In the same year (1835) he attracted attention as politician and orator by his defense of R. M. Johnson in the Democratic National Convention. He was a strong supporter of Buchanan in 1856, and was appointed by him Commissioner of Patents in the following year. In 1859 he became Postmaster-General, and in 1860 succeeded Floyd as Secretary of War. A Douglas Democrat before the war, he heartily supported the Union, and in 1862 became Judge-Advocate, and two years later Judge Advocate-General. As head of the department of military justice he conducted the trial of Fitz John Porter and that of Lincoln's assassins. He was brevetted major-general in 1865 and retired ten years later.

HOLTEL, hól'ti, KARL VON (1798-1880). A German poet, dramatist, and novelist, born in Breslau, where at the age of twenty-one he went on the stage. In 1821 he married an actress, Luise Rogée, and after acting as secretary and dramaturgist to the Breslau Theatre for two years went to Berlin with his wife, who had been engaged at the Court Theatre there, and wrote the very successful plays, *Die Wiener in Berlin* and *Die Berliner in Wien*. His wife died in 1825, and he soon married Julie Holzbecher (1809-39), a clever comedienne. In 1833 he returned to the stage and toured with his wife, writing for this purpose *Loorbeerbaum und Bettelstab* and *Shakespeare in der Heimat* (1840). He died at Breslau, in the cloister of the Brothers of Charity. The best of his productions is his *Schlesische Gedichte* (20th ed. 1893), lyrics in the Silesian dialect. Holtei's collected plays are contained in the *Theater* (1867). Besides his plays and lyrics, Holtei wrote many novels, among which mention should be made of *Die Vagabunden* (8th ed. 1894); *Christian Lammfell* (4th ed. 1878); *Noblesse oblige* (2d ed. 1862), and others collected in

Erzählende Schriften (1861-66); and sketches and criticisms. Consult Storch, *Karl von Holtei* (Waldenburg, 1898).

HOL'TON. A city and the county-seat of Jackson County, Kan., 80 miles northwest of Kansas City, Mo., on the Chicago, Rock Island and Pacific, the Union Pacific, and the Missouri Pacific railroads (Map: Kansas, G 2). It is the commercial centre for a stock-raising and farming section, the chief crops of which are corn, wheat, and hay. Campbell University (Baptist) was established here in 1882. Settled in 1859, Holton was incorporated in 1870. The government is administered by a mayor, elected every two years, and a common council. Population, in 1890, 2727; in 1900, 3082.

HOLTON, LUTHER HAMILTON (1817-80). A Canadian statesman, born in South Leeds, Ontario. He was a prominent merchant and city councilor of Montreal before becoming its representative in Parliament (1854-57). He was member for Chateaugay (1863-80), and held different positions in the Government. He was leader of the opposition in the Quebec local House, president of the Montreal Reform Association, a governor of McGill University, and for five years director of the Grand Trunk Railway.

HÖLTY, hël'té, LUDWIG HEINRICH CHRISTOPH (1748-76). A popular German poet, born at Mariensee, the son of a country parson. He studied theology at Göttingen (1769), fell in there with Bürger, Voss, and the Stolbergs, and assisted in founding the patriotic poetic league of the Hainbund. He was naturally sentimental, and dwelt, though not morbidly, on death, nature, and solitude, showing the influence of Rousseau, and especially of the *Night Thoughts* of Young. Occasionally there is also a joyous or even a playful strain, but it is with harmonious melancholy that he is associated in the popular mind. A few of his poems are known wherever German is sung. Hölty's *Works* were collected in 1789. There is a life by Ruete (Guben, 1883), and biographies in the critical editions by Voss (Hamburg, 1835), Voigt (Hanover, 1858), and Halm (Leipzig, 1870).

HOLTZ, hólts, WILHELM (1836—). A German physicist. He was born October 15, 1836, at Saatel, near Barth, in Pomerania, and studied physics and other sciences at Berlin, Dijon, and Edinburgh. He invented the electrical machine which bears his name (see ELECTRICAL MACHINE) in 1865, and engaged in many researches, particularly in electricity, but his health forced him to give up scientific investigations for a number of years. In 1877 he became assistant in the physical laboratory of Greifswald, where in 1881 he was made privat-docent, and three years later professor. He is the author of many papers on electricity published in the scientific journals, and of two volumes on lightning protection. *Ueber Theorie, Anlage und Prüfung der Blitzableiter* (1878), and *Ueber die Zunahme der Blitzgefahr und ihre vermuthlichen Ursachen* (1880).

HOLTZENDORFF, hólts'en-dórf, FRANZ VON (1829-89). A German jurist. He was born in Vietmannsdorf, Prussia; studied law at Berlin, Heidelberg, and Bonn; became professor of jurisprudence at Berlin in 1860, and held the same professorship at Munich from 1873 until his death. He strove especially to correct the crim-

inal law, to abolish the death penalty, and to improve the condition of penal institutions. He was interested and active in the Protestant Union, in the Berlin People's Kitchens, and in the reform of female labor. Among his works are: *Französische Rechtszustände* (1859); *Die Reform der Staatsanwaltschaft in Deutschland* (1864); *Die Prinzipien der Politik* (2d ed. 1879); *Wesen und Wert der öffentlichen Meinung* (2d ed. 1880); and *Das Verbrechen des Mordes und die Todesstrafe* (1874). He edited: *Allgemeine deutsche Strafrechtszeitung* (1861-74); the *Encyclopädie der Rechtswissenschaft* (1880-90); a series of manuals on German law (1871-89); and with Virchow, the *Sammlung gemeinverständlicher wissenschaftlicher Vorträge* (1866 et seq.). Consult Stoerk, *Franz von Holtzendorff* (Hamburg, 1889).

HOLTZ (hólts) **MACHINE**. See ELECTRICAL MACHINES.

HOLTZMANN, hólts'mán, ADOLF (1810-70). A German philologist, born at Karlsruhe. He studied theology at Berlin and was for a short time vicar at Kandern. In 1832 he renewed his studies at Munich and later at Paris, and made a specialty of old Germanic dialects and Sanskrit. In 1852 he was made professor of German and Sanskrit at Heidelberg, where he died. His works are: In Indian philology: *Ueber den griechischen Ursprung des indischen Tierkreises* (1841), and the translations *Ramajana* (last edition, 1843), *Indische Sagen* (1845-47); in Germanics: *Kelten und Germanen* (1855), an attempt to identify the two peoples; *Untersuchungen über das Nibelungenlied* (1854), and *Das Nibelungenlied* (1857), both attacking Lachmann's theory of the composite authorship of the poem and renewing the question; the much more important grammatical works, the edition of Isidorus (1836), *Ueber den Umlaut* (1843); *Ueber den Ablaut* (1844); *Altddeutsche Grammatik* (uncompleted, 1870-75); and the posthumous works, *Germanische Altertümer mit Text, Uebersetzung und Erklärung von Tacitus Germania* (1873), and *Deutsche Mythologie* (1874).

HOLUB, hól'up, EMIL (1847-1902). An African explorer, born at Holitz in Bohemia. He studied medicine and natural science at the University of Prague, and then, in 1872, went to South Africa. He lived for a time in the diamond-fields, but early in 1873 made a journey through the southern Bantu countries, and in the fall a second to the Transvaal and the lands to the north. In 1875 he succeeded in reaching the Zambezi and the Victoria Falls, and brought back with him a rich natural science and ethnological collection, which he divided among various European institutions. In 1883, accompanied by his wife, he started from Cape Town with the intention of traversing the entire length of the African continent to Egypt. He had accomplished scarcely one-third of the journey, however, when he was attacked by hostile tribesmen on the Kafue, a northern tributary of the Zambezi, and only after a desperate struggle was he able to win his way back to civilization. Fortunately, he was able to save the large collection which he had gathered, and this, after it had been exhibited in Vienna and Prague, he divided among a number of museums. His publications include: *The Victoria Falls* (1879); *Sieben Jahre in Südafrika* (1880-81), translated by Ellen E. Frewer as *Seven Years in South Africa* (2d ed.

1881); and *Von Kapstadt ins Land der Maschukulumbe* (1888-90).

HOLY ALLIANCE. A league formed after the fall of Napoleon, at the instance of Alexander I. of Russia, by the sovereigns of Russia, Austria, and Prussia, nominally to regulate the relations of the States of Christendom by the principles of Christian charity. As it formed itself in the mind of Alexander it was the scheme of a pietistic idealist, but it was utilized by Metternich as an instrument of his reactionary policy. The document was drawn up by Alexander, and was signed by the three rulers at Paris in September, 1815. The Russian Emperor at that period was greatly under the influence of the mystical philosophy then current, and especially of its exponent, Madame Krüdener (q.v.), to whom was perhaps due his dream of a community of Christian States under their legitimate sovereigns, which was the underlying thought of the Alliance. In addition to the original signatories Naples, Sardinia, France, and Spain acceded to the treaty, and it received the commendation, though not the signature, of the Prince Regent of Great Britain. It was formally made public in the *Frankfort Journal*, February 2, 1816. Metternich, who privately sneered at the treaty, used it as the basis for the conferences of Troppau and Laybach, and the congresses of Karlsbad and Verona, which were intended to unite the powers in support of absolutism everywhere. It was in the name of the Holy Alliance that Austria, in 1821, crushed the revolutions in Naples and Piedmont, and that France, in 1823, restored absolutism in Spain. Apart from this use of it, as one writer has said, "no one of the princes who adhered to the Holy Alliance, with the single exception of Alexander himself, ever took it seriously." Meaningless in itself, it soon ceased to have any importance.

The text of the covenant is as follows:

In the name of the Most Holy and Indivisible Trinity: Holy Alliance of Sovereigns of Austria, Prussia, and Russia. Their Majesties the Emperor of Austria, the King of Prussia, and the Emperor of Russia, having . . . acquired the intimate conviction of the necessity of settling the steps to be observed by the Powers, in their reciprocal relations, upon the sublime truths which the Holy Religion of Our Saviour teaches: They solemnly declare that the present Act has no other object than to publish, in the face of the whole world, their fixed resolution, both in the administration of their respective States, and in their political relations with every other government, to take for their sole guide the precepts of that Holy Religion, namely the precepts of Justice, Christian Charity, and Peace. . . . *Art. I.* . . . The three contracting Monarchs will remain united by the bonds of a true and indissoluble fraternity, and, considering each other as fellow countrymen, they will, on all occasions and in all places, lend each other aid and assistance; and, regarding themselves toward their subjects and armies as fathers of families, they will lead them, in the same spirit of fraternity with which they are animated, to protect Religion, Peace, and Justice. *Art. II.* In consequence, the sole principle of action, whether between the said Governments or between their Subjects, shall be that of doing each other reciprocal service, and . . . to consider themselves all as members of one and the same

MOUNTAIN OF THE HOLY CROSS

Christian nation; the three allied Princes looking on themselves as merely delegated by Providence to govern three branches of the One family, namely, Austria, Prussia, and Russia, thus confessing that the Christian world, of which they and their people form a part, has in reality no other Sovereign than Him to whom alone power really belongs. . . . *Art. III.* All the Powers who shall choose solemnly to avow the sacred principles which have dictated the present Act . . . will be received with equal ardor and affection into this Holy Alliance. Done in triplicate and signed at Paris, the year of grace 1815, 14/26th September.

Perhaps the most noteworthy development from the Holy Alliance came from the attempt to extend its operation to the New World by the coercion of Spain's revolted colonies. George Canning (q.v.), on behalf of England, opposed this at the Congress of Verona (q.v.), and the threatened invasion of American autonomy, together with the proposed colonization of the Pacific coast of North America by Russia, the leader in the Alliance, brought from the Government of the United States the famous declaration of American policy known as the Monroe Doctrine (q.v.). For accounts of the Holy Alliance and its bearing upon contemporaneous history, consult the histories of the time and the biographies of leading persons connected with it.

HOLY CITY. The common designation among different peoples and religious sects for the city regarded as the chief place of their religion. The term is most often understood as applying to Rome, but has been used also of Jerusalem, Allahabad, Benares, Mecca, Medina, Moscow, Kiev, and Cuzco.

HOLY COAT. A relic preserved with the greatest reverence in the Cathedral of Treves (q.v.). It is alleged to be the seamless robe or upper garment of Jesus Christ (John xix. 23), and to have been discovered in the fourth century by the Empress Helena, in her memorable visit to Palestine (see HELENA, SAINT) and by her deposited at Treves. The earliest definite documentary evidence, supported, however, by still earlier incidental testimony, dates from the eleventh century. The holy coat of Treves was solemnly exhibited to the public gaze in 1196, and again in 1512, when Luther wrote against it and Leo X. appointed it to be exhibited every seven years. The Reformation and wars prevented the regular observance of this religious festival; but it was celebrated in 1810, and was attended by a concourse of no fewer than 227,000 persons, and in 1844 and 1891 by still greater crowds, while miraculous cures were confidently asserted to be performed by the precious relic. The exhibition of the holy coat in 1844 led to the secession of the German Catholics (q.v.) from the Church of Rome. The seamless coat of Jesus is also said to be preserved in the church at Argenteuil, near Versailles, but this claim is not considered well founded. The legend here is that it was given by Charlemagne to the monastery located there, his daughter Theodrada being abbess. Consult: Beissel, *Geschichte des Heiligen Rockes* (Treves, 1889); Clarke, *Pilgrimage to the Holy Coat of Treves* (London, 1892); Plater, *The Holy Coat of Treves* (ib., 1891).

HOLY COMMUNION. See LORD'S SUPPER.

HOLY CROSS, COLLEGE OF THE. A Roman Catholic educational institution founded in 1843

and situated at Worcester, Mass. It is under the control of the Fathers of the Society of Jesus. It maintains collegiate and preparatory departments, and had in 1903 385 students, of whom 175 were in the preparatory school. At the same time its library contained 24,000 volumes, the buildings and grounds were valued at \$490,000, and the annual income was \$20,000.

HOLY CROSS MOUNTAIN. A celebrated peak of the Rocky Mountains in Colorado, situated in Eagle County, in the central part of the State, 15 miles northwest of Leadville. Its height is 14,006 feet. It derives its name from two snow-filled ravines, which cross each other at right angles, and present from a distance the appearance of a white cross.

HOLY DYING, RULE AND EXERCISES OF. A devotional manual, by Jeremy Taylor, published in 1651. It reached a twenty-first edition in 1710; has been frequently republished during the nineteenth century; and may be said, with its equally popular companion tractate, *Rule and Exercises of Holy Living* (1650), to offer a summary of the duties and devotions necessary to a Christian life.

HOLY FAMILY. The name given in art to representations of the Virgin and the Infant Saviour and their attendants. The earliest such composition is that in the Catacomb of Saint Calixtus in Rome, with the Prophet Isaiah. The Virgin is represented sitting on a seat, which soon became a throne, the traditional attitude up to the Renaissance. The Byzantine School, as early as the sixth century, invented the type in which the Child is seated directly in the centre of the Virgin's lap, and is blessing, both figures gazing straight forward. Some of these early pictures were regarded as painted by Saint Luke and endowed with miraculous powers. Such are a number in the churches of Rome (e.g. at San Sisto, Santa Maria Maggiore, etc.), and Venice (e.g. that of Saint Mark, brought from Saint Sophia in 1204). Later, this school added attendant angels, who sometimes, as in the school of Candia, bore the emblems of the Passion, the sight of which affrights the Child. The arrangement in which the angels are throne-bearing and adoring figures, in rhythmic arrangement on either side of an immense throne, was developed very beautifully by Cimabue and Duccio in their famous pictures at Florence and Siena. It was quite late in the Middle Ages when other figures were brought into the composition. These were, especially, Saint Anna, the mother of the Virgin (sometimes holding the Virgin in her lap), Saint Joseph, and as playmates to the Infant Christ, the infant John the Baptist (usually in goat-skin and bearing a cross), or Saint Catherine (with whom Christ is being sometimes mystically married). Even the early legendary history of the infancy of Christ has been drawn upon for such scenes as the Twelve Apostles playing with the Infant Christ as boys—a scene peculiar to German art. Of all subjects of Christian art that of the Madonna and Child, comparatively unknown before the thirteenth century, came into overwhelming prominence, becoming the favorite theme of the Italian painters of the Renaissance. Giovanni Bellini, Perugino, Filippo Lippi, Leonardo, Raphael, and Andrea del Sarto may be mentioned among the many who frequently treated it. One of its variants at

that time was the adoring Virgin on her knees before the Infant (Filippo Lippi). The scene of the Holy Family must be distinguished from the more elaborate scenes in which the Virgin and Child, similarly portrayed, are accompanied by several large figures, saints and fathers of the Church, which are not mere accessories of the sacred group; this is usually termed a *Sacra* (or *Santa*) *Conversazione*, and was a popular scene, especially with the Umbrian, Venetian, and northern schools of the fifteenth and sixteenth centuries.

HOLY GHOST, or HOLY SPIRIT. In orthodox theology, the third person of the Trinity (q.v.), "proceeding from the Father and the Son," yet of one substance, majesty, and glory with the Father and the Son, very and eternal God. That the Holy Spirit is God is attested by passages of Scripture ascribing to Him the same names and attributes as to God (II. Cor. iii. 16, 17; II. Tim. iii. 16; II. Peter i. 21). He is distinct from the Father and the Son (Matt. xxviii. 19; II. Cor. xiii. 14; I. Peter i. 1-4), and this distinction is of a personal nature, similar to that between the Father and the Son, proved by many passages, such as John xv. 26: "But when the Comforter is come, whom I will send unto you from the Father, even the Spirit of truth, which proceedeth from the Father, He shall testify of Me." The "procession" (q.v.) of the Spirit is the subject of one of the chief differences between the Eastern and the Western churches. The Holy Spirit is essentially a spirit of holiness, and His grand function is to apply to the hearts of men the benefits of Christ's death, to regenerate them, and then to sanctify them by the truth.

HOLY GHOST, ORDER OF THE (Fr., *l'Ordre du Saint-Esprit*). The name of an order of knighthood founded in 1578 by Henry III., King of France, because on Pentecost, 1573, he had been elected King of Poland, and on Pentecost, 1574, had succeeded to the French throne. The grand master of the order was always to be the King of France. The insignia were a green cross with eight points, on the obverse of which was a dove turned downward, on the reverse the representation of the archangel Michael; the chain, after Henry IV., bore the lilies of France and the monogram 'H.' There were one hundred knights, without counting foreigners. The order was definitely dissolved on February 10, 1831, by Louis Philippe.

HOLY GHOST FLOWER, or DOVE FLOWER. See HOLY SPIRIT PLANT.

HOLY GRAIL. See GRAIL, HOLY.

HOLY GRASS (*Hierochloë borealis*). A grass about a foot high, with a brownish glossy lax panicle. It is found in the North of Europe, and throughout North America. It has a sweet smell, like that of sweet vernal grass; and in Iceland, where it is plentiful, it is used for scenting apartments and clothes. In some countries it is strewn on the floors of the places of worship on festival days, whence its name. Its stems are used by North American Indians to weave into their baskets, mats, etc. It is of little value for forage, as stock seem to dislike it. This grass is known by many other names, as vanilla grass, seneca grass, sweet-scented grass, etc.

HOLY GROTTTO. The traditional scene of the Annunciation, at Nazareth. Over the grotto stands a monastery, occupying the site of the

Santa Casa, the house in which Mary was born, and which was carried by a miracle to Loreto. The grotto is marble-lined and is lighted by nine silver lamps. It is 20 feet square and 10 feet deep.

HOLYHEAD, hól'f-héd. A seaport of Anglesey, North Wales, situated on the little island of Holyhead, 24½ miles west-northwest of Bangor (Map: England, B 3). It is the terminus of the London and Northwestern Railway, and the port for the mail steamers to Dublin, 60 miles distant. It has a celebrated breakwater, 7860 feet long, which forms a harbor of refuge of 400 acres. It has three lighthouses. Coasting trade, ship-building, and rope-making are carried on. The town possesses assembly rooms and baths and a picturesque old embattled church. Interesting Roman and early English remains exist in the neighborhood. The United States is represented by a consular agent. Population, in 1891, 8745; in 1901, 10,072.

HOLYHEAD ISLAND. A small island of North Wales, west of the island of Anglesey, forming part of the county of that name (Map: Wales, B 3). Its area is about 6000 acres. Population, in 1891, 10,000; in 1901, 11,414.

HOLY ISLAND, or LINDISFARNE. A small island belonging to Northumberland, England, in latitude 55° 40' N., longitude 1° 47' W., 10 miles southeast of Berwick-on-Tweed and 3 miles north of the Farne Islands (Map: England, E 1). It is about 4 miles long and 2 miles broad, and is connected with the mainland at low water by sands 3 miles in extent. On the south coast is the village of Holy Island, much resorted to by summer visitors. On the island are several ruins, the chief of which are the extensive and sombre-looking remains of the famous Abbey of Lindisfarne, originally a Saxon edifice, founded in 635 by Aidan, the disciple of Saint Columba. There is also an ancient castle, now fortified. Holy Island flourished under Saint Cuthbert, who died here in 687. In 793 the abbey was destroyed by the Danes. Consult Wilson, *Lindisfarne Churches* (1870). Population 700.

HOLY LANCE. The lance with which the Saviour's side was pierced, and according to one account, found at Jerusalem by Saint Helena, carried to Constantinople, and sent from there in 1492 to the Pope; now preserved in Saint Peter's. According to another account, it was lost until discovered by the Crusaders at Antioch, June 14, 1098. This discovery encouraged them so that they won a great victory. In 1104 this lance was presented to the Byzantine Emperor. The holy lance plays a prominent part in the legends of the Holy Grail (q.v.).

HOLY LAND. See PALESTINE.

HOLY LEAGUE. The name given to a number of political alliances in Europe. Of these the principal were the leagues formed (1) in 1511, by the Pope, Spain, and Venice against France; (2) in 1527, by the Pope, Francis I., and Henry VIII. against the Emperor Charles V.; (3) in 1538, by Charles V. and the Catholic princes of Germany against the Schmalkaldic League; (4) in 1571, by the Pope, Spain, and Venice against the Turks; (5) most important of all, the one formed in 1576 by the Guises, the Pope, Spain, and the Parlement of Paris against the Huguenots. In 1609 a Holy League (known as the Catholic League) was organized

by the Catholic States of Germany, with Bavaria at its head, in opposition to the Protestant Union.

HOLY MAID OF KENT. See BARTON, ELIZABETH.

HOLY MOTHER OF THE RUSSIANS. An epithet originally given to Moscow, the former capital of Russia, by the masses of that nation, and still preserved among the peasantry.

HOLYOAKE, hōl'yōk, GEORGE JACOB (1817—). An English writer, lecturer, and reformer, particularly identified with the 'coöperative movement.' He was born in Birmingham, England; was educated at the Mechanics' Institution there, taught mathematics for a time, and while still young became widely known as a radical in politics and religion, attracting attention in particular by his advocacy of the theories of Robert Owen (q.v.). He early became especially interested in the theory and practice of coöperation, was active in the movement for the organization of the so-called 'Rochdale Pioneers' in 1843, and subsequently was largely engaged as a lecturer and writer in the interests of coöperation. In 1842 he was imprisoned for six months for blasphemy, his being the last conviction on that charge in England. Soon afterwards he devised a moral system, known as 'secularism' (q.v.), which he advocated in public speeches and in the press. For a time he was president of the London Secular Society, the central organization of Secularism. He was instrumental in securing the repeal of the so-called 'tax upon knowledge' in 1854. He edited at various times the *New Moral World*, the *Reasoner* (from 1846 to 1866), and the *Cause of the People*, in which he contended vigorously for his views; and published numerous books, including: *History of the Rochdale Pioneers* (1857); *The History of Coöperation in England* (1875); *Life of Joseph Rayner Stephens, Preacher and Political Orator* (1881); *Self Helps One Hundred Years Ago* (1890); *The Coöperative Movement of To-Day* (1891); *Sixty Years of an Agitator's Life* (1892), an interesting though somewhat rambling autobiography; *Nature and Origin of Secularism, Showing that Where Free Thought Commonly Ends Secularism Begins* (1896); and *Jubilee History of the Leeds Coöperative Society* (1897).

HOLYOKE, hōl'yōk. A city in Hampden County, Mass., 8 miles north of Springfield; on the Connecticut River, and on the Boston and Maine and the New York, New Haven and Hartford railroads (Map: Massachusetts, B 3). It was originally a part of West Springfield, and was incorporated as the Third Parish in 1786, though it was commonly called Ireland Parish, from the fact that several Irish families were the first settlers. In 1850 Holyoke was set off from West Springfield and incorporated as a separate town; and in 1873 it was chartered as a city. Its importance as a manufacturing centre dates from 1847, when the Hadley Falls Company began to develop the great natural water-power. The river here falls 60 feet and is crossed by a dam 1000 feet long, affording the most valuable power in New England. For many years it was noted for its paper-mills, but it now has also extensive manufactures of cottons, woollens, thread, silk, alpaca, bicycles, automobiles, belting, bricks, screws, wires, machinery, envelopes, and school supplies. It is an impor-

tant centre for hydraulic engineering, for testing water-wheels, etc. There are a public library, a college of music, city hospital, and House of Providence Hospital. The Holyoke Scientific Society has done valuable work in American archaeology, and has fine collections of Indian antiquities. In the vicinity are many points of scenic interest, notably Mount Tom (1215 feet), ascended by an electric railway from Holyoke, and Mount Holyoke (955 feet). Holyoke is governed under a revised charter of 1896, by a Mayor, elected annually, and a city council, two-thirds of whose members are elected at large for two years, the remainder by wards for one year. The subordinate offices are filled as follows: appointed by the Mayor—board of public works, fire commissioners, board of health, city marshal and assistants, city solicitor, and inspector of milk; appointed by the Mayor with the consent of the council—sealer of weights and measures and inspectors of animals and provisions; elected by the council—water commissioners, city physician, poor overseers, city auditor, and city messengers; by the people—all others. The annual income and expenditures of the city amount to about \$1,780,000 and \$1,745,000 respectively, the main items of expense being \$50,000 for the police department, including amounts for police courts, jails, etc.; \$70,000 for the fire department, and \$175,000 for schools. The city owns and operates its water-works, and has voted to acquire the gas and electric-light plants. Population, in 1890, 35,637; in 1900, 45,712. See MOUNT HOLYOKE COLLEGE.

HOLYOKE, MOUNT. A steep ridge of greenstone 5 miles southeast of Northampton, Mass., rising 955 feet above sea-level (Map: Massachusetts, B 3). A carriage-road winds upward to the summit, and a mountain railway carries passengers up a precipitous incline to a hotel built on the summit in 1821. The view here obtained of the Connecticut River and valley has long been famous as one of the finest in New England.

HOLY PHIAL, ORDER OF (Fr. *Sainte Ampoule*). The name of an order of knighthood which formerly existed in France. It was composed of four persons, usually the first in point of rank, family, and fortune in the Province of Champagne, who were styled *Barons de la Sainte Ampoule*. At the coronation of the French kings, they were delivered to the dean, priors, and chapter of Rheims, as hostages for the return of the holy phial in which the coronation oil was kept. The phial, according to legend, was brought from heaven by the Holy Ghost in the form of a dove and put into the hands of Saint Remigiris at the coronation of Clovis (q.v.). The holy phial preserved at Rheims was broken by Ruhl, a member of the Convention, in 1793. The badge of the order was a cross of gold enameled white, cantoned with four fleurs-de-lis, and on the cross a dove descending with a phial in its beak, and a right hand receiving it.

HOLY ROMAN EMPIRE. The name now given to the Empire erected by Charles the Great (q.v.), King of the Franks, in Western Europe, usually dated from his coronation, at Rome, by Pope Leo III. in 800; or, more technically, to this Empire as revived in 962 by Otho the Great (q.v.). In theory the Holy Roman Empire was a continuation of the Western Empire, which was

overthrown by the barbarians in 476. When Charles the Great was crowned Emperor by Leo III. he thought of himself as the successor of Augustus, Trajan, and Marcus Aurelius, and styled himself Augustus. This theory prevailed throughout the Middle Ages. Louis the Pious, Lothaire I., Louis II., Charles the Bald, and Charles the Fat were crowned as Roman emperors. After the deposition of the latter (887), which was followed by the disruption of the great Frankish Empire, the Imperial title was still held by a few princes, as Arnulf, King of Germany, and Berenger I., King of Italy. In 962 Otho the Great, after wresting the royal crown of Italy from a descendant of Charles the Great, had himself crowned Emperor of the Romans by Pope John XII., and inaugurated the Roman Empire of the German nation. From that time the King of Germany was usually Emperor. The Empire consisted of Italy and the lands whose rulers recognized the overlordship of the German monarch; but theoretically the Emperor was the ruler of all Christians in Western Europe, and some emperors, as, for example, Henry VI., dreamed even of a world-wide empire. At different periods the rulers of Hungary, Poland, Denmark, Jerusalem, and Cyprus were to a greater or less extent vassals of the Roman Emperor. Until the reign of Frederick Barbarossa the name had been merely 'Roman Empire;' Frederick added the designation 'Holy,' either to vindicate its sacred character against the exclusive pretensions of the Church, or else to describe its chief function as the protection of that Church. By the close of the thirteenth century the authority of the German emperors in Italy was reduced to a mere shadow. At the close of the fifteenth century the Swiss cut loose completely from the Empire. In the Netherlands the Imperial authority had come to an end long before their connection with the Empire was declared to be severed in an article of the Peace of Westphalia (1648).

The early German kings were elected by the chief men of the nation with the assent of the other freemen. Gradually the chief nobles secured almost entire control of the elections, but there was no fixed mode of procedure. At the election of Lothair in 1125, for example, a committee consisting of ten from each duchy was chosen to select an Emperor. In the thirteenth century—by a process of evolution, which it is not possible to trace now—the number of electors had been fixed at seven, but there was a dispute as to who were included in the seven. This was settled in 1356 by the Golden Bull of Charles IV., which determined that the electoral college should be composed of the Archbishops of Mainz, Treves, and Cologne, the King of Bohemia, the Count Palatine of the Rhine, the Duke of Saxony, and the Margrave of Brandenburg. The Golden Bull also declared that the electoral votes were attached to the office, not to the persons, and descended in the case of the lay principalities by right of primogeniture. This continued to be the constitution of the electoral college until 1623, when Ferdinand II. arbitrarily transferred the vote belonging to the Count Palatine to Maximilian of Bavaria. At the Peace of Westphalia (1648) an eighth electorate was created for the Palatinate. In 1692 the ninth electorate, that of Hanover, was instituted. The Imperial elections were held at Frankfort-on-the-Main and the cor-

onation city was Aix-la-Chapelle. The Emperor at some time during his reign went to Rome to receive the Imperial crown at the hands of the Pope. The last ceremony of this kind took place in 1530, when Charles V. was crowned at Bologna by Pope Clement VII. The successor-elect to the Emperor of the Romans was styled King of the Romans.

During the so-called Interregnum following on the death of the last Hohenstaufen Emperor there was a double election (1257), both Richard of Cornwall and Alfonso X. of Castile being made Emperor, one receiving four votes and the other three. Their election may be taken to illustrate the theory held by some at the time, that a man of any nationality might be chosen to the Empire; but their total failure to obtain anything but the mere Imperial title proved that as a matter of fact the sovereignty of the Holy Roman Empire could be held only by a Germanic prince. After 1438 all the emperors but two belonged to the House of Hapsburg.

Charles the Great and his immediate successors followed the old German custom of calling together, at frequent intervals, the nobles and freemen for consultation about the public welfare. As feudalism developed these assemblies ceased, and the Emperor called together only such of his vassals as he chose. Their meetings were called Imperial Diets (*Reichstage*). In the thirteenth century the cities became very influential, and consequently their representatives were summoned to the Diets. As the power of the emperors declined, the Diets took a more prominent part in the administration of the Empire. Their functions were judicial as well as administrative. In the fourteenth century it came to be fixed that the Diet consisted of the three classes: electors, princes, and representatives of the cities. The lesser nobility had no voice in the Diet. But the power of the Diet was slight, because it was concerned only with Imperial matters, and the Empire had ceased to be of real importance as a factor in European politics. This was clearly shown in 1496, when Maximilian I. attempted to unite the Imperial estates against the French invasion of Italy. The Diet which he summoned did nothing to check the French, but with the Emperor's consent created the Imperial Chamber (q.v.) a supreme tribunal for the preservation of peace within the Empire. It consisted of a president and sixteen members, who could not be removed from office. It held its sessions at Frankfort, Speyer, and other cities until 1698, when it was established permanently at Wetzlar. Gradually the Imperial Chamber became an important factor in the maintenance of peace within the Empire. The Emperor was jealous of it, as he had no control over it. Consequently he attempted to transfer some of its authority to the Aulic Council (q.v.), a somewhat similar body for Austria, which was under his control. During the first half of the sixteenth century the Aulic Council interfered in the affairs of Italy, the Netherlands, and other portions of the Empire. After that time, however, it was again restricted to Austrian interests alone.

The Empire came to an end in 1806, when Francis II. resigned the Imperial crown after having assumed (1804) the title of Emperor of Austria. After the time of the Hohenstaufen, whose dynasty came to an end in 1254, the Em-

pire rapidly sank in importance, and owed any real authority which it possessed to the strength of the ruler who was Emperor. Still the possession of the title gave some additional prestige. By the Peace of Westphalia (1648) the bonds which held the Empire together were greatly loosened, the right being accorded to the individual States to enter into foreign alliances. In the eighteenth century Voltaire said of the Holy Roman Empire that it was neither holy, nor Roman, nor an empire. During its earlier existence, however, it was a very important factor in the history of Europe. Consult: Bryce, *The Holy Roman Empire* (London, 1864); Fisher, *The Mediæval Empire* (2 vols., London, 1898). See GERMANY; ITALY, and the articles on the individual emperors, with the books cited.

HOLYROOD (hō'li-rōōd) PALACE. The former residence of the Scottish Kings in Edinburgh. It was rebuilt between 1671 and 1679 by King Charles II. of England from the designs of Sir William Bruce of Kinross, after the almost total destruction by fire in 1560 of the prior palace built by James IV. It occupies the site of the famous Augustinian Abbey of the Holy Rood erected by King David I. in 1128, at the place where, according to a fabulous story, he was miraculously saved from the attack of a hunted stag by the interposition of the lost holy cross or rood which fell from the stag's antlers into the King's hands, and at the sight of which the animal turned and fled. The black rood of Scotland, as it was called, was brought to Scotland by Saint Margaret about the year 1070 and became one of the kingdom's heirlooms. It is known to have fallen into the hands of the English at the battle of Neville's Cross in 1346, but its disappearance, in course of time, gave currency to the above fable. The sole remains of the abbey are the ruins of the church which, anciently, was a safe refuge for criminals, and remained so for debtors until the abolition of imprisonment for debt in 1880. Holyrood is interesting as the scene of many historical events, including the term of Queen Mary's residence and of Rizzio's murder in 1566. It is the occasional residence of the British sovereigns, and since the death of Queen Victoria has undergone thorough renovation. Consult: *Historical Description of the Monastery and Chapel Royal of Holyrood House* (Edinburgh, 1819); Wilson, *Memorials of Edinburgh* (Edinburgh, 1848).

HOLY SEPULCHRE. The place where Jesus was entombed. According to the New Testament data, the sites of the crucifixion and burial of Jesus were not far apart (John xix. 41), outside Jerusalem (Heb. xiii. 12), and near a road (Mark xv. 29; Matt. xxvii. 39). The tomb itself was in a garden (John xix. 41), and apparently on a slope. The place of crucifixion was called Golgotha (Mark xv. 22; Matt. xxvii. 33; John xix. 17), an Aramaic word meaning skull. Calvary is but the anglicized form of the Latin *calvaria*, skull. There is no evidence for supposing that the locality was sufficiently elevated to be called a hill or mount. The Gospels imply that the site was well known when they were written, but the references are not full enough to make a modern identification easy or certain.

The traditional site of both Golgotha and the tomb of Jesus is that now covered by the Church

of the Holy Sepulchre, 400 to 500 yards west of the northern part of the Haram esh-Sherif, or temple area, and well within the modern city of Jerusalem. Here Constantine the Great built a beautiful church on the spot then supposed to be the place of the Ascension. This identification was not seriously disputed until Jonas Korte, in 1741, claimed that, being within the city walls, it could not be correct. Korte supposed that the modern north wall was in existence at the time of the crucifixion, but in fact it was built later. In 1841 Edward Robinson, in his *Biblical Researches*, disputed the correctness of the traditional site, on the supposition that the second wall of Josephus—i.e. the north wall in Christ's day—passed to the north of it, and in that case it must have been within the city. Since Robinson, this has been felt to be the chief and fatal obstacle to the view that the modern church actually covers the spot where Jesus was buried. But the excavations and measurements of Conrad Schick (1888 and later) have made it all but certain that the wall in Christ's day lay south and east of the disputed site, which therefore was outside the city, and may well have been the scene of the crucifixion and burial. Of other proposed sites, two, both outside the modern city, near the Damascus Gate, have received strong support. The question is still unsettled, but the drift of competent opinion is toward acceptance of the traditional view.

A few years after the crucifixion, the northern area of Jerusalem was inclosed by a third wall, as it was becoming thickly settled. There is no reason to suppose that the early Christians forgot where the crucifixion and burial had occurred, though there is no probability that they venerated the place as holy. In the Jewish war with Rome (66-70), this part of the city was occupied by the Roman army preparatory to the assault on the second wall. From its capture by Titus (70) to the rebellion of Bar-Cochba (132-35), the city was practically in ruins, though not entirely desolate. After suppressing this rebellion Hadrian rebuilt Jerusalem as a heathen city, calling it *Ælia Capitolina*, and absolutely forbidding Jews to enter it. On the site of the temple a shrine to Jupiter was built, and on that of the supposed tomb of Jesus a temple to Venus was erected (by Hadrian or one of the later emperors). Incidentally this may be evidence that even then Christian tradition pointed out that spot as worthy of veneration. In the third century the holy places of the city and vicinity began to attract pilgrims from various parts of the Empire, though there is no evidence that any visited this particular spot. In the fourth century the pilgrimages became more popular, and when through Constantine I. the Empire became nominally Christian, it was but natural that the Emperor, urged on, doubtless, by his mother, determined to rescue the holy sepulchre from oblivion and disgrace. What guided Constantine in selecting this spot was, without doubt, the tradition already current. On removing the accumulated rubbish, the workmen came upon a rock tomb. So astonishing was this coincidence that it was counted as simply miraculous that the precious grave, so long hidden away, should at last have come to light. Legends soon began to multiply—e.g. that Helena, Constantine's mother, miraculously discovered the true cross near by, of which Eusebius, the contemporary

and well-informed witness, says nothing. (See CROSS, INVENTION OF THE.) Constantine now built here a magnificent church. Over the grave was erected a beautiful gilded dome open to the sky, supported by columns and surrounded by a wall, the inside diameter being about 65 feet. From the rotunda eastward extended the basilica, 250 feet in length, with its nave and two aisles, the nave ending in a semicircular choir. Still further to the east, connected with the basilica by three gateways, was the atrium, surrounded with colonnades and containing basins for the customary ablutions. From the atrium three gates led out into the propylæum, which connected the whole edifice with the market street to the east. The entire length of the church or cathedral so constructed was about 475 feet. It was due, doubtless, to the necessities of the situation that the propylæum and atrium were to the east rather than, as usual, west of the basilica. In the south aisle, a knob of the native rock, with a cleft in it (the grave of Adam, according to legend), rose a few feet above the level of the floor, inclosed within a silver fence. This was supposed to be the rock in which the cross was set—i.e. Golgotha proper. In A.D. 336, ten years after its foundation, Constantine's church was dedicated by the Synod of Tyre. For nearly three hundred years the edifice remained intact, famed for its beauty, one of the chief attractions for the numerous pilgrims constantly visiting Jerusalem. During this period legends grew apace, and numerous miraculous events were associated with the locality. In 614 the church was destroyed, at least partially, by the Persians under Chosroes II. Steps were taken at once by Modestus, acting Bishop of Jerusalem, to rebuild the edifice, and after ten years' labor, (616-26) the work was completed. The new buildings were not of the same plan or dimensions or beauty as their predecessor. The rotunda was rebuilt as a separate church—of the Resurrection—and on the site of the large basilica of Constantine a smaller one, the Martyrium, over the place where the cross was said to have been found, was erected. Southeast of the rotunda a new church in honor of the Virgin was built, while over Golgotha, now outside of the basilica, a chapel was placed. These edifices remained, with occasional damage and consequent repairs, until their destruction by Hakim, Caliph of Egypt, in 1010. With the assistance of the Byzantine Emperor they were restored in 1048, with some changes of plan. In 1140 the Crusaders began a general rebuilding of all the edifices on a larger scale. The new church was dedicated July 15, 1149, but not completed until 1168. The Church of the Crusaders was destroyed in 1244, but again rebuilt (c.1300). Extensive alterations and improvements took place in 1555 and 1719. In 1808 the rotunda was burned and much other damage done to the western buildings. The restoration, the work of the Greeks and Armenians, was completed in 1810. Since that time, with the exception of the renewal of the dome in 1868 by Napoleon III. and Alexander II. of Russia, the buildings have undergone no serious alteration.

For plan of the present buildings, with extended descriptions, consult Baedeker's *Palestine and Syria* (Leipzig, 1898); for the plan and extent of the buildings of Constantine, Mommert, *Die heilige Grabeskirche zu Jerusalem in ihrem ursprünglichen Zustande* (Leipzig, 1898); for the

best bibliography, Guthe's article in the *Hauck-Herzog Realencyklopädie* (Leipzig, 1899).

HOLY SEPULCHRE, KNIGHTS OF THE. An order of knighthood instituted, probably by Pope Alexander VI., for the guardianship of the Holy Sepulchre, and the relief and protection of pilgrims. The Pope was originally the grand master, but he subsequently ceded his rights to the Guardian Father of the Holy Sepulchre at Jerusalem. The knights were held to strict rules of honor, faith, and purity, but in return they had the most unusual and extraordinary privileges conferred on them. They were exempt from taxation, could marry, could, as an organization, possess property, could legitimize bastards, and could cut down and bury the bodies of criminals who had been hanged. After a temporary union with the Hospitalers, the order was reconstructed in 1814, both in France and in Poland, and is still in existence, its members being chosen by the Guardian of the Holy Sepulchre out of noble and devout pilgrims. The badge of the order consists of a cross potent of red enamel, with four similar smaller crosses between its arms, surmounted by a crown and held by a black ribbon. The collar is made up of small crosses like the badge.

HOLY SPIRIT. See **HOLY GHOST.**

HOLY SPIRIT PLANT, or DOVE PLANT. Names given to a species of orchid, *Peristeria elata*, found in Central America, especially in the vicinity of Panama. It is an epiphytic orchid, with large, striated green pseudobulbs, which bear three to five lanceolate leaves, often a yard long and six inches across. The flower-stem springs from the base of the pseudobulbs, and is four to six feet high, a third of its height bearing creamy-white, fragrant flowers, an inch or more in diameter, the inner part of which is often tinged with crimson or other shades of red. The name is derived from the shape of the united column of style and stamens. This column resembles a conventional dove hovering with expanded wings in the vase formed by the petals. It is used in religious festivals in Central America as symbolical of the Holy Spirit; hence its name, 'el spirito santo.' See **ORCHID.**

HOLY STONE. A miraculous rock at Ardmore, Ireland, which is said to have floated from Rome with robes, a bell, and a lighted taper for Saint Patrick.

HOLYSTONE. A piece of soft stone, usually sandstone, used in scrubbing decks. To holly-stone a deck is to scrub it, using hollystones. Hollystones are smooth on one side at least, and have a small depression on the other to receive the end of a handle or stick by which they are pushed back and forth. To increase the scrubbing power of the stones, the decks are wetted and sand is sprinkled over them prior to holly-stoning. The derivation of the term is supposed to be from the fact that hollystoning used chiefly to be done on Saturday as a preparation for Sunday inspection, church, etc.

HOLY THURSDAY. See **ASCENSION DAY; HOLY WEEK.**

HOLY WAR, THE. (1) The first of Thomas Fuller's historical writings (1639). It is a history of the Crusades, and very popular up to the time of the Restoration. (2) A religious allegory, explained on the title-pages as "made

by Shaddai upon Diabolus," by John Bunyan (1682).

HOLY WATER (Lat. *aqua benedicta*). Water blessed by a priest for religious uses, and employed in the Roman Catholic and Oriental churches. In most ancient religions, the use of lustral or purifying water not only formed part of the public worship, but also entered largely into the personal acts of sanctification prescribed to individuals. The Jewish law contained many provisions to the same effect; and Christ, by establishing baptism with water as the necessary form of initiation into the religion instituted by Him, gave His sanction to the use. The usage of sprinkling the hands and face with water before entering the sanctuary, which was prescribed in the Jewish law, was retained, or at least very early adopted, in the Christian Church. It is expressly mentioned by Tertullian in the end of the second century. And that the water so employed was blessed by the priests we learn from Saint Jerome, and from the Apostolic Constitutions, which contain a formula for the purpose. That now given in the Roman missal and ritual has been preserved unaltered from the sacramentary of Saint Gregory. It includes an exorcism (q.v.) and the admixture of salt which has been blessed. The water so prepared is sprinkled by the priest on the congregation before high mass (this rite being called the *Asperges*, from the first word of the anthem which is sung during its progress), and is publicly employed as part of the rites for funerals and for the blessing of various objects and persons; that used in the consecration (q.v.) is prepared in a special manner. The ordinary holy water is also used privately by devout Roman Catholics on entering and leaving the church, and at other times. It is considered by them as included among sacramentals (q.v.). Although it is difficult to fix the precise time, it cannot be doubted that the practice of mingling salt with the water is of very ancient origin.

HOLY WATER VASE, or **SROUP**. A receptacle, known in France as *bénitier*, for holy water, placed at the entrance of Roman Catholic churches, so that those who come in or go out may dip their fingers in it and cross themselves. It is frequently in the form of a shell and usually attached to the wall. The kind of a vessel known as *pila* in Italy stands on a base of its own.

HOLY WEEK. The week immediately preceding Easter, and especially consecrated to the commemoration of the passion of Christ. In the Roman Catholic Church, the special characteristics of the celebration of the Holy Week are increased solemnity and gloom, penitential rigor, and mourning. If any of the ordinary Church festivals fall therein, it is transferred till after Easter. All instrumental music is suspended in the churches, the altars are stripped of their ornaments, the pictures and statues are veiled from public sight; manual labor, although it is no longer entirely prohibited, is by many persons voluntarily suspended; the rigor of fasting is redoubled, and alms-deeds and other works of mercy sedulously enjoined and practiced. All Church services of the week, moreover, breathe the spirit of mourning, some of them being specially devoted to the commemoration of particular scenes in the passion.

Palm Sunday commemorates the triumphal

entry of Christ into Jerusalem, and is observed by the blessing of palm branches, which are carried in the procession as they were by the people of Jerusalem on that day. Spy Wednesday is the old English name for the day which commemorates the betrayal of Christ by Judas. Holy Thursday (also called Maundy Thursday) is the commemoration of the Last Supper and the institution of the Eucharist. With this in mind, white vestments are worn at the mass (only one mass is celebrated on this day), after which the altars are solemnly stripped and washed by the clergy. (See also FOOT-WASHING.) The matins of the last three days, generally sung on the preceding evening (see TENEBRÆ), constitute an impressive service. On Good Friday the mass is not celebrated, the day being the commemoration of the one sacrifice of the great High Priest; but a special service is held, called the 'mass of the presanctified,' including the communion of the priest from the host reserved from the previous day on the 'altar of repose.' (For the ceremony of the 'adoration of the cross,' see CROSS.) Holy Saturday was in the earliest times set aside for the solemn administration of baptism and orders; the present services of the day begin to partake of the gladness of Easter (q.v.). In the Anglican communion the observance of the week in a similar spirit is prescribed, and the Scripture selections all have a bearing upon the events commemorated. Good Friday is a legal holiday in England and Ireland, and its observance is largely increasing, even among the non-liturgical denominations throughout the English-speaking world.

HOLYWELL, hō'ī-wēl. A municipal and Parliamentary borough and market-town in Flintshire, North Wales, 4½ miles northwest of Flint (Map: England, C 3). It has limestone quarries, coal and lead mines, and numerous establishments for smelting, manufacturing shot, zinc, etc. There are also manufactures of cottons, flannels, and galloons, paper, and Roman cement. Holywell owes its origin to the renowned well of Saint Winifred, which is said to be the most copious spring in Britain. Its waters were believed to be efficacious in curing diseases, and are still resorted to by Roman Catholic pilgrims. The well is covered by a fine Perpendicular chapel attributed to Margaret, mother of Henry VII. In the vicinity are remains of the old Saxon Abbey of Basingwerk, and in the town is Saint Buenos College for Roman Catholic priests. Population, in 1891, 2894; in 1901, 2652.

HOLZ, hōlts, ARNO (1863—). A German poet and critic, born at Rastenburg. Before he was nineteen he was engaged in journalism, and in 1882 published a volume of poems, *Klinginsherz*, which won the Augsburg Schiller Prize. In a second volume, *Deutsche Weisen* (1884), written with Jerschke, and in the *Buch der Zeit* (1885 and 1892), his extremely modern tendency appears, and the attention to details and the attempt at photographic realism is carried even further in *Neue Gleise* (1892), in which he collaborated with Johannes Schlaf (q.v.). His realistic theory is further illustrated in the plays *Socialaristokraten* (1896) and *Die Blechschmiede* (1902), the latter a satiric dialogue, and is defended by Holz in *Die Kunst* (1891 et seq.), and *Revolution der Lyrik* (1899).

HOLZBAUER, hólts'bou'ér, IGNAZ (1711-83). An Austrian composer, born in Vienna. Despite the opposition of his parents, who intended him for the law, he studied music, and in 1745 became kapellmeister to Count Rottal and at the Court Theatre of Vienna. He was later kapellmeister at Stuttgart and at Mannheim. He spent much of his time in Italy, where most of his operas were produced. They were popular, and include: *Il figlio delle selve* (1735); *Alessandro nell' Indie* (1759); and *La clemenza di Tito* (1780). He composed, in addition, a great quantity of Church music, and excellent concertos, string quartets, and 196 symphonies. He died at Mannheim.

HOLZSCHUH, hólts'sh'oo, DIETRICH. A German pretender, also called TILE KOLUP. He laid claim to the throne as Frederick II., who died in 1250. In Cologne (1284) his claim was ridiculed, he was ducked in a sewer, and driven from the city. At Neuss he fared better, and in 1285 went to Wetzlar and there held court; but on the approach of Rudolf he was turned over to the King and was burned as a traitor (1285). Consult: Meyer, *Tile Kolup* (Wetzlar, 1868), and Petri, "Der falsche Friedrich," in vol. ii. of *Zeitschrift des Bergeschen Geschichtsvereins* (Bonn, 1864).

HOMAGE (from OF. *homage*, *hommage*, Fr. *hommage*, Prov. *homenatge*, *homenage*, from ML. *hominaticum*, *homage*, from Lat. *homo*, man). In feudal law, the formal acknowledgment of the service which the vassal owed his lord. The form was ordinarily as follows: The vassal knelt before his lord, placed his hands between his lord's hands, and declared himself the lord's vassal for his fief. The lord then gave him a kiss and raised him from his knees. Homage and fealty (q.v.) were usually parts of the same ceremony, but were not synonymous. Consult Luchaire, *Manuel des institutions françaises* (Paris, 1892). See FEUDALISM.

HOMAGE ANCESTRAL. An ancient form of English land tenure of a privileged character. It was a form of the tenure of free and common socage (q.v.) and existed "where time out of mind a man and his ancestors had held by homage" only, in lieu of all other services. The alienation of an estate held by homage ancestral converted it into an ordinary socage tenure by homage, and freed it from the peculiar privileges which attached to it by virtue of its ancestral character.

HOMALONOTUS (Neo-Lat., from Gk. ὁμαλός, *homalos*, level + νῶτος, *nōtos*, back). A genus of fossil trilobites of large size, found in the Silurian and Devonian rocks, and characterized by the absence of trilobation of the thoracic segments. See TRILOBITES.

HOMALOP'SIDÆ. See HERPETON.

HOMATROPINE (from Gk. ὁμός, *homos*, same + Eng. *atropine*, from Neo-Lat. *atropina*, from *Atropa*, deadly nightshade, from Gk. Ἄτροπος, *Atropos*, name of one of the Fates, the inflexible, from α, *a*, not + τροπος, *tropos*, a turning, from τρέπειν, *trepein*, to turn). A by-product in the manufacture of atropine, used chiefly in preparing the eye for examination. For this purpose the hydrobromate, which is freely soluble in water, is employed. Its action is similar to that of atropine, but less powerful and less pro-

longed. The dilatation of the pupil passes off in from 24 to 36 hours, while that resulting from atropine lasts several days. Homatropine is often combined with cocaine when used for dilating the pupils. For internal use it is inferior to atropine.

HOMBURG VOR DER HÖHE, hóm'boorck för dër hē'e. A fashionable watering-place, largely frequented by English, in the Prussian Province of Hesse-Nassau, situated at the foot of the Taunus Mountains, 11 miles northwest of Frankfort (Map: Germany, C 3). It has an old castle which formerly belonged to the landgraves of Hesse-Homburg, and is now used by the Prussian royal family. The landgraves resided here from 1622 to 1866. The elaborate Kurhaus contains a museum of antiquities. The splendid gambling resort here was closed in 1872. The chief mineral spring is the Elisabeth-Brunnen, the water of which is very rich in salts, and is extensively exported. Other springs are rich in iron, and the waters of several of the springs are only used for bathing. The annual number of guests exceeds 12,000. Homburg has some manufactures of machinery and soap. Population, in 1900, 9635. The environs are delightful. Remarkable remains of extensive Roman intrusions are to be seen in the vicinity.

HOME, DANIEL DUNGLAS (1833-86). A Scotch spiritualist medium, born near Edinburgh. He was descended on his mother's side from a Highland family noted for its gift of 'second sight.' When a child he was brought to the United States, and before he was twenty he was widely known as a medium. On the testimony of William Cullen Bryant, Professor Wells of Harvard, and other well-known men, it is recorded that knocking on the walls, the sliding about of the furniture, and the 'levitation' of the medium himself in the air occurred without the slightest recourse to trickery so far as they could observe. When he returned to England in 1856, his sances were attended by many prominent people, including Robert Browning and his wife. Mrs. Browning is said to have believed in spiritualism; but her husband disbelieved, and was inspired to write *Mr. Sludge, the Medium*. In 1856 Home became a Catholic while at Rome; but in 1864 was expelled from the city as a sorcerer. Dr. Robert Chambers and Dr. Lockhart Robertson were among his converts, and a number of scientists were convinced of the genuineness of his powers, including Sir William Crookes, who published an account of the experiments made with him, entitled *Researches in the Phenomena of Spiritualism* (1874). In 1866 Home became secretary of the Spiritual Athenæum, for the propagation of spiritualism. He instituted a vigorous campaign against professional mediums and scrupulously abstained from taking money at his sances. He published *Incidents in My Life* (2 vols., 1863-72), and *Lights and Shadows of Spiritualism* (1877). Consult: Madame Home, *D. D. Home: His Life and Mission* (London, 1888), and *The Gift of D. D. Home* (ib., 1890).

HOME, Sir EVERARD (1756-1832). An English surgeon, born at Hull, the son of an army surgeon. He studied at Westminster School, and in 1773 resigned a scholarship in Trinity College, Cambridge, to study under John Hunter (q.v.); who married Home's sister. Home was long connected with the College of Surgeons, was its pro-

fessor of anatomy and surgery, later master, and in 1821 its first president. It seems impossible to free Home from censure for burning Hunter's valuable manuscripts, of which he was custodian, or from the charge of using them in his work on *Comparative Anatomy* (1814-23), which gains what value it has from that fact. Among Home's other writings are: *The Properties of Pus*, which won a gold medal from the Lyceum Medicum Londinense (1788); a biographical notice of Hunter, prefixed to Hunter *On Blood, Inflammation, and Gunshot Wounds* (1794); *Practical Observations on the Treatment of Strictures in the Urethra and Œsophagus* (1795); *Observations on the Treatment of Ulcers on the Legs* (2d ed. 1801); *Practical Observations on the Diseases of the Prostate Gland* (1811-18); and *On the Formation of Tumors* (1830).

HOME, HENRY, LORD KAMES (1696-1782). A Scottish judge and author, born at Kames. He entered the bar in 1724, was raised to the bench in 1752, with the title of Lord Kames, and was made one of the lords of judiciary in 1763. As a coarse but able judge, he is mentioned by Scott in *Redgauntlet* (ch. i.). In 1728 he published *Remarkable Decisions of the Court of Session from 1716 to 1728*. The materials for this work were in 1741 embodied in his *Dictionary of the Decisions of the Court of Session during its whole history*. He is best known, however, by *Essays on the Principles of Morality and Natural Religion* (1751), containing a solution of the question of human freedom, which brought on him the suspicion of infidelity; *Introduction to the Art of Thinking* (1761); and, above all, the celebrated *Elements of Criticism* (1762), the work on which his fame now chiefly rests. In 1774 appeared his *Sketches of the History of Man*. While thus occupied with judicial and literary labors, he took a very active interest in agriculture, writing a useful tract entitled *The Gentleman Farmer, Being an Attempt to Improve Agriculture by Subjecting It to the Test of Rational Principles* (1776). His last work, *Loose Thoughts on Education* (1781), was written in his eighty-fifth year. Consult Lord Woodhouselee (A. F. Tytler), *Memoirs of the Life and Writings of Home* (Edinburgh, 1807).

HOME, JOHN (1722-1808). A Scottish dramatist, born at Leith. He was educated at the University of Edinburgh, and prepared for the Church. During the uprising of 1745 he fought as volunteer on the Hanoverian side. In 1747 he became minister of Athelstaneford, in East Lothian, where he wrote his famous tragedy of *Douglas*. Performed at Edinburgh in 1756, and at London in 1757, it was received with enthusiasm. For his plot Home used the popular Scottish ballad of *Childe Maurice*, and in a less degree Shakespeare's *Othello*. The play, though turgid in diction, has great merits. It was the best English tragedy since Otway. The clergy of the Scottish Kirk, opposed to the theatre on principle, were scandalized by the production. After a bitter controversy Home resigned his charge (1757). He became secretary to Lord Bute, tutor to the Prince of Wales (afterwards George III.), and received liberal pensions. In 1770 he married and returned to East Lothian, and after a time settled in Edinburgh. Besides *Douglas*, Home wrote other plays, which either failed or met with moderate success. Among

them are: *Agis, Aquileia, Fatal Discovery, Alonzo, and Alfred*. He also wrote a *History of the Rebellion of 1745*. Consult *Works*, with memoir by Henry Mackenzie (Edinburgh, 1822); and for Douglas alone, Wilson, *Poets and Poetry of Scotland* (London, 1875).

HOME AS FOUND. A novel by J. Fenimore Cooper (1838). It is a sequel to *Homeward Bound*, and, like it, is a criticism of American social conditions.

HOMER. A city and the parish-seat of Claiborne Parish, La., 50 miles east by north of Shreveport; on the Louisiana and Northwest Railroad. It is the commercial centre for a productive cotton-growing district (Map: Louisiana, C 1). Population, in 1890, 1132; in 1900, 1157.

HOMER (Lat., from Gk. Ὅμηρος). A name for the early epic poetry of Greece. The less critical of the ancients attributed to Homer many minor poems, as the *Hymns*, the *Margites*, the late *Batrachomyomachia* (Battle of the Frogs and Mice), and many of the lost so-called Cyclic Epics, dealing with the early legends. To the more thoughtful he was the author of the *Iliad* and the *Odyssey*. The skeptical 'separators' (chorizontes) denied him the *Odyssey*. To us he is the unknown poet who chiefly shaped the *Iliad* and possibly the *Odyssey*. His date is placed by Herodotus about B.C. 850; by the moderns, anywhere from 900 to 1100. At any rate, he is the first name in European literature. The *Iliad* is an episode in the legendary siege of Troy, or Ilium, a real town of which Schliemann has excavated the remains at Hissarlik, a hillock in Northwestern Asia Minor. This siege is probably an idealization of the prolonged struggles of Achaean and Æolian invaders from Greece with the old (Phrygian?) possessors of the soil. In the legend it is undertaken to recover the beautiful Helen, wife of King Menelaus of Sparta, who had eloped with Paris, son of King Priam of Troy. In the tenth year of the war Achilles, the Achaean (Thessalian) hero, quarrels with the commander-in-chief, Agamemnon, King of Mycenæ, about a captive girl, Briseis, and sulks in his tent, to the great loss of the Greeks, until aroused by the death of his dearest friend Patroclus. Then he hurls himself into the battle again and slays the slayer, Hector, the chief bulwark of Troy, with whose solemn burial the poem concludes.

The *Odyssey* relates, likewise in twenty-four books, the surprising experiences of Odysseus after the ten years' siege of Troy, wandering for ten years more, yearning to see the rocky isle of Ithaca. Underplots describe the life of his faithful wife, Penelope, persecuted by the importunate wooing of rude suitors, and the adventures of his son, Telemachus, who in the tenth year goes forth in search of his father. In the end, Odysseus returns, joins Telemachus, slays the suitors, and is at last recognized by Penelope. A literature does not thus begin with two long artistic and skillfully constructed epics. We must assume behind the *Iliad* shorter epic ballads such as the bard Phemius in the *Odyssey* chants to the suitors, and Demodocus recites at the Phæacian Court, hymns to the gods, and songs of the 'glory of men,' such as Achilles, idle in his tent, sings to the music of a lyre won from the spoils of a captive town. The systematic mythology of the poems, the number of

clearly defined personalities which they present, the profusion of detail about things and persons and places, their literary art, poetical diction, and mastery of the hexameter—all these things presuppose a long historical and literary development. But of this we know nothing except by analogy and inference from the poems themselves. The manifestly spurious ancient 'lives' are fictions, in many cases fashioned from minor poems attributed to 'Homer.' Homer, they tell us, was born of the nymph Critheis and the river Meles (at Smyrna), and hence called Melesigenes. The name 'Homer' was variously derived from the Greek word for hostage, because he was a hostage in youth, or from a dialectic word for blind, because he lost his sight. Homer, the 'Lives' continue, wandered from city to city of Asia Minor earning his bread by reciting his poetry or by 'teaching,' and immortalized by name in his poems many of those who treated him kindly. Some poems he actually gave to others who won fame by them—to Stasinus of Cyprus, e.g. he gave as his daughter's dowry the *Cypria*, one of the so-called Cyclic Epics, of which only a few fragments remain. He died, as an oracle had foretold, through chagrin at his inability to read the riddle of the fishermen: "What were we left, what we caught not we bring," which referred not to fishes, but to an animal more 'familiar to man.' After his death, "Seven cities claimed the mighty Homer dead, where living Homer begged his daily bread."

All this and much more is fable. Modern scholars ask, rather: What is the origin of epic poetry in Greece? Can we detect in the *Iliad* traces of the ballads or shorter lays out of which we may conceive it to have been composed? Can we break up the *Iliad* into two chief groups of lays—the wrath of Achilles proper, and the general picture of the siege of Troy, by which this original framework was enlarged? What features of style, language, and manners mark the *Odyssey* as later than the *Iliad*? What parts of the *Iliad* most resemble the *Odyssey* in these features? Can we dissect the *Odyssey* into a 'return of Odysseus' and a 'Telemachiad'? Was the 'story of Achilles' originally composed in Thessaly in the Æolic dialect, then transferred to the scene of the struggles of early Greek colonists in Northwestern Asia Minor, and finally Ionicized, enlarged, embellished, and chanted by minstrels in the halls of Ionian nobles and merchant princes on the Lydian coast? Does the *Odyssey* reflect the travelers' tales brought back to Ionian seaports by the first navigators of the Euxine and the Mediterranean? What is the precise relation of the life depicted by Homer to the traditional legend of early Greek history on the one hand, and on the other to the apparently similar civilization revealed at Troy, Mycenæ, and Tiryns by the spade of Schliemann, and conjecturally carried back to the third millennium B.C. by recent discoveries in Crete?

These questions are debated by specialists, but with little unanimity of result. Meanwhile the *Iliad* and the *Odyssey* abide. They may be studied: (1) As a picture of early Greek life; (2) as literature; (3) in their historic influence.

Homer is the most objective of poets. In his mind has not yet been turned back upon itself. It is a mirror of the world. If the heroes dine, the ox is consecrated to the gods, slain, cut up, roasted, carved, and served up in our presence.

We assist at all the details of the hero's toilet, or of his arming for battle. Homer does not enumerate the parts of a ship or a bed; but he shows us Odysseus building the craft that is to bear him away from the isle of Calypso, or the bed whose secret reveals his identity to Penelope. We watch every step in the launching of the vessel that bears Chryseis back to her father. We are not merely told that the ox sacrificed by Nestor has gold-tipped horns; we see the goldsmith come with the tools of his craft to lay on the gold. In consequence, we know the life of the Homeric man more intimately than that of any other primitive people—than that of the Hebrews or of our own Teutonic ancestors. This lore has been collected in three huge double volumes of Homeric 'Realien,' or real things, by the German Buchholz, and every history of Greece contains its chapter on early Greek life, religion, government, and manners, drawn from the same source. And this wealth of concrete detail is a striking, if not the chief, literary quality of Homeric poetry. Homer does not "beat in the void his luminous wings in vain." He does not analyze and refine. He is not dominated by any one great unifying religious or patriotic idea, like Vergil or Dante or Milton. He does not delay to moralize or reflect except in brief pregnant sentences. He flows on and on in a broad, pellucid stream of narrative, description, and, above all, action. "The multitude of things in Homer is wonderful" (says Hazlitt)—"the splendor, the truth, the power, the variety." The great gods of Homer—Zeus, Apollo, Athena, Hera, Poseidon—have remained for 3000 years as ideal types for all subsequent poetry and sculpture. His personages—Achilles, Hector, Nestor, Odysseus, Helen, Andromache, Penelope, Nausicaa—live for the imagination to-day as no others save those of Shakespeare's greatest tragedies. The berserker battle rage and impassioned eloquence of Achilles still stir the sluggish blood like wine. The great pathetic or dramatic episodes—the parting of Hector and Andromache, the death of Sarpedon, the horses of Achilles mourning for Patroclus, Hecuba baring her bosom to her son from the walls of Troy, the dirges for Hector—are still the despair of imitators. The *Odyssey* is yet the most interesting story-book in the world. In short, the Homeric poems are still, as Matthew Arnold said, "the most important poetical monument existing." The most distinctive literary quality of that poetry is due to its intermediate position between the literary epic, as *Paradise Lost*, and the supposedly spontaneous popular epic, as the *Edda*, the *Kalevala*, or the *Chanson de Roland*. It has all the simple, childlike charm of the one, all the lucidity, architectonic order, and noble diction of the other. The primitive feelings still preserve their freshness and force, but they appeal to us through the medium of a noble and dignified art. But though an artist, and perhaps a conscious artist, the Homeric poet is not like his successors, Apollonius of Rhodes, Vergil, Tasso, Milton, conscious of an inimitable model, of a long line of predecessors, and of a code of critic-formed rules. Matthew Arnold's four canons of Homeric style are well known: Homer, he says, is rapid, plain, and direct in syntax and words, plain and direct in matter and ideas, and yet withal eminently noble—a master of the grand style in simplicity. There is space only to mention some minor traits:

HOMER

FROM AN ANTIQUE BUST IN THE LOUVRE, PARIS

(1) The stereotyped epithets, 'cloud-compelling Zeus,' the 'wine-dark' or 'unharvested' sea, the 'rosy-fingered dawn,' 'the swift-footed Achilles,' the 'red-cheeked ships;' (2) the peculiar Homeric simile which, suggested by one point of resemblance, is continued for the sake of the picture into details where the likeness ceases. It is cleverly imitated by Matthew Arnold in *Sohrab and Rostum*. There are nearly 200 such similes in the *Iliad*, many of them containing precious detail about Homeric life. Those drawn from lions and the chase are particularly vigorous. To the Greek, Homer was Bible, Shakespeare, Milton, and Domesday Book in one. Later forms of poetry were looked upon as evolutions or borrowings from Homer. He was the foundation of education, and many cultivated Greeks knew the *Iliad* by heart. Even in the prime of the Attic drama professional rhapsodists recited the *Iliad* and *Odyssey* to enthusiastic audiences of thousands. Ethical reflection took its first texts from Homer, and was largely occupied in the criticism of the conduct and character of his personages. Purer religious ideas presented themselves in the form of a censure by Plato and Xenophanes of Homeric anthropomorphism, and the allegorical interpretation of literature was invented as a reconciliation. The first beginnings of literary and linguistic criticism among the Greek sophists attached themselves to Homeric problems. Lexicography probably originated in books of Homeric glosses. The conception of text criticism arose in the effort to establish a sound Homeric text. And the critical science of the great Alexandrian scholars, Zenodotus, Aristophanes of Byzantium, and Aristarchus, had its origin and achieved its greatest triumphs in the study of Homer.

It is in the modern world that the famous Homeric Question begins, if we ignore slight anticipations by Bentley and Vico, with Wolf's Latin *Prolegomena*, published in 1795. This was partly called forth by the recent publication of the Venetian scholia, which revealed how much the true text had been debated by the critics of antiquity. Wolf also collected stray notices in ancient authors to the effect that Solon or Hipparchus required the rhapsodists to recite Homer in due succession or from prompting, and that Pisistratus first reduced the scattered poems of Homer into one body. He inferred that the *Iliad* and the *Odyssey* were not originally composed as we have them, but were put together out of pre-existing materials. He confirmed this view by the argument (now refuted by facts) that writing was unknown, or at least rare, in early Greece, and that a long epic could not have been composed without writing. Since Wolf's time, Lachmann, Hermann, Nitzsch, Grote, Christ, and a host of others have elaborated theories of the composition of the *Iliad*. The debate between the partisans of lays stitched together and an original framework expanded and interpolated often degenerated into a logomachy. The tendency now is toward the second hypothesis. Proof is in the nature of things unattainable.

The imitation of Homer through Vergil by Tasso, Camões, and Milton is too large a theme for our space. The critics of the seventeenth and eighteenth centuries elaborated rules for the correct epic which have been entertainingly parodied by Macaulay in his prophetic account of the 'Wellingtoniad.' Pope's translation (about 1720)

long remained a classic and the model of poetical diction. It of course failed to satisfy the taste of the romantic revival at the end of the century, or to meet the demands of the new scholarship born about the same time in Germany. Many attempts have been made to supersede it in popular favor; but, despite its artificial rhetoric, it still remains for the majority of English-speaking readers the one poetical translation of Homer. The early versions of Hobbes and Ogilby are of interest only to professional students of literature. Chapman is praised on the faith of Keats's noble sonnet, and because of occasional spirited passages and exquisite lines. But the rugged rhythms, the obscurity of the syntax, the fantastic Elizabethan conceits, and the long uninspired tracts of doggerel make him intolerable in continuous perusal. Cowper, in his blank-verse version, aimed at uniting Miltonic stateliness with fidelity to Homeric simplicity, but succeeded only in being pompous and dull. Since the publication of Matthew Arnold's classic lectures *On Translating Homer*, we have had, among others, the estimable blank-verse translations of Lord Derby and of Bryant, and Way's spirited rendering in rhymed anapestic hexameter. No definitive translation of Homer is possible, for every generation must reinterpret him in order to blend Homeric sentiment with its own in the measure demanded by its taste. Of late the majority of readers prefer the literal prose versions in the slightly archaic and consciously simple English of Lang, Leaf, and Myers (*Iliad*), and Butcher and Lang (*Odyssey*).

BIBLIOGRAPHY. The needs of the English student will be best met by Jebb, *Introduction to Homer* (Glasgow, 1887); Lang, *Homer and the Epic* (London, 1893); Seymour, *Introduction to the Language and Verse of Homer* (Boston, 1889); and Monro, *Homeric Grammar* (Oxford, 1891).

Good text editions are those of Dindorf-Hentze and Caner. A good annotated (English) edition of the *Iliad* is that of Leaf (London, 1888), and of the *Odyssey* that of Hayman (London, 1882). The fullest Homeric lexicon is the *Lexicon Homericum* of Ebeling (Leipzig, 1885), or in English the Homeric Dictionary, by Keep-Autenrieth (New York, 1891). For the general study of Homeric antiquities, consult: Buchholz, *Homeric Realien* (2d ed., 3 vols., Leipzig, 1887); Helbig, *Das Homerische Epos* (Leipzig, 1887); and Anderson-Engelmann, *Pictorial Atlas to Homer* (New York, 1892). See EPIC POETRY; GREEK LITERATURE.

HOMER, APOTHEOSIS OF. A celebrated relief containing many figures, now in the British Museum. It was found in the Appian Way in the seventeenth century, and probably dates from the first century A.D.

HOMER, WINSLOW (1836—). An American painter, born in Boston. He had been in a lithographer's shop in Cambridge, and contributed sketches to magazines, before he became a pupil in the National Academy of Design, at the same time taking lessons from Frederic Rondel. During the Civil War he was special artist for *Harper's Weekly*. He went to New York in 1859, and in 1864 exhibited his first large picture, "Prisoners from the Front." The following year he was made an academician. Afterwards he settled in Scarborough, Maine. Between the years 1864

and 1884 he produced a number of genre subjects, usually taken from American life, such as "Home, Sweet Home," "Cotton Pickers," "In the Field," and "A Visit from the Old Mistress." All these show his independent realism and vigorous individuality. He began his sea pictures with the "Life Line" (1884). The series includes: "Eight Bells," "Danger," "Launching the Boat," "The Tempest," "The Peril of the Sea," and "The Lookout" (1897). They are all essentially dramatic studies of sturdy fisher-folk and longshoremen, and prepared the way for the purely marine pictures which he did later. Among these are: "A North Easter," "The Gulf Stream," and, particularly, "The Maine Coast," a magnificent marine of stormy skies, black rocks, and driving spray, which is his masterpiece. The strong color and broad, virile workmanship in Homer's pictures attracted much attention at the Paris Exposition of 1900. He is also an admirable painter in water-color.

HOMERIDES, hō-mēr'i-dēs, or **HOMERIDÆ** (Lat., from Gk. Ὅμηριδης, *Homēridēs*, descendant of Homer, from Ὅμηρος, *Homēros*, Homer). The name of a family or clan in the island of Chios, often mentioned; Strabo says that they claimed descent from Homer, and were adduced by the Chians to prove that Homer himself was a Chian. The name *Homēridæ*, however, is used by Pindar and by others frequently to mean persons who recite the Homeric poems, i.e. rhapsodists; and it is in this sense that the name is commonly used. The *Homēridæ* of Chios have played a large part in the theories of some scholars as to the transmission of the Homeric poems; but there is no evidence that they were a guild of poets or even of rhapsodists.

HOMER PIGEON RACING. See PIGEON-FLYING.

HOME RULE. A term in British politics, designating the particular movement, begun in 1870, to secure for Ireland a local legislature, and thus recognize and satisfy the persistent sentiment of Irish nationality. The question of Home Rule, ignored by Pitt in the Act of Union of 1800, was revived by O'Connell's agitation for repeal. With the failure in 1848 of that movement, hostility to British rule passed from the field of constitutional exertion to that of violence and revolution. But neither the doctrinaire fiasco of 1848 nor the plots of the Fenians brought any realization of the national aspirations. After twenty troubled years of conspiracy and secret crime, the concession by Gladstone of Church disestablishment and land reform called the thoughts and hopes of the Irish people once more to constitutional activity. In 1870, a year after the Act of Disestablishment was passed, and while Gladstone's first Land Bill was still under discussion in Parliament, the first step was taken in the movement for Home Rule.

On May 19th in that year, there assembled at the Bilton Hotel, Dublin, a number of Irishmen of the better class, representing all shades of political and religious belief. The dominant element was Protestant and Conservative. Discontented with the concessions made by Gladstone's Government, they were ready to consider some plan for taking out of British hands the control of Irish affairs. After free discussion, it was resolved "that the true remedy for the evils of Ireland is the establishment of an

Irish Parliament, with full control over our domestic affairs." In accordance with this opinion, a permanent organization was soon afterwards effected, under the name of 'The Home Government Association of Ireland.' Its declaration of principles announced as its only object the obtaining of a distinct Parliament for Ireland, to regulate her internal affairs, while leaving to the Imperial Parliament all questions affecting the colonies, foreign relations, and the stability and defense of the Empire. With this declaration the movement for Home Rule was formally inaugurated.

The history of the Home Rule movement from 1870 to the present time may be divided into four periods: First, the leadership of Isaac Butt (1870-79); second, the merging of Home Rule into the land agitation (1879-86); third, the adoption of the principles by the Gladstonian Liberals (1886-93); and fourth, the Conservative policy of 'killing Home Rule by kindness.'

FIRST PERIOD. This was the time of development and definition. From the outset the Home Rule idea was favorably received among the better classes of the Irish people, though ancient religious antipathies often blocked the way. Among the lower classes—those particularly in which Fenianism had found its chief support—the new form of constitutional agitation was slow to inspire confidence. Under the direction of Isaac Butt, however, who had made himself popular by his legal services in behalf of arrested Fenians, considerable progress was made, and at bye-elections several Home Rulers, including Butt himself, were elected to Parliament. In the fall of 1873 the Home Government Association was replaced by the Irish Home Rule League, a new and more comprehensive organization, whose skillful management secured the return of sixty Home Rulers in the general election of 1874. For the next five years, under the leadership of Isaac Butt, they acted as a distinct party when Home Rule or Irish interests were at stake, but on other questions followed their individual preferences. In fact, during this period, outside of Ireland, there was very little interest in the subject, and English Liberal and English Conservative alike had voted against Butt's annual motion for an Irish Parliament. But an awakening was to come, when Parnell, who entered the Commons in 1875, began to advocate his policy of 'obstruction,' applying it—aided by a little group of followers—to all questions alike, whether Irish, English, or Imperial. In this course he was opposed by Butt and the majority of the party at that time; but through this policy Parnell succeeded in arousing the English people to a discussion of the subject, and in winning, partly perhaps by means of the hatred he excited toward himself on the part of the old British parties, the enthusiastic support of Irishmen to a degree which Butt's milder course had never done.

SECOND PERIOD. Butt died in the spring of 1879. The Home Rule Party chose as his successor William Shaw, whose methods it was known would be those of Butt. But Parnell was the rising man in Irish circles. In this same year, by throwing himself heart and soul into the land agitation, and assuming the presidency of the Land League, he became the idol of the Irish masses. During the four succeeding years Home Rule was entirely overshadowed by the great agrarian issue. The general elections of 1880

showed an increase of the Home Rule delegation in Parliament from 60 to 68. But the extreme views of Parnell and his followers on the land question tended to alienate the moderate element in the party, already disgusted with his Parliamentary tactics. During the desperate struggle made by the Parnellites against the Coercion Bill in January, 1881, Shaw and his followers formally withdrew from the Home Rule Party in Parliament. This action was significant of a great change in the character of the party outside of Parliament. By connecting Home Rule with the land question, Parnell drew to his support a great following which Butt had never won; but he lost the Conservative and aristocratic element, which had practically inaugurated the movement. A Catholic peasantry instead of a Protestant middle class became the chief support of the party. With this absorption of the larger element one end was achieved which has been a source of about equal glory and reproach to Parnell—the physical-force faction, hitherto apathetic, was drawn into the constitutional agitation. The Irish National League, organized October 17, 1882, was the formal expression of the Parnellite policy. Its programme combined essentially the principles of the Home Rule League and those of the recently suppressed Land League. In the elections of 1885 the success of Parnellism was demonstrated. The Nationalists returned 86 members to the House of Commons, and secured the balance of power between the Liberals (333) and the Conservatives (251). Of the 103 members from Ireland, 85 were followers of Parnell.

THIRD PERIOD. With an absolute Liberal majority in Parliament, so skillful a leader as Gladstone had found it almost impossible to transact business in the face of Nationalist obstruction. Now that Parnell held the balance of power, and could displace Ministries at will, the conduct of the Government on any principle known to British practice seemed hopeless. On January 27, 1886, the Nationalists aided the Liberals to overthrow Lord Salisbury's Government, just as in the preceding year they had joined the Conservatives against Mr. Gladstone. The Conservatives now made advances looking to an understanding between the Nationalists and themselves, but without results. On the other hand, Gladstone, after careful consideration and consultation, decided to accept Home Rule as a Liberal principle, so on the 6th of April he brought in his famous Home Rule Bill. In it was embodied the long-sought provision for a distinct legislative body for Ireland, with powers extending to all subjects except those specifically reserved to the Parliament at Westminster. At the same time a sweeping measure for land purchase was announced, with the declaration that the two should be inseparable, together forming a complete scheme for the settlement of the Irish question. Parnell, with certain qualifications, accepted the bill on the part of the Irish Nationalists, and his party threw themselves heartily into alliance with the followers of Gladstone. The question of Home Rule now became one for the people of Great Britain to settle. With the adoption of the Irish demand by Gladstone, a great section of the Liberals declined to follow their old leader. Protesting against anything which looked like a step toward separation of the two islands, they took the name of Liberal

Unionists, and ultimately entered into alliance with the Conservatives. Gladstone's bill was defeated on the second reading by 343 to 313, 93 Liberals voting in the negative. Upon the appeal to the constituencies, the adversaries of Home Rule gained a majority of 113 over the combined Gladstonians and Nationalists. Lord Salisbury assumed power with a policy of coercion, with possibly some eventual measure of concession in reference to local government in Ireland. Home Rule remained the most prominent issue throughout the four succeeding years, the Gladstonians expressing confidence in the ultimate support of a British majority, a belief which the bye-elections seemed to justify, as the Liberals gained 16 seats in 99 contests. In the winter of 1890-91 a divorce case in which Parnell was corespondent brought much odium upon him, and raised the question of his retirement from the leadership of his party. Gladstone announced that he could not hope to hold the Liberals to the Nationalist alliance unless Parnell resigned. The latter rejected all suggestions of his own withdrawal, and by his course alienated a large section of his Parliamentary followers. The result was a schism in the Irish Nationalist Party, which made the future success of the Home Rule movement exceedingly doubtful. The death of Parnell, in October, 1891, only served for the moment to intensify the animosity of the Parnellite faction toward the majority of the Home Rulers, who accepted the leadership of Justin McCarthy (q.v.). The elections of July, 1892, resulted in a Liberal majority in the House of Commons of 40, so that Gladstone again became Premier, and in March, 1893, introduced a bill granting Home Rule to Ireland. It provided for an Irish legislative body of two houses, the members of the Upper House to be chosen by electors having a property qualification, and for complete self-government in local matters. The difficult question of Ireland's representation in the Imperial Parliament was first decided in favor of the 'in-and-out' plan—Irish members voting on some questions, not on others—but later in favor of a reduction of its membership in the House of Commons from 103 to 80, giving them the same rights as to other members. The bill passed the Commons September 1st (301 to 267), but was overwhelmingly defeated in the Lords, receiving only 41 votes out of a total of 450. Gladstone resigned in March, 1894, and Lord Rosebery assumed the Premiership, professing adherence to Home Rule, but doing nothing for it during his Ministry, which came to an end in June, 1895.

FOURTH PERIOD. This period opened with the Conservatives in power, the Home Rulers split into cliques and factions, and the Liberals demoralized and lukewarm toward the cause of the Irish Nationalists. The Conservatives, believing that Irish discontent had its source in economic conditions, in poverty and want, passed, under the cry of 'killing Home Rule by kindness,' a land act which simplified the rent problem, provided for land purchase, tended to bring a peasant proprietor class into being, and in general ameliorated economic conditions. In 1898 a Local Government Bill was introduced, and became a law in 1899, which placed county and municipal governments in the hands of the people, with provisions for an almost universal suffrage. In part due to improved conditions, in part due to these reforms, public agitation had almost ceased, and

it seemed as if 'Balfourian amelioration' was on the point of success, when the Boer War broke out. Under the impulse of this war, the warring Irish factions came together, accepted John E. Redmond as a common leader, revived their demand for an Irish Parliament, and in the election of 1900 chose 81 members to the House of Commons to express their cause. Believing that the Local Government Act had already proved the capacity of the Irish people for self-government, asserting that the British Parliament had too much to do to do it well, and insisting on the justness of their cause, Redmond and his 80 followers intend to block legislation whenever they can and whenever it will benefit their cause, until the British people and Parliament are forced to accede to Ireland's demand for Home Rule.

The literature on Home Rule in Ireland is very extensive, and only a few of the best works can be mentioned: McCarthy, *The Case for Home Rule* (London, 1887); O'Brien, *Irish Wrongs and English Remedies* (London, 1887); Chamberlain, *Home Rule and the Irish Question*, speeches, 1881-85 (London, 1887); Dicey, *England's Case Against Home Rule* (London, 1887); Gladstone and others, *Handbook of Home Rule, Being Articles on the Irish Question* (London, 1887); Hurlburt, *Ireland Under Coercion* (2 vols., Boston, 1888); the *London Times*, *Report of the Proceedings of the Special Committee* (4 vols., London, 1890); Gladstone, *Special Aspects of the Irish Question* (London, 1892); Lloyd, *Ireland Under the Land League* (London, 1892); and Pollock, "Home Rule and Imperial Sovereignty," published in *Oxford Lectures and Other Discourses* (London, 1890). There is also an almost unlimited amount of magazine literature.

HOMESPUN, ZEKIEL and CICELY. A brother and sister, in Colman the Younger's comedy *The Heir at Law*. They are simple country people, showing the best traits of their class.

HOMESTEAD (*home*, AS. *hām*, Goth. *haims*, OHG. *heim*, Ger. *Heim*; connected with Lith. *kemas*, Gk. *κῆμα*, *kōmē*, village, Skt. *kṣēma*, abode, from *kṣi*, to dwell + *stead*, AS. *stede*, Goth. *staps*, OHG. *stat*, Ger. *Statt*, place; ultimately connected with Eng. *stand*). In law, an estate in land, used as a home by the tenant or owner thereof, and to a greater or less extent protected by law from the claims of creditors. This right of exemption of the 'homesteader,' as he is termed, is a modern privilege created by statute and was unknown to the common law. It does not exist in England, but is peculiar to the United States, where it is everywhere recognized, excepting in Rhode Island, Pennsylvania, Delaware, Maryland, and the District of Columbia. It does not constitute a distinct form of estate in land, but belongs to the class of exemptions from the claims of creditors, which, originating in the common law, has been greatly extended by the humane policy of American law. See EXEMPTION.

HOMESTEAD. A borough in Allegheny County, Pa., eight miles southeast of Pittsburg; on the Monongahela River, and on the Pennsylvania and the Pittsburg and Lake Erie railroads (Map: Pennsylvania, B 3). It has one of the largest steel plants in the United States, employing about 6000 men, and producing both structural steel and nickel-steel armor plate.

There is a Carnegie library. Settled in 1871, Homestead was incorporated in 1880, the date of the charter now in operation, which provides for a mayor, elected every three years, and a unicameral council, in whose power rests the appointment of chief of police, street commissioner, and water-works engineer. The water-works are owned and operated by the borough. In 1892 Homestead was the scene of a notable strike, which was attended by such rioting as necessitated the interference of State troops. Population, in 1890, 7911; in 1900, 12,554.

HOMESTEAD LAWS. Homestead laws are of two classes: those enacted by Congress and those enacted by State Legislatures. The primary object of the first class is to enable citizens without capital to acquire homes. The main object of the second class is to secure homes, once acquired, against the claims of creditors. Legislation of the first class has done much to stimulate the settlement and improvement of wild, unoccupied land. That of the second class has saved countless families from pauperism.

The Federal homestead laws begin with the Act of 1862, now a part of the United States Revised Statutes (§§2289-2317). Their policy is to give portions of the public lands to those who will settle, cultivate, and make permanent homes upon them. Any person who is the head of a family, or who is twenty-one years of age and is a citizen of the United States, or who has filed his declaration of intention to become such, may acquire a tract of unappropriated public land, not exceeding one hundred and sixty acres, on condition of settlement, cultivation, and continuous occupancy as a home by him for the period of five years, and of the payment of certain moderate fees. It is expressly declared that no lands acquired under this statute shall in any event become liable to the satisfaction of any debt contracted prior to the issuing of the patent therefor by the Government to the settler. This provision was inserted for the purpose of protecting debtors and of inducing them to settle upon the public domain. Its constitutionality was questioned, but was sustained by the courts. It would be difficult to point to any enactment of Congress more wise in conception, just in policy, and beneficial in its results than this homestead statute and its amendments. Under their provisions, more than 85,000,000 acres of unoccupied public lands have been transferred by the United States to homestead settlers. During the fiscal year ending June 30, 1901, the Commissioner of the General Land Office reports that "the original homestead entries, final homestead entries, and commuted homestead entries aggregated 111,390, and embraced 15,455,057.46 acres for actual *bona fide* homes to American settlers."

The term 'original entry' refers to the proceeding by which a person enters a tract of land as his homestead. Its important features are the filing of an affidavit, prescribed by statute, with the register of the land office in which he is about to make the entry, and the payment of a fee of five dollars if his entry is for not more than eighty acres, or of ten dollars if it is for more than that amount. The 'final entry' refers to the proceedings connected with the issue of a certificate of title or patent by the United States to the person making the original entry, or to his widow, heirs, or devisees. Ordinarily the patent does not issue until the expiration of five

years from the date of the original entry, and then only upon furnishing the evidence required by statute of the actual occupancy of the land and its cultivation by the claimant during that period. Provision is made, however, for shortening this term by 'commuting,' that is, paying the minimum Government price for the land. Upon such payment, the homesteader may obtain a patent at any time. It is also provided that the term which a homestead settler served in the United States Army, Navy, or Marine Corps, "during the Rebellion," or in "the Spanish War," or "in suppressing the insurrection in the Philippines" may be deducted from the five years required to perfect his title and to receive a patent for his original entry.

Passing now to State homestead laws, we shall find, as we have already stated, that their object and tenor are quite different from those of the Federal Government. Their aim, it has been judicially declared, "is to provide a place for the family and its surviving members, where they may reside and enjoy the comforts of a home, freed from any anxiety that it may be taken from them against their will, either by reason of their own necessity or improvidence, or from the importunity of their creditors." This policy of protecting citizens and their families from the miseries and demoralizing influences of destitution, of fostering the disposition to improve and to take pride in a permanent homestead, has commended itself to both legislators and judges. The former have enacted laws providing for large exemptions to the homesteader, while the latter have, with few exceptions, construed such laws very liberally in his favor. In most of the States, the benefits of this legislation are confined to families, although in a few commonwealths they are extended to any resident, whether he has a family dependent upon him or not.

State legislation provides three distinct ways in which a homestead may be secured to the family against the debts of its owner. The first method is by a prescribed form of public notice properly executed and recorded. It must contain a statement of the facts showing that the person making it is the head of a family; a statement that such person resides on the land and claims it as a homestead; a description of the land, and an estimate of its actual cash value. The second method is by actual occupancy and use. The third method is by a proceeding in a court of justice. Its principal characteristics are an application to a designated court, a notice to creditors, and a judicial decree setting apart certain property as a homestead.

It is not to be understood that homestead property is exempted from every sort of claim against its owner. As a rule it is subject to debts contracted before the homestead was duly recorded or set apart as such; to the liens of mortgages and judgments which were on the property when it was set apart; to claims for unpaid purchase money for the property, as well as for such improvements to the property as entitle the creditor to a mechanic's lien (q.v.) thereon; and to taxes and assessments for public improvements.

The amount of land which may be exempted under homestead laws varies in the different States. In some the limits are those of acreage, in others those of cash value. The former range

ordinarily from 40 to 160 acres; the latter from \$500 to \$5000. Consult: Thompson, *Homesteads and Exemptions* (San Francisco, 1886); Waples, *Homesteads and Exemptions* (Chicago, 1892).

HOME, SWEET HOME. A popular song by John Howard Payne, in his opera, *Clari, or the Maid of Milan*, first produced in 1823. The music of the song is by the composer of the opera, Sir Henry Bishop, who is said to have adapted it from an old Sicilian air.

HOMEWARD BOUND. A novel by J. Fenimore Cooper (1838). It relates the adventures of passengers on the packet *Montauk*, which was blown out of her course to the coast of Africa.

HOMICIDAL MANIA. The impulse to take life in one mentally disordered. In melancholia, in mania, in general paresis, in paranoia, and other insane conditions, the homicidal impulse is not infrequent. Indeed, in normal mental action the desire to kill is not infrequently present, but is controlled. In the various stages of insanity this control is either diminished, or through hallucinations or delusions, the motive is stronger and uncontrollable, and murder results. It is impossible to determine beforehand whether an insane person will or will not take another's life. Often such an act is apparently the first symptom of the insanity. It is fruitless to generalize concerning such acts; the obvious lesson is that the slightest symptoms of disturbed mental action should be carefully noted and proper precautions taken to prevent accidents. This caution is particularly pertinent in the case of puerperal women in whose family there has been any taint of insanity.

HOMICIDE (OF., Fr. *homicide*, from Lat. *homicidium*, manslaughter, from *homo*, man + *cadere*, to kill). The killing of one human being by the act, procurement, or omission of another. In primitive communities, we find that it does not subject the slayer to criminal prosecution by the State. It is thought of, not as an offense against the common weal, but simply as a wrong to the slain man's kindred; a wrong which they are at liberty to redress by vengeance upon the slayer or his kindred. But this policy leads to the perpetuation of blood feuds and to great waste of human life. Accordingly, at a very early time, the practice is introduced of buying off the injured kindred; of appeasing the feud by a money payment. Then a scale of compensation is fixed either by custom or by legislation, graduated generally by the rank of the person slain. In Anglo-Saxon law this is known as *wergild*—a man's price. At first the acceptance of such compensation is left to the choice of the injured kindred. They may take it and stay the feud, or they may reject it and enforce their right of private vengeance. But as the State grows more powerful, and the death of its citizens is felt to be a harm to the common weal, public authority compels the injured kindred to accept the compensation and not to pursue the feud. Then comes the final stage of legal development, in which the unlawful taking of human life is considered as primarily a wrong to the State, a public offense which cannot be compounded by private bargain. See AVENGER OF BLOOD; BLOOD FEUD; BLOOD-MONEY; ASYLUM; WEREGILD; etc.

Homicide is a generic term, including the crimes of manslaughter (q.v.) and murder (q.v.), as well as the non-criminal forms of killing

known as excusable and justifiable homicide. This article will be confined to the two latter species. By the early common law an important distinction was made between excusable and justifiable homicide. The slayer in the latter case was not liable to any punishment, while in the former he was. In other words, excusable homicide was not legally excusable. Just how far it subjected the slayer to criminal punishment is uncertain. Lord Coke declares that it rendered him liable to death, but Blackstone and Stephen insist that his liability did not extend beyond the forfeiture of goods. At present neither excusable homicide nor justifiable homicide is punishable at all, but the two terms are still retained in use in England and in many of our States. The signification of each, however, has been varied by modern legislation from the common-law meaning. At common law excusable homicide was of two kinds: killing by accident or misfortune, and killing in self-defense. At common law, justifiable homicide was of three kinds: killing by a public officer in conformity to a judicial sentence; killing by an officer or his assistant when necessary to overcome unlawful resistance to legal process, or to the performance of a legal duty, including killing by military forces in time of war or riot; and killing to prevent the commission of an atrocious crime.

Homicide is not wholly excusable unless it is committed without legal fault on the part of the slayer. The killing may not have been planned or thought of—it may have been accidental—yet if it resulted from the slayer's unlawful conduct, it is not a case of excusable homicide, but of manslaughter or murder, as the case may be. So, too, homicide is justifiable only when it is inflicted in strict accordance with lawful authority. A sheriff who inflicts the death penalty upon a convict in a manner not authorized by the judicial sentence which he undertakes to execute does a criminal, not a justifiable act. An officer cannot justify the unnecessary killing of even the worst malefactor that is resisting arrest. Nor is a person at liberty to take the life of a brutal assailant unless he can show that he had reasonable ground to believe that the assailant was about to commit a felony or do some great personal injury to the slayer or to some member of his family or other person in his presence, and that there was imminent danger of the assailant's accomplishing his design.

Consult: Stephen, *History of the Criminal Law of England* (London, 1883); Clark and Marshall, *Law of Crimes* (Saint Paul, 1900); and the authorities referred to under CRIMINAL LAW.

HOMILDON, hōm'īl-don, or **HUMBLEDON** (hūm'b'l-don) **HILL**. An elevation near Wooler, in Northumberland, England, not far from the Scottish border, noted as the scene of a battle in which the English, under the Earl of Northumberland and his son, Harry Hotspur, overthrew a Scottish army under the command of Sir Murdoch Stewart and the Earl of Douglas, September 14, 1402. The victory at Homildon Hill was soon followed by the rebellion of the Earl of Northumberland and his son. See HENRY IV.

HOMILETICS (from Gk. *ὁμιλητικός*, *homilētikos*, relating to conversation, from *ὁμιλία*, *homilia*, conversation, from *ὁμιλεῖν*, *homilein*, to converse, from *ὁμιλος*, *homilos*, assembly, from *ὁμός*, *homos*, similar + *ἔλγῃ*, *ilē*, *ἐλγῃ*, *eilē*, com-

pany, from *ελεειν*, *eilein*, to crowd together). As the term is now used, the science of sermon-writing. Originally the religious discourses were less formal than they became later (see HOMILY), and so were properly called 'homilies.' The earliest writer on the subject of homiletics is Saint Augustine, whose book *De Doctrina Christiana* is in some sense an adaptation of profane rhetoric to sacred uses. Rabanus Maurus and Isidore of Seville also incidentally treat the subject; but the nearest approach to a systematic treatment in mediæval literature is to be found in Hunibert, *De Eruditione Concionatorum*. Saint Carlo Borromeo's *Instruktionen Pastorum* was a part of his general scheme for the improvement of clerical education; and in the ecclesiastical course, as well of Catholics as of Protestants, homiletics occupies an important place. Text-books on homiletics have been written by Bautain, Broadus, Claude, Dabney, Hoppin, Kidder, Phelps, Shedd, Storrs, Vinet, and many others.

HOMILIARIUM (ML., from Lat. *homilia*, Gk. *ὁμιλία*, *homilia*, conversation, homily). A collection of homilies for the use of the clergy either to read to their congregations or for their own edification. Such collections were in use from the sixth century, when the great majority of the clergy were too ignorant to write their own sermons. The homilies of the Venerable Bede were in familiar use among the clergy in all parts of the West, and we find in the letters of the early mediæval time traces of an interchange of sermons, original or otherwise, between bishops and clergy, even in distant countries. Alcuin made an homiliarium, which, strangely enough, considering its author, passed out of mind and was only discovered in 1892. What since the fifteenth century has been called his is really a revision of that by Warnefried mentioned below. One of the many reformatory measures of Charlemagne was a compilation of homilies under the title of 'Homiliarium,' which was made under his direction by the deacon, Paul Warnefried, a monk of Monte Cassino and one of his chaplains. It was compiled in the end of the eighth century, and contains homilies for all the Sundays and festivals of the year. It is the most famous of these collections. Maximus of Turin (fifth century, homilies in Migne, *Patrol. Lat.*, lvii.) is more drawn upon than any other author, but Bede comes next, and then Leo the Great, Gregory the Great, Augustine, and others. The language was, of course, Latin. Many synods directed the clergy to translate these sermons for their flocks, and the collection continued in use for this purpose down to the sixteenth century. It was printed at Speyer in 1482, and again at Cologne in 1557, and is reprinted in Migne, *Patrol. Lat.*, xciv. A collection of English homilies turned into verse, that they might be more readily remembered by the people, appears to have been composed about the middle of the thirteenth century. This collection, affording a metrical sermon for every Sunday and festival day in the year, exists in manuscript; and a portion of it was edited with introduction and notes by John Small, librarian to the University of Edinburgh (*English Metrical Homilies*, Edinburgh, 1862). When the Reformation was introduced into England the unfitnes of the clergy to preach was so keenly felt that a book of homilies was prepared and sent forth by authority of Edward VI. (1547), and again under

Elizabeth (1563) a second book, and the reading of these homilies was enjoined. The two books were reprinted at Oxford, 1859. See **HOMILY**; **HOMILIES OF THE CHURCH OF ENGLAND**.

HOMILIES OF THE CHURCH OF ENGLAND. A collection of sermons, the first part of which was published in 1547, the first year of the reign of Edward VI., to be read in the churches, partly in order to supply the defect of sermons, but partly also to secure uniformity of doctrine, and to guard against the heterodoxies, old and new, which threatened the unconsolidated Church. The second part was published in 1563, at the same time with the Articles, under Elizabeth. The titles are twenty-one in number. The homilies are not now read in churches; but they are frequently appealed to in controversies as to the doctrine of the Anglican Church on the points of which they treat. The precise degree of authority due to them is matter of doubt.

HOMILY. In ecclesiastical usage, a discourse held in the church, and addressed by the minister to the congregation. The practice of explaining in a popular form the lessons of Scripture read in the synagogues had prevailed among the Jews, and appears to have been adopted in the Christian churches from the earliest times. The discourses employed for this purpose were of the most simple character; but with the exception of one ascribed to Hippolytus (q.v.), we have no sample of this form of composition earlier than the homilies of Origen, in the third century. Taking these as a type, the early Christian homily may be described as a popular exposition of a portion of Scripture, accompanied by moral reflections and exhortations. It differs from the sermon (Gk. *λογος*, Lat. *oratio*) in eschewing all oratorical display, and in following the order of the scriptural text or narrative, instead of being thrown into the form of a rhetorical discourse or a didactic essay. The schools of Alexandria and Antioch appear to have been the great centres of this class of sacred literature, and in the early centuries and mediæval times many preachers continued to use the homiletic form; and even in the modern Church many have regarded it as the best medium of scriptural instruction. See **HOMILIARIUM**; **HOMILETICS**; **HOMILIES OF THE CHURCH OF ENGLAND**.

HOMINE REPLEGIANDO, hóm'i-nē rē-plē'-jī-án'dō (ML., for replevying a man). The title of an old writ in English law, meaning to bail a man out of prison. It was an ancient form of the writ of habeas corpus, by the later form of which, as now employed, it has been superseded in England and generally in the United States. In a few of the American States, however, the older writ has recently been revived in an amended form, as being better adapted to the purpose of securing the release of a prisoner on bail than the more usual writ of habeas corpus (q.v.).

HOMING PIGEON, or **HOMER**. The name among fanciers for that breed of domestic pigeon, also called 'carrier,' used in carrying messages and in long-distance races. The name refers to its proclivity for returning to its home with the utmost possible speed and directness when liberated at a distance. See **PIGEON**.

HOMINIDÆ (Neo-Lat. nom. pl., from Lat. *homo*, man). The family to which man belongs, and which, together with the various families of monkeys, baboons, and apes, forms part of the order Primates. Among the characters which distinguish the Hominidæ are: (1) The posture is completely erect; (2) the anterior appendages are provided with hands, the posterior with feet; (3) the feet have the inner digit greatly enlarged and non-opposable, forming a great toe; (4) the body is sparsely haired, except on the top of the head; (5) the lower jaw has a prominent ridge, the chin; (6) the facial angle exceeds 60°; (7) the brain is more than double the size of that of apes, and the cranial capacity three times as much; (8) the teeth stand in an uninterrupted series without a space in front of the upper incisors; (9) man has the power of speech. In his general organization man is so closely related to the higher apes that it is difficult to draw a hard and fast line between the Hominidæ and the lower groups. See *Anthropoid Apes*, under **APES**.

HOMMEL, hóm'mel, FRITZ (1854—). A German Orientalist, born at Ansbach. He was educated at Leipzig, and in 1877 became connected with the library of Munich, and was made docent of the university, in which he was appointed professor in 1885. His principal writings, aside from contributions to Oriental journals, are: *Die Namen der Säugethiere bei den südsemītischen Völkern* (1879); *Zwei Jagdschriften Asurbanipals* (1879); *Die semītischen Völker und Sprachen* (1883); *Geschichte Babyloniens und Assyriens* (1885); *Der babylonische Ursprung der ägyptischen Kultur* (1892); *Aufsätze und Abhandlungen arabistisch-orientologischen Inhalts*, vols. i.-iii. (1892-1902); *Südarabische Chrestomathie* (1893); *Die altisraelitische Ueberslieferung in inschriftlicher Beleuchtung* (1896); *Sumerische Lesestücke* (last ed. 1899); *Der Gestirndienst der Alten Araber* (1900).

HOMME QUI RIT, L', lóm' kē rē' (Fr., the man who laughs). A romance by Victor Hugo (1869), the story of a boy whose face has been mutilated so that he always has the appearance of laughing. The central thought of the romance is the antithesis between physical and moral characteristics.

HOMŒCELA. See **HETEROCELA**.

HOMŒOP'ATHY (from Gk. *ὁμοιοπάθεια*, *homoiopathēia*, similarity of feeling, from *ὁμοιος*, *homoiōs*, similar + *πάθος*, *pathos*, feeling). A distinctive system of medicine elaborated by Sampel Hahnemann (q.v.) upon the suggestions of a number of predecessors, and published in 1796. His chief dicta enunciated at that time were as follows:

"Every powerful medicinal substance produces in the human body a peculiar kind of disease; the more powerful the medicine, the more peculiar, marked, and violent the disease." "We should imitate nature, which sometimes cures a chronic disease by superadding another, and employ, in the disease we wish to cure, that medicine which is able to produce another very similar artificial disease, and the former will be cured, *similia similibus*." He was brought to this conclusion through observing the toxic effects of drugs, as recorded in the various works on materia medica, which he was translating

from English into German, and by experiments made upon himself and others in corroboration. It is not claimed that Hahnemann first noted similarity of drug action and diseased condition, for many times in previous medical history had isolated instances been noticed; but he was the first to urge a general application of his principles and to state the propositions upon which were based the new treatment. In 1806, in a treatise entitled *The Medicine of Experience*, he indicated the name by which the new system of treatment should be known, and thenceforward HOMŒOPATHY designated the science and art, as did 'homœopathic' the practitioner.

In 1810 he published the *Organon of Rational Medicine*, which became and remains the embodiment of the fundamental methods of homœopathy. These fundamentals may be stated briefly thus:

- (1) Proving of medicines upon the healthy.
- (2) Selection and administration of medicines according to the law of similars.
- (3) The single remedy.
- (4) The minimum dose.

A medicine is 'proved,' according to the homœopathic method, as follows: A fluid extract or a tincture of a drug is selected for 'proving.' Of this medicinal preparation a dose of one drop, two drops, or five drops is given to a healthy person at certain intervals, during which the person notes his symptoms. Gradually increasing doses are administered until the experimenter is satisfied and a set of tables of symptoms, believed to be caused by the drug in the healthy person, have been compiled. These tables of symptoms are then compared with symptoms noted in various diseases. Upon discovering that a disease presents a similar set of symptoms to those noted, by the healthy person, as caused by the test drug, the homœopathist argues that this drug will be the remedy for this disease. His method of reasoning is that if a drug produces certain symptoms in health it will cure a disease which causes similar symptoms. Upon this basis lies the fundamental 'law of similars,' generally stated in Latin, *similia similibus curantur*.

In the way just described, Hahnemann proved upon himself and others more than ninety drugs. Societies were formed for the purpose; and since his death many medicinal substances have been tested to learn toxic, pathogenic, and curative power, if any. Thus each drug had its pathogenesis or 'picture,' and the one corresponding to the totality of diseased symptoms as elicited from the patient by the physician, if administered, would, according to the homœopathic claim, result in a cure. No two drugs having precisely the same picture and no two patients the like totality of symptoms, he therefore individualized his cases, and declared that a single remedy should be given. Later in life he modified this to some extent, and, recognizing the *genus epidemicus*, prescribed without seeing the patients, as in the cholera epidemic of 1831.

When he began prescribing according to his law, he gave massive doses; but, believing that the human system when diseased is much more sensitive than in health, he gradually lessened the quantity. Then it was that he wrote the *Spirit of the Homœopathic Doctrine*, in which he argued the morbid cause of disease and the dynamization of remedies. In regard to disease,

Hahnemann recognized the *morbific cause*, which, acting upon the *morbid properties* in the tissues, developed *disease*. Therefore, he argued, *disease* is a morbid property developed into an active pathological state by the influence of a corresponding morbid force. Likewise regarding drugs. His idea was that the drug forces are cosmic principles or agents of the same order as the disease-developing forces; the germinal principles inherent in the plant correspond with the morbid properties in the tissues, and drugs correspond with the fully developed disease. He believed that the morbid cause is in closer affinity with the drug than with the tissues of the organism, and this union secures the restoration of the organism to a state of physiological harmony. He said, "As the human organism, even in health, is more readily influenced by drugs than by natural morbid agents, this influence is felt in the highest degree by an organism which is properly predisposed by disease, provided the artificial drug disease is homœopathic to the natural malady. Hence the smallest dose of the remedial agent is sufficient for a cure, for the spiritual power of the medicine does not, in this instance, accomplish its object by means of quantity, but by potentiality and quality; a larger dose might be injurious, for this reason, that a larger dose does not only not overcome the morbid affection more certainly than the smallest possible dose of the homœopathically administered agent, but likewise imposes a complex medicinal disease, which is always a malady, though it runs its course in a shorter time." Herein lie the doctrines of small doses and 'medicinal aggravations.' From this mode of accounting for a cure in accordance with the law '*Similia similibus*,' there naturally followed the 'potentization' of drugs, according to Hahnemann.

The attenuation was accomplished in the following manner: If the drug was a vegetable substance, a strong tincture was made and called mother-tincture. Of this, two drops were taken, added to 98 drops of alcohol, and agitated. This was marked first dilution. Two drops of this with 98 drops of alcohol constituted the second dilution, the third in a similar manner, and so on. This constituted what was known as the centesimal scale. Some preferred adding one drop of tincture to nine drops of alcohol, the label being first decimal, second, third, etc., according to the number of attenuation desired. Insoluble substances were triturated with sugar of milk in the proportions of one grain of the drug to 99 of sugar, or 9, as the physician deemed best. When the fifth trituration was reached, the substance, now claimed to be soluble, was dissolved in distilled water, and the further process carried on with alcohol as in the case of tinctures.

Hahnemann writes, quoting from the first American edition of *Organon de Medicini* (Philadelphia, 1836): "Diseases are *dynamical* (spiritual) aberrations, which our *spiritual* existence undergoes in its mode of feeling and acting—that is to say, *immaterial* changes in the state of health" (p. 19). "A homœopathic dose, however, can scarcely ever be made so small as not to amend and, indeed, perfectly cure" (p. 157). "It will stand good as a homœopathic rule of cure, refutable by no experience whatever, that the *best dose* of the rightly selected medicine is ever the *smallest*" (p. 187). When describing the preparation of 'potences' of fluid dilutions,

the author says: "These manipulations are to be conducted thus" (by adding 2 drops of a preceding 'potence' to 98 drops of alcohol and shaking twice) "from the first up to the thirtieth or decillionth development of power, which is the one in most general use" (p. 200). The effect of shaking, on homœopathic medicines, "is so energetic that latterly I have been forced by experience to reduce the number of shakes to two, of which I formerly prescribed ten to each dilution" (p. 205). "The best mode of administration is to make use of small globules of sugar, the size of a mustard-seed; one of these globules having imbibed the medicine, and being introduced into the vehicle, forms a dose containing about the three-hundredth part of a drop; for three hundred of such globules will imbibe one drop of alcohol." "By placing one of these on the tongue, and not drinking anything after it, the dose is considerably diminished. But if the patient is very sensitive, and it is necessary to employ the smallest dose possible, and attain at the same time the most speedy results, it will be sufficient to let him smell once" (p. 207).

The directions for smelling a 'remedy' are as follows: "The patient should hold the phial containing the globule under one nostril, when one momentary inhalation of the air in the phial is to be made; and if the dose is intended to be stronger, the same operation may be repeated with the other nostril" (p. 191). Hahnemann considered mesmerism a homœopathic remedy. He says: "This curative power, of whose efficacy none but madmen can entertain a doubt, which through the powerful will of a well-intentioned individual, influences the body of the patient by the touch, acts homœopathically, by exciting symptoms analogous to those of the malady" (p. 210).

In 1813 an epidemic of typhus fever occurred in Leipzig, during which it is said that seventy-three patients were allotted to Hahnemann for treatment. Of these it is claimed that but one died. Many of his claims were denied and many of his ideas were ridiculed. As a result of the opposition of the apothecaries' guild he was forbidden to prepare his own medicines for pay. In spite of all opposition, he and his pupils continued their practice and gave the remedies gratuitously when they were not allowed to take pay. Finally, opposition and social ostracism so discouraged Hahnemann that he left Leipzig in 1820 for Rothen, where, under the patronage of the Duke of Anhalt, he had a certain vogue. Up to this time homœopathy was centred in the person and teachings of Hahnemann; but now that he was absent, his pupils, already having become doctors of medicine, began, in 1821, the publication of the first homœopathic journal, the *Archive of the Homœopathic Method of Curing*. This publication was continued until 1843. The growth of homœopathy in Germany has ever been slow. In Austria, homœopathy was first officially known in 1819, in which year the Emperor Francis I. decreed that the method should be forbidden. Afterwards it was tacitly permitted, and the decree was revoked in 1837. Since 1846 there has been no governmental interference with individual preference. Homœopathy was introduced into Russia in 1823. There, as elsewhere, its pioneers were laymen, and its growth has been slow. It was introduced into Great Britain in 1827, by Quin, a physician. Shortly after, the

medical opposition was so great as to prevent those who desired to practice it from obtaining a decree entitling them to register as physicians. At present there are no restrictions placed upon any person desiring to practice this system, but there are no legally incorporated schools for instruction. In France, homœopathy was first systematically tried in the year 1830. It steadily grew in favor until 1835, when Hahnemann, settling in Paris, gave the cause a powerful impetus. He grouped around him a large number of able men, and until his death in 1843 Paris was the Mecca of homœopathy.

The laws of France, as of most countries in Europe, discriminate against homœopathy, and no place of public preferment or emolument is allowed them. It is believed that there are no legalized homœopathic medical colleges in Europe.

In the United States, and in other young countries, homœopathy has been most active. Dr. Hans B. Gram, a native of Boston, educated at Copenhagen, first began the practice of homœopathy in New York City. The novel method was adopted by many, and many became earnest advocates of the system. Later, and about the same time, there came into notice men and women, generally and very largely of the laity, who, without knowledge of disease or of science, began to report cures with the aid of homœopathic 'remedies.' Domestic practice was so easy, by means of a cabinet of phials filled with globules and a book giving complete instruction for the use of homœopathic medicines as adapted to any symptoms, without the need of a diagnosis of disease, that the new cult grew rapidly. Soon there came from over the sea men who had learned the science and art from Hahnemann and his associates, and as a help to the more perfect understanding of this way, the first homœopathic college was established at Allentown, Pa., in the year 1835. While the converts to homœopathy have never been subjected to positive repressive legislation, yet they have been buffeted by the same storm of opposition as greeted their brethren in other lands. In order that the cause might be strengthened and physicians record progress, the publication of the *American Journal of Homœopathy* was begun in 1835. The American Institute of Homœopathy, the oldest national medical association in the country, was organized in 1844, though there were already societies in the States of Pennsylvania, New York, and Massachusetts. The existence of most of the local societies is mainly due to the suggestion and fostering care of the American Institute, to which they annually report.

In 1900 there were in the United States about 15,000 homœopathic physicians, and about eighteen medical colleges in which homœopathic therapeutics are taught. Considering its age, homœopathy is especially rich in theoretical and practical literature. The most exhaustive work on any division of the subject is the *Encyclopædia of Materia Medica*, by the late Prof. T. F. Allen, M.D., of New York City. Every department of medicine has been treated by homœopathic authors. Perhaps the chief factor in the spread of homœopathy in this country, especially in the newer portions of the Western States, is the equality of all schools of medicine and all qualified practitioners before the law. For many years homœopathists in this country taught only

therapeutics and practice, and as a result all the earlier, and for many years most of the well-equipped, native American physicians were graduates of the regular school. Finally, homœopathic medical schools were established, in which all the branches of medicine were taught, and the inexplicable terms 'homœopathic surgeon' and 'homœopathic obstetrician' came into use. The influence of the school has been waning for some years. In 1883 the *Hahnemannian Monthly* said: "A few years ago the editors of the *New York Medical Times* dropped from the title of their journal the distinctive word 'Homœopathic'; now they boldly urge the renunciation of the word as applied to our school of medicine. If we are emancipated from the thralldom of sect, we shall not only save our school from imminent dissolution, but shall also become an integral part of the medical profession of the day, honored as true, broad, liberal, progressive physicians. But if we cling to a name which by no means represents the catholicity and spirit of the new school, we are doomed to annihilation."

In the large cities of the Eastern States, great numbers of graduates of homœopathic medical schools have taken courses of study in post-graduate departments of regular medical colleges, and afterwards, while retaining the term homœopathic, practice medicine principally according to the regular principles, using 'old-school' drugs in 'old-school' dosage. The editor of the *New York Medical Times* (homœopathic) asserted that there are only two 'pure' homœopathic practitioners in that city.

Whether due to its influence or not, since the advent of homœopathy the repulsiveness in taste and appearance as well as the size of the dose of old-school remedies have been greatly modified; and in a vast number of cases suggestion and encouragement together, perhaps, with placebos, have taken the place of active medicinal treatment, and natural recuperative power has worked the cure. It is certainly true that without the resort to and adoption of regular 'old-school' remedies homœopathy would have died out except among those who love mystery and prefer magic to medicine. Few and rare to-day are the practitioners who adhere to the potentization tenets of Hahnemann, or who are content to treat symptoms in ignorance of the disease present.

The terms 'allopathy' and 'allopathic' came into use after the invention of the words 'homœopathy' and 'homœopathic,' and were used by the adherents of the new school in designating the old school and its practitioners, through a mistaken idea. The terms are etymologically incorrect. See HAHNEMANN.

HOMŒOPATHY, AMERICAN INSTITUTE OF. The oldest national medical organization in the United States, its first session having been held in New York City, on April 10, 1844. Its objects are the reformation and augmentation of the *Materia Medica*, and the furthering of the principles of homœopathy. It has two thousand members, divided into bureaus on various lines of medicine and surgery, and meets annually in the large cities of the country. The institute publishes annual volumes of "Transactions," including reports and original papers.

HOMOGENEITY, LAW OF. The product of two homogeneous integral functions of the m th

and the n th degree, respectively, is a homogeneous, integral function of the $(m+n)$ th degree. The value of this principle in checking the process of multiplication of homogeneous functions is evident. The notion of homogeneity may be extended to irrational and fractional functions. In this case the degree is determined by introducing a factor k into each variable, and observing the degree of the factor k in the resulting function.

HOMŌIOUSION, hō'moi-ōō'si-on. See HOMŌOUSION.

HOMOLŌGA'TION (from ML. *homologare*, to homologate, from Gk. *ὁμολογῆν*, *homologeîn*, to agree, from *ὁμολογος*, *homologos*, agreeing, from *ὁμός*, *homos*, same + *λόγος*, *logos*, word, from *λέγειν*, *legeîn*, to say). In the civil law, the judicial confirmation of an award, or of an accounting, or of any other administrative or judicial proceeding. In Scotch law, an act or course of conduct which confirms or approves of something which otherwise might be invalid. Thus, an informal deed, though useless in itself, yet if acted on by one or both parties, will be set up and made valid as against the party homologating. To constitute homologation, a clear knowledge of what the party is doing is necessary. Cf. ESTOPPEL.

HOMOLŌGOUS SERIES. See HYDROCARBONS.

HOMOLŌGY (from Gk. *ὁμολογία*, *homologia*, conformity, from *ὁμολογος*, *homologos*, harmonizing, from *ὁμός*, *homos*, same + *-λογία*, *-logia*, account, from *λέγειν*, *legeîn*, to say). (1) In biology, a term used to indicate structural correspondence based on blood-relationship, as opposed to analogy, which is applied to functional resemblance, such as that between the wings of a bird and those of a butterfly. Different sorts of homology have been recognized. There is the homology of the different parts of the body; namely, serial homology, as of the front and hind paired fins of fishes, or the arms and legs of man; antimeric homology, as of the petals of a flower or the right and left sides of the body. There is homology of corresponding organs in different individuals. This is most certain in individuals of the same species; somewhat less certain between genera and families; often doubtful between orders and classes; usually speculative between phyla. The criteria of homology are: (a) The criterion of connections. A part having similar relations in two species, and making similar connections is homologous in the two cases. (b) The criterion of structure. Homologous parts have a fundamental similarity of structure. (c) The criterion of development. Homologous organs arise from the same germ-layer in corresponding parts of the body and develop in the same fashion. Despite these clear-cut criteria, homologies are practically often very difficult of determination, particularly beyond the limits of a class.

(2) In geometry, figures which are in perspective are often spoken of as homologous, because the centre and axis of perspective introduced by Poncelet were called by Chasles centre and axis of homology. (See PERSPECTIVE; GEOMETRY.) The term is used in another sense to signify the relation of reciprocity or duality (q.v.) which exists between geometry and algebra.

LAW OF HOMOLOGY. Given two sets of con-

cepts, G (geometric) and A (algebraic), such that to every concept in set G (for example, a rectangle, or a line) shall correspond a concept in set A (say, a product, or a number); and to every relation between any two of one set (for example, equality) a relation (in this case equality) between the corresponding two of the other, then all language, reasoning, and conclusions as to the one set may be applied to the other set.

This correspondence of one symbol, one operation, one result, etc., of algebra, to one symbol, one operation, one result, etc., of geometry, or, as it is called, this 'one-to-one correspondence,' suggests many theorems of geometry that would otherwise remain unnoticed. Eg.:

GEOMETRIC THEOREMS.

If x, y, z, \dots are line segments, and xy, xz, \dots represent the rectangles of x and y, x and z, \dots , and $x(y+z)$ represents the rectangle of x and $y+z$, and x^2 represents the square on x , then

1. $x(y+z) = xy + xz.$
2. $(x+y)^2 = x^2 + y^2 + 2xy.$
3. $x^2 - y^2 = (x+y)(x-y).$

ALGEBRAIC THEOREMS.

If a, b, c, \dots are numbers, and ab, ac, \dots represent the products of a and b, a and c, \dots , and $a(b+c)$ represents the product of a and $b+c$, and a^2 represents the second power of a , then

1. $a(b+c) = ab + ac.$
2. $(a+b)^2 = a^2 + b^2 + 2ab.$
3. $a^2 - b^2 = (a+b)(a-b).$

HOMONYMS (Lat. *homonymus*, from Gk. *ὁμόνυμος*, having the same name, from *ὁμός*, *homos*, same + *ὄνομα*, *onoma*, name). Words that agree in form, but differ in origin and meaning. A familiar example of this class of words is *sound*, which in its different meanings goes back to the Latin *sonus*, Scandinavian *sund*, and Anglo-Saxon *gesund* and *sundian*. Many homonyms are often distinguished by the accent, as *absent*, the adjective, and *absent*, the verb. Strictly speaking, these are not homonyms, but homographs, since the exact correspondence is confined to the spelling. A third term is also used—'homophones,' words that agree in the sound, but not necessarily in the spelling. Thus *write*, *wright*, and *rite* are homophones.

HOMOOUSSION, hō'mō-ōō'si-on (Gk. *ὁμοούσιον*, *homoouision*, consubstantial, from *ὁμός*, *homos*, same + *οὐσία*, *ousia*, essence). A term of Greek theology, employed against the Arians at the Council of Nicæa (A.D. 325), to denote that in the doctrine of the Trinity the Son is "of the same essence [or substance] with the Father." According to the received text of what we call the Nicene Creed, the article in question reads: "And [I believe] in one Lord Jesus Christ . . . being of one substance with the Father." The word *homoouision* is much older than the Council of Nicæa. Not to speak of its employment by Gnostics, like Basilides, it is found in the writings of Irenæus, in the latter half of the second century, and not infrequently in the third century. It was rejected by a synod held in Antioch, against Paul of Samosata (268 or 269), where it seems to have borne a meaning somewhat different from that which was applied to it by Athanasius. In the fourth century the word aroused a long and bitter controversy. The Athanasian party defended it; the Arians attacked it on every side. In the progress of the struggle various alternatives were proposed. Some extreme Arians wished to substitute *heteroouision* (of a different substance) for *homoouision*, thus affirming the direct opposite of what the orthodox party insisted upon. Others, less radical and

largely indifferent to the real issue involved, suggested the colorless term *homoion* (similar), meaning simply the Son 'is like' the Father. Others still were willing to go so far as to use the word *homoiousion* (i.e. the Son is 'of a like essence, or substance,' with the Father). After nearly sixty years of theological warfare, the Church, at the Council of Constantinople (381), reaffirmed its allegiance to the *homoouision* doctrine, and now applied it not simply to the Son, but also to the Holy Ghost, thus completing the dogma of the Trinity, which has ever since remained the orthodox faith of Christendom.

Consult: Harnack, *History of Dogma*, vol. iv., translation (London, 1898); Athanasius, *Select Works*, translation in the *Nicene and Post-Nicene Fathers*, second series, edited by Schaff and Wace, vol. iv. (New York, 1892); Dubose, *The Ecu-menical Councils* (2d ed., New York, 1897). See ARIUS and NICENE CREED.

HOMOPH'ONY (Gk. *ὁμόφωνος*, *homophōnos*, having the same sound, from *ὁμός*, *homos*, same + *φωνή*, *phōnē*, sound). The style of modern music where one voice or melody predominates. The other voices are not independent, but serve chiefly to furnish the harmonic basis for the leading voice. Thus it is directly opposed to the older polyphony (q.v.), where all voices were independent and of equal importance. See AN-TIPHONY; MONODY.

HOMOPLASY. A term proposed by Lankester to express, as he says, 'the parallelism of genetically distinct organs.' Its meaning by some is expressed by the word 'convergence,' now in frequent use. It is due to the action of similar or identical habits or environment on a part or parts of an animal or on the entire animal. Lankester's definition is: "When identical or nearly similar forces, or environments, act on two or more parts of an organism which are exactly or nearly alike, the resulting *modifications* of the various parts will be exactly or nearly alike." Lankester illustrates homoplasy by the case of the remarkable coincidence in the pteropod mollusks and cephalopod mollusks of appendages around or near the mouth provided with suckers. Osborn asserts that homoplasy has been confused with 'parallelism' and 'convergence,' which may affect absolutely non-homologous structures. *Homoplasy*, he says, should be confined to structures in which there is an element of homology. *Convergence* may be restricted to cases of 'parallelism' between animals of entirely unrelated groups or classes, like the following: Marsupial mice, and other animals of that group exactly resemble placental mice, etc.; whales resemble fishes owing to their similar adaptation to the water. Many cases of so-called mimicry (q.v.) appear to be instances of convergence. Legless lizards may be mistaken for snakes. There are multitudes of such examples, and the resemblance or parallelism is so exact as to have often misled well-trained zoologists.

HOMOPTERA (from Gk. *ὁμός*, *homos*, same + *πτερόν*, *pteron*, wing). A suborder of the Hemiptera including insects with wings (when present) of uniform thickness throughout. It contains some of the most destructive of insects and others that are the most beneficial. It includes the cicadas, lantern-flies, spittle-insects, leafhoppers and treehoppers, plant-lice, scale-insects, and others. A few of the scale-insects fur-

nish materials that are useful to man, such as cochineal lac and wax. A famous scale-insect is the 'San José' scale, and the mealy bugs of green-houses are well-known representatives of this group. See HEMIPTERA; BUG; COCHINEAL; APIID; CICADA; FROTH-FLY; SCALE-INSECT.

HOMOSPORY (from Gk. *ὁμός*, *homos*, same + *σπόρος*, *sporos*, seed—literally, 'spores similar'). A word generally used only in connection with such plants as have a distinct alternation of generations (q.v.). The sexless generation (sporophyte) in the alternating series produces spores, which in turn produce the sexual generation (gametophyte). Among the liverworts and mosses (bryophytes), most of the ferns and their allies (pteridophytes), these spores are all alike in appearance and power, each in germination producing a gametophyte which bears both male and female organs. The term contrasts with 'heterosporry' (q.v.), a condition in which the sporophyte produces two kinds of spores, unlike in size and power, the larger of which produce female gametophytes, the smaller male gametophytes. All the seed-plants (spermatophytes) are heterosporous, as well as the water-ferns, quillworts, and little club-mosses among the pteridophytes. Isosporry is the same as homosporry.

HOM'OTAXY, or **HOM'OTAX'IS** (from Gk. *ὁμός*, *homos*, same + *τάξις*, *taxis*, arrangement, from *τάσσειν*, *tassein*, to arrange). A geological term which signifies a similarity in the succession of strata in different regions as shown by the included life forms. See GEOLOGY.

HOMS, *hōms*, or **HEMS**, *hēms* (Lat. *Emesa*). A city of Syria, situated near the right bank of the Orontes, about 32 miles south of Hamah (Map: Turkey in Asia, G 5). It is built chiefly of black basalt; has crowded houses and narrow streets, and is surrounded by old half-ruined walls. Although there are now no ancient buildings remaining, the antiquity of the city is attested by numerous fragments of columns, by Greek inscriptions, and the foundations of ancient baths with specimens of mosaic pavements. The town has considerable trade in silk, cotton, oil, and gold ware, and has also some manufactures. The population is estimated at 60,000, including about 6500 Christians. Ancient Emesa was celebrated chiefly for its splendid temple of the sun, one of the priests of which, Elagabalus, or Heliogabalus, was raised to the Imperial throne of Rome. Under the walls of Emesa, Zenobia was defeated by the Emperor Aurelian in A.D. 272. The city was taken by the Saracens in 636, when its old Semitic name, Hems, was revived. In 1099 the Crusaders rode through its opened gates. Here the Egyptian army, under Ibrahim Pasha, defeated the Turks in July, 1832.

HOMURAI. See HORNBILL.

HO-NAN, *hō'nān'* (Chin., south of the river). One of the eighteen provinces of China proper, bounded on the north by the provinces of Shan-si and Chih-li, on the east by Shan-tung, Kiang-su, and Ngan-hwei, on the south by Hu-peh, and on the west by Shen-si (Map: China, D 5). It lies between the parallels of latitude 32° and 37° N., and the meridians of longitude 110° and 116° E.; area, 65,104 square miles. The eastern part is comparatively level, and belongs to the Great Plain, while in the western section spurs of the Fu-niu range of mountains with a southeast

trend are found. Its principal river is the Hoang-ho, which traverses the northern part from west to east. The soil is fertile, and in addition to the usual cereals, produces cotton, hemp, indigo, and tobacco. Patches of the remarkable formation called loess (q.v.) by Richtig-hofen, and 'lake loam' or terrace deposit by Pumphelly, are found in both the northern and southern parts. Ho-nan is rich in minerals, iron, lead, tin, copper, etc., and has enormous deposits of anthracite coal, which has hitherto been mined only by native methods. The capital, Kai-fung (or fêng), is situated 11 miles south of the Hoang-ho and near the point where in 1853 the river burst its banks and took a new course to the northeast through Shan-tung to the Gulf of Pe-chi-li, instead of southeast through Kiang-su to the Yellow Sea as formerly. Kai-fung is a station on the new *Lu-Han* or Hankow-Peking Railway. The people of the province are notorious for lawlessness and turbulence. Population, 22,000,000.

HONDA, *ōn'dā*. A city of Colombia, situated on the Magdalena, in a mountainous region, 55 miles northwest of Bogotá (Map: Colombia, C 2). The town has a very hot climate, as the surrounding mountains shut off the cool winds. It is important as the head of navigation, and the transit point of the trade for Bogotá, as well as the depot for the tobacco and quinine from the Ambalema District. Population, 4000. Honda received its town charter in 1643. In 1805 it was destroyed by an earthquake.

HONDECOETER, *hōn'de-kōō'tēr*, MELCHIOR D' (1636-95). A Dutch animal painter. His grandfather, GILLIS (died 1627), was a landscape painter at Amsterdam, and his father, GISEBERT D'HONDECOETER (died 1653), painted animals. Melchior was born at Utrecht, and studied under his father and his uncle, Jan Weenix (q.v.). From 1659 to 1663 he lived at The Hague, and after that at Amsterdam, where he received the freedom of the city in 1688, and resided until his death, April 3, 1695. He stood in high favor with the Dutch magnates, and while at The Hague was employed by William III., afterwards King of England, to paint his menagerie. His grandfather had made a considerable name in that form of art. Hondecoeter painted every kind of animal, but his favorite subjects were cocks, hens, ducks, and peacocks, which he delineated with wonderful correctness and truth. He depicts, with great charm, motifs like the maternity of the hen, and he even lends beauty to subjects like 'cock-fights,' and "Ducks in a Pond." No one has excelled, or even equaled him, in painting the feathered tribe. The landscapes which he introduced as backgrounds to his pictures are equally true to nature, and finished with a delicate lightness and transparency of touch that harmonizes admirably with the subject of the piece. The museums of France, Germany, and Austria, and the private and public collections of England have fine examples of his work, but his masterpieces are at Amsterdam and The Hague. His most celebrated work is "La plume flottante" (the Floating Feather), in the Museum of Amsterdam, representing a pond full of water-fowl.

HONDO, *hōn'dō*, or **HON-SHIU**, *hōn'shyōō'* (Chino-Japanese, chief island). The name of the chief island of the Empire of Japan, often,

but incorrectly, called Nippon or Nippon (Map: Japan, E 6). Nippon is not the name of any one island, but of the entire Japanese Empire. The application of the erroneous name Nippon to the chief island originated with Kaempfer (q.v.), the Jesuits who wrote previously to him knowing Japanese geography too well to use the misleading term. Of late years the Japanese, studying geography in the Western fashion, and seeing the necessity of a name for their chief island, have called it Hondo. Hondo lies between latitude 24° 14' and 41° 33' N., and longitude 130° 44' and 142° 14' E., and has an area (with its isles) officially computed in 1894 at 87,771 square miles, with a population (December 31, 1898) of 33,327,918. It comprises the circuits of Tokaido, Go-Kinai (or the five home provinces), Tozando, Hokurikudo, Sanindo, Sanyodo, and one province of Nankaido (the other four provinces of this circuit forming the island of Shikoku). For administrative purposes Hondo is divided into 3 fu and 34 ken (or prefectures), and contains 447 districts, 34 large cities, 10,618 villages. Of its taxable area in acres, 7,250,000 are in rice-fields, 3,898,550 in arable land, 752,787 in building lots, and 15,490,807 in forest, besides 774,743 acres of untaxed land. Its shape is a crescent, with horns toward Asia. A remarkable difference in climate is noted between the eastern and the western halves of Hondo, the former, under the influence of the Kuro-Shiwo, or gulf stream of the Pacific, being mild and warm; the latter receiving the cold winds, and under the influence of cold currents having a more severe climate. The promontories of Hondo are now dotted with well-equipped light-houses, and the island is well supplied with railways and telegraphs.

HONDT, hōnt, **HOND**, or **HONDIUS**. A Flemish family of painters and engravers. **JODOCUS** or **JOSSE** (1546-1611) was born at Wack-en. To avoid the troubles in the Netherlands, then in the throes of the war with Spain, he went to England and became an engraver of maps and a maker of mathematical instruments. He also engraved some portraits, such as those of Queen Elizabeth, Henry IV., Drake, and Cavendish; some plates for Mercator's *Atlas Major* (1605), and other works. He often added to his signature the figure of a dog, in allusion to his name.—His son, **HENDRIK** (1588-1658), called the Younger, was born in London. He was also an engraver, and is said to have executed many plates, but his works are confused with those of another Hendrick Hondt (1573-1648), born at Duffel in Brabant, the son of William Hondt, and a pupil of Jan Wierix. The first named opened a studio at The Hague, and during fifty years produced many plates, including a series of portraits of the great reformers, Wyclif, Melanchthon, Knox, Calvin, and Savonarola, and a series of painters, besides genre and historical subjects.—Another **WILLIAM HONDT** (1601-c.1632) was the son of Hendrick (1573-1648). He was born at The Hague, and is said to have been Court painter to Ladislas IV., King of Poland. His works include a portrait of the King, and a number of engraved portraits after Van Dyck and others, notably one of himself after that master.—**ABRAHAM** (1638-95), a painter and engraver, was born at Rotterdam. He was the grandson of Jodoeus or Josse Hondt, and was known especially as a painter of dogs. He went to London while very young, and under Charles

II. acquired a great reputation for his studies of the chase. He also painted torch-light scenes, and left some rare water-colors. There is a "Wild Boar Hunt" by him in the Metropolitan Museum of Art, New York City.

HONDURAS, hōn-dōō'rās, *Sp. prom. òn-dōō'-rās*. A republic of Central America, bounded by the Caribbean Sea on the north and northeast, Nicaragua on the southeast, Labrador and the Pacific Ocean on the southwest, and Guatemala on the west (Map: Central America, D 3). Area, estimated at over 46,000 square miles. It is a mountainous country, a plateau in the interior, with low coast lands. The only plains of important extent are along the coasts of both oceans, and on the lower courses of a few rivers. The widening of river valleys in the interior results in small plains, many of them at a considerable elevation. The mountains occupy a proportionately larger area than in neighboring Guatemala, but the ranges are inferior in extent and height, though some peaks rise to about 8000 feet. Volcanoes have recently played a smaller rôle than in any other country of Central America, though there are an important number of extinct volcanoes, one of which formed the island of Sacategrande in the Gulf of Fonseca. In the western half of Honduras, young eruptive rocks cover as large an area as all the other geological formations together, while in the eastern half very little of the surface is formed of volcanic outpourings of recent geological times, though the older eruptive rocks are largely represented, particularly in the north. The coasts have a long Atlantic and a small Pacific frontage. The Atlantic ports are Trujillo, Ceiba, and Puerto Cortés. Amapala has one of the best natural harbors on the Pacific coast. The water parting between the Atlantic and Pacific rivers is far to the south, so that most of the drainage is to the Atlantic Ocean. Some of the Atlantic rivers are navigable, among them being the Coco or Segovia (known also as the Wanks), which forms part of the boundary with Nicaragua.

In the interior the climate is healthful, and on the whole temperate. The coast lands, owing to their small elevation, have a much higher temperature. Honduras, swept by the trade winds receives an enormous quantity of rain, and the tropical vegetation is very luxuriant. The broad Atlantic coastal lowlands, however, receive much less rainfall than the mountain regions of the interior, where most of the water vapor brought by the east winds is condensed. The result is that though the eastern lowlands are covered with vast forests of mahogany, cedars, and other cabinet woods, in which also sarsaparilla and other medicinal plants abound, vegetation in the east is not so luxuriant as in the higher regions inland, where there are boundless forests of pines and other conifers so dense that one may travel for days without being able to see more than 100 yards in any direction. The Pacific coast is driest, and a dry period prevails from November to May. The Atlantic coast is not healthful for the white race, and its products are mainly those of the forest and tropical fruits. The interior, from 1500 to 7000 feet, produces tropical products in the lower zone, coffee in the middle zone, and the products of temperate climates in the upper belt. Numerous relics of a former civilization are found in some districts, most of them

being the ruins of temples and other religious edifices.

For flora and fauna, see AMERICA.

MINERAL RESOURCES. The country is richer in minerals than any other Central American State excepting Nicaragua. They include gold, silver, copper, zinc, iron, lignite, etc. Lack of capital and energy, however, has prevented the large development of these resources. The mining activities are practically confined to the washing of gold from the rivers and the production of some silver in the southern part of the country, these metals being the largest exports.

AGRICULTURE. The soil is very rich; but in spite of its unusual fitness for agriculture, Honduras is the most backward State of Central America. The natural conditions are conducive to the cultivation of almost all the products of Central America, but the sparsity of population as well as the lack of transportation facilities stand in the way of agricultural development. More attention is paid to stock-raising and to the cultivation of bananas and other fruits in the Atlantic coastal region than to any other branch of farming. Steamers carry a large quantity of bananas and coconuts to the United States. Tobacco, sugar, maize (the chief food staple), coffee, rice, etc., are all grown in quantities sufficient to supply the local demand, and considerable coffee is sold abroad. The almost prohibitive export duties have brought about a considerable increase in the live stock of the country. The exports of live cattle, however, as well as of hides, are not unimportant. Sheep, goats, and swine are few in number.

TRANSPORTATION. With regard to transportation facilities the situation in Honduras is worse than in any other of the Central American States, although the natural obstacles in the way of a railway line from coast to coast are less than in most of the other States. The construction of a narrow-gauge line from Puerto Cortés on the Atlantic to the Gulf of Fonseca on the Pacific was begun in 1868 by an English company, which had secured from the Government a land grant of ten square miles per mile of road constructed, and extensive mining and lumbering privileges. Bonds to the amount of \$30,000,000 were issued and sold, but the work was discontinued after about 60 miles, or one-fourth of the road, was constructed. Since then all efforts to resume construction have been unsuccessful, and the part completed, between Puerto Cortés and La Pimenta, has been operated with varying success by several companies. A mule train is three weeks on the road between Puerto Cortés on the Atlantic and the Pacific port of Amapala, a journey that might be made in less than a day if this railroad were completed. Several concessions for shorter roads have been obtained by foreign companies from the Government. There are a number of tolerable wagon-roads, but most of the traffic is still carried by mules. The telegraph lines of the country had 2730 miles of wire in 1899.

COMMERCE. The commerce of Honduras is naturally insignificant in view of the general backwardness of the country. The imports in 1900 were estimated to amount to 1,074,050 pesos gold, of which over two-thirds came from the United States. The exports were valued at over 2,635,600 pesos gold, and consisted of precious metals, fruit, cattle, coffee, cabinet woods, tobac-

co, hides, and skins. The skins of the roebuck and the feathers of tropical birds are also important in trade. One-half of the exports of Honduras find their way to the United States, the remainder being principally divided between Germany and the other Central American States. The chief articles imported from the United States to Honduras are breadstuffs, cotton manufactures, iron and steel manufactures, and beverages, almost the entire import trade being usually with this country.

GOVERNMENT. The Constitution of Honduras, as modified in 1894, provides for a republican form of government. The executive power is vested in the President, elected by popular vote for a term of four years. The Chamber of Deputies, which is intrusted with the exercise of the legislative power, is composed of Deputies elected directly for four years, at the rate of one Deputy for every 10,000 inhabitants. The President is assisted in his duties by a Cabinet of Ministers. For administrative purposes the republic is divided into 15 departments, administered by governors appointed by the President. The administration of justice is in the hands of a supreme court, situated at the capital, and a number of minor tribunals and justices of the peace. The capital is Tegucigalpa.

FINANCE. The chief sources of revenue are customs duties and the spirits, powder, and tobacco monopolies. The revenue for 1900-01 was estimated at 2,423,000 pesos, and the expenditure at 2,416,824 pesos, of which about one-third was spent by the Department of War. The finances of the country are in a deplorable condition, owing to the expenditures incurred during the war with Salvador and Guatemala, and to the continuous civil strife as well as to general mismanagement. Thus the external debt of the country amounted in 1900 to \$26,992,850, while the arrears of interest at the same period amounted to \$64,498,440, bringing up the foreign indebtedness of the country to \$91,491,290. The internal debt amounted in 1900 to 1,800,812 pesos.

DEFENSE. Military service is obligatory upon every able-bodied citizen between the ages of eighteen and forty. The active army is very small, being estimated at only about 500 men. The militia numbers over 40,000.

POPULATION. The population of Honduras was 587,500 in 1900, exclusive of (uncivilized) Indians. Most of the population are called aboriginal 'Indians.' The number of persons of pure European descent is very small. Religious freedom is provided for by the Constitution, and no religion is officially recognized by the State. The prevailing religion is Roman Catholic, but there are also a number of Protestant churches. Education is supported by the State to a considerable degree, but the present facilities are far from adequate. In 1901 there were nearly 800 primary schools, of which 700 were national, all attended by about 29,000 pupils. There are also a high school for girls, and a normal school, both situated at Tegucigalpa, besides six national colleges and seven other educational institutions that receive subventions from the Government. There is also a national industrial school. Most of the departments of the republic are provided with national colleges, and there are also some institutions for higher education. As regards penal and charitable institutions, there

are a penitentiary and general hospital at Tegucigalpa; also a hospital at Amapala.

HISTORY. The coast of Honduras was discovered by Columbus in 1502. The first settlement was made in 1524, by Cristóbal de Olid, a lieutenant of Cortés, sent to take possession of the country in the name of his commander. Olid founded the town of Triunfo de la Cruz, and set up an independent government. Cortés set out in person to bring Olid to terms, and after a tedious march of six months over the mountains and rivers of Mexico and Central America, he reached the little colony in the spring of 1525. There he reinforced the colonists and founded the town of Natividad de Nuestra Señora, on Caballos Bay, returning to Mexico in 1526. A royal Governor was appointed to rule the province. The mines of Honduras were valuable, but under Spanish government the colony developed slowly. In 1539 the province was made an *audencia* of the Captain-Generale of Guatemala. The laws enacted for the protection of the natives were systematically disregarded. In 1821 Honduras revolted from Spain, and was annexed to the Mexican Empire. In 1823 it joined the federation of Central American States which was formed in October of that year, and lasted until 1838, when it was virtually dissolved, although the President's term did not expire until February 1, 1839. In 1849-51 Honduras formed a union with Salvador and Nicaragua, which ended in 1863 in war between the contracting parties. Between 1856 and 1860 the usual course of internal dissension was interrupted by the filibustering exploits of William Walker (q.v.). In 1871 war broke out between Honduras and Salvador and Guatemala, and after peace was declared, in 1874, a revolution in the interests of the ex-President, Medina, took place. Other States interfered, and the Guatemalan candidate, Soto, acted at first as provisional President, and was elected to that office in April, 1877. In 1880 the national capital was removed from Comayagua to Tegucigalpa and Soto was reelected President. In 1899 General Sierra was chosen President for the term ending in 1903.

HONDURAS, BAY OF. An inlet of the Caribbean Sea, between British Honduras, Guatemala, and Honduras (Map: Central America, D 2). It forms several inlets and contains the island of Turneffe, and the Bay Islands, of the coast of Honduras.

HONDURAS, BRITISH. See BRITISH HONDURAS.

HONE, PHILIP (1780-1851). An American merchant and politician. He was born in New York City, where with his brother he built up a good business as an auctioneer. In 1816 he established the first savings bank in New York; was Mayor of the city in 1826; and founded the Mercantile Library Association. He had been a Federalist, joined in the formation of the Whig Party and, it is said, gave it that name. He was prominent in national politics, where he opposed Jackson, and later condemned abolition, and was a man of taste and some learning. He wrote a diary for the years 1828 to 1851, which, edited in part by Tuckerman (1889), gives valuable impressions of life in New York and of the early days of the Whig Party.

HONE, WILLIAM (1780-1842). An English author, born at Bath. He was brought up in the strictest piety, even learning to read and write from the Bible. When ten years old he was apprenticed to a London attorney. He afterwards set up as bookseller, but did not succeed. He gained a contemporary notoriety by his satires on the Government, which were illustrated by Cruikshank. For his parodies on the prayer-book he was prosecuted, but acquitted. His *Political House that Jack Built* (1819) ran through 54 editions. Withdrawing from politics, he produced works of more permanent value, as: *Ancient Mysteries* (1823); a new edition of Strutt's *Sports and Pastimes* (1830); *Every Day Book* (1826-27); *Table Talk* (1827-28); *The Year Book* (1832); and many cheap and popular reprints. During his last years he frequently preached. He died at Tottenham. Some of the most characteristic of Hone's works have been reprinted by W. Tegg: *Every Day Book, Table Talk, and Year Book* (1873); and *The Three Trials*, an account of his prosecution by the Government (1876).

HONES (AS. *hān*, Icel. *heín*, stone; ultimately connected with Lat. *cuneus*, Gk. *κῶνος*, *kōnos*, wedge, Skt. *śāna*, whetstone, from *śā*, *śi*, to sharpen), or WHETSTONES. A particular class of stones used for the purpose of sharpening edge-tools, such as razors, knives, scythes, etc. They are usually cut into pieces of convenient size, according to their intended uses. The finest kind of hones are those called oil-stones; these are hard, compact, and so very siliceous that they readily wear down the hardest steel; they are varieties of slate, derived from the argillaceous schists of the Paleozoic period. These stones are found in Turkey, Bohemia, Persia, in the Harz Mountains, in Styria, in the United States, Spain, Peru, and in Siberia. In Great Britain several localities yield hone-stones of excellent quality, and none better than the celebrated Water-of-Ayr stone, which is much used for polishing copper plates, as well as for hones. The hones used for sharpening scythes, etc., are usually made of coarse-grained sandstone. One of the best American stones for hones comes from Arkansas. In addition, there are artificial stones formed from

abrasive materials, which possess advantages for certain purposes. See ABRASIVES.

HONES/DALE. A borough and the county-seat of Wayne County, Pa., 32 miles northeast of Scranton; on the Lackawaxen River, and on the Delaware and Hudson Company's and the Erie railroads (Map: Pennsylvania, F 2). It has a public library and several public parks. As the centre of a highly productive coal-mining district, Honesdale carries on an extensive coal trade, and manufactures cut glass, boots and shoes, silk and woolen goods, axes, foundry products, elevators, flour, etc. Population, in 1890, 2816; in 1900, 2864.

HONEST GEORGE. A nickname given to George Monck, first Lord Albemarle.

HONEST MAN'S FORTUNE, THE. A play by Fletcher and Massinger and possibly others, performed in 1613 and printed in 1747. Accompanying it is a set of verses, *Upon an Honest Man's Fortune*, signed by Fletcher.

HONEST MAN'S REVENGE, THE. See ATHEIST'S TRAGEDY, THE.

HONEST WHORE, THE. A play in two parts by Dekker, and perhaps Middleton, the first part of which was published in 1604. The earliest extant edition of the second part was not printed until 1630. Its full title as originally published is *The Honest Whore, with the Humours of the Patient Man, and the Longing Wife*.

HONEY (AS. *hunig*, OHG. *honag*, *honang*, Ger. *Honig*, of uncertain origin). A thick, sweet liquid, of more or less pronounced flavor, produced by bees of various kinds and by other insects. The neuter or working bees gather the nectar from the nectaries of flowers (and other sweet substances if flowers are lacking), extracting it by means of the proboscis and passing it into the crop or honey-bag. The bee disgorges the honey into the cells of the comb. Apparently the sweet substance undergoes some change in the honey-bag, as honey differs in flavor from the nectar of the flowers from which it is gathered. The consistency of honey varies with age, and is influenced by its source, that from some flowers being much thicker than that from others. The flavor also varies with the source from which it is gathered, that from clover, sweet clover, basswood or linden flowers, for instance, being very agreeable; that from buckwheat is darker colored and less liked by some. Age also affects the flavor. Some honey which at first has a weedy taste loses this on keeping.

Honey has on an average the following percentage composition: Carbohydrates, 81.2; water, 18.2; protein, 0.4; and ash, 0.2. The carbohydrates are made up of dextrose and levulose in about equal proportion. Honey sometimes contains a little wax and some aromatic bodies, which give it flavor. The best and newest honey is clear and contained in a white comb. Older honey is of a yellowish tone, and sometimes darker. On standing, dextrose sometimes crystallizes out from liquid honey and renders it opaque or often thick. The composition of honey varies somewhat according to the food of the bees, their age, season, etc. It is a favorite article of diet, owing to its sweet taste and agreeable flavor. The actual food value depends upon the sugars (carbohydrates) present. Like all other carbohydrate foods, it is a source of

energy. Honey has a fairly high fuel value, on an average—1520 calories per pound. It is, however, generally eaten for its flavor rather than for its true food value. To the ancients, who were unacquainted with sugar, it was of more importance than it is now. Taken in moderate quantity honey is wholesome and laxative, but persons suffering from digestive disorders often find that it aggravates their symptoms, and there are persons in health who, owing to some idiosyncrasy, cannot eat honey without distress. Its therapeutic action is probably not very great, but it is frequently employed in mixtures prescribed for allaying coughs and in various agreeable cooling drinks used in febrile and inflammatory affections. It should be mentioned that honey occasionally possesses poisonous properties, due to the flowers from which it was gathered. The poisonous honey of Trebizond is gathered from *Azalea pontica*. In America, poisoning has occurred from eating honey gathered from laurel (*Kalmia latifolia* and *Kalmia angustifolia*). Many other instances of poison honey are on record.

Honey is marketed in the comb and also extracted from it. The latter, sometimes called 'strained' honey, is frequently adulterated with commercial glucose. It is stated that much of the so-called honey which is sold contains none of the product gathered by the bee, and is entirely artificial. Of sixty-six samples of honey examined by the Massachusetts State Board of Health, fifteen were adulterated with cane-sugar or commercial glucose or both. One sample contained as high as 88 per cent. of commercial glucose. See also BEE.

HONEY-BADGER. See BADGER; RATEL.

HONEY-BEAR (so called from its fondness for honey). The Malayan sun-bear (*Ursus Malayanus*). One of the native names is Aswail. See BEAR.

HONEY-BEE. See BEE; BEE-KEEPING.

HONEY-BERRY. See MELICOCCA.

HONEY-BUZZARD, or PERN. A large hawk of the genus *Pernis*, peculiar in having the lores closely covered with feathers, which overlap one another like scales. The food of honey-buzzards consists, not of honey, but chiefly of bees, wasps, and their young, in quest of which these birds dig up the ground to get at the nests of the insects. They feed also partly on other insects, and less frequently on lizards, small birds, and the like. The several species are natives of the Old World.

HONEYCOMB (AS. *hunigcamb*, from *hunig*, honey + *camb*, connected with *comb*, OHG. *kamb*, *champ*, Ger. *Kamm*, *comb*, Gk. *γυμφοσ*, *gomphos*, OChurch Slav. *zambŭ*, Skt. *jambhya*, tooth). (1) See BEE; HONEY. (2) In a gun, a condition of erosion which, eating into the rifling of the barrel, alters the direction of the projectile or bullet, and renders the firearm both dangerous and un-serviceable. It is caused by the action of exploded gunpowder, and is a consideration of grave importance in the selection of ammunition for army purposes.

HONEY/COMB, HENRY. A nom-de-plume of Leigh Hunt representing a professed descendant of Will Honeycomb, one of the *Spectator* editors.

HONEYCOMB, WILL. A member of Addison's mythical *Spectator* Club. He is an authority on matters pertaining to the fashionable world.

HONEY-CREEPER. A bird of the family Cerebidae, a passerine family of tropical and subtropical America, especially abundant in the West Indies. They are small birds, four or five inches in length, but usually of very handsome plumage. The colors are frequently brilliant, blue being especially common. The bill is very slender, sharp, and often decurved, and the tongue is deeply bifid and penicillate. The honey-creeperes are very closely allied to the American warblers, of the family Mniotiltidae, so common throughout the United States. About forty species are known, one of which, the banana-quit, has occasionally strayed to Florida. They probe the corollas of flowers for the minute insects contained therein (not for the honey) and often hover before them like humming-birds, which some of them hardly exceed in size or fall below in brilliance. Consult: Gosse, *Birds of Jamaica* (London, 1847); id., *A Naturalist's Sojourn in Jamaica* (London, 1851).

HONEYDEW. A term applied to the sweetish secretion which under certain conditions drips from the water-pores of the leaves of some trees. It is a form of 'bleeding' which appears only when an abundant supply of moisture (reducing evaporation) and a high temperature permit the development of a considerable sap-pressure in the live cells. Some kinds of manna are the dried honeydew or the saccharine exudations of certain plants. Very generally this exudation, as it dries, coats the surface of leaves and branches with a clammy film, to which everything brought by the atmosphere adheres, thus closing the pores of the plant and impairing its health.

The name honeydew is often applied to a saccharine secretion of certain insects, notably the plant-lice, the flea-lice (Psyllidae), certain scale-insects and white flies (Aleyrodidae), and certain leaf-hoppers or tree-hoppers. Of the latter, *Proconia* (*Oncometopia*) *undata* secretes the most abundant supply, and is the cause of the phenomenon often described as 'weeping trees.' The honeydew secreted by all of these insects is frequently very abundant, giving the foliage and bark of trees a glistening appearance, and frequently attracting swarms of bees, ants, wasps, and other honey-loving insects. It is usually secreted from the anus, and with the tree-hoppers is ejected forcibly in a spray, or several small drops at frequent intervals, so that a tree in which they are very numerous appears to be 'weeping.' Honeydew affords a welcome nidus for the spores of certain of the smut-fungi, and an affected tree is likely soon to become black with smut. Thus an olive orchard in California or Southern Europe, the leaves of which turn black, will surely be found to be infested with a scale-insect (*Lecanium oleæ*) which secretes a quantity of honeydew. Orange and lemon plantations sometimes suffer great injury from the abundance of honeydew; and it has been proved a cause of very great loss in the coffee plantations of Ceylon. See APRIL.

HONEY-EATER, or HONEY-SUCKER. A name sometimes given to some of the Oriental sun-birds (q.v.), but also the common name of a large family of birds nearly allied to these peculiar to Australia and the islands of that part of the world. This family, Meliphagidae, of the order Passeres, has a long curved sharp bill (see

Plate of CREEPERS), not so slender as in humming-birds and sun-birds; the tongue terminates in a pencil of delicate filaments, the better to adapt it for sucking honey from flowers, or juices from fruits. These are a part of the food of the honey-eaters, but they also devour insects in great numbers. They are birds of elegant form, and generally of gay plumage. Most of them have a long and broad tail. They are vivacious and active, and keep up a continual chattering. Some 200 species of this family are known, arranged in about 25 genera. Examples are elsewhere described under BELLBIRD; BLOODBIRD; PARSON-BIRD; etc. Compare FLOWER-PECKER, and see CROSS-FERTILIZATION.

HONEY-GUIDE, INDICATOR, or MOROC. The popular name of a family of birds ranked in the vicinity of the barbets (q.v.) and woodpeckers (q.v.), but differing from these families in characters which show a slight approach to cuckoos, and also, in some respects, to creepers. About a dozen species are known, mostly natives of Africa, and found in almost all parts of it, but one species occurs in India, one in Malacca, and one in Borneo. They have acquired their name from guiding men to honey, a curious instinct prompting them to flutter near the traveler with frequent repetitions of a cry which resembles the syllable *cherr*; and it is said that if followed they almost always lead to a place where a bees' nest may be found. This story has been denounced as fabulous, but reliable observers vouch for its truthfulness. The birds are very fond of honey, and always reap a harvest after man has once opened up a bee-tree and taken what honey he wants. It is said that the Kaffirs never fail to leave a generous meal for the bird which has guided them to the tree. The honey-guides are small birds of dull plumage and rather stout bill. They generally build pensile nests, and lay white eggs, but some species are said to lay their eggs in the nests of other birds, as the European cuckoo and the cowbird do. See Plate of TROGON, HOOPOE, etc.

HONEY-LOCUST, *Gleditsia triacanthos*, also known as sweet locust and black locust, and in Great Britain as three-thorned acacia. A lofty and beautiful tree of the natural order Leguminosæ, a native of the rich valleys from Ontario through the basin of the Mississippi. It is not found wild on the Atlantic coast of North America, although often planted for ornament in the vicinity of habitations. The flowers, which are small, greenish, and in spikes, usually have, when perfect, six stamens and one pistil, but are very generally unisexual. The leaves are twice pinnate, without terminal leaflets, and derive a peculiar gracefulness from the numerous small light-green shining leaflets. The tree is furnished with numerous sharp triple spines. The pods are long, flat, pendulous, often twisted; the seeds large, brown, and enveloped in a pulp, which, when the pod is ripe, is very sweet. Sugar has been made from it, and when fermented it yields an intoxicating beverage, in use among the American Indians. The honey-locust attains a height of 70 or 80 feet. The wood resembles that of the American locust-tree (see ACACIA), but is more coarse-grained. A variety is common in which the trees are nearly without thorns. The honey-locust is valuable for windbreaks, hedges, and other plantations. A

second species, *Gleditschia monosperma*, is found from Kentucky and Missouri to the Gulf region and along the Atlantic from South Carolina to Florida. A third species, *Gleditschia Teavana*, is a large tree in Texas, where it attains a height of more than a hundred feet.

HONEY-MAKING ANT. Any of several species of ants of the genus *Myrmecocystus*, inhabiting Colorado, Arizona, New Mexico, and Mexico. Like other ants, they live in colonies, in subterranean nests, the entrance to which is in a small raised mound. The honey is obtained at night from small galls on oak-leaves by foraging workers which come home considerably distended with honey. With the honey they feed the other workers and the young in the hill, and what is left over is communicated to a number of ants which simply serve as living receptacles. These live honey-bags cling to the roof of the cavern and move very little, and in time their abdomens become enormously distended. According to McCook, these living storehouses merely retain the honey until it is needed by the colony during the winter, when it is given out from the surcharged crops to feed the colony. An ant with similar habits, but of the genus *Melophorus*, has been described by Lubbock from Australia, and still another genus (*Plagiolepsis*) has more recently been discovered in South Africa. In Mexico these ants are eaten by the natives. Consult: McCook, *The Honey Ants of the Garden of the Gods*, etc. (Philadelphia, 1881); Comstock, in *Standard Natural History*, vol. ii. (Boston, 1884); Sharp, in *Cambridge Natural History*, vol. vi. (New York and London, 1900). See ANT.

HONEYMOON, THE. A comedy in five acts, by John Tobin. It was produced after the author's death in 1805, and frequently reprinted. It is partly based on Shakespeare's *Taming of the Shrew*, and its style is strongly influenced by the Elizabethan dramatists.

HONEY-MOTH. See WAX-MOTH.

HONEY-POD. See MESQUITE-TREE.

HONEYSTONE. See MELLITE.

HONEY-SUCKER. A bird of the family Meliphagidae, or some related form, as the diamond-bird; an indefinite term for a somewhat indeterminate assemblage of Oriental and Australian birds. See HONEY-EATER.

HONEYSUCKLE (AS. *hunisuce*, *hunisuge*, from *hunig*, honey + *sūcan*, *sūgan*, OHG. *sūger*, Ger. *saugen*, Lat. *sugere*, to suck), *Lonicera*. A genus of plants of the natural order Caprifoliaceae. The species number one hundred or more, all of which are indigenous in the Northern Hemisphere. They are shrubs, often twining, and have the flowers either in whorls or in pairs. The calyx is short and five-toothed; the corolla, tubular-funnel-shaped, five-cleft, generally two-lipped; the fruit a three-celled and many-seeded berry. About half the species of *Lonicera*, as well as many hybrids, are in cultivation. The common honeysuckle, or woodbine of England (*Lonicera periclymenum*), is very abundant in woods and thickets in most parts of Great Britain. On account of its beautiful cream-colored flowers and their delightful fragrance, the honeysuckle is often planted in shrubberies. It is said to be the 'twisted eglantine' of Milton. Very similar to this is the perfoliate honey-

suckle (*Lonicera caprifolium*), with whorls of paler flowers, and remarkable for having the upper leaves united so that an opposite pair form one leaf, through the middle of which the stem passes. This peculiarity is confined to the flower-bearing shoots, and does not occur in the young runners; it is also most perfect near the flower. This species is a native of the south of Europe, and much planted, as, although less fragrant than the common honeysuckle, it flowers earlier. There are numerous other species, natives of Europe, Siberia, and North America. The fly-honeysuckle (*Lonicera xylosteum*) is an erect shrub, a native of Europe and Asia, common in shrubberies. Its branches are not infrequently used in some parts of Europe for tubes of tobacco-pipes; and it is said to make good hedges in dry soils. The trumpet-honeysuckle (*Lonicera sempervirens*), a twining green shrub, called in America the coral honeysuckle, is a native of the Southern United States, often planted on account of its beautiful scented flowers, red on the outside and scarlet within. The Japanese honeysuckle (*Lonicera Japonica*) has become established in the eastern part of the United States, having escaped from cultivation. The berries of the honeysuckle are nauseous. The name honeysuckle is also given to shrubs very different from this genus, but of which the flowers abound in honey, as to species of *Banksia* in Australia, *Diervilla*, *Aquilegia*, etc., in the United States. *Rhododendron viscosum* is called swamp-honeysuckle in North America.

HONEYSUCKLE ORNAMENT. See ANTHEMION.

HONEYWOOD. The hero of Goldsmith's play *The Good-Natured Man*. He carries his generous folly so far as to resign to another the woman whom he loves and who loves him in secret. He is cured by a trick of his uncle, Sir William, who returns from abroad in disguise and exposes the hypocrisy of the other suitor.

HONFLEUR, ōn'flēr'. A seaport town in the Department of Calvados, France, on the southern shore of the estuary of the Seine, seven miles from Havre, which lies on the opposite shore (Map: France, G 2). The town lost much of its former commercial importance, owing to the silting of its harbor, and the proximity of Havre. Since 1860 a floating basin and other harbor improvements have revived in a measure its waning commerce, and thriving fishing industries and a considerable trade in agricultural and animal products are carried on. The United States is represented by a consular agent. Population, in 1901, 9610. Honfleur, founded in the eleventh century, was of considerable strategical importance during the wars between France and England.

HONG-KIANG, hōng'kyāng', or WESTERN RIVER. See SI-KIANG.

HONG KONG, hōng kōng (Chin., Fragrant Streams). An island belonging to Great Britain, lying off the southeast coast of China, from which it is separated by a narrow channel (one-fourth mile at its narrowest), known as *Ly-e-Mun* or (Carpfish Pass, at the mouth of the Chu-kiang or Pearl River (Map: China, D 7). It is 75 miles southeast of Canton, and 38 miles east of Macao. Consisting of a range of granitic hills, it has little level land, its coast-line is very irregular, and its shores are steep and precipi-

tous, but broken in many places, especially on the south coast, by deep inlets, the chief of which are Ty- (or Tai) tam, and Shek-pai Wan. It is between eight and nine miles long, from east to west, and nearly four miles in average breadth. Area, 20 square miles. The highest of six mountain peaks is Victoria Peak, with an elevation above sea-level of 1825 feet.

Geologically, Hong Kong is entirely of igneous origin, its prevailing rock being a gray rapidly disintegrating syenite upheaved and penetrated by porphyritic rocks and basaltic trap. The climate of the island is very trying to foreigners. The temperature seldom exceeds 93° F.; the minimum summer temperature is 75°; but the rainfall in certain seasons is sometimes excessive. The driest month of the year is December, and winter generally is the most delightful part of the year. The sanitary arrangements are good, but the Chinese quarter is sometimes visited by epidemics.

Notwithstanding the rocky character of the island and its generally barren appearance, Hong Kong possesses a rich and varied flora, which corresponds as a rule with that of Assam, Sikkim, and Nepal. Bentham, in his *Flora Hongkongensis* (London, 1861), enumerates 1056 species of flowering plants and ferns, divided into 591 genera and 125 orders. The fauna of the island includes only a few species of kingfisher, some singing birds and rock-pigeons; several varieties of snakes and lizards are found, and scorpions and centipedes abound. Insect life is more plentiful, and includes the mosquito, and a flying cockroach from an inch to an inch and a half or two inches long. Ants, both white and red, are abundant and destructive. Fish are plentiful in the surrounding waters, and a most wonderful variety is daily marketed.

The population consists principally of Chinese from the mainland. In 1897 it was 236,382, of whom only about 9000 were Europeans and Americans, and about 2000 East Indians and Japanese. The boat population numbers nearly 18,000. The great bulk of the population is found in the city of Victoria (called by the Chinese Kwan-tai-lo), which stretches for nearly four miles along the north shore, opposite the rocky peninsula called by the Chinese Chim-sha-tsui, but better known as Kow-lung ('nine dragons'), about 1½ miles distant. Here are the Government buildings and the great business houses and warehouses stretching along the water-front or perched in terrace-like rows on the steep hill-sides, while far up on the Peak are many handsome bungalows. The buildings are substantial and imposing, and usually white. The more prominent are the Government House, City Hall, the Clock Tower, and the Anglican and Roman Catholic cathedrals. There are a public garden, several hospitals and cemeteries, two public libraries, many clubs, and a race-course. The streets, which are well made and well kept, are lighted with gas and electricity, and a plentiful supply of water is brought from Taitam by an aqueduct three miles long. The principal mode of conveyance is by jinrikisha in the more level parts, and sedan chairs, and these are now supplemented by an inclined plane and steam tramway two-thirds of the way to the Peak.

The harbor is capacious and safe, though exposed at times to typhoons. Four square miles of the peninsula of Kow-lung, which juts out

from the mainland opposite and shuts in the harbor on the north and west, have been held by the British since 1860, under a lease obtained from the Governor-General of the two Kwang provinces of China. This was a base of operations during the Anglo-French punitive expedition to the north in that year, and since then has served as a sanatorium for the inhabitants and the troops stationed here. In 1898 an extension (to 376 miles) of the territory and a lease for 99 years were granted by the Chinese Government of Peking, and the peninsula now forms part of the Colony of Hong Kong. Here are dry docks and warehouses, some tanneries, etc., and here also is a station of the Chinese Imperial Maritime Customs, to check smuggling to the mainland of China. The hill of the Sung Emperors, with many historical associations, has been set apart as a recreation ground.

On the opposite side of the island are several small centres of population, the most important of which is Aberdeen, on the inlet known as Shek-pai Wan. Here are the sugar-refineries, ship-building yards, and foundries, etc., and two large graving-docks, the larger of which is 465 feet long, 80 feet wide, and has a depth on the sill of 24½ feet at spring tides. The chief industries of the colony are sugar-refining, cotton spinning and weaving, tanning, rope-making, ship and boat building; the manufacture of cement, drain-pipes, tiles, black-wood furniture, paper, bamboo, and rattan ware, etc. There is also a vermilion factory, and among the natives many hands are employed in wood and ivory carving, gold-beating, and the production of gold, silver, copper, iron, and sandalwood wares. Granite-quarrying is an important industry, and large quantities of dressed stone are exported annually. Hong Kong is a free port, and has no custom-house, and its commercial activities are chiefly distributive. The amount of business can only be inferred from the harbor-master's reports.

In 1898, 77,293 vessels, with a tonnage of 15,938,174 tons, entered port, and 79,629 vessels, of 17,265,780 tons, cleared. The trade of the port is chiefly with Great Britain and her colonies, the open ports of China, Japan, and the United States. The only commodity that pays a tax is opium. In 1898, 39,392½ chests were imported, and 37,828½ (= 43,142,525 catties) were exported. For trade purposes the Mexican and Hong Kong dollar are legal tender, and bank-notes issued by the three great banks doing business here are in circulation.

The island was ceded to Great Britain by Kishin, the Chinese Commissioner, and was occupied by British forces in January, 1841, but this treaty was disallowed by the Emperor. In the following year, however, it was ratified by the treaty made at Nanking. On June 26, 1843, Hong Kong became by proclamation a separate colony, but continued to be governed by the Minister Plenipotentiary to China until 1857. Since that date its affairs have been administered by a Governor and an executive council composed of the Colonial Secretary, the officer commanding the troops, the Attorney-General, the Registrar-General, the Treasurer, and the Director of Public Works. There is also a legislative council of ten, of whom five are official, and five unofficial members. Of the latter three are nominated by the Crown—one of them must be a Chinese, one is nominated by the Chamber of Commerce, and one

by the justices of the peace. Justice is administered by a supreme court, a police court, and a marine magistrate's court. In 1898 the police force consisted of 630 men, of whom 112 were Europeans, 226 East Indians, and 292 Chinese.

The public revenue is derived chiefly from land taxes and land sales, licenses, fees of court, the post-office, rent of Government property, light and harbor dues, opium, etc. In 1898 the total revenue was \$2,918,159, and the expenditure \$2,841,805, leaving a surplus of \$76,354. The chief items of expenditure were: Public works, \$423,828; military purposes, \$519,274; police, \$222,163; sanitary purposes, \$101,613; education, \$72,420; and jails, \$57,954. The contribution for Imperial defense is £40,000 per annum. There is an Imperial garrison of several regiments, and a local volunteer artillery corps of over 100. The China naval squadron has its headquarters here, and the defenses are of great strength.

EDUCATION. In 1898 there were in the colony 109 educational establishments, with 8522 pupils, and of these 16 were Government schools. Queen's College, a Government institution, had 1344 students on the roll. Besides this there are Saint Paul's College, an Anglican institution, and many missionary and private schools. A number of ably conducted newspapers, both Chinese and English, are published. Consult: Mayer and Dennys, *Treaty Ports of China and Japan* (London and Hong Kong, 1867); Norman, *The Far East* (London, 1898).

HONI SOIT QUI MAL Y PENSE, ó'né' swä kē mál é pāns (Fr., Evil to him who evil thinks). An exclamation traditionally ascribed to Edward III. It is said to have been uttered at a ball when the King tied about his leg a garter which the Countess of Salisbury dropped while dancing. The words form the motto of the Order of the Garter (q.v.).

HONITON, hōn'ŋ-ton. A market-town and municipal borough in Devonshire, England, on the Otter, 16 miles northeast of Exeter (Map: England, C 6). It is famous as the original manufacturing seat of 'Honiton lace.' Its manufacture was introduced by the Lollards during the reign of Elizabeth. The Vale of Honiton is famous for its butter. The town maintains its own water-supply. Population, in 1891, 3216; in 1901, 3270.

HONOLULU, hōn'ó-lō'loō. The capital and commercial centre of the Hawaiian Islands, situated on the southern coast of the island of Oahu, in 21° 18' N. latitude and 157° 55' W. longitude, 2089 miles southwest of San Francisco (Map: Hawaii, D 2). It is wholly a modern town, surrounded by luxuriant fruit and ornamental trees and foliage, and is famed for its beauty and the loveliness of the region. It has a very healthful and mild climate, especially favorable for pulmonary troubles. The streets are well laid out, and the houses, although unpretentious, are rendered picturesque by their gardens. Honolulu has twenty-five miles of macadam streets. The area of its public parks is 194 acres. Among the public buildings are the royal palace, completed in the Italian style in 1882, the Government buildings, several churches, a museum containing interesting remains relating to the early history of the archipelago, a theatre, and a bank. There are 19 public schools and one high school, with a total attendance of 3345

pupils. Honolulu has one hospital and a public library. There are manufactures of machinery. The town is equipped with a good water-supply, electric lighting and railway and telephone service. Its water-works plant, costing \$1,300,000, and its electric-light plant are owned and operated by the Territorial Government. The city's municipal property had an assessed value in 1900 of about \$2,500,000. The budget for that year balanced at \$1,131,905. Over one-half of the expenditure was for construction and other capital outlay. There was spent on schools \$128,047. The harbor is well protected by coral reefs. The light from its lighthouse is visible eight leagues. Honolulu has regular steam communication with San Francisco (with which it is also connected by cable), Seattle, Vancouver, New Zealand, Sydney, and Japan. It forms the chief outlet for the trade of the entire archipelago. It is the seat of an Anglican and of a Catholic bishop, and of a number of European consular agents, as well as of the Government officials of the islands. As late as 1815 the present capital was a mere village. In that year, at the suggestion of the American John Young, then Governor of Hawaii, it was fortified, and in 1820 it became the capital of the archipelago. Population, in 1890, 22,907; in 1900, 39,306.

HONOR. n. In English feudal land law, an estate or lordship made up of several manors held under one baron or lord paramount. One court baron was often held for the whole estate, but regarded as the court of each manor. It was distinct from the great manor, although the name has been sometimes applied to the latter. See MANOR.

HONOR, KNIGHTS AND LADIES OF. A fraternal benevolent society organized in Kentucky in 1877 for social and beneficial purposes. A distinguishing feature of this society is that men and women are admitted to membership on equal terms. The central authority is the supreme lodge, and the chief officer has the title of supreme protector. The Order has sixteen grand lodges and 1160 subordinate lodges, representing a total membership of 63,000. Since its organization it has dispensed benefits to the beneficiaries of deceased members to the amount of \$19,000,000, and during the last fiscal year the disbursements for the same object amounted to \$1,178,000.

HONOR, KNIGHTS OF. A fraternal benefit society in the United States, organized at Louisville, Ky., June 30, 1873, by the institution of Golden Lodge No. 1, with seventeen charter members. Its objects are the social, moral, and intellectual elevation of its members, the establishment of bonds of fellowship between them, and the payment of death benefits to the widows and orphans of deceased members. It is incorporated under the laws of the State of Missouri, with headquarters at Saint Louis. The supreme lodge is the executive head of the Order, and is composed of the officers and of representatives from the various grand lodges, who meet annually and enact all laws governing the Order. The grand lodges are composed of representatives from subordinate lodges, are governed by officers elected by the representatives, and they control the subordinate lodges, in accordance with the laws of the supreme lodge. The Order has paid to beneficiaries since its organization \$78,094,864. The benefits disbursed during the year ending

in 1902 amounted to \$3,074,649. There were in existence at the close of 1902 36 grand lodges and 1918 subordinate lodges, representing a membership of 55,733, with insurance in force of \$96,852,500.

HONOR, MAIDS OF. See **HOUSEHOLD, ROYAL.**

HONORIA, JUSTA GRATA. A daughter of Constantius III. and sister to Valentinian III., born about A.D. 418 in Constantinople. Living at Valentinian's court in Rome, she secretly invited Attila the Hun to marry her; but as he did not entertain the proposition, she sent another invitation, and Attila, accepting it, claimed with her a portion of the Empire. As Valentinian refused to accede to such a demand, Attila invaded Gaul. Honoria's fate is unknown.

HONORIUS. The name of four popes and one antipope.—**HONORIUS I.**, Pope 625-38. He was born of a consular family in Campania. Of his early history little is known, except that he took an active part in bringing to a close the disputes which arose in Northern Italy about the controversy of the three chapters. (See **VIGILIUS**.) As Pope his name is connected with the history of the paschal controversy in Ireland, and with that of the early Anglo-Saxon Church, and his pontificate is particularly memorable on account of the Monothelite heresy. (See **MONOTHELITISM**.) Honorius, misled, it is alleged, by a statement of Sergius, Patriarch of Constantinople, expressed himself in language which would appear to condemn the doctrine of two wills of Christ. In a decree of the sixth general council (Constantinople, 680-81) Honorius is anathematized in company with many others, of whose heterodoxy there can be no doubt. Catholic theologians, however, defend his orthodoxy, or at least point out that his case is not one of those in which infallibility is claimed by the Vatican decree. It was because Döllinger (q.v.) believed that the heresy of Honorius was irrefutably established that he could not conscientiously accept the dogma of Papal infallibility, because it was retroactive and implied that there never had been a pope who was heretical. This assertion in regard to Honorius was an important factor in the Old Catholic movement. He died in 638. Consult: Döllinger, *Fables and Prophecies of the Middle Ages* (New York, 1892); Pennacchi, *De Honorii Causa in Concilio Sexto* (Rome, 1870); Willis, *Pope Honorius and the New Roman Dogma* (London, 1879). The letters of Honorius are in Migne, *Patrologia Latina*, lxxx.—**HONORIUS II.** (Lambert, Cardinal of Ostia). Pope 1124-30. He recognized Lothair of Saxony as German Emperor (see **LOTHAIR II.**), and was unable to crush the growing power of Count Roger of Sicily in South Italy. (See **ROGER II.**) His letters are in Migne, *Patrologia Latina*, clxvi.—**HONORIUS II.** was also the title taken by Peter Cadalous, Bishop of Parma, antipope to Alexander II., 1061. He died 1073.—**HONORIUS III.** (Cencio Savelli). Pope 1216-27. He crowned Frederick II. as Emperor, tried in vain to institute a crusade, and confirmed the orders of the Dominicans and Franciscans. To him we owe the famous *Liber Censuum Romanæ Ecclesiæ*, in which the income of the Church of his day is detailed. It was reprinted by Paul Fabre, *Liber Censuum* (Paris, 1899, et seq.). Consult Tauge, *Die päpstlichen Kanzleiordnungen von 1200-1500*

(Innsbruck, 1894). His works are in Horoy, *Medii Ævi Bibliotheca Patristica* (Paris, 1879-82). For his life, consult Clausen (Bonn, 1895).—**HONORIUS IV.** (Giacomo Savelli). Pope 1285-87. He was born in 1210, and notwithstanding his years when called to the Papal see, was very energetic. Consult his life by Pawlicki (Münster, 1896).

HONORIUS, FLAVIUS (A.D. 384-423). Roman Emperor of the West from 395 to 423, second son of Theodosius the Great. He was born in 384. On the death of his father, A.D. 395, the Empire was divided into two parts, Honorius receiving the western half, with Rome as his capital, while his brother Arcadius received the eastern half, with Constantinople as his capital. Honorius, being only ten years old, was put under the guardianship of Stilicho (q.v.), who was all his life the *de facto* ruler of the Western Empire. Honorius first took up his residence at Milan, and later for the most part held his Court at Ravenna. In 398 he married Maria, the daughter of Stilicho. In 401 Alaric, King of the Visigoths, invaded Italy. Stilicho, who was then in Germany, marched against him, and a great battle was fought at Pollentia in 403 (or 402), followed by another encounter at Verona. Alaric, unable to withstand Stilicho, withdrew from Italy. Another irruption of barbarians, under Radagaisus, took place in 405, which was again repelled by Stilicho, who, nevertheless, lost the favor of his master, and was treacherously slain at Ravenna, A.D. 408. Alaric was not slow to take advantage of the opportunity afforded him. In the same year he invaded Italy, and besieged Rome, which escaped only on the payment of a heavy ransom; and in the following year he again besieged and took it, raising Attalus to the Imperial purple, but a little later deposing him. In 410 the Visigothic King again appeared before Rome and handed it over to be pillaged by his troops. The death of the invader in the same year again freed Italy. A new champion of the falling Empire arose in the person of Constantius, who suppressed the rebellions of Constantine, Jovinus, and Sallustius in the northern provinces, and of Heraclian in Africa. He was now appointed the colleague of Honorius in the consulship, and received in marriage the hand of Placidia, sister of Honorius, along with a share in the Empire, which he did not long enjoy, as his death took place a few months after. The Gothic and German tribes had for some time been slowly but steadily encroaching upon the Western Empire, and Honorius's reign saw Spain, Gaul, and Pannonia, some of the finest provinces, snatched from its grasp. He died August 27, 423.

HONORS, MILITARY. See **SALUTES.**

HONORS OF WAR. Stipulated privileges allowed a capitulating enemy; formerly a chivalrous appreciation of his valor, but in later times dictated almost entirely by the politic or economic phase of the question. Honors of war include the retention of arms, or standards, the granting of parole, and the general treatment of the surrendered troops and stores.

HON-SHIU, hōn'shyōō'. The most important of the group of islands constituting the Empire of Japan. See **HONDO**.

HONTHEIM, hōnt'him, JOHANN NIKOLAUS VON (1701-90). A German Roman Catholic prelate and writer. He was born at Treves, January

27, 1701. He was educated in the Jesuit school of his native city, studied canon law at Louvain under the celebrated Van Espen, and afterwards taught at Treves and Coblenz, finding time to write at Treves two voluminous works on the history of the town, *Historia Trevirensis Diplomatica* (1750) and *Prodromus Historiæ Trevirensis* (1757). But his literary career is chiefly memorable for a theological essay, *De Statu Ecclesiæ et Legitima Potestate Romani Pontificis* (1763), which by the novelty and boldness of its views created an immense sensation in the theological world. The work was composed with a view to the reunion of Christian sects. The name of the author was for a long time unknown, the work being published under the pseudonym of Justinus Febronius (a name taken from that of Hontheim's niece, a canoness at Juvigny, who was called Justina Febronia), and the system of Church government which the work propounds has been called Febronianism (q.v.). The work, immediately after its appearance, was condemned by Clement XIII., as well as by many individual bishops. It drew forth a number of replies, the most important of which are those of Zaccaria (1767) and Ballerini (1768). Pius VI., in 1778, required from Hontheim a retraction of these doctrines. This retraction, however, was modified by a subsequent *Commentary*, published at Frankfort in 1781, to which, at the desire of the Pope, Cardinal Gerdil replied. Hontheim made full submission to the Church in 1788, and died in his ninetieth year at Montquintin, in Luxemburg, September 2, 1790. Consult Mejer, *Febronius* (Freiburg, 1885), a work biased in favor of Hontheim.

HONTHORST, hōnt'hōrst, GERARD VAN (1590-1656). A Dutch painter, called 'Gherardo dalle notti,' from his frequent painting of night scenes. He was born at Utrecht, and at first studied under Abraham Bloemaert. At twenty he went to Italy, and was greatly influenced by Caravaggio; it was here that he gained his sobriquet. When he returned to Utrecht he was made the head of the Guild of Saint Luke (1623), and opened a large school. An invitation from Charles I. took him to England in 1628. There he decorated Whitehall. After this he went to The Hague, where he lived for several years. He painted a great number of pictures, and of all kinds, including portraits. All these show a good deal of power and coarse realism. The European galleries contain many of his works. A constantly repeated subject of his is a group of several persons with musical instruments, and one of these "Concerts" (1624) is at the Louvre. His brother, WILLEM VAN (1604-66), was also a painter, particularly of portraits, in the style of his brother.

HONVÉD, hōn'vād (Hung., land-defenders). The name given in Hungary under the earlier kings to the national champions. With the disappearance of these the word, too, disappeared; but in the summer of 1848 it was revived, and applied first to those Hungarian volunteers dispatched to the south against the Serbs, and subsequently, when the war with Austria commenced, to the whole patriotic army. Since the reconstruction of the Austro-Hungarian monarchy the name honvéd, or honvédség, has been given to the militia of the Hungarian portion of the Empire.

HOOBLY, hōō'bli. A town in the Province of Bombay, British India. See HUBLI.

HOOGH, hōg, or **HOOGH**, PIETER DE (1632-81). A Dutch painter, born at Rotterdam. According to the latest biographers of this artist, he was the pupil of Nikolaas Berchem at Amsterdam, but he seems to have been more influenced by Rembrandt than by Berchem. About 1654 he went to Delft, and in 1655 was elected a member of the Guild of Saint Luke. In 1667 he was still at Delft, but at this date all positive trace of him is lost. There is some evidence that he lived in Amsterdam after this, and still later at The Hague. It is curious that such a great painter as de Hooch should not have been appreciated until our own time, but such is the case. His works are now greatly prized. The list of them includes about eighty, principally in the museums of Holland; the National Gallery of London possesses three fine interiors with figures, and there are several in the Louvre and some in private collections. He generally treated domestic scenes out of doors, where his mastery of light is unequaled by any painter of his country.

HOCHENOO, hōō'chē-nō. A spirituous liquor concocted by the natives of Alaska, and named from one of the tribes of Indians.

HOOD, ALEXANDER (1758-98). An English navy captain. His first voyage was aboard the *Romney* with his cousin, Captain Samuel, afterwards Viscount Hood, but in 1772 he went round the world on the *Resolution* with Captain Cook. Between 1776 and 1783 he was on active service in the West Indies, but was appointed (1797) to command the *Mars* of the Channel fleet, and was one of the captains put ashore by the mutineers off Saint Helens and Spithead. The next year, when his frigate was engaged in the famous duel with the *Hercule*, Captain Hood was mortally wounded at the moment of victory.

HOOD, EDWIN PAXTON (1820-85). An English Congregationalist. He was born in London, December 18, 1820, educated privately, and became a Congregational clergyman in 1852. He held various charges, and from 1880 to his death in Paris, June 12, 1885, he was pastor of the Falcon Square Church, Aldersgate Street, London. He rendered conspicuous service in raising the funds for the Royal College for Incurables, his pamphlet, "The Palace of Pain" (1885), having brought in £2000. He was the author of numerous volumes, several of which are still read, especially his *Lamps*, *Pitchers*, and *Trumpets: Lectures on the Vocation of the Preacher* (1867), a racy volume on homiletics and the history of preaching, and *The World of Moral and Religious Anecdote* (1870). His agreeable book-making powers were exhibited in the biographies of John Milton (1852), Andrew Marvell (1853), Emanuel Swedenborg (1854), William Wordsworth (1856), Thomas Binney (1874), Isaac Watts (1875), Thomas Carlyle (1875), Christmas Evans (1881), Robert Hall (1881), and Oliver Cromwell (1882).

HOOD, JOHN BELL (1831-79). An American soldier, prominent on the Confederate side during the Civil War. He was born in Owingsville, Ky.; graduated at West Point in 1853; and remained in the United States Army until 1861, when he resigned to accept a commission in the Confeder-

ate service. During the first years of the war he took part in the Virginia campaigns, where his gallantry gained him the rank of major-general. At Gettysburg his division was stationed on the extreme right of the Confederate line, and took part in some of the most desperate fighting of that bloody battle. In September, 1863, he was sent to the aid of General Bragg in Tennessee, and took part in the battle of Chickamauga, September 19th-20th, where he lost a leg. The next spring he again took the field and was made a lieutenant-general in Johnston's army. During the campaign by which this general sought to impede Sherman's advance on Atlanta, Hood was engaged in several battles, and on May 25, 1864, his corps was attacked by Hooker at New Hope Church. On July 17th he was given the temporary rank of general, and was appointed to succeed Johnston in command of the Army of the Tennessee. Sherman was exultant at this change, for he knew that Johnston's wearing tactics would now give place to a policy which would enable him to make good use of his superior fighting strength. On July 20th was fought the battle of Peach Tree Creek, as a result of which Hood was compelled to withdraw into the fortifications about Atlanta, and two days later the battle of Atlanta followed his flank movement toward Decatur. On July 28th he attacked the Federal forces, but was again compelled to withdraw into his fortifications. After another engagement at Jonesboro, on September 1st, he abandoned Atlanta, which was entered by Sherman on the 2d. Hood, after operating for several weeks along the line of Sherman's communications, and moving westward into northern Alabama, crossed the Tennessee River about the end of October and began to move northward through Tennessee against General Thomas. After his attack on the Federal forces under Schofield at Franklin had been repulsed (see FRANKLIN, BATTLE OF), he proceeded to Nashville, where he found Thomas stationed with a force about equal to his own. Thomas was not prepared at the outset, and for nearly two weeks the two armies faced each other. At last, on December 15th, Thomas ordered the attack. The Confederates fought desperately, but were forced back all along the line. That night Hood re-formed his army and the next day awaited the Federals on the Overton Hills. Owing to his strong position, he succeeded in repelling the first assault, but the second was more successful, and soon the Confederates were driven in utter rout. As a military force Hood's army disappeared, and on January 23, 1865, at his own request, he was relieved of his command. After the war he became a commission merchant in New Orleans and president of the New Orleans branch of the Life Association of America. He wrote a book entitled *Advance and Retreat: Personal Experiences in the United States and Confederate States Armies* (1880), and wrote a number of articles for *Battles and Leaders of the Civil War* (New York, 1887).

HOOD, MOUNT. A peak of the Cascade Range (q.v.), on the western border of Wasco County, Ore. (Map: Oregon, D 4). It is 50 miles east by south of Portland, whence it is reached by rail to Hood River, 66 miles, and thence by stage to the base of the northern glaciers. It has an altitude of 11,934 feet; there are no formidable

obstacles to its ascent, and the summit commands an extensive and magnificent view.

HOOD, ROBIN. The hero of a group of English ballads, which represent him as an outlaw, dwelling in Sherwood forest, Nottinghamshire, or in Barnsdale, a woodland district in the West Riding of Yorkshire. The earliest known mention of him is in the second version of *Piers Plowman* (about 1377), where Sloth says he "knows rymes of Robyn Hood" (*Skeat*, *Passus* v. II. 401, 402). The oldest extant ballad of which he is hero is "A Geste of Robyn Hode," assigned to about 1400. This poem, consisting of 456 four-line stanzas, is in magnitude almost an epic. Among succeeding ballads, of which Professor Child collected thirty-nine, are "Robin Hood and Guy of Gisborne," "Robin Hood and the Monk," and "Robin Hood's Death." As early as the last half of the fifteenth century Robin Hood became a popular character in the semi-dramatic celebrations of May-day, both in England and in Scotland, and later in the regular drama, as in Ben Jonson's beautiful pastoral *The Sad Shepherd*. Robin is the ideal outlaw, courteous, liberal, and reverent. Skillful with the bow, he shoots the King's deer, but he loves the King. He takes from the rich clergy their superfluous goods, but what he does not need himself he gives to the poor. He is chivalrous toward all women, and reveres the Virgin Mary. His chief foe is the sheriff of Nottingham. With him is a numerous band. There are Little John, Scathlock, or Scarlock, Friar Tuck, Maid Marian, Much the Miller's Son, and several others. In his illness Robin goes to a prioress, who is his cousin, to be bled. She allows him to be bled to death.

Unsuccessful attempts have been made to prove the real existence of Robin. True, his career as eventually developed has all the details of authentic history; but these were taken from the ballads themselves, or from semi-historical personages, as Hereward the Wake, and Wallace, and applied to Robin. Others have tried to connect the surname Hood with Woden, the chief of the Norse gods, or with Hödr (warrior), another Norse divinity. It is now rather thought to be a variant of Hodeken, an elf in Germanic folktales. Robin is of course a diminutive of Robert. Robin Hood then seems to have been at first only an elf of the woods, about whom later gathered typical adventures of the outlaw. Robin Hood is the hero of a comic opera by Reginald De Koven (q.v.), and a late drama by Tennyson, *The Foresters*, has Robin Hood as its main character. Consult: Child, *English and Scottish Ballads* (Boston, 1883 et seq.); *Bishop Percy's Folio*, ed. Hales and Furnivall, vol. i. (London, 1867); Ritson, *Robin Hood* (London, 1795, new ed. 1885); and for an attempt to prove the existence of Robin Hood, Hunter, *The Great Hero of the Ancient Minstrelsy of England* (London, 1852).

HOOD, SAMUEL, Viscount (1724-1816). An English admiral, born at Thorncombe. He embarked at first as captain's servant, then as seaman, was midshipman on Rodney's ship (1743), was lieutenant at twenty-two and post-captain at thirty-two. During his retirement from active service (1778-80), he was commissioner of the dock yards at Portsmouth, but went to sea again under Admiral Rodney, as next to him in rank upon the North American Squadron. Hood took part in several famous naval battles in 1781-82,

notably that of Dominica, for his share in which he was granted an Irish peerage. He was elected member of Parliament for Westminster in 1784, was made a Lord of the Admiralty four years later, took command of the British fleet in the Mediterranean in 1793, and in 1796 was made a viscount. He was specially strong as a tactician, and his junior officer, Horatio Nelson, acknowledged his indebtedness to him in that particular, and upon his retirement wrote: "The fleet must regret the loss of Lord Hood, the best officer, take him altogether, that England has to boast of; great in all situations which an admiral can be placed in."

HOOD, THOMAS (1799-1845). An English poet and humorist, born in London, May 23, 1799. After leaving school he was placed in a merchant's counting-house, but his health failing, he was sent to Dundee. At the age of nineteen he returned to London, and studied the art of engraving with his uncle. In 1821 he became assistant sub-editor of the *London Magazine*. He contributed to it considerable verse, and made the acquaintance of its brilliant staff, which included De Quincey, Hazlitt, and Lamb. His first separate publication was entitled *Odes and Addresses on Great People*, written in conjunction with J. H. Reynolds (1825). In 1826 he published *Whims and Oddities*, of which a second series appeared during the following year. In 1829 he began the *Comic Annual*, and continued it for nine years. The same year he edited the *Gem*, one of the popular annuals, contributing to its pages his striking poem entitled "Eugene Aram's Dream." In 1824 Hood married the sister of J. H. Reynolds, and in 1831 he went to reside at Wanstead, in Essex, where he wrote his novel *Tynney Hall* (1834). While there he suffered from the failure of a publisher. In 1835, now weakened in health, he went to the Continent, where he remained five years, first at Coblenz, on the Rhine, and then at Ostend. He, however, continued his *Comic Annuals*, started *Hood's Own* (1838), containing a portrait and reminiscences, and made Smollett's *Humphrey Clinker* a framework for some humorous sketches called *Up the Rhine* (1839). In 1840 he returned to England, and began to write for the *New Monthly Magazine*, of which he became editor the following year. Here appeared "Miss Kilmansegg," his best comic poem. Withdrawing from this magazine toward the close of 1843, he started *Hood's Magazine*, January, 1844; and in the same year collected his fugitive pieces under the title of *Whimsicalities*, which were illustrated by Leech. By Christmas he took to his bed, which he never again left. During his last illness Sir Robert Peel conferred on him a pension of £100 a year, which he transferred to his wife. He died on May 3, 1845, and was buried in Kensal Green Cemetery.

Hood takes a high place both as humorist and as serious poet. He is great at once in comedy and in pathos, and he sometimes curiously mingles and combines both. As a punster he is supreme; he connects far-separated words and ideas by the most subtle analogies, and sends them loose. Much of his comedy, however, is verbal and shallow, and will be soon forgotten. It is as a poet that Hood will be remembered. His "Eugene Aram's Dream," "Song of the Shirt," and "Bride of Sighs" are among the most perfect

poems of their kind in the English language. Consult: *Memorials*, ed. by his daughter (London, 1860); *Literary Reminiscences in Hood's Own*, first series (ib., 1838); Eliot, *Hood in Scotland* (Dundee, 1885); *Works*, ed. by son and daughter (10 vols., London, 1869-73); *Poems*, ed. by Ainger, in "Everley Series" (12 vols., ib., 1897); and *Haunted House*, with memoir by Austin Dobson (ib., 1895).

HOODED CROW (so called from the marking on the head). A true crow (*Corvus cornix*) of the north of Europe, also called in England 'dun,' or 'gray,' and 'Royston' crow, and in Scotland 'hoodie.' The head, fore parts, and wings are glossy black; the remainder of the body, ash-color; the bill and feet, black. It is slightly migratory, and retreats southward in winter from the most northerly parts of Europe and Siberia when the other crows go south. Its general habits are those of the carrion-crow, with which it interbreeds extensively, so that some naturalists believe the two birds to be varieties of one species. See Newton, *Dictionary of Birds* (London and New York, 1896).

The 'hooded crow' of India is a smaller species (*Corvus splendens*) of similar appearance. It is tame to the point of being a nuisance to Europeans wherever it is numerous. Hardly a station or camp in British India, it is said, is free from a crowd of these feathered thieves. They have the amusing habit of building their nests of the wire from discarded soda-water bottles.

HOODED MERGANSER. See MERGANSER.

HOODED SEAL. A large seal (*Cystophora cristata*) inhabiting the coasts of Greenland, and North America as far south as the United States. It also occurs on the coasts of Sweden and Norway and in the Arctic Ocean. It is found generally in the icy islands, or floating ice-fields, in the open sea, and visits the land in April, May, and June. About two inches from the extremity of the upper jaw there is a cartilaginous crest, increasing in height as it passes backward to the back part of the head, where it is about seven inches high, and has a longitudinal depression in the middle, about an inch deep. This crest is an elongation of the septum of the nose, and the true nostrils open on either side of it. It is covered by a muscular hood clothed with fur. The whole apparatus is probably defensive, but may be accessory to the organ of smell, and, as the fishermen suppose, may serve as a reservoir of air while the animal is under water. The hood is wanting in the females and young. The hooded seal is polygamous and brings forth its young on the ice. It has a voice resembling the bark and whine of a dog, and when attacked weeps copious tears.

HOODED WARBLER (so called from the marking on the head). One of the most beautiful and active of the American 'fly-catching' warblers. (See WOOD-WARBLER.) It is olive-green above and yellow below, with the head, neck, and breast deep black. It inhabits in summer the Eastern United States, where it frequents thickets and undergrowth, and makes a soft, cup-like nest in low bushes. Its systematic name is *Sylvania mitrata*. See Colored Plate of WOOD-WARBLERS.

HOODIE. See HOODED CROW.

HOOF (AS. *hōf*, OHG. *huof*, Ger. *Huf*; connected with OChurch Slav. *kopyto*, hoof, or with Skt. *śapha*, Av. *safa*, hoof). The exterior horny covering of the foot of many animals. The healthy soundness of the horse's foot is mainly preserved by permitting it to grow uninjured by the rasp and knife; its toughness is secured, and undue dryness and evaporation prevented, by smearing daily the crust, sole, and frog with a little glycerin, or a mixture of a pound of lard and a quarter of a pound each of tar, honey, beeswax, and glycerin melted together. Softness and brittleness of the hoof, which are common sources of cracks and corns, may be remedied by the regular use of such dressings, by placing the feet for several hours daily in thick woolen swabs, kept cool and moist by frequent applications of cold water, and by encouraging a more healthy growth of horn by occasional mild blisters round the coronary band. Cracks, or sand-cracks, as they are termed, mostly occur among horses much upon the road, cause lameness, and constitute unsoundness. When serious and recent, poulticing, thinning away of the crust about the crack, and perfect rest are essential. After the earlier heat and tenderness are removed a hot iron should be drawn at right angles to the crack, both above and below, so as to separate the diseased from the sound horn. Waxed thread or fine wire should be wound round the hoof, and a sound growth of horn stimulated by a blister round the coronet. The horse's hoofs are too hard and coarse to be employed for the making of the better class of combs and buttons, for which purpose the hoofs of cattle are extensively employed. They are, however, largely used by manufacturers of prussiate of potash and artificial manures. See CORN.

HOOFT, *höft*, PIETER CORNELISZON (1581-1647). A Dutch poet and historian, born in Amsterdam. He was the son of an Amsterdam burgo-master; received a thorough education in the classics, and made an extensive journey through France, Germany, and Italy. After his return in 1601 he studied jurisprudence at Leyden, and was appointed bailiff of Muiden. At the Castle of Muiden and in Amsterdam he gathered around him the most celebrated artists, poets, and scholars of the day, known in Dutch literary history as the 'Muiden circle.' He is considered one of the first, if not the first, of Dutch prose writers, despite his too frequent Latinisms. His letters are particularly charming, and are free from this failing. Among his poetical works are the pastoral play in Italian style, *Granida* (1615), the tragedies *Gheraert van Velzen* (1613), *Theseus en Ariadne* (1614), and *Baeto* (1626). His chief historical works are *Hendrik de Groote* (1626); *Rampzaaligheden der verheffinghe van huize Medicis* (1636); *De Nederlandsche Historien* (2 vols., 1642). The latter is one of the classics of Dutch literature and Hooft's chief work. He also translated Tacitus, of whom he was an imitator, and he is often called the 'Dutch Tacitus.' His *Poems* were published in 1636 (new complete edition, ed. P. Leendertz, Haarlem, 1864). His erotic verse is particularly notable as being the first of this genre to appear in Dutch literature. Consult his *Breven*, edited by J. van Vloten (Leyden, 1855-57).

HOOGEVEEN, *hō'ge-vān'*. One of the fen colonies of the Netherlands, situated in the Province of Drenthe (Map: Netherlands, E 2). It has extensive peat-mines and shipyards. Population, in 1889, 11,702; in 1899, 11,924.

HOGLY, *hōg'li*. One of the arms of the Ganges. See HUGLI.

HOOGSTRAETEN, *hōg'strā'ten*, SAMUEL VAN (1627-78). A Dutch painter, born at Dordrecht. He was the pupil of his father, Dirk van Hoogstraeten (1596-1640), an artist, and afterwards of Rembrandt. He began as a portrait painter in the manner of his last master, but afterwards was influenced by the Italian school and did landscape and still life. In this style he is reminiscent of Pieter de Hooch. In 1651 he went to Vienna and Rome, and also paid a visit to England (1653). He is the author of an *Introduction to the High Art School* (1678), which is full of admiration for Rembrandt. His paintings include: "A Lady Walking in a Court," "Old Jew," "Inner Court of a Fortress," and "A Sick Girl."

HOOGSTRATEN, *hōg'strā'ten*, JAKOB VAN (c.1454-1527). A Belgian priest and inquisitor, born at Hoogstraeten. He entered the Dominican Order and became doctor and professor of theology, and prior of the Order at Cologne. He is widely known through his connection with the celebrated humanist Reuchlin. Hoogstraten proposed to burn all the Jewish books, on the ground that they contained nothing but calumnies against Christ. Reuchlin persuaded the Emperor Maximilian against this course, and thereby incurred the enmity of the inquisitor, who subjected him to every persecution. Thereupon there ensued the polemic war called by Erasmus "The beginning of the Lutheran tragedy," and this was the occasion of the famous *Epistolæ Obscurorum Virorum*. Hoogstraten's epitaph, though composed by his enemies, is a fitting description of the man's character—*Hic jacet Hoogstratus vivunt ferre patique quem potyere mali, non potuere boni*. Among his treatises are *Destructio Cabbalæ contra Reuchlinum* (1518), and *De Christiana libertate Tractatus V. contra Lutherum* (1526).

HOOK, JAMES CLARKE (1819—). An English painter, born in London. He studied in the Royal Academy, and in 1846 won a scholarship by his picture "Rizpah," and went to Italy. In 1860 he became an academician. His English pastoral subjects are most popular, though his first works were nearly always of Italian scenes. Among his paintings are: "Mother Carey's Chickens," "Breton Fishermen's Wives," "Morning After a Gale," "Market Girls," "Luff, Boy," and "A Surrey Stream." His work is characterized by strong brilliant color and fresh realistic treatment.

HOOK, THEODORE EDWARD (1788-1841). An English wit and novelist, son of James Hook, a musical composer, born in London, September 22, 1788. Educated mostly at private schools, he attended for a short time Harrow and Oxford. Between 1805 and 1811, while yet a boy, he produced, either single-handed or in conjunction with his father, thirteen comic operas and melodramas, all of which were popular at the time. His ready wit, sparkling humor, and wonderful powers of improvisation made him the delight of society; and having pleased the Prince Regent, he was appointed (1813) Accountant-General and Treas-

urer at Mauritius, with a salary and allowances amounting to nearly £2000 a year. These offices he held till 1818, when the discovery of a deficiency of £62,000 in the military chest caused him to be arrested and sent to England, and his effects seized and sold. The speculation, it afterwards appeared, had been committed by a clerk, who committed suicide. On obtaining his liberty, Hook supported himself by writing for the newspapers and magazines, and on the establishment of *John Bull*, a weekly Tory newspaper, in 1820, he was appointed its editor. From his connection with this bold, clever, and virulent print he derived during its prosperous state fully £2000 a year. In August, 1823, he was arrested for his debt to the Crown, and his property sold. He remained within the rules of the King's Bench till May, 1825, when he was released from custody. In 1824 appeared, in three volumes, the first series of his *Sayings and Doings*, which yielded him £2000. A second series followed in 1825, and a third in 1828, for each of which he seems to have received about 1000 guineas. Several other three-volume novels followed in rapid succession—*Maxwell*; *Love and Pride*; *Gilbert Gurney*, which contains a sort of autobiography of himself; *Jack Brag*; *Births, Deaths, and Marriages*; and *Gurney Married*. He died August 24, 1841. Hook's novels are sketches of contemporary manners, and as such they possess value. Exceedingly popular in their own day, they are now difficult reading, for the witty thrusts are no longer obvious. Hook himself was regarded by his later contemporaries as a jester. He is the original of Lucian Gay in Disraeli's *Coningsby*, and is introduced in *Vanity Fair* as Mr. Wagg. The better side of his character is given by Lockhart in the *Quarterly Review*, vol. xxii. (London, 1845). Consult: *Humorous Works* (London, 1873), and Barham, *Life and Remains of Hook* (London, 1849; revised 1899).

HOOK, WALTER FARQUHAR (1798-1875). An English dean and ecclesiastical historian. He was the nephew of the humorist Theodore Hook, and the son of Dr. James Hook, Dean of Worcester. He was born in London, graduated M.A. at Christ Church, Oxford, in 1824, and received the degree of D.D. in 1837. He took holy orders in 1821, and after holding curacies in the Isle of Wight and in Birmingham, was Vicar of Holy Trinity, Coventry, from 1828 to 1837, when he became incumbent of Leeds. Here by his tact and resourcefulness he overcame strenuous opposition on the part of Dissenters and among the working classes, who objected to compulsory Church rates, won great popularity; and in 1859, when he became Dean of Chichester, left Leeds richer by 21 new churches, 29 vicarages, and 27 schools. From 1827 he was chaplain-in-ordinary to George IV., William IV., and Victoria, on the accession of the latter preaching in the Chapel Royal his famous sermon, "Hear the Church," of which 28 editions, numbering over 100,000 copies, were sold in a short time. Its great vogue was due to the original enunciation of the fact that the Anglican Church of the sixteenth century was a reformed church and a return to the early English Church founded by the Apostles. At Chichester he wrote his most important work, *Lives of the Archbishops of Canterbury* (12 vols., 1860-76). Besides sermons and devotional works he published: *A Church Dictionary* (1842; 14th

ed. 1887); and *Dictionary of Ecclesiastical Biography* (8 vols., 1845-52). His memory is perpetuated in Leeds by a handsome Gothic memorial church, completed in 1880. Consult Stephens, *Life and Letters of Dean Hook* (London, 1878).

HOOKE, NATHANIEL (1690?-1763). A British historian, born in Ireland. He studied law, but practiced literature, beginning with a translation of the *Life of Fénelon* (1725), and *An Account of the Conduct of the Dowager Duchess of Marlborough* (1742), taken down from her dictation, and ending with a *Roman History from the Building of Rome to the Ruin of the Commonwealth* (4 vols., 1738-71), the latter half of which was not published till after his death, while the latest edition (6 vols.) came out in 1830. Hooke was the friend of many prominent characters of his time, including Pope.

HOOKE, ROBERT (1635-1703). An English physicist. He was born on the Isle of Wight, and was educated at Westminster School, and at Christ Church, Oxford. He assisted Boyle in the construction of his air-pump, and in 1662 was appointed curator of experiments to the Royal Society. In 1664 he became professor of geometry in Gresham College, London. In 1667 he was appointed city surveyor, though his model for rebuilding the city of London after the great fire of 1666 had not been adopted. From 1677 to 1682 he was secretary to the Royal Society. Though a man of extraordinary acuteness of perception and inventive genius, Hooke did not always enjoy the esteem of his contemporaries, owing to his peevish and excitable temper. He claimed priority—in many cases justly—to some of the most important discoveries and inventions of the time, and authorities admit that he was the first to recognize clearly that the problem of planetary motion should be treated as a purely mechanical one. He undoubtedly grasped the fundamental principle upon which Newton subsequently constructed the theory of gravitation; he failed, however, to develop it mathematically. Among his important inventions were the use of the balance spring for the regulation of watches, and many useful improvements in physical and astronomical instruments. His publications include: *Micrographics* (1666); the *Lectiones Cutlerianæ* (1678-79); and his *Posthumous Works* (1705).

HOOKE, WILLIAM (1601-78). An English clergyman, domestic chaplain to Oliver Cromwell. He was born in Southampton, was educated at Oxford, and after one charge in Devonshire went to America, and took charge of a church at Taunton, Mass. (1637-44). His next congregation was in New Haven, but he returned to England in 1656, and as his wife was Cromwell's cousin, the Protector made him master of the Savoy Hospital in Westminster, also his own chaplain. Some of Hooke's sermons were published, as well as his *New England's Tears for Old England's Fears* (1640).

HOOKER, MOUNT. One of the loftiest peaks of the Rocky Mountains in Canada, situated near the boundary of British Columbia and Alberta (Map: Northwest Territories, F 4). It has an estimated elevation of 15,700 feet.

HOOKER, JOSEPH (1814-79). A distinguished American soldier. He was born at Hadley, Mass., November 13, 1814; graduated at West Point in

1837 in the same class with Jubal Early and Braxton Bragg, and was assigned to the First Artillery. He served in Florida and on the Maine frontier in 1837-40, and was adjutant at West Point in 1841, and of his regiment from 1841 to 1846. During the Mexican War he served as aide to Gens. Persifer F. Smith, Thomas L. Harmar, William O. Butler, and Gideon I. Pillow; participated in the principal battles both of the northern and of the southern campaign, receiving the brevets of captain, major, and lieutenant-colonel for gallantry; became captain in 1848; was assistant adjutant-general to the Pacific Division in 1849-51, and resigned from the army February 21, 1853. From that date until the outbreak of the Civil War he was in turn farmer, civil engineer, and colonel of California militia. He was appointed brigadier-general of volunteers, May 17, 1861, and in March, 1862, was assigned to the command of the Second Division, Third Corps, Army of the Potomac. On May 5, 1862, he became major-general of volunteers, and at the battle of Williamsburg, Va., fought on that day, handled his division with skill and valor. He was active throughout the Peninsular campaign, and subsequently was conspicuous in the battles of Bristoe Station, the second battle of Bull Run, and Chantilly. In the Maryland campaign, as commander of the First Corps, he took part in the battles of South Mountain and Antietam, being wounded in the latter engagement. He was appointed brigadier-general in the Regular Army September 20, 1862.

In November, 1862, he was placed in command of the Fifth Corps, and at the battle of Fredericksburg (q.v.) commanded the centre grand division of the Army of the Potomac, comprising the Third and Fifth Corps. On January 26, 1863, he was assigned by President Lincoln to the command of the Army of the Potomac. His first act was to refit and reorganize the army. In a few months he had recruited depleted regiments, supplied them with new clothing and equipments, weeded out incompetent officers, armed, equipped, and organized the mounted troops in a single corps, and in other ways had infused new life into the army.

In his new command General Hooker failed, however, to show those qualities on the battlefield which had distinguished him as a corps and division commander. With the greater part of his army he advanced against General Lee, who then had a force half the size of his own, and who was stationed south of the Rappahannock, with the intention of attacking him in flank and rear and crushing him at one blow. His plans were somewhat deranged by high water and the failure of his cavalry under Stoneman to cut Lee's communications. While in position around Chancellorsville his right flank was surprised by the Confederate General Jackson, one corps was thrown into confusion, and after a protracted struggle, lasting from the 2d to the 4th of May, in which both armies suffered great losses, the Army of the Potomac was forced to recross the Rappahannock. While the fighting was hottest, on May 3d, Hooker was stunned, a pillar against which he was leaning having been struck by a cannon-ball. The disastrous result was largely due to his vacillation and his inability to cope with an emergency. (See CHANCELLORSVILLE, BATTLE OF.) After the battle Hooker and Lee stood for some time facing each other

across the Rappahannock, and shortly after Lee had started on his aggressive campaign which terminated in the battle of Gettysburg, Hooker broke up his camp and followed. The pressure of public opinion in the North, however, combined with friction between General Hooker and General Halleck, and growing lack of confidence in Hooker on the part of President Lincoln caused him to offer his resignation, and on June 28, 1863, General Meade succeeded him. The Government then gave him command of the Eleventh and Twelfth Corps, later combined to form the Twentieth Corps (Army of the Cumberland), and sent him (September 24, 1863) to reinforce Rosecrans at Chattanooga. On November 24th, in the so-called 'battle among the clouds,' at the head of his new command, he led a charge in the face of the Confederate artillery and infantry posted on Lookout Mountain. For his conduct on this occasion he was, on March 13, 1865, brevetted major-general in the Regular Army. He further distinguished himself under Sherman at Dalton and Resaca, and in the attack on Atlanta. At his own request (July 30, 1864), he was placed on waiting orders September 28th, when he was put in command of the Northern Department. On July 8, 1865, he was given charge of the Department of the East, and soon afterwards of the Department of the Lakes, with headquarters at Detroit, where he remained until 1867. A paralytic attack occasioned his retirement from active service (October 15, 1868), with the full rank of major-general in the Regular Army. General Hooker was a man of handsome physique and of great personal magnetism. He died at Garden City, L. I., October 31, 1879.

HOOKER, JOSEPH DALTON (1817—). A noted British botanist and traveler, second son of W. J. Hooker (q.v.). He was born at Glasgow, where he obtained the degree of M.D. in 1839. He immediately thereafter renounced the pursuit of medicine for that of botany, and joined the Antarctic expedition of the *Erebus* and *Terror*. When he returned, in 1843, he brought 5340 species of plants, which, with those discovered on the voyages of Captain Cook and other travelers, are discussed in six quarto volumes under the titles of *Flora Antarctica*, *Flora Nova Zelandiæ*, and *Flora Tasmaniae* (1844-60), works which won him an eminent position in science. In 1847 he undertook a three years' expedition to the Himalayas, upon which he made large collections, which, joined with those of his friend, Dr. Thomson, of the Botanical Gardens, Calcutta, aggregated nearly 7000 species. His *Himalayan Journals* (2 vols., 8vo, 1852 and 1854) contain the narrative of this expedition, and the *Rhododendrons of the Sikkim-Himalaya* (1849-51) illustrate the most remarkable additions which he made on this occasion to ornamental garden plants. With Dr. Thomson he undertook a *Flora Indica* (vol. i., 8vo, 1855), the first volume of which, containing only a few orders, remains a fragment. Half of the volume is occupied with a dissertation on botanical geography, a department of science to which he paid special attention in various works. He afterwards again undertook a *Flora of British India*, which was completed in 1874. In 1871 he made an expedition to Morocco, ascended the Great Atlas, the summit of which had never before been reached by a European, and brought back a valuable collection of plants. In 1855 he was appointed

assistant director at Kew Gardens, and, on the death of his father in 1865, director. He was president of the British Association in 1868, was appointed Companion of the Bath in 1869, and served as president of the Royal Society from 1872 to 1877. In the latter year he was knighted Commander of the Star of India. In the list of scientific memoirs published by the Royal Society, he is recorded as the author of 58 independent numbers and the joint author of 18 others. His *Students' Flora of the British Islands* is chiefly characterized by the record of the geographical distribution of the species. His great work, *Genera Plantarum*, undertaken in conjunction with his friend, George Bentham, commenced to appear in 1862. Among his other voyages, accounts of which appear in various books and journals, may be mentioned one to Palestine and Syria in 1860, and another to the Rocky Mountains, California, in 1877.

HOOKER, RICHARD (c.1553-1600). An English clergyman, author of the most famous existing treatise on the constitution of the Church of England. He was born at Exeter, in the year 1553 or 1554, of poor parents. He was a grave, bashful, and quiet boy, diligent in his studies, and quick at learning. His early progress was so rapid that his uncle, John Hooker, was induced to aid him in pursuing his education further. With additional help from John Jewel, Bishop of Salisbury, who afterwards became his patron, he was enabled to go to Oxford, where he entered Corpus Christi College in 1567. He became a scholar of Corpus Christi in 1573, was admitted to the degree of Master of Arts in 1577, and the same year became a fellow. The range of his learning was wide, and by no means confined to theology. From the age of nineteen he served as tutor, and in 1579 he was summoned, in an emergency, to deliver the Hebrew lecture, which he did so much to the satisfaction of the authorities that he continued to perform this duty so long as he remained at Oxford. For some unknown reason—perhaps through Puritan influence—he was once temporarily suspended from college, but honorably restored within a month. In 1582 Hooker took holy orders, and not long after married, Walton says, to his own sorrow. This marriage put an end to Hooker's quiet and congenial Oxford life. He was now obliged to seek a parish. He received the modest living of Drayton-Beauchamp, in Buckinghamshire (1584), where he lived, rather uncomfortably, for about a year. At the end of that period his fortunes were bettered by his being made Master of the Temple, London, over the head of a Puritan, Walter Travers, who was already reader there.

Hooker's London life was troubled with ecclesiastical controversy, which he disliked, yet which he would not attempt to avoid when once it was forced upon him. His colleague, Travers, represented that party in the Church of England which desired the adoption of Genevan ideas and usages, whereas Hooker stood for the episcopal establishment. These opposite views were reflected in the preaching at the Temple. "The forenoon sermon spake Canterbury, and the afternoon Geneva," was the current saying. Presbyterianism was either more popular, or else it had the better presentation, for we hear that the congregation "ebbed in the morning" (when Hooker preached),

and "flowed in the afternoon" (to hear Travers). The Puritan champion was at last silenced by Archbishop Whitgift, but the discussion was continued in print. Hooker was so deeply stirred by the question at issue that he determined to give it exhaustive treatment in book form, and at once entered upon the preparation of what became the celebrated *Laws of Ecclesiastical Polity*. To carry out his design a change of scene was necessary, and Hooker sought once more the quiet of a country parish, and found it at Boscomb, in Kent (1591). At the same time he was made a minor prebend of Salisbury, which added to his income without increasing his labor. In Boscomb Hooker wrote the first four books of the *Laws*, and they were published in 1594. The following year he removed to Bishop's Bourne, in Kent, where he spent the remainder of his life. Book V. of the *Laws* appeared in 1597, and there is reason to believe that the other three books were written here, although they were not published. There were to be eight books in all, according to Hooker's original plan. The *Laws* were hailed as the best defense of the Anglican position ever written. Visitors sought the author out in his retreat, but he himself was all unconscious of the important position he had come to occupy. His days were passed in quiet labor, and he continued to fulfill every duty of his parish with conscientious fidelity until his death, November 2, 1600, at the comparatively early age of forty-seven.

Hooker's reputation rests upon his writings, not upon his preaching. In personal appearance he was not prepossessing, and his manner in the pulpit was not effective. But as the author of the *Ecclesiastical Polity* he stands in the front rank of English men of letters. This work is a monument of literary style, in the formative period of English prose, besides being the most important contribution to the subject of Church government in the language. We have the first five books precisely as Hooker wrote them. The fate of books vi. to viii. in their completed form is shrouded in mystery. Walton relates that the manuscript was destroyed by Puritan relatives of Mrs. Hooker, but that the earlier rough draughts were preserved. From these, long afterwards, the seventh and eighth books were printed. What claimed to be a sixth book appeared in 1648, along with the eighth, but most of this probably does not belong to the *Laws* at all. The whole eight books were republished, with a life of Hooker by Izaak Walton, in 1666, since which time they have passed through many editions. In substance the *Ecclesiastical Polity* is a treatise on Church and civil government. Hooker's conception of the origin of the State resembles the 'social compact' theory of more recent times. The Church he holds to be simply the English State, looked at from the religious point of view. He defends the Established Church system, with all its ceremonial; but he does this with singular moderation, and he invariably accords courteous treatment to his opponents. In discussing the theories of Presbyterians and Independents, he points out what he believes to be their fundamental defects, and he defends the episcopal theory on Scriptural and rational grounds, as well as because of its antiquity and practical success. All succeeding writers on the English Church have built upon the foundations which Hooker laid.

Hooker's *Works* (including the *Ecclesiastical Polity*, the controversy with Travers, a *Discourse of Justification*, and a few *Sermons*) were published by John Keble (4 vols., 1836). This edition superseded all previous ones. It was reissued, with improvements (7th ed.) by Dean Church and Canon Paget, in 1888. Consult Walton, *Life of Richard Hooker*, prefixed to most editions of his works (Oxford, 1836).

HOOKER, THOMAS (c.1586-1647). A New England clergyman, the real founder of the Colony of Connecticut. He was born at Markfield, Leicestershire, England, and was educated at Emmanuel College, Cambridge, where he took the degree of B.A. in 1608, and that of M.A. in 1611. After holding a fellowship for some time at Cambridge, he became, about 1620, rector of a little church at Esher, in Surrey. In 1626 he accepted a lectureship at Chelmsford, Essex, where he soon won renown as an eloquent preacher, but by this very prominence attracted the attention of Laud, then Bishop of London, to his Puritanism. In May, 1629, he appeared before Laud, and was threatened by him with action before the Court of High Commission, and in the following year, upon being cited to appear before that tribunal, he left England and settled in Holland. In Holland he remained for three years, preaching in the English churches at Amsterdam, Delft, and Rotterdam. In 1633 he sailed for New England, on the same ship with John Cotton (q.v.), settling in Newtowne (Cambridge) in October of that year, and being admitted a freeman in the following spring. He was chosen pastor of the first church at Newtowne on October 11, 1633, and soon afterwards became one of the most influential clergymen in the Colony. It was he who in October, 1635, argued with Roger Williams before the General Court. There was something of a spirit of rivalry, not only between the people of Newtowne and Boston, but between their principal pastors, Hooker and Cotton. As early as May, 1634, the people of Newtowne complained to the General Court that they did not have room enough, and sought either for permission to extend their boundaries or remove to a new location, and in July they sent a small party into the Connecticut Valley to find a suitable place. The matter was temporarily adjusted by the extension of the town limits, but the spirit of unrest remained, and in 1636 Mr. Hooker and his church, with large delegations from the churches at Dorchester and Watertown, removed into the Connecticut Valley. The Newtowne church members established themselves at Hartford, but the influence of Hooker extended also to the towns of Windsor and Wethersfield, which were settled by others who had followed his lead into the new country. But it is not only as the leader and moving spirit of the new settlements that Hooker deserves to be known, but as the inspirer, if not the actual author, of the Fundamental Laws which delegates from the several river towns adopted for their government in 1639. In January, 1639, Hooker accompanied John Haynes, the first Governor of Connecticut, to Boston to confer with Winthrop concerning a proposed confederation of the New England settlements to provide for their mutual defense against the Dutch, the Indians, and the French. The year 1643 saw the result of their labors in the successful organization of the 'United Colonies of New England,' the first attempt at federal

government in America. Hooker published a great many sermons, and also: *The Soule's Preparation for Christ* (1632); *The Soule's Implantation* (1637); *The Soule's Ingrafting into Christ* (1637); *The Soule's Exaltation* (1638); *The Soule's Vocation* (1638); *An Exposition of the Principles of Religion* (1630); *The Saint's Guide* (1645); *A Survey of the Summe of Church Discipline* (1648), a defense of the New England churches which had great influence in the development of Congregationalism in America. Consult: Walker, *Thomas Hooker*, in the "Makers of America Series" (New York, 1891); Walker, *History of the First Church in Hartford* (Hartford, 1883); Johnston, *Connecticut*, in the "American Commonwealths Series" (Boston, 1878); *Johns Hopkins University Studies*, vol. vii. (Baltimore, 1889); Cotton Mather, *Magnalia Christi Americana* (London, 1702).

HOOKER, WILLIAM JACKSON (1785-1865). A celebrated English botanist. He was born at Norwich, and studied branches of natural history as a pastime during his youth. In 1811 he published his first work, *Journal of a Tour in Iceland*, of which a second edition was demanded in 1813. From that time forward he was constantly busy in the publication of botanical works. His investigation of the British *Jungermannia* and mosses led to his appointment to the chair of botany in Glasgow University, where he lectured with marked success until 1841, when he became director of the royal gardens at Kew. Here his pronounced executive ability wrought wonders. The garden, which at that time consisted of eleven acres, was extended to 45, in addition to which a park of 240 acres was added; the 10 old conservatories were replaced by 25 much larger ones of more modern construction; in conjunction with Henslow, he founded the most complete museum of botany in the world; and by his enormous correspondence with and ready aid to botanists throughout the realm, Kew Gardens became the distributing point of hundreds of useful plants, which were sent there in collections and then shipped to colonies for testing. Through his efforts Great Britain has largely extended her commerce in products of the soil. Accompanying his official duties he was collecting for his private herbarium, and writing books on botany which at the time of his death numbered about one hundred volumes. His herbarium was purchased by the nation after his death. His name was enrolled in the lists of all scientific societies at home and abroad, and on account of his scientific acquirements he was knighted in 1836. Among his works may be mentioned: *Monograph of the British Jungermannia* (1812-13); *Muscologia Britannica* (1818); *The British Flora* (1830), a work which has gone through seven editions; *A Century of Orchidaceous Plants* (1848); *Icones Plantarum*, in 10 volumes (1837-60); *British Ferns* (1862); *Garden Ferns* (1862).

HOOKER, WORTHINGTON (1806-67). An American physician, born in Springfield, Mass. He graduated at Yale in 1825, and in medicine at Harvard in 1829, and practiced in Connecticut until 1852, from which time until his death he was professor of the theory and practice of medicine in Yale. His principal works are: *Physician and Patient* (1849); *Homoeopathy: an Examination of the Doctrines and Evidences* (1852); and

Rational Therapeutics (1857). His *Child's Book of Nature* achieved a deserved reputation and is still widely used.

HOOK-SQUID. A squid of the family Onychoteuthidae, allied to the common squids, but having the eyes destitute of any covering of skin. The two longer arms, or 'tentacles,' and sometimes the shorter arms, bear suckers, each inclosing a powerful hook, which is retractile, like

HOOKS OF A HOOK-SQUID.

1. Side view of a sucker, showing a half-concealed hook. 2. Front view of same. 3. A fossil hook-squid (*Acanthoteuthis speciosa*); impression of arms, traceable by the preserved hooks, in the lithographic slates of Eichstätt, Bavaria.

the claws of a cat. Hook-squids are found in the Sargasso Sea, in the Polynesian seas, etc., and are much dreaded by swimmers and divers, as they are sometimes six feet or more long.

HOOLE, JOHN (1727-1803). An English translator and dramatist, born in Moorfields, London. He had little education, was too near-sighted to become a watchmaker like his father, so entered the India House as a clerk (1744), was made auditor of Indian accounts, then principal auditor. He is known to letters because of his acquaintance with John Scott, and his biography of him, and for his acquaintance with Johnson, for whom he organized (1781) a city club, and whom he attended in his last illness. His poetical style was smooth and artificial. Hoole's works are: the translations, *Tasso's Jerusalem Delivered* (last edition, 1819), *Dramas of Metastasio* (1767), *Tasso's Orlando Furioso* (1791), and *Tasso's Rinaldo* (1792), which were all severely criticised by Scott, Southey, and Lamb; his own dramas, *Cyrus*, from Metastasio's *Ciro Riconoscinto* (1768); *Timanthes*, an imitation of Metastasio's *Demofonte* (1770); and *Cleonice*, said to have been corrected by Johnson (1775); the life of Scott, already mentioned, which was prefixed to Scott's *Critical Essays*; and a monody on *The Death of Mrs. Woffington* (1760).

HOO'LOCK. The white-browed gibbon (*Hylabates hoolock*) of Northeastern India, where it leads an active life among the hill forests. It is frequently kept captive, and proves a docile, cleanly, and interesting pet. The name is a na-

tive imitation of their whooping call, heard most frequently at sunrise. See GIBBON.

HOO'NOOMAN, hoo'nōō-mān. The sacred monkey of India. A better spelling of the word is Hanuman (q.v.).

HOOP-ASH. See HACKBERRY.

HOOPER, JOHN (c.1495-1555). An English prelate and martyr. He was born in Somersetshire about 1495, and educated at Oxford. He became a Cistercian monk, and when the monasteries were dissolved went to London to live. He was converted to Protestantism, and, advocating his new views, had to flee to the Continent (1540), and spent some time in Switzerland. Some time after the accession of Edward VI. he returned to England (1549), and became a preacher in London. In 1550 he was appointed Bishop of Gloucester, but his objections to wearing the episcopal vestments caused some delay in his consecration. In 1552 he received the bishopric of Worcester *in commendam*. On the commencement of Mary's reign in 1553 he was committed to the Fleet, where he remained for 18 months, being frequently examined before the Council, was condemned as a heretic, and burned at the stake at Gloucester, February 9, 1555. He was the author of numerous sermons and controversial treatises, of which a collected edition appeared at Oxford (1855).

HOOPER, JOHNSON J. (c.1815-1863). An American humorist. He was born in North Carolina, removed early to Alabama, edited a newspaper and practiced law there, and was secretary of the Provisional Confederate Congress. In 1845 he published the *Adventures of Captain Simon Suggs*, one of the raciest books of its time, descriptive of a gambling sharp of the Southwest in the 'flush times.' His *Widow Rugby's Husband and Other Tales of Alabama* (1851) is less successful.

HOOPER, WILLIAM (1742-90). An American jurist and signer of the Declaration of Independence, born in Boston and educated at Harvard. He studied law with James Otis, and practiced very successfully in North Carolina, where he ably assisted the Provincial Government in suppressing the disturbances of 1770, and was elected to the Legislature in 1773. There he became a leader, and, a year later, was elected to the Continental Congress, from which he resigned in 1777. He was one of the Federal judges appointed to adjudicate the territorial dispute between Massachusetts and New York.

HOOPESTON, hoop'ston. A city in Vermilion County, Ill., 100 miles south of Chicago; on the Chicago and Eastern Illinois and the Lake Erie and Western railroads (Map: Illinois, E 3). It is the seat of Greer College, established in 1891, and has McFarren and other public parks. The city is in a fertile agricultural region, and manufactures horseshoe nails, cans and canning machinery, and canned goods, among its establishments being two of the largest sweet-corn canning factories in the United States. In 1877 Hoopeston received a city charter, still in operation, which provides for a mayor, elected biennially, and a council. The water-works are owned and operated by the municipality. Population, in 1890, 1911; in 1900, 3823.

HOOPING COUGH. See WHOOPING COUGH.

HOOPOE (obsolete *hoopoop*, reduplication of *hoop*, Fr. *huppe*, OF. *huppe*, hupe, from Lat.

upupa, hoopoe). One of a small and singular group of birds of the warmer parts of the Old World, which take both their common and systematic names (genus *Upupa*, family *Upupidae*) from their cry. In this family the bill is long and slender, the wings of moderate size or short, the legs short, the toes long, and the claws strong and curved. The common European

HOOPOE.

hoopoe (*Upupa epops*) is an African bird, visiting in summer most parts of Europe and Asia, but rare in Great Britain. It is about the size of a blue jay; its plumage exhibits a fine mixture of white, buff, and black, and it has a large crest of two parallel rows of feathers. Its strange appearance and habits have caused it to figure largely in European legend and folk-lore. It gets its food chiefly on the ground, and its peculiar notes are said to be made by striking the bill on the ground as the note is uttered. The nest is made in a hole in a tree or wall, and the eggs are white. The hoopoes were formerly thought to be related to the crows, but it is now generally admitted that their nearest relatives are the hornbills, although they are apparently so different. An extensive account of the curious and interesting traits of this bird is given in the *Royal Natural History*, vol. iv. (London, 1895). See BIRD for other authorities. See Plate of TROGONS, HOOPOE, ETC.

WOOD-HOOPOE. The birds of the family *Irisoridae*, which are found in South Africa, are nearly related apparently to the *Upupidae*, and are known as wood-hoopoes. They are arboreal, have a glossy blackish plumage, no crest, and a long graduated tail. They are said to be noisy and restless birds, and to climb about on trees like woodpeckers. Like the true hoopoes, they emit a strong, disagreeable smell.

HOOPS, HOOP-SKIRT. See CRINOLINE.

HOOPSNAKE. A small snake (*Abastor erythrogrammus*) of the South Atlantic States, foolishly feared by the negroes, who say it will put its tail in its mouth, stiffen its body, and roll along like a hoop, aiming to let go of its stinging tail and dart it into the first person it meets. Similar stories are told of a closely related species, the wampum-snake (*Farancia abacura*), common in swampy ground in the South; and both are called 'horn-snakes.' In fact both species are perfectly harmless, and spend most of their time beneath the ground, burrowing deeply into the soil. The former is blue-black above, marked with three red lines, and flesh-colored below, with black spots; while the latter is uniform bluish black above and banded with red on the abdomen.

HOORN, hörn. A seaport of the Netherlands, in the Province of North Holland, situated on the Hoornerhop, a bay of the Zuider Zee, 25 miles northeast of Amsterdam (Map: Netherlands, D 2). It is a typical old Dutch town, and has several quaint buildings, among them the Harbor Tower, the town hall, and the court-house.

other notable edifices are the museum and the Grootte Kerk (great church), the latter with a monument to Admiral Floriszoon. Hoorn was formerly one of the richest towns in Holland, the great nets for the herring fishery being employed here as early as 1416. It has now a considerable trade in dairy products, and also some ship-building. Hoorn is the birthplace of the navigator Willem Schouten, who named Cape Horn after his native town. Population, in 1889, 11,033; in 1899, 10,714.

HOORNE, HOORN, HORN, or HORNES, PHILIPPE DE MONTMORENCY-NEVELE, Count of (c.1518-68). A Flemish statesman and soldier, born at Nevele. Trained to arms under Charles V., he distinguished himself in the war against the Schmalkaldic League and later accompanied Philip II. on his travels in Germany, Italy, Spain, and England. At the battle of Saint-Quentin (1557) Hoorne did brilliant service as commander of the artillery. Later he accompanied Philip to Spain, but in 1561 returned to Brussels, as counselor of State. In this capacity he sided with Egmont and the Prince of Orange in opposition to Cardinal Granvella and the Spanish party. He urged on Margaret of Parma to a policy of concession, and having been sent to Tournay to reestablish order there, he showed a spirit of toleration which won for him the regard of the patriotic party, but increased the animosity of the Ultramontanes. The failure of Egmont (q.v.) and Hoorne to throw in their lot with the Spanish party was, however, fatal. When the Duke of Alba arrived the two noblemen were treacherously seized, and after an illegal trial before the Council of Blood, were executed in the great square of Brussels, June 5, 1568. Besides the contemporary chronicles, consult: *Le comte d'Egmont et le comte de Hornes* (Brussels, 1863); and the popular account by Schiller, "The Trial and Execution of Counts Egmont and Horn," in his *Historical Works* (London, 1847); also the histories by Motley and others, cited under NETHERLANDS.

HOO'SAC MOUNTAINS. A spur of the Green Mountain Range in west Massachusetts, extending 16 miles north and south on the east side of the valley of the Upper Hoosac (Map: Massachusetts, A 2). The Hoosac railway tunnel (see TUNNEL), which pierces Hoosac Mountain, is the largest tunnel in America.

HOOSAC RIVER. A river of Vermont and New York States, rising in Berkshire County, Mass., and after a north and northwest course flowing into the Hudson, 15 miles north of Troy (Map: Vermont, A 10). In New York State it is known as the Hoosick.

HOOSE, hōōz or hōōs. A parasite of sheep. See LUNG-WORMS.

HOO'SICK FALLS. A village in Rensselaer County, N. Y., 27 miles northeast of Troy; on the Hoosac (Hoosick) River, and on the Boston and Maine Railroad (Map: New York, G 3). It has extensive manufactures of agricultural implements, cotton and woolen goods, shirts, paper, and paper-making machinery. Settled in 1688, Hoosick Falls was incorporated first in 1827. Under a charter of 1884, revised in 1890, the village is governed by a president, chosen every three years, and a board of trustees, elected from their re-

spective wards on a general ticket. Population, in 1890, 7014; in 1900, 5671.

HOOSIER (hōw'zhēr) **FROG.** See **MINK-FROG.**

HOOSIER SCHOOLMASTER, THE. A novel by Edward Eggleston (1875), one of the first successful attempts to picture the rude surroundings of the pioneers of the Middle West. The story became very popular and was the author's only successful novel.

HOOSIER STATE. Indiana. See **STATES, POPULAR NAMES OF.**

HOOVE, or HOVEN. See **BLOAT.**

HOP (from MDutch *hoppe*, Dutch *hop*, OHG. *hopfo*, Ger. *hopfen*, hop, of doubtful origin), *Humulus Lupulus*. A perennial plant which belongs to the Urticaceæ, or nettle family. The single species, a native of America and England, where it is often found growing wild upon trees and shrubs, has given rise under cultivation to many varieties. The hop is a dioecious climbing vine with rough stems and heart-shaped, three to seven lobed leaves. The pistillate flowers are the hop of commerce, used mainly in the manufacture of beer. Hop culture is not general like the culture of cereals, but is confined to certain areas, comparatively limited in extent, which on account of soil and climatic conditions are especially suited to the production of the crop. The principal hop-producing regions of the United States are New York and the Pacific Coast States. Wisconsin also produces a small quantity. In Europe hops are grown for the market in England, Bohemia, Germany, France, and Belgium. The hops from Kent in England and from Saaz and Auscha in Bohemia have long been considered of the finest quality throughout the world. In general, the hops are known in the European markets by the name of the locality in which they were grown. This serves as an indication of their comparative quality and value.

The hop may be grown on a variety of soils, but it always requires a well-drained subsoil. It succeeds best on a moist, sandy loam. Soil conditions are generally considered the most important factor in determining the quality of the crop. In preparing land for hops it is plowed deeply and brought to a fine tilth. The hop is propagated by cuttings made from the underground stems which the plant sends out near the surface of the ground. These cuttings are made and set out in the spring. In the United States the plants are usually placed about seven feet apart each way, but in European hop-fields the distance is about four feet. In this country one male plant is grown per hundred or so, but in Europe as a rule only female plants are grown, as the presence of seeds in the hops injures the flavor of certain beers made from them. The vines are either trained on poles or on wire trellises. The latter method is gradually displacing the system of training on poles. During the growing season the soil is cultivated to keep it mellow and retentive of moisture and for the purpose of killing the weeds. Harvesting is done by hand, and forms the hop-grower's busy season, as the hop deteriorates when exposed too long to the weather after it is ripe. The yield varies from 1000 to 3000 pounds per acre. When the hops are harvested they are immediately cured by air-drying under cover or by drying in kilns constructed for that purpose. The cured

product is pressed into bales of about 200 pounds each and is shipped in this form to distant markets. In Europe hops are generally shipped in large sacks without being baled. By the *American Agriculturist*, the crop of 1900 was estimated at 208,000 bales; 1901, 210,000; 1902, 195,500. The largest crop recorded was that of 1894, which was estimated to be 320,000 bales.

The valuable principle of the hop is a yellowish aromatic, resinous substance called lupulin, which has been found to contain two preservative or soft resins (oleoresins), and a non-preservative or hard resin. The preservative resins are the most valuable, since they are particularly unfavorable to the growth of lactic ferments, but not to the true yeast of beer. The deterioration of hops caused by exposure when mature, or by excessive drying, consists in the waste of the lupulin. To fulfill the requirements of the brewer the product must be a well-ripened hop, properly dried and with the resin and other qualities unimpaired.

HOP.

HOP-APHIS. See **HOP-LOUSE; HOP-INSECTS.**

HOPAT'CONG, LAKE. A picturesque body of water in Sussex County, N. J., 50 miles northwest of Jersey City. Stages connect it with Hopatcong railway station, 4 miles distant. The lake is 8½ miles long, 3½ miles wide, and lies in a well-wooded fir and pine district, 725 feet above sea-level. The Musconetcong River drains it from the southwest into the Delaware. There are numerous hotels and boarding-houses on its shores, and it is a favorite summer resort.

HOPE, ALEXANDER JAMES BERESFORD- (1820-87). An English politician and author, son of Thomas Hope and stepson of William Carr, Viscount Beresford. He was educated at Harrow and at Trinity College, Cambridge; served in Parliament from 1841 to 1852; was reelected in 1857; and from 1868 to his death represented Cambridge University. An independent Conservative, he opposed the abolition of Church rates, the legalization of marriage to one's deceased wife's sister, and, especially, the Reform Bill of 1867. In the debate on the last measure he broke lances with Disraeli, calling him the 'Asian mystery,' and getting recognition of his Dutch ancestry and poor delivery in Disraeli's allusion to 'Batavian graces.' A High Churchman and deeply devoted to the English Church and to its

control by the State, Hope bought, in 1844, Saint Augustine's Abbey, Canterbury, as a missionary college, built All Saints' Church, in London, and wrote on religious liberty, at the time of the excitement over Roman aggression, in the *Chronicle*, and later in the *Saturday Review*, being closely associated in both with John Douglas Cook. Hope was president of the Royal Institute of British Architects (1865-67), of the Architectural Museum, and of the Ecclesiological Society. His works include: several works on Church politics; *A Popular View of the American Civil War* (3d ed. 1861); and a successful novel, *Strictly Tied Up* (4th ed. 1886).

HOPE, ANTHONY. See HAWKINS, ANTHONY HOPE.

HOPE, Sir JAMES (1808-81). A British admiral, born in Edinburgh. He was educated in the Royal Naval College, Portsmouth, and when fourteen years old went as midshipman on a frigate bound for the West Indies. In five years he was promoted lieutenant and by 1830 had reached the rank of commander, having by that time made voyages to the Mediterranean and the East Indies. He saw service in North and South America (1833-45), and after opposing the Russians in the Baltic for two years was created rear-admiral (1857), and commander of the Chinese squadron (1859-62). In 1859 he made a gallant attempt to enforce the ratification of a treaty the Pekin Government had entered into with France and England. He lost ships and men and was himself severely wounded, but returned to the attack the following year and was successful (1860). From 1863 to 1867 he commanded in North American waters and the West Indies, and for three years (1869-72) was in charge at Portsmouth. He was made an admiral in 1870, chief naval aide-de-camp to Queen Victoria in 1873, and was retired in 1878, but was created honorary admiral of the entire fleet a year later.

HOPE, THOMAS (c.1770-1831). An English author and virtuoso. He belonged to a rich family of merchants, Scotch by descent, who had settled in Amsterdam. While still a youth he traveled extensively in Southern Europe and in the East, and collected many drawings, chiefly of buildings and sculptures. After 1796 he made England his home. He first attracted attention by the decorations which he bestowed on the interior of his mansion in Duchess Street, Portland Place, London, a description of which appears in his book *Household Furniture* (1807). In 1809 he published *Costumes of the Ancients and Architecture of Theatres*. Three years afterwards appeared *Modern Costumes*, and in 1819 *Anastasius, or Memoirs of a Modern Greek at the Close of the Eighteenth Century*. Published anonymously, this last work was ascribed to Lord Byron, who said that he had wept because he did not write it. It is a brilliant romance describing adventures and manners in the East. After his death appeared *An Essay on the Origin and Prospects of Man* and *An Historical Essay on Architecture*.

HOPE, THOMAS CHARLES (1766-1844). A Scotch professor of chemistry, born in Edinburgh. He graduated at the University there in 1787 and for the following eight years was professor of chemistry and assistant in medicine at the University of Glasgow. He returned to his alma mater to be associated with Prof. Joseph

Black in chemical instruction, became his successor in 1799, and retained the chair till a year before his death. He was specially skilled in experimental work, and the results of his two most important discoveries are contained in a paper read before the Royal Society of Edinburgh, *An Account of a Mineral from Strontian, and of a Peculiar Species of Earth which It Contains* (1793), and in *Experiments on the Contraction of Water by Heat*, published by the Edinburgh Royal Society (1805). Professor Hope instituted a prize in chemistry (1828), but he was averse to permitting his students to take a practical part in his experiments.

HOPE COLLEGE. An institution of learning, situated at Holland, Mich. It was organized by Dutch colonists in 1857 as an academy, and chartered as a college in 1866 under the auspices of the Reformed Church in America. The Western Theological Seminary was founded in 1869. The college is coeducational and had in 1902 121 preparatory, 65 collegiate, and 17 theological students, an endowment of \$270,191 and an income of \$20,424. At the same time the library contained 10,000 volumes. Besides the ancient languages, instruction is given in French, German, Dutch, Italian, and Spanish. The degree of Bachelor of Arts is conferred.

HOPE DALE. A communistic settlement, founded in 1841 by a society under the leadership of Rev. Adin Ballou, in the town of Milford, Worcester Co., Mass. The chief aim of the founder was to restore the original ideals of Christian life, rather than to reorganize society economically. A farm of 238 acres with mill sites was purchased by the society, organized as a joint-stock company. The community consisted of twenty-eight persons, who observed strictly the rules of communism. As the community increased in numbers, these rules were somewhat relaxed. A board of trustees at first controlled the industries of the community; but later the several branches were farmed out to individuals. The community was not a success financially, nor was social harmony long maintained. In 1854 it had reached its highest point, embracing about two hundred members. Agriculture and several branches of manufacture were carried on. Two years later the community was found to be deeply in debt, and the joint-stock company was dissolved. As a purely religious organization it continued to exist for some years, but during the Civil War merged in the Hopedale parish, with Mr. Ballou as pastor, the industries founded by the society being carried on by private management. Consult Adin Ballou, *History of the Hopedale Community* (Lowell, 1897).

HOPE DIAMOND. A large blue diamond, in the possession of the family of H. T. Hope, weighing 44¼ carats. It is supposed to have been cut from a stone purchased from Tavernier by Louis XIV., which weighed uncut 112½ carats, and 67½ carats after cutting. The stone was lost in 1792, and the Hope diamond came into the market in 1830.

HOPEFUL. In Bunyan's *Pilgrim's Progress*, the companion of Christian on the journey from the City of Destruction to the Delectable Mountains and the Shining Gate.

HOPE THEATRE, THE. A sixteenth-century bear-garden, on the Bankside, Southwark, London, which was changed into a playhouse in

1581. It was restored to its former capacity at the Restoration, but toward the end of the seventeenth century gradually lost its popularity.

HOPFEN, hōp'fen, HANS VON (1835—). A German novelist and poet, born and educated at Munich. In 1866 he moved to Berlin, where he devoted himself to literature, having already edited the *Münchener Dichterbuch* (1862) and written the novel *Peregretta* (1864). A book of essays, *Streitfragen und Erinnerungen* (1876); a volume entitled *Theater* (1889); the plays *Aschenbrödel in Böhmen, In der Mark; the Neues Theater* (1892-93); the tragedy *Göttin der Vernunft* (1892); the drama *Helga* (1892); and the comedy *Es hat so sollen sein* (1893), comprise his best dramatic and miscellaneous work. The remainder of his writings include a score of novels and collections of stories, of which the following may be mentioned: *Verdorben zu Paris* (2d ed. 1892); *Die Hierat des Herrn von Waldenberg* (2d ed. 1884); *Der alte Praktikant* (3d ed. 1891); *Die Geschichten des Majors* (3d ed. 1882); *Neue Geschichten des Majors* (1890); *Im Schlaf geschenkt* (4th ed. 1896); *Zehn oder elf* (1901); and *Gotthard Lingsens Fahrt nach dem Glück* (1902).

HOP-HORNBEAM. See HORNBEAM.

HOPÍ, hō'pé, or **MOKI**, mō'ké. An interesting Pueblo tribe of Shoshonean stock, occupying seven villages upon three mesas in north central Arizona, and numbering about 1600, including those of Tewa or Hano. The principal villages are Walpi and Oraibi. In many respects the Hopi may be considered the most interesting of Pueblo tribes. They are all mesa-dwellers, their villages being situated hundreds of feet above the surrounding desert. They are only to be reached by steep, adventurous trails. They hold fast to their old aboriginal culture, which is of the typical Pueblo character, but better preserved than that along the Rio Grande. Their ceremonials are elaborately conducted, particularly those of the 'new fire' and the 'winter solstice,' also the celebrated snake dance, in which the performers carry living rattlesnakes in their mouths as they dance. They are industrious farmers and have always in their granaries abundant stores of corn, beans, and pumpkins. They also weave baskets and blankets, and are skillful potters and wood-carvers. (See Colored Plates in articles BASKET and BLANKET.) The clan system is rigid and highly developed among them. According to archaeological evidence, the ancestors of these tribes were authors of many of the ancient ruins in the surrounding region. The people of the small village of Hano are of different language, originally being refugees of Tanoan stock, who fled from the Rio Grande at the time of the great Pueblo rebellion in 1680.

HOP-INSECTS. The most destructive insect enemy of the hop crop is the hop-aphis. Other species are of less importance, but they sometimes do considerable damage to the plant. The hop-grub or hop-plant borer (*Goryna immanis*) is the larva of a noctuid moth which lays its eggs in the early part of the season upon the young shoots of the plant. The young caterpillars, which are slender and greenish in color spotted with black, bore into the vine just below the tip and remain at this point for some time. The head turns downward and stops growing. Such vines are called 'muffled heads' or 'stag

vines,' and sometimes 'bullheads,' the caterpillar at this time being called 'tip-worm.' A little later it drops to the ground and enters the stem at the surface of the ground. It is then called the 'collar-worm,' changing to a white color with black spots. About the end of July it becomes full-grown and transforms to pupa near the roots of the plant. The moth issues in the fall or in the spring.

A number of different caterpillars feed upon the foliage. The hop-vine snout-moth (*Hypena humuli*) is one of the principal forms. The larvæ of two butterflies (*Polygonia interrogatoris* and *Polygonia comma*) feed quite abundantly upon this plant and are known to hop-growers as 'hop-merchants' from the gold and silver markings upon the chrysalids. The zebra caterpillar (larva of *Mamestra plectra*), the common woolly-bear caterpillar (larva of *Spilosoma virginica*), and the saddle-back caterpillar (larva of *Empretia stimulea*) are the remaining principal species. One of the leaf-hoppers, *Tettigonia confluenta*, causes more or less damage to the foliage, and the striped flea-beetle (*Phyllotreta vittata*) also damages the leaves, while the so-called 'red spider' or 'spinning mite' (*Tetranychus telarius*) often causes the leaves to turn yellow. The best remedy for all of these insects consists in spraying at the proper time, using an arsenical spray for the caterpillars and the flea-beetle, a kerosene emulsion for the leaf-hoppers, and a sulphur wash for the spinning mite. Consult Howard, "Pests of the Hop Crop," in *The Hop Industry* (New York, 1898).

HOPKINS, EDWARD (1600-57). A Colonial Governor of Connecticut. He was a London trader who came to New York in 1637, and settled at Hartford. He was chosen Governor of the Colony of Connecticut every alternate year from 1640 to 1652. After that he lived in London. He assisted in forming the Union of the New England Colonies in 1643. He left £1000 to support grammar schools in Hartford and New Haven. With the sum of £500 left for 'public ends,' Harvard College, to which it was turned over, bought a township from the 'praying Indians,' and named it Hopkinton.

HOPKINS, EDWARD JEROME (1836-98). An American musician, born at Burlington, Vt. He was practically a self-taught musician, and remarkably precocious. He held many positions as organist in New York City, was the originator of the 'lecture-concerts,' and made many concert tours in the United States, and in 1890 in England. He founded the American Music Association (1856) for performing native works; the Orpheon Free Schools (1865), which had over 30,000 pupils; and the New York *Philharmonic Journal* (1868). His compositions embrace almost every department of music, but although many of them, as *Easter Festival Vespers* (for three choirs, echo choir, two organs and orchestra, harp and cantor priest), are of strikingly original form, they have not met with much favor. He died at Athenia, N. J.

HOPKINS, EDWARD WASHBURN (1857—). An American Sanskrit scholar and philologist, born at Northampton, Mass. He graduated at Columbia College, New York, in 1878, and after studying in Germany and teaching at Bryn Mawr College, Pa., he was called to Yale University in 1895, as professor of comparative philology

and Sanskrit, to fill the chair left vacant by the death of Whitney. Besides numerous contributions to the Oriental and philological journals of America, he is the author of several important books connected with India: *The Four Castes in Manu* (1884); *Religions of India* (1895); *The Great Epic of India* (1901); *India Old and New* (1901).

HOPKINS, ESEK (1718-1802). An American naval officer, born in Scituate, R. I. In the Revolutionary War he was at first a brigadier-general in the army, but in 1775 Congress commissioned him commander-in-chief of the new American Navy. Washington officially addressed him as admiral. He went to sea in February, 1776, with four ships and three sloops, and took the forts at New Providence, with all the guns, ammunition, and stores. On his return he seized a British schooner and a bomb-brig. His later operations were less fortunate, and in January, 1777, he was dismissed from the service because he let the *Glasgow* get away from him and failed to appear before Congress when so ordered. He was afterwards prominent in Rhode Island political affairs. Consult Field, *Esek Hopkins, Commander-in-Chief of the Continental Navy During the American Revolution, 1775-78* (Providence, 1898).

HOPKINS, EZEKIEL (1634-90). Bishop of Londonderry. He was born at Pinne, Devonshire, December 3, 1634. His early education was conducted under Presbyterian and independent influences. He graduated B.A. at Oxford (1653), and became chaplain of Magdalen College (1656). In 1662 he conformed, and was presented to the living of Saint Mary Woolnoth, in London. When the great plague broke out in the capital (1666), Hopkins withdrew to Exeter, where he obtained the living of Saint Mary's. When Lord Robartes was made Lord Lieutenant of Ireland (1669), Hopkins went with him to Dublin, and through his influence obtained the deanery of Raphoe (1670), and in 1671 the bishopric of Raphoe. In 1681 he was made Bishop of Londonderry. In the course of the siege of the town by the Irish adherents of James II., in 1689, Hopkins withdrew from the town, and retired first to Raphoe and afterwards to London, where he was made rector of Saint Mary Aldermanbury (1689). This charge he held until his death, June 19, 1690. His works, which have been frequently republished, comprise: *Sermons; Expositions of the Decalogue and the Lord's Prayer*; and elaborate discourses on *Regeneration and The Vanity of the World*. The best edition of his collected works is by Pratt (London, 1809).

HOPKINS, JOHN HENRY (1792-1868). A Protestant Episcopal bishop. He was born in Dublin, Ireland, January 30, 1792; came to the United States in 1801, and became an iron-manufacturer in Pennsylvania. Not succeeding in business, he studied law, and began practice in Pittsburg, but in 1823 he entered the ministry of the Protestant Episcopal Church. In 1831 he accepted the charge of Trinity Church, Boston, and the next year was chosen Bishop of Vermont, taking also the rectorship of a church in Burlington. He took great interest in education, and made heavy pecuniary sacrifices for its promotion. After 1856 he devoted his whole time to the supervision of the diocese. Hopkins was a prolific writer, leaving nearly twenty published works,

among which are: *Christianity Vindicated* (1833); *The Primitive Creed Examined and Explained* (1834); *The Novelties which Disturb Our Peace* (1844); *History of the Confessional* (1850); *The American Citizen, His Rights and Duties* (1857); *A Scriptural, Ecclesiastical, and Historical View of Slavery* (1864). He was prominent in the Lambeth Conference in London in 1867. He died at Rock Point, Vt., January 9, 1868. Consult his biography (New York, 1873), by his son JOHN HENRY (1820-91).

HOPKINS, JOHNS (1795-1873). An American financier and philanthropist. He was born of Quaker parentage in Anne Arundel County, Md., where he lived on a farm until he was seventeen, when he went to Baltimore, and worked for a time in his uncle's grocery. Afterwards he became a merchant, with wide connections in Maryland, Virginia, and North Carolina. His credit and counsel were highly valued in financial and mercantile affairs, and he became one of the leading financial men in Baltimore. His services to the Baltimore and Ohio Railroad were of great value. Toward the end of his life, having no children, he determined to devote his fortune to the service of the public. Accordingly, in addition to minor gifts to individuals and charities, he founded and endowed two great institutions which perpetuate his name—the Johns Hopkins University and Johns Hopkins Hospital, whose activities are united in the Johns Hopkins Medical School. The total gift for these two purposes was more than \$7,000,000.

HOPKINS, LEMUEL (1750-1801). An American political poet, born in Connecticut. He practiced medicine at Litchfield, and after 1784 in Hartford, where he became allied with the 'Hartford Wits,' Joel Barlow, John Trumbull, David Humphreys, Theodore Dwight, and others, and with them wrote: *The Political Greenhouse, The Echo*, and—advocating strong federal government—*The Anarchiad* (republished at Hartford, 1861). Hopkins also wrote *The Hypocrite's Hope* and *The Victim of a Cancer Quack*.

HOPKINS, MARK (1802-87). An American educator, grandnephew of the theologian Samuel Hopkins, and brother of the astronomer Albert Hopkins. He was born at Stockbridge, Mass., was educated at Williams College, was tutor there for two years, and, after studying medicine and practicing for a short time in New York, became professor of moral philosophy in Williams in 1830, and president of the institution in 1836. He resigned this position in 1872, but remained college preacher and incumbent of the chair of moral philosophy. In 1857 he had become president of the American Board of Foreign Missions. Undoubtedly one of the greatest of American educators of his day, Hopkins did much to build up the prestige of Williams College and much more to develop the individual student. He was a powerful preacher and a successful lecturer. He published: *The Influence of the Gospel in Liberalizing the Mind* (1831); *The Connexion Between Taste and Morals* (1841); his Lowell Lectures, *The Evidences of Christianity* (3d ed. 1875); *Miscellaneous Essays and Reviews* (1847); a second series of Lowell Lectures, *Moral Science* (1862); *The Law of Love and Love as a Law* (last ed. 1881); *An Outline Study of Man* (last ed. 1893); *Strength and Beauty* (1874; in 1884 under the title *Teachings and Counsels*); and *The Scriptural Idea of Man* (1883).

HOPKINS, SAMUEL (1721-1803). An American clergyman and founder of the Hopkinsian theology. He was born at Waterbury, Conn., September 17, 1721. Having graduated at Yale College in 1741, he studied theology with Jonathan Edwards, and from 1743 to 1769 was pastor of Housatonic, now called Great Barrington, Mass. He then removed to Newport, where he died December 20, 1803. His writings consist of a life of Jonathan Edwards, sermons, addresses, a work on the millennium, and a system of theology, republished in Boston, 1852. He was remarkable for his simplicity, earnestness, and persevering industry. His peculiar theological doctrines have found numerous followers in America in certain of the Christian bodies of which the tenets are generally Calvinistic. They hold most of the Calvinistic doctrines, even in their most extreme form; but they entirely reject the doctrine of imputation, both the imputation of Adam's sin and of Christ's righteousness. The fundamental doctrine of the Hopkinsian system, however, is that all virtue and true holiness consists in disinterested benevolence, and that all sin is selfishness—the self-love which leads a man to give his first regard even to his own eternal interests being condemned as sinful. Consult his collected writings with memoir by E. A. Park (Boston, 1852).

HOPKINS, STEPHEN (1707-85). A Colonial Governor of Rhode Island, and one of the signers of the Declaration of Independence. He was born in Providence, R. I., and was descended from an old English family, his great-grandfather, Thomas Hopkins, having settled in Providence about 1638. Stephen's early life was spent on a farm, and he had little opportunity to gain an education, though under the tutelage of his grandfather and uncle he learned surveying, and later broadened his intellectual horizon by extensive reading. In 1732 he began his active participation in public affairs by becoming clerk of the newly constituted township of Scituate, a position which he continued to hold for ten years. From 1732 to 1738 (excepting the year 1734) he was a representative from Scituate to the General Assembly, and upon being returned in 1741 he was chosen Speaker. He became a justice of the Court of Common Pleas in 1736 and was appointed its clerk in 1741. Six years later he was made assistant justice of the Superior Court at Newport and in 1751 Chief Justice. He was one of the Rhode Island delegates to the intercolonial congresses which met in 1746, 1754, 1755, and 1757, and in the Albany convention of 1754 was a member of the committee which was appointed to draw up a 'plan of union.' (See ALBANY CONVENTION.) In 1755 he was elected Governor of Rhode Island and was reelected almost continuously until 1768, when he withdrew finally from the gubernatorial contest. Meanwhile he had acquired large shipping and commercial interests, and had begun to take an active interest in the question of England's right to tax the Colonies. In 1764 he sent to the Assembly a tract, *The Rights of Colonies Examined*, which the Assembly ordered to be published and which was widely read. After acting as chairman of several Colonial committees, he was a member of the General Assembly from 1770 to 1775. In 1774 he framed a bill to prohibit the importation of slaves, and from 1774 to 1780 was one of Rhode Island's representatives in the Continental Congress, being one of the signers of the Declaration

of Independence in 1776. He was also a member of the Rhode Island Council of War and a delegate to numerous New England conventions. He died in Newport. He wrote: *A True Representation of the Plan Formed at Albany for Uniting All the British North American Colonies* (1755); and *An Historical Account of the Planting and Growth of Providence* (originally published in the *Providence Gazette* in 1762 and 1765), which, though a fragment, is of considerable value. It has been republished in the *Collections of the Massachusetts Historical Society*, 2d series, vol. ix. (Boston, 1822), and in the *Collections of the Rhode Island Historical Society*, vol. vii. (Providence, 1885). Consult Foster, *Stephen Hopkins, a Rhode Island Statesman* (Providence, 1884; forming Nos. 19 and 20 of the *Rhode Island Historical Tracts*).

HOPKINSON, FRANCIS (1737-91). An American politician, jurist, and miscellaneous writer, born in Philadelphia, Pa. He is best remembered for his *Battle of the Kegs* (1778), a humorous ballad based on an incident in the Revolutionary War. He was educated at the College of Philadelphia, admitted to the bar in 1761, and a few years later he spent a year in England, where his cousin was then Bishop of Worcester. Returning to Philadelphia, he practiced law, was active in learned societies, declared his republican sympathies, and was made delegate to the Continental Congress (1776). He took part in drafting the Articles of Confederation, and signed the Declaration of Independence. He held various offices under the United States Government, was Judge of Admiralty for Pennsylvania, suffered an impeachment which failed (1779-89), and was district judge there (1790-91). Hopkinson was a man of exceptionally varied accomplishments. He composed music for his facile songs, painted, was a dilettante in popular science, a humorist, and a political pamphleteer. His works were collected in three volumes (Philadelphia, 1792). Besides the *Battle of the Kegs*, his most popular production was a short prose allegory of the relations between the Colonies and the mother country, entitled *A Pretty Story* (1774). He was father of Joseph Hopkinson (q.v.).

HOPKINSON, JOHN (1849-98). An English physicist and electrical engineer. He was born at Manchester, England, and received his education at Owens College, Manchester, and at Trinity College, Cambridge, where he graduated with honors in 1871 and was appointed fellow and tutor. Commencing practice as an engineer, he soon became interested in electrical engineering, and was led to many important investigations. He was made a fellow of the Royal Society of London in 1878, and in 1890 was awarded by it a royal medal for researches in electricity and magnetism. He was at the time of his death a member of the Councils of the Institutions of Civil and Mechanical Engineers and professor of electrical engineering in King's College, London. Among his most important researches are those in which he showed the effect of temperature upon the magnetic properties of various metals. He was an authority in the theory and practice of dynamo-electric machinery, and discovered the method of employing the so-called 'characteristic curve' in discussing such problems. This curve is obtained by taking the electro-motive forces as ordinates and the current as abscissas, and

serves for the dynamo the same purpose as the indicative diagram in the case of the steam-engine. He was the author of: *Dynamic Electricity* (1884); *Original Papers in Dynamo Machinery and Allied Subjects* (1893); and many papers on various electrical and engineering subjects. He met his death with his children in an accident while mountain-climbing in the Alps.

pal council of which the executive is a member. Population, in 1890, 5833; in 1900, 7280.

HOP'LOPHO'NEUS (Neo-Lat., from Gk. ἵπλος, *hopla*, arms + φόνιος, *phonios*, murderous). A Miocene fossil cat, found in the White River formation of Colorado, Wyoming, and Dakota. See SABRE-TOOTH TIGER.

HOP-LOUSE. A very destructive aphid or plant-louse (*Phorodon humuli*), found commonly

TWIG WITH WINTER EGGS; NATURAL SIZE.

PARTHENOGENETIC FEMALE; SECOND GENERATION.

WINGED MIGRANT, THIRD GENERATION.

HOPKINSON, JOSEPH (1770-1842). An American jurist, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1786, and in 1791 began the practice of law at Easton, Pa., but soon removed to Philadelphia, where he rose to the front rank in his profession. He was the leading counsel in the famous suit of *Rush vs. Cobbett* in 1799, and defended Judge Chase in his impeachment before the Senate in 1800. From 1815 to 1819 he served as a Federalist Representative in Congress, where he distinguished himself in the debates on the tariff and the Seminole War, and strongly opposed the rechartering of the United States Bank. In 1823 he was appointed by President Adams a district judge, an office which he held until his death. For several years he was president of the Philadelphia Academy of Fine Arts and Vice-President of the American Philosophical Society, to each of which he contributed many papers of interest. In 1837 he was a member of the Pennsylvania Constitutional Convention, and served as chairman of his Judiciary Committee. His legal essays and decisions were long accepted as authoritative; but he will be longest remembered for his national song, "Hail Columbia," written in 1798, which attained immediate popularity and did much to fortify wavering patriotism.

on the hop-plant, and called in England 'hop-fly.' In certain years this insect causes an almost total loss of the hop crop in parts of England and

HOP-LEAF, WITH LICE; NATURAL SIZE.

New York, and a number of years ago forced the abandonment of this industry in Wisconsin. About 1890 it made its first appearance in the States of

HOPKINSVILLE. A city and the county-seat of Christian County, Ky., 75 miles northwest of Nashville, Tenn.; on the Louisville and Nashville and the Illinois Central railroads (Map: Kentucky, D 4). It is the seat of the South Kentucky College (Christian), established in 1849, Bethel Female College (Baptist), founded in 1854, and of the Western Kentucky Lunatic Asylum. The city is principally engaged in tobacco manufacture and trade, but has a considerable business also in flour, wheat, corn, hay, and live stock. Hopkinsville was settled in 1797 and incorporated in 1798. As provided by a charter of 1893, revised in 1896, the government is administered by a mayor, elected every four years, and a municipi-

FOURTH GENERATION; FIRST ON THE HOP.

Oregon and Washington, and has since done great damage. The winter eggs are laid on plum-trees

in the neighborhood of the hop-yards. These eggs hatch in the spring at the time when the buds are about to burst, and three generations of wingless, parthenogenetic females are born upon the plum-trees. Then a fourth generation, con-

ship, Gloucester County, New Jersey, December 3, 1771. At sixteen years of age he was apprenticed to an uncle in Philadelphia to learn the trade of a tailor. In early manhood he became an active and leading member of the abolition society founded

sisting of winged agamic females, makes its appearance. These females fly to the hop fields and establish themselves there, giving birth to living

by Franklin, Rush, and others, and was also an overseer of a school for colored children, secretary of a society for the employment of the poor, inspector of a prison, guardian of abused apprentices,

WINGED MALE, AT END OF SUMMER.

SHRUNKEN FEMALE IN ACT OF DEPOSITING WINTER EGGS.

young which, agamic and wingless, give birth to individuals like themselves. The tenth or eleventh generation is winged, flies back to the plum, and gives birth to true sexual females which are wingless, but which mate with winged males which fly in from the fields. The winter egg is then laid once more upon the plum twigs. (See ALTERNATION OF GENERATIONS, and APHID.) The best remedy for this injurious creature is to cut down all but one or two of the plum-trees near the hop-yard, and then to destroy in May all of the lice on the one or two remaining trees by spraying with a dilute kerosene-soap emulsion or a fish-oil soap wash.

HOP O' MY THUMB. The diminutive hero of a popular fairy tale, taken from Perrault's *Comtes des Fées*, the popular sources of which are the classic stories of Ulysees and Polyphemus and of Theseus and Ariadne.

HOPPER, ISAAC TATEM (1771-1852). An American philanthropist, prominent in the anti-slavery movement. He was born in Deptford town-

and a friend of the insane. He belonged to the Society of Friends, and in the division which occurred in 1827-28 he acted with those who were called 'Hicksites,' influenced much, no doubt, by his great regard and admiration for Elias Hicks as an earnest anti-slavery preacher;

in 1829 he came to New York to take charge of the book-store opened by the Hicksite Friends. His activity in opposition to slavery exposed him to much abuse and even imperiled his life; but this did not in the least abate his zeal. In 1841 he gave up the charge of the book-store and was appointed treasurer and office agent of the American Anti-Slavery Society, and so continued until 1845, when he became the first agent of the New York Prison Association. Declining years and ill health compelled his resignation in February, 1852. He died in New York, May 7, 1852. Consult his life by Child (New York, 1881).

HOPPE-SEYLER, hōp'pe-zī'lēr, FELIX (1825-95). A German physiologist and chemist, born at Freyburg-on-the-Unstrut, and educated at Halle, Leipzig, Berlin, Prague, and Vienna. After five years as assistant to Virchow and director of the chemical laboratory of the Berlin Pathological Institute, he became professor of applied chemistry at Tübingen (1861), and (1872) of physiological chemistry at Strassburg. He wrote: *Handbuch der physiologisch- und pathologisch-chemischen Analyse* (6th ed. 1893); *Medizinisch-chemische Untersuchungen* (1866-70); and *Physiologische Chemie* (1877-81). Consult Baumann and Kossel, *Zur*

Erinnerung an Felix Hoppe-Seyler (Strassburg, 1895).

HOPPIN, AUGUSTUS (1828-96). An American book illustrator, born in Providence, R. I. He graduated at Brown University in 1848, and was admitted to the bar, but soon gave up the law and went abroad to study art. Upon his return, he devoted himself to drawing on wood and to the illustration of books, in which he was successful. His pictures in *Nothing to Wear*, *Potiphar Papers*, and *The Autocrat of the Breakfast Table* are widely known. He published several volumes of sketches and novels, among the latter *Recollections of Auton House* (1881), and *Married for Fun* (1885).

HOPPIN, JAMES MASON (1820—). An American educator and writer. He was born at Providence, R. I., graduated at Yale in 1840, at the Harvard Law School in 1842, and at the Andover Theological Seminary in 1845; studied for some time abroad and was pastor of a Congregational church at Salem, Mass., from 1850 to 1859. From 1861 to 1879 he was professor of homiletics at Yale, where he was also professor of the history of art from 1879 to 1899, when he became professor emeritus. Among his publications are: *Old England, Its Art, Scenery, and People* (1867); *The Office and Work of the Christian Ministry* (1869); *Life of Rear-Admiral Andrew Hull Foote* (1874); *The Early Renaissance and Other Essays on Art Subjects* (1892); and *Greek Art on Greek Soil* (1897).

HOPPNER, JOHN (1758-1810). An English painter, of German parentage, born in London. He was a choir-boy in the Royal Chapel, and afterwards, by the assistance of the Prince of Wales (afterwards George III.), studied at the Royal Academy. He became a popular portrait painter, and was acknowledged by Lawrence to be his only rival. His works include portraits of the Prince, the Duke of York, Lord Nelson, Pitt, Wellington, Canning, and Grenville. He wrote a book entitled *Select Series of Portraits of Ladies of Rank and Fashion* (1803), the illustrations of which were from paintings by himself, engraved by Wilkins. One of his best works is "Lady Culling Smith and Her Children." He is more successful in his portraits of women and children than of men, as his art has an altogether feminine quality and lacks the robustness of Reynolds, whom he sometimes imitated.

HOP-TREE (*Ptelea trifoliata*). An American shrub of the rue family, called also shrubby trefoil, wafer-ash, and wingspeed, which grows in rocky places from Pennsylvania to Minnesota and southward. It usually grows from 6 to 10 feet in height, but when well trimmed and cultivated sometimes attains a height of 30 feet or more. The leaves are trifoliate, the leaflets obovate and pointed, and downy when young; the flowers, which grow in terminal cymes, are greenish white, and have a disagreeable odor. The fruit has a broad wing which resembles that of the elm, and is very bitter, but does not possess the aromatic principle of the hop; nevertheless, it is said to have been used as a substitute for hops in making beer. The bark and root are of some repute in medicine. When dried the bark has a peculiar, somewhat aromatic smell, and a bitter, pungent, acrid taste. The bark contains an acrid, bitter oleo-resin, starch, albumin, a yellow coloring substance, and salts of lime, pot-

ash, and iron; also the alkaloid berberine, probably the tonic principle.

HOR, hōr (Heb., mountain). (1) A mountain of Arabia Petraea, between the Gulf of Akabah and the Red Sea, and forming part of the mountain range of Edom or Seir. It was here that Aaron (q.v.) is said to have died during the journey of the Israelites into Palestine (Num. xx. 22-29; xxxiii. 38, 39; Deut. xxxii. 50). The modern name of the place is Jebel Haroun ('Mount of Aaron'), and the Mohammedans point to a structure on the top of the mountain as the tomb of the brother of Moses. (2) A mountain which was to be the northern border of the inheritance of the Hebrew tribes (Num. xxxiv. 7). If the Hebrew text is correct (which is doubtful), the name refers to the Lebanon range, and probably to Mount Hermon. Some scholars, however, give the preference to Jebel Akkar, in the northeast of the Lebanon.

HORA, hō'ra, ἭΩΡΑ (c.1740-85). A Ruman patriot and national hero of Transylvania, sometimes called *Nikla Urss*, Nicholas the Bear. With Juon Kloska and George Kriszán, he roused the people to rebellion against the Imperial order for general conscription (1784). The uprising spread until thirty thousand men had joined. But Imperial troops were hurried in in such numbers that the revolt failed, the three leaders were captured, and Hora was killed. Hora's exploits form the theme of popular Ruman songs.

HORACE, ó'rás'. A five-act tragedy in verse, by Pierre Corneille, produced in 1640. It is founded on the old Roman legend of the Horatii and Curiatii. In it patriotism and affection are contrasted in the characters of Horace and Curiaice, the latter being the lover of the former's sister. One of Lope de Vega's plays, *El honrado hermano*, is founded on the same myth.

HORACE (QUINTUS HORATIUS FLACCUS) (B.C. 65-8). A Latin poet, born at Venusia, on the borders of Lucania and Apulia. His early years were thus passed amid a picturesque environment of mountain, forest, and stream, which made a deep impression upon his mind, and strengthened that love of nature which so often finds expression in his verse. The older Flaccus was a *coactor*, a collector of taxes or of money due for goods sold at public auctions, and by his thrift was successful not only in buying his own freedom, but also in acquiring a small estate and an income which enabled him to give to his son the best education the capital itself could offer. Thither, about the age of twelve, Horace went with his father, who, in his affection and devotion to his son's interests, made himself the boy's comrade in the daily round of study and play, and at Rome, as at Venusia, helped to form his son's standards by his own shrewd comments upon men and manners. It was naturally the *mos maiorum* rather than any abstract ideal of which the freedman pointed out the advantages, but the familiar talks had their desired effect in the rise in Horace's mind of an instinctive aversion to excess of every sort, and trained him, besides, in similar habits of keen observation and pointed, though kindly, criticism. It was then customary among young Romans of birth and means to complete their education by what may be called a university course in the schools of philosophy at Athens or in those of oratory at Rhodes, and so, between eighteen and twenty,

Horace took up his residence at Athens, listened to the exposition of conflicting philosophical theories, and entered into the social life of his fellow students. Purely speculative problems attracted him as little as they did the average Roman, nor had he, in fact, much relish for the technicalities of any philosophical system. The paradoxes and social eccentricities of the Stoic thinkers, for instance, long made it difficult for him to do justice to the real elevation of their essential principles. But he had already become profoundly interested in the practical problem of how to order one's life aright, and his stay at Athens confirmed this taste for ethical inquiry. At this time, too, he must have come to know more intimately the work of Alcæus, Sappho, Archilochus, and the other Greek lyric poets who were to be his models in the *Epodes* and the *Odes*.

But these peaceful and congenial pursuits were suddenly interrupted by the news of the assassination of Cæsar in March, 44, and the subsequent arrival of Brutus in Athens to secure recruits for the republican cause. The liberator, himself a lover of letters and an eager student of philosophy, was received with enthusiasm, and was so much taken with Horace's promise that the latter, despite his youth and lack both of family connection and of military experience, was made a staff officer, and ultimately served in the campaign of Philippi as *tribunus militum*. That decisive defeat and the suicide of his chief seem to have convinced him of the futility of further effort, and he made his way back to Rome, where, finding that his father's estate had been confiscated, he obtained employment as a clerk in the quaestor's office. It was the darkest period of his life, and, as the earliest of the *Epodes* show, the bitterness of his feeling found unrestrained expression in the verses which, in his own words, poverty drove him to write. But he was so fortunate as to win the regard of Vergil and Varius, who, three years after his return to Italy, introduced him to Mæcenas. That discerning but cautious statesman waited nine months after the first interview before he again sent for the young writer. He then bestowed the friendship that saved Horace for poetry.

But it was in metrical prose rather than imaginative poetry, as he himself viewed his work, that Horace first tried to gain an audience. Early training and the mood of the moment combined to make the choice of satire almost inevitable. Lucilius, a member of the Scipionic circle, had for the first time in Latin literature used the old *mélange* form of Ennius as a vehicle for witty and often stinging criticism of the political and social life of his time. The range of topics was naturally exceedingly wide, the treatment often dramatic, and cast in the dialogue form, the metres varied, though in the end the hexameter decidedly predominated. The new *satira* was marked by a feature quite as original and as noteworthy as itself. This was the establishment of a personal and intimate relation between Lucilius and his reader, so that the frankest revelation of the poet's inmost feelings seemed yet free from egotism and consistent with self-respect. It was thus natural that Horace should be strongly attracted by Lucilius, though, with a mind already much occupied with the niceties of phrase and cadence, he could not but feel that, despite all its vigor and charm,

the work of the older poet was sadly lacking in artistic finish. To write in the manner of Lucilius, but with a more perfect art—this was the end proposed and achieved in the *Satires* (*Sermones*, 'causeries,' as he calls them), of which the first volume appeared about B.C. 35. The second, published about B.C. 29, is far superior in execution to the first, and shows Horace at his best in this kind. We are listening to an accomplished man of the world, intimately acquainted with human nature, whose whims and weaknesses he probes with delightful humor. He is exceedingly fond of the weapon of irony, which he uses against himself quite as often as against others, and every page reflects his sunny nature, genuinely tolerant and charitable. These 'talks,' however light in their touch, have yet a definite and serious purpose. It is the art of living that is ever under discussion, and, as he studied others, so also Horace studied most minutely the nature best known to him, so that one of the special charms of the *Satires* is the presence of this constant self-analysis. One may say of Horace what Mr. Sidney Colvin says of Stevenson in his introduction to the *Vailima Letters*, that he "belonged to the race of Montaigne and the literary egotists." The word seems out of place, since of egotism in the sense of vanity or selfishness he was of all men the most devoid; but he was nevertheless a watchful and ever interested observer of the motions of his own mind. He saw himself as he saw everything else (to borrow the words of Mr. Andrew Lang) with the lucidity of genius, and loved to put himself on terms of confidence with his readers.

One notices already in the *Satires* an attitude of mind that became characteristic and was later both to limit his range and to widen his appeal as a lyric poet. He takes counsel of his head rather than of his heart, and distrusts enthusiasm, especially about ideas, as if warmth of feeling, not held carefully in check by the reason, rendered impossible that equipoise through which alone one may hope to see things as they really are. This is true of even his friendships, where he is tenderness and loyalty itself. But this studied moderation of thought and utterance is the fruit of experience and self-discipline. His earliest attempts in lyric verse show all the ardent temper of youth, and are marked by an exuberance of phrase in striking contrast with the wonderful compression of his later work. In these *iambi*, as he called them, published about B.C. 30, Archilochus is his model, though not more than half of the seventeen poems that Horace deemed worthy of preservation show the personal animosity associated with the name of the Greek poet. With one exception, the seventeenth, they are written in couplets, the second verse of which forms a refrain (*epodus*, ἐπώδός) to the first, and thus they came in time to be known as *Epodes*. Immature as they are as a whole, and interesting chiefly as the first essays of the Horace of the *Odes*, three certainly reveal poetical power of no mean order—the idyllic second, with its sudden turn to satire at the close, the fifth, with its extraordinary picture of the sorceress Canidia, and the passionate appeal to his countrymen in the sixteenth.

Shortly after the appearance of the first book of the *Satires*, Mæcenas presented Horace with a small farm among the Sabine hills, in the valley through which the cool Digentia flows south to

join the Anio near the market-town of Varia, the modern Vico-Varo. Perhaps no gift ever exercised a more important influence upon a man's career. It was not merely that he was thus enabled to devote himself wholly to his art without thought of pecuniary return. The farm was his "arx," his sure retreat from the fatigues and distractions of the great world. The peace of nature, loved since the days at Venusia, entered into and possessed his soul, and the pure air—it was about two thousand feet above the sea—renewed his physical strength, of which, as the years passed, he had to take increasing care. He has immortalized the farm, and, indeed, the whole valley, in his affectionate praise. One may doubt whether he could have been happy without active participation in the brilliant life of the capital, but much of what is truest and best in the inspiration of the *Odes* and the *Epistles* is due to the many quiet days spent with his books in *Sabinis*.

The eighty-eight lyrics that are comprised in the first three books of the *Odes* were undoubtedly privately circulated among his friends previous to their final collection and publication in one little volume in the year 23. Their composition extended over about seven years, for the earliest that can be dated with certainty (i., 37) was written upon the receipt at Rome of the news of Cleopatra's suicide, and few, if any, could have preceded this. They were the outcome of long and loving study of the great Greek lyric poets, especially Alcæus and Sappho, belonging to the early classical period rather than to the Alexandrian age. But, while their form is similar, their content is vitally different in its effect, and it is difficult to define precisely the nature of that unfailling charm which almost from the moment of their appearance they have been universally felt to possess. Shelley in his *Defence of Poetry*, following a famous passage in Plato's *Phædrus*, and Sidney in his *Apologie for Poetry*, both maintained that "poets are so beloved of the gods that whatsoever they write proceeds of a divine fury." But nothing could be more alien to Horace's temper than this. He has neither the passion of Burns or Catullus in the expression or feeling, nor the absorbed and ecstatic earnestness of Lucretius in urging the claims of the true philosophy of life, nor yet the imaginative and mystical power of Vergil. Gray, however, a poet whose method of composition resembled Horace's in its critical deliberateness—in the second poem of the fourth book of *Odes*, Horace compares himself to a bee that with infinite labor gathers its sweets from many a flower—says in one of his letters: "Extreme conciseness of expression, yet pure, perspicuous, and musical, is one of the grand beauties of lyric poetry." The three adjectives here used are peculiarly appropriate to Horace's work; indeed, no other lyric poet in Latin literature has so exquisite a verbal technique. The *Odes* abound in phrases of such perfect finish that no change save for the worse seems possible, phrases which have been the common property of educated men for centuries; *Persicos odi, puer apparatus; carpe diem; dulce et decorum est pro patria mori; vivere fortes ante Agamemnona; matra pulchra filia pulchrior; nil desperandum; splendide mendax; dulce est desipere in loco; post equitem sedet atra cura*—to give a complete list would be almost to quote the *Odes* entire. Yet it is all a *curiosa*

felicitas, as Petronius aptly described it, effects carefully and minutely wrought out by a mind trained in the nicest apprehension of the color values of words and an ear attuned to all the subtleties of cadence. And no artist was ever more alive to the delicate shades of meaning that words gain from their context. Partly, no doubt, from the difficulties inherent in the use of foreign metres, but more especially because of his own liking for moderation and simplicity, the vocabulary which he has chosen to employ is notably limited. Yet the oft-recurring words produce so different an effect in their ever-changing settings that one does not notice the repetition. The themes themselves are even more limited in their range than the vocabulary, but upon the few that he selects he plays variations of surpassing beauty. There is nothing transcendental, nothing of what Poe held to be the essence of poetry, "no mere appreciation of the beauty before us, but a wild effort to reach the beauty above." The *Odes* are rather the expression of idealized common sense, and just for this reason Horace has been in all ages the favorite poet of minds the most diverse, for none makes a surer appeal to the finer sensibilities of humanity in its every-day moods.

In the *envoi* to the first three books of the *Odes*, Horace expresses his entire confidence in their abiding fame, and with this achievement his lyrical impulse seems to have satisfied itself. A new series of 'talks' engaged his attention, cast, however, in a different literary form, that of the letter. These *Epistles*, of which the first book appeared toward the end of 20, or, at the latest, in 19, do not differ much from the *Satires* in the subjects discussed. Conduct is more than ever 'three-fourths of life.' But the years of reading and reflection have brought truer insight and greater breadth of view. He is still a searcher after the philosophy of life (his mind was far too independent to accept any creed formulated by others), but he urges with tactful insistence the elementary principles of whose truth he has become convinced. The humor is kindlier and more subtle; in fact, one is often in doubt whether he is speaking in jest or earnest, so that he has the inexhaustible charm of one whose secret is never wholly surprised. He is no idealist; it is rather the doctrine of the mean, the *auræ mediocritas*, that he so winningly inculcates. Not even virtue itself is to be sought beyond the bounds of reason, as indeed Aristotle had claimed long before him. Both the language and the metre of the *Epistles* show the effects of the seven years devoted to lyric composition. There is the same wealth of terse and happy phrase, and the hexameter, which even in the *Satires* was an immense advance upon the rhythm of Lucilius, is always smooth and often musical.

The death of Vergil in 19 left Horace by general consent the greatest living poet; and it was as such that in 17 Augustus commissioned him to write the hymn for the religious festival of the Secular Games. The result to modern ears may seem rather stiff and unimaginative in spite of the technical excellence of the verse, but to the great Roman audience—we must remember that the *Carmen Sæculare* was chanted in the open air—there must have been something peculiarly impressive in the linking of the old liturgical formulas with the new faith in the city's imperial

destiny. Two years later, at the personal request of the Emperor, he composed two odes in celebration of the victories of Drusus and Tiberius, the step-sons of Augustus, over the Rhæti and Vindelici, and, about the same time, two others in praise of the beneficent results of the reign for Italy. But Horace, though he had long been a sincere supporter of the new régime, was ill fitted for work of this kind, and these poems, especially the first two, show the laboriousness that not infrequently attaches to the official odes of a poet laureate. To give them permanence, he added eleven fugitive pieces (one of which, however, the seventh, is a perfect gem), and published this fourth book of the *Odes* in 13.

According to Suetonius, the charming bit of literary criticism which opens the second book of the *Epistles* was written to meet a complaint of Augustus that to him alone Horace had dedicated nothing. It is in substance an attempt to show that no true parallel could be drawn between the development of poetry in Greece and that at Rome, and that the work of the modern school, of which he regarded Vergil, Varius, and himself as the best representatives, marked the highest level yet reached of artistic achievement. In the second of the two epistles of this book he sets forth at length with characteristic irony and indirection the reasons why henceforth lyric poetry must give place to the "rhythms and harmonies of real life." The latest of his letters and the one which is most nearly a formal essay is that addressed to the Pisos. It is generally known as the *Art of Poetry* (*Liber de Arte Poetica*), though this title seems not to have been given to it by Horace himself, and is, indeed, scarcely appropriate, for only one branch, that of the drama, receives any systematic treatment. The discussion has all the sanity and breadth of judgment that mark the moral epistles, and is, in effect, another defense of the poetic ideals of the Augustan school.

Of the details of the closing years of his life we have no record. The death of Mæcenas, who in his last words commended his life-long friend to Augustus, was a severe shock. Horace, who had once (C. ii., 17) prayed that they might not be separated in death, did not long survive him, dying on the 27th of November, B.C. 8, when he had nearly completed his fifty-seventh year. He was buried on the Esquiline, close to the tomb of Mæcenas.

Mr. Mackail has admirably summed up the significance of his work: "Among the many amazing achievements of the Greek genius in the field of human thought were a lyrical poetry of unexampled beauty, a refined critical faculty, and, later than the great thinkers and outside the strict schools, a temperate philosophy such as we see afterwards in the beautiful personality of Plutarch. In all these three Horace interpreted Greece to the world, while adding that peculiarly Roman urbanity—the spirit at once of the grown man as distinguished from children, of the man of the world, and of the gentleman—which up till now has been a dominant ideal over the thought and life of Europe."

BIBLIOGRAPHY. The *editio princeps* was published at Venice in 1470. The most important editions before Bentley were those of Lambinus (last edition, Coblenz, 1829), Cruquius (Antwerp, 1578), and Heinsius (Leyden, 1612). Richard Bentley's edition, first published at

Cambridge in 1711 (3d ed., Berlin, 1869), made a new era in Horatian criticism. The best critical edition of the text is that of Keller and Holder (2 vols., Leipzig, 1864-70). Keller issued a second edition of the first volume (*Odes, Epodes, and Carmen Seculare*) in 1899, and also a supplementary volume of text discussion, *Epilogomena zu Horaz* (Leipzig, 1879-80). The best general editions are those of Orelli revised by Hirschfelder and Mewes (4th ed., 2 vols., Berlin, 1886-92, with Latin notes and complete word index); Kiessling (2d ed., 3 vols., Berlin, 1890-97; vol. i. in 3d ed., 1898); Müller, *Odes and Epodes* (Leipzig, 1900), *Satires and Epistles* (1891-93); Wickham, *Odes and Epodes* (3d ed., Oxford, 1896), *Satires and Epistles* (1891); Schütz (Berlin, 1880-83; vol. i. containing *Odes and Epodes*, 3d ed., 1889). The *Odes* have been edited separately by Nauck (13th ed., Leipzig, 1889), Page (4th ed., London, 1890), Smith (Boston, 1895), Shorey (Boston, 1898); the *Satires* by Krüger (14th ed., Leipzig, 1897), Palmer (London, 1883); the *Epistles* by Wilkins (3d ed., London, 1889). Porphyron's *Scholias* have been edited by Holder (Innsbruck, 1894).

The translations of Horace are all inferior to the original. Among the best are those of Francis, entire (London, 1778); Lord Ravensworth, *Odes* (London, 1858); Martin, entire (Edinburgh, 1888, with an interesting memoir and good illustrative notes); Conington, *Odes and Epodes* (3d ed., London, 1865), *Satires and Epistles* (1892); Lord Lytton, *Odes and Epodes* (London, 1869); Gladstone, *Odes* (New York, 1894); Cooper, *Odes* by various hands (London, 1880); Sargent, *Odes* (Boston, 1893); De Vere, *Selected Odes and Epodes* (London, 1893). A sumptuous edition of the *Odes and Epodes* is that of the Bibliophile Society (6 vols., Boston, 1901-02), with introduction, life, and Latin text, translated and annotated by 'eminent scholars, statesmen, and poets.' Pope's *Satires and Epistles of Horace Imitated* is very brilliant (best edition by Pattison).

The most valuable literary treatment of Horace is Sellar's *Horace and the Elegiac Poets* (Oxford, 1892). Good also are Boissier's *The Country of Horace and Vergil* (translated from the French, London, 1896), and Plüss, *Horazstudien* (Leipzig, 1882). There are good chapters on Horace in Nettleship, *Lectures and Essays*, first series (Oxford, 1885); Patin, *Etudes sur la poésie latine* (3d ed., Paris, 1883); Mackail, *Latin Literature* (New York, 1900); Tyrrell, *Latin Poetry* (Boston, 1895).

HORÆ (Lat., from Gk ὥραι, *Hōrai*, hours, seasons; connected with ὥρος, *hōros*, year, Av. *yārə*, year, OChurch Slav. *jarŭ*, spring, OHG. *jár*, Ger. *Jahr*, Goth. *jer*, AS. *gëar*, Eng. *year*). In ancient Greece, goddesses of the seasons of the year, at first with special reference to the farmer. At Athens they seem to have been originally two, Thallo and Carpo, the goddesses of the blossoming and ripening fruit. In general they were at first three, Eunomia, Dike, Eirene, whose names show that the ethical side of their nature, as guardians of the due order and peaceful succession of natural processes, has become prominent. In the legend they are daughters of Zeus and Themis, guardians of the gates of Olympus, attendants upon the gods. They bring flowers and fruits to mortals, and are closely connected with the Charites or Graces (q.v.). In the

Hellenistic time the Horæ become more closely connected with the seasons, and now the number is increased to four, each of whom is given attributes appropriate to a special season. These four Horæ, however, rarely appear in literature, until the late epic of Quintus Smyrnaeus and Nonnus. The fiction of twelve Horæ for the hours of the day is also very late, and cannot be found in art with any certainty. Consult: Preller-Robert, *Griechische Mythologie*, vol. i. (Berlin, 1894), and Rapp, in Roscher, *Lexikon der griechischen und römischen Mythologie* (Leipzig, 1886 et. seq.).

HOR/APOL'LO (Lat., from Gk. Ὅραπόλλων, *Horapollōn*). An Egyptian who wrote on Greek grammar, probably in the fourth century A.D. He lived in Alexandria and at Constantinople, and wrote commentaries on the Greek poets. Another Horapollo lived at the close of the next century. It is uncertain whether we should ascribe to the former or to the latter the work on hieroglyphics, apparently a Greek translation of the work in Egyptian of one Horapollo, or possibly Horus, which gives this name importance, and which has some value to the Egyptologist. The best edition of the work on hieroglyphics is by Leemans (Amsterdam, 1835).

HORATII, hō-rā'shī-i. Three Roman brothers, born at one birth, cousins to the Curiatii, of Alba, also three brothers born at one time. Their mothers were twins, who had been married on the same day, and given birth to their sons at the same time. During the Roman wars, when Cluilius, the Alban King, and Tullus Hostilius, the Roman King, were in conflict, it was decided to leave the issue to a personal combat between these brothers. Two of the Horatii were soon slain, and the third brother, feigning flight, was pursued by the Curiatii, all wounded, whom he slew one by one. The sister of the Horatii was betrothed to one of the Curiatii, and had made for him a beautiful mantle. As the victor entered the gate of Rome bearing his spoils, he was met by his sister, who, upon recognizing the cloak in her brother's hands, broke out in lamentations. Enraged that she should prefer her lover to her country, her brother slew her on the spot, and her body remained unburied until passers-by covered it with stones. He was condemned to be scourged to death, but was afterwards pardoned. The story is given by Livy (I. 24); behind the pure myth lies the fact of the close union in early times between Rome and Alba Longa, and the later subjection of the latter.

The famous Horatius (Cocles) who, with Titus Herminius and Spurius Lartius in B.C. 507, so gallantly defended the bridge against the army of Lars Porsena, King of Clusium, while their companions broke down the Sublician bridge behind them, was a worthy descendant of the survivor of the three Horatii.

HORATIO, hō-rā'shī-ō. (1) In Shakespeare's *Hamlet*, a character who in his philosophical attitude toward varying fortunes forms an admirable foil to his morbid and introspective friend Hamlet. (2) The friend of Lord Altmont in Rowe's *Fair Penitent*. He informs Altmont of Calista's seduction by Lothario, and the latter is killed in the duel which ensues.

HÖRDE, hēr'de. A town of the Prussian Province of Westphalia, situated on the Emsche, two miles by rail from Dortmund (Map: Prussia,

B 3). In the vicinity are productive iron and coal mines, and the town has important industries connected with the working of iron. Population, in 1890, 16,346; in 1900, 25,126.

HORDEIN, hōr'dē-in (from Lat. *hordeum*, barley). A substance that can be extracted from barley. It is merely a mixture of starch, cellulose, and a little nitrogenous matter.

HORDEOLUM. See STYE.

HOR'DEUM. See BARLEY.

HOREB, hō'rēb. See SINAI.

HORE'HOUND (AS. *hār'hūne*, from *hār*, hoar + *hūne*, hoarhound), *Marrubium*. A genus of plants of the natural order Labiatae. The species are mostly

herbaceous perennials, natives of the south of Europe and the East. One species, the common or white horehound (*Marrubium vulgare*), is found generally throughout Europe, except in the more northern regions, and in the United States, growing in waste places, waysides, etc. It is about 1 to 1½ feet high, bushy, with roundish,

HOREHOUND.

ovate, crenate, wrinkled leaves, and almost globose whorls of white flowers. The whole plant has a whitish appearance, from the down with which its leaves are covered. It has an aromatic but not very agreeable smell. It is tonic, stimulant, and laxative, and is popularly and efficaciously used for coughs, as an infusion, as a syrup with sugar, or as a candy. In England the name horehound is applied also to another plant, *Ballota nigra*, sometimes called black or fetid horehound, a fetid plant, also of the order Labiatae, and of a genus very closely allied to *Marrubium*. It closely resembles the white horehound in taste, and possesses similar medicinal properties. A third British plant, *Lycopus Europæus*, a diandrous plant of the same natural order, is sometimes called water-horehound, and is also known as gypsywort. All these species have been introduced in the United States, and, in addition, six or eight species of *Lycopus*, or water-horehound, are rather abundant.

HORGEN, hōr'gen. A town in Switzerland, on Lake Zürich, 10 miles south of Zürich (Map: Switzerland, C 1). It is a thriving industrial centre, with manufactures of cotton and silk goods, and chemicals. Population, in 1888, 5519; in 1900, 6883.

HOR'ICON. The Indian name of Lake George, N. Y.

HOR'ITES. An ancient people who dwelt in and around Mount Seir before the Edomites came there (I. Chron. i. 38-42). Biblical tradition preserves a recollection that the Horites formed a group of seven tribes (Gen. xxxvi. 20-

30). They were smitten by Chedorlaomer and the kings of the East when they attacked Sodom in the days of Abraham (Gen. xiv. 6; Deut. ii. 12-22). They were overcome, and perhaps absorbed, by the Edomites. The name Horite has usually been explained to mean 'cave-dwellers,' but this is doubtful. See EDOM.

HORI'ZON (Lat. *horizon*, from Gk. ὁρίζων, pres. part. of ὁρίζω, *horizein*, to bound, from ὅρος, *horos*, boundary). (1) In popular language, the circular line formed by the apparent meeting of earth and sky. Astronomers call this the *sensible horizon*, distinguishing it from the *rational horizon*, i.e. the circle formed by a plane passing through the centre of the earth, perpendicular to the plumb-line, and produced to meet the heavens. (2) A term in geology, referring to a bed or beds which are characterized by some special forms of fossils found in them.

HORLA, ὄρ'λά', LE. A story dealing with madness, by Guy de Maupassant (1887), who himself became insane in 1892.

HORMAYR, hör'mir, JOSEPH, Baron (1782-1848). An Austrian historian, born at Innsbruck. He studied law at the University of Innsbruck, and afterwards entered the Ministry of Foreign Affairs at Vienna. In collaboration with Archduke John, he published a number of pamphlets against Napoleon, and in 1809, as intendant in the army commanded by John, he incited the popular uprisings in the Tyrol, Vorarlberg, and Salzburg. After the truce of Znaim he returned to Vienna and devoted himself to historical work until his unauthorized attempt to stir up another revolt among the Tyrolese led to his being arrested at Metternich's command. On his release the Emperor made him Court historiographer, but his imprisonment had so embittered him against Metternich that in 1828 he accepted the position of Councilor in the Bavarian Ministry of Foreign Affairs. Four years afterwards he was sent to Hanover to represent the Bavarian Government, and in 1839 was transferred to Bremen, and then was given charge of the Government archives at Munich. His intimate connection with public men and events during one of the most interesting periods of European history give a peculiar value to his writings, many of which deal with subjects of which he had a first-hand knowledge. His publications include: *Allgemeine Geschichte der neuesten Zeit, vom Tode Friedrichs des Grossen bis zum zweiten Pariser Frieden* (1817-19; 2d ed. 1831); the much criticised but highly entertaining *Lebensbilder aus dem Befreiungskriege* (1841-44); and *Das Land Tirol und der Tirolerkrieg von 1809* (1845).

HORMIZD, hör'mist, or **HORMIZDAS**. The name of several kings of Persia. See SASSANIDÆ.

HOR'MOGO'NIA (Neo-Lat. nom. pl., from Gk. ὄρμος, *hormos*, chain + γόνιμος, *gonimos*, productive, from γόνος, *gonos*, seed). Portions of the filaments of blue-green algae that separate to form a new plant. See CYANOPHYCEÆ.

HOR'MOS (Gk. ὄρμος, chain). A Greek war dance supposed to have been invented by Lycurgus. Like most of the other Greek dances, it was danced in a long line which wound in and out. The performers were youths and maidens, and the leader of the line played on a

lyre to which the steps were timed. The figures which the men danced were wild and warlike, and they were followed by the girls, who danced gracefully and quietly, in contrast to the exaggerated steps of the men. The name was also applied to an ancient Scotch dance.

HORN (AS., Icel., OHG. *horn*, Ger. *Horn*, Goth. *haurn*, Runic *horna*, horn; connected with Ir., Welsh *corn*, Galatian *κάρνον*, *karnon*, Lat. *cornu*, horn, and ultimately with Gk. κέρας, *keras*, Skt. *śrngā*, horn, as well as with Lat. *cervus*, AS. *heorot*, Eng. *hart*). (1) A modification of the cuticle observable in man and most other vertebrated animals; and (2) a special adaptation of this substance to form appendages of the head in certain mammals. The word has many other applications, more or less remote from this, in zoölogy as elsewhere. Thus the chitinous material of the harder parts of insects is frequently termed 'horn,' whereas the tortoise-shell, which is truly of this nature, is rarely so designated. The projections from the prothorax of 'stag' and other beetles, the feelers or ovipositors of other insects, the eye-stalks of snails, frontal feathers (plumicorns) of owls, the projecting front teeth of the narwhal, etc., are frequently called 'horns,' though all are different in both substance and function from the true horns to which this article is restricted.

NATURE AND SERVICE OF HORN. Horn is the connective tissue of the epidermis hardened and thickened, and in some cases mixed with, or composed of, agglutinated hairs. Its purpose is to form a resisting or protective surface, or a tough tool or weapon. The whole, or principal part, of the epidermis may become of this nature, as is the case in the hide of armadillos and the scaly ant-eaters, ancient and modern, in serpents and lizards (whose scales are horny), and in the turtles which supply tortoise-shell (q.v.). In the higher ranks it constitutes the 'whalebone' developed from the palate of the baleen-bearing whales; becomes the protective sheath of the mandibles forming the serviceable beaks of birds and turtles; and, by more or less completely ensheathing and extending the outermost bone of each digit, forms nails, claws, and hoofs (see NAIL), strengthening and arming the fingers and toes of such reptiles as have feet, of all birds, and of all the mammals except whales. Horn enters also into spurs on the legs and other parts of certain animals, forms one or more shields, or weapons, or both, on the head; and callosities elsewhere, such as on the heel of man (and the 'corns' on his toes), the knees of camels, etc., as use and habit call for a hardening of the cuticle to resist wear and relieve pressure. Further particulars as to these structures will be found in the article BIRD (the beak); INTEGUMENT; NAIL (nails, claws, hoofs, spurs, etc.); SKELETON; SNAKE (scales, rattle, etc.); TORTOISE-SHELL; TURTLE; and under HORNS below. The chemical composition of the various horny tissues is exhibited in the table following.

These tissues differ slightly in the quantity of inorganic matter which they contain, but the difference does not vary much beyond 1 per cent. Hair yields from 0.54 to 1.85 per cent. of ash, containing among other ingredients, peroxide of iron and a little silica. In feathers, the quantity of silica is very considerable, and it is doubtless to this constituent that the shaft in a great measure owes its strength and hardness.

HORNY TISSUE appears as a variety of tumor upon different regions of the human skin, but especially upon the face, and occasionally in dermoid cysts. These manifestations are considered as warts, of which the epidermal cells are intimately united in the same manner as in the nails; and they are classed with warts, corns, and some nævi, under the term corneous papillomata. The tendency to horny excrescences on the skin is rare, and belongs to advanced age. There is a disease of the skin called 'hystricismus,' which is a peculiar variety of papillary hypertrophy, with hornifying of

this way it is employed in making handles for umbrellas, knives, forks, and a variety of other articles. Combs are made out of the flattened sheets, and beautiful carvings are made out of the solid parts of buffalo-horns. Ox-horns, too, are sometimes of fine quality and color, and are fashioned into drinking-cups and other articles, often highly ornamental. Before the horn is softened for manufacture, the solid tip is usually saved off, to be treated separately. This is usually sawed into blanks to be used for buttons and other purposes. These blanks are heated, pared, heated again in water and pressed between

	Hair	Horse's hoof	Cow's horn	Nails	Epidermis	Whale-bone	Tortoise-shell

the epidermis of such a nature that it resembles short porcupine-quills. Horny excrescences occasionally break and fall off spontaneously; but they grow again if not cured radically by the excision of the portion of skin upon which they are located.

ECONOMIC USES OF HORN. The horns of animals enter largely into the manufacture of many useful and ornamental articles, and are employed for useful and ornamental purposes. The principal horns employed are those of the ox, buffalo, sheep, and goat. These are quite different in structure from the antlers of various deer, which are really bone and resemble ivory in structure. More like true horns are hoofs, claws, nails, and quills. Horns have but 2 or 3 per cent. of earthy matter, while bones have over 50 per cent. Horn can be softened and split into thin layers or laminae, or pressed into molds. As it recovers its peculiar character of flexibility, toughness, and transparency when cold, it is particularly adapted for a great variety of purposes. It can also be dyed various colors. A solution of gold in aqua regia dyes it red; a solution of nitrate of silver in nitric acid, black; a paste of red lead, made with a solution of potash, colors it brown; so that with a proper arrangement and application of these materials, the most admirable imitations of the much more costly tortoise-shell can be produced, which, indeed, it resembles in structure. The more common vegetable dye-stuffs, as logwood, Brazilwood, barwood, saffron, indigo, etc., will also color horn, but neither so permanently nor so brightly as the metallic materials.

By long-continued soaking, the horns of all the animals above mentioned can be softened, and those of the sheep and goat can easily be split into several layers after they have been soaked and boiled. These layers can not only be flattened out by putting them between smooth iron plates heated and placed in a press, but can be welded together firmly by pressing their edges together between polished copper plates, and then plunging them for some time into boiling water and then into cold water. This property enables the horn-worker to use up the smallest cuttings with profit. Another valuable property of horn is that when heated it can be pressed into a die, and not only takes a beautiful sharp impression, but if left in the die until cold it retains it. In

dies, after which they are buffed and polished. The value of the horns and hoofs imported into the United States to be consumed in domestic manufactures in recent years has been as follows: 1893, \$554,902; 1894, \$235,232; 1895, \$263,800; 1896, \$568,445; 1897, \$150,134.

HORN. A musical instrument, belonging to the family of brass wind instruments and distinguished by a cupped mouthpiece, a flaring bell, and a narrow, conical tube which is between nine and eighteen feet long, and is twisted back on itself. The natural or French horn (q.v.), although having an exceedingly tender, sonorous tone, was a very imperfect instrument, and is now entirely superseded by the valve horns. The horn is built in almost any key; there are horns in A, B \flat , C, D, E \flat , E, F, G. Its range is from C—c 2 . As the horns (except the one in C) are transposing instruments, lower tones than C can be obtained by using different horns. For instance, on the low B \flat horn the note C sounds B \flat , on the E \flat horn E \flat , etc. The music for horns is always written in the G clef, except the very low tones. Strange to say, the tones written in the bass clef are always written an octave lower than the actual sound. In the smallest orchestra there are always two horns. The ordinary symphony orchestra has four, and Wagner employs as many as eight. When four horns are used the first and third are written on the same staff in the score, and the second and fourth together on another staff. What kind of horns are employed depends upon the tonality of the composition and also to some extent upon the modulation within the tonality. Thus a composer writing in C major might employ two horns in C and two in F, or two in C and two in G. Some modern masters use the F horns for all keys. A peculiarity in writing music for horns is that no key signatures are used. All music is written in C and every chromatic alteration is specially marked. Muted tones can also be produced upon the valve horns. They have a peculiar ominous sound, and are sometimes employed in dramatic works to express situations of fear, horror, mystery, etc. In the *Nibelungen* Wagner has an effective phrase on muted horns whenever Wotan's ravens are mentioned. Unfortunately, these muted tones have been abused and are used without sufficient reasons in the works of the Neo-German school. Of the early composers, Weber

was preëminent for his skillful use of horns in producing new effects.

HORN, hörn, ARVID BERNHARD, Count (1664-1742). A Swedish statesman, born at Vuoren-taka, Finland. He served in the Swedish Army, and was rapidly promoted to be general of brigade (1700). He assisted in the deposition of King Augustus of Poland (1704), and under Stanislaus Leszczynski, his successor, he remained as Ambassador. In 1705 he was made counselor to the King. After the death of Charles XII. he forced his sister, Ulrica Elinore, to submit to an election before she could ascend the throne, and later imposed on her the Constitution of 1719. The years when he was marshal of the Kingdom were spoken of afterwards as the 'time of Arvid Horn,' so successful had the country been under his leadership. He retired from active life in 1738.

HORN, CAPE. See CAPE HORN.

HORN, CHARLES EDWARD (1786-1849). An English composer and conductor, born in London. He was the pupil of his father, Karl Horn, a music-teacher, and received singing lessons from Rauzzini. He first appeared at the English Opera House in 1809. The following year he composed *The Magic Bride*, his first opera. From 1814 to 1832 he was connected with the English Opera House as singer, composer, and conductor. He made a prolonged visit to America in 1832, and conducted English opera in New York City. During this time the Handel and Haydn Society produced two of his works, an *Ode to Washington* (1832), and an oratorio, *The Remission of Sin* (1836). This latter, renamed *Satan*, was given in London in 1845. He was elected conductor of the Handel and Haydn Society in 1847, and reëlected in 1848. Among his works are: *Daniel's Prediction* (1848); several operettas, such as *Tricks upon Travelers* (1810) and *The Devil's Bridge* (1812); of his songs, "Cherry Ripe" and the duet "I Know a Bank" have remained popular.

HORN, GUSTAF (1592-1657). A Swedish soldier, born at Oerbyhus. He studied at the universities of Rostock, Jena, and Tübingen, entered the army in 1612, and served against the Poles. In 1630 he commanded half the army of Gustavus Adolphus in the advance of that monarch upon Frankfort-on-the-Oder. He directed the Swedish left in the battle of Breitenfeld, in 1631, and participated in the defeat of Tilly's army on the Lecl. In 1634 he was completely defeated, together with his ally, Bernhard of Weimar, at Nördlingen, and made a prisoner by the Imperialists. He was not released until 1642. He later distinguished himself in the war against Denmark.

HORN, PAUL (1863—). A German specialist in modern Persian philology, born at Halle. His education was at the university in that city, where he devoted himself chiefly to Oriental and linguistic studies, and received the degree of doctor of philosophy in 1885. Four years later he became privat-docent at the University of Strassburg, and he has held a professorship there since 1900. Among his writings may be mentioned: *Die Nomenalflexion im Avesta und den altpersischen Keilinschriften* (Halle, 1885); *Sassanidische Stempelsteine* (Berlin, 1891); *Die Denkwürdigkeiten Schah Tahmâsp's* (Strassburg, 1891); *Neupersische Schriftsprache* (Strassburg, 1898);

Geschichte Irans in islamitischer Zeit (Strassburg, 1900); *Geschichte der Persischen Litteratur* (Leipzig, 1902).

HORN, VAN DE, or VAN (1635-83). A Dutch buccaneer. After studying seamanship on board of merchant vessels, at the age of twenty-four he bought one of his own, set up as a pirate, and preyed upon the shipping of his native land. Next he became a sailor of fortune, serving whichever European power would pay him most highly, and it was chiefly France that engaged him to wage war upon Spanish ships by fair means or foul, generally the latter. He was with De Graff in the despoiling of Vera Cruz (1683), but fought a duel with him over the division of plunder and died from the results of the wound thus received.

HORNBEAM (*horn* + *beam*, AS. *beam*, OHG. *boum*, Ger. *Baum*, tree; connected ultimately with Gk. *φύειν*, *phyein*, to grow, Skt. *bhū*, to become), *Carpinus*. A genus of the natural order Cupulifera, which consists of trees with compact, rough, hard wood, almost smooth whitish-gray bark, deciduous leaves, and monœcious flowers. The common hornbeam (*Carpinus betulus*), very frequent in moderately moist, shady woods of many parts of Europe, is a beautiful tree which attains a height of 60 to 100 feet. It has ovate, acuminate, almost triply serrate leaves, and the fruit has very large, deeply three-partite bracts. Its root descends deep into the ground. The wood, which is much used by carpenters and wheelwrights, is white, very hard, uncommonly strong and tough, and therefore suitable for bearing heavy strains. It takes a very fine polish, and, when well stained, might readily be mistaken for ebony. In the earth, or where exposed to the changes of the weather, it is not very durable. It burns readily, and is one of the best kinds of firewood; it affords an excellent charcoal, and the ashes yield much potash. The young stems, by reason of the dense growth of their twigs, are very suitable for forming live fences and bowers; and as it bears clipping well, the hornbeam was often employed to form live walls formerly fashionable. The genus is represented in North America by *Carpinus Americana*, a small tree 25 to 40 feet high, which occurs from Quebec to Florida and west to Minnesota and Texas. Its wood is very hard, dense, and heavy, and is one of the toughest woods of the Northern States. It is known as hornbeam, blue beech, water-beech, and ironwood. The hop-hornbeam (*Ostrya Virginiana*) is of much the same habit, range, and properties. It is of slow growth and is seldom planted, although a very ornamental tree. This tree is also known as ironwood and leverwood.

HORNBILL. The name of an African and East Indian family of large birds, forming the family Bucerotidæ, and remarkable for the enormous size of the bill, and for a large bony protuberance (epithema, or casque) with which it is usually surmounted. The bill is curved, broad at the base, compressed toward the tip, the bony protuberance on the upper mandible assuming different forms in different species. Two subfamilies are recognized—the Bucoracinae (or Bucorvinæ) and the Bucerotinae. The former are African, have the casque hollow, and are of terrestrial habits. They are described under GROUND HORNBILL. The latter contain the 'true'

HORNBILLS AND TOUCANS

1. FLAT-CASQUED HORNBILL (*Hydrocorax planicornis*);
2. RHINOCEROS HORNBILL (*Buceros rhinoceros*);
3. ARIEL TOUCAN (*Rhamphastos ariel*);
4. MEXICAN TOUCAN (*Rhamphastos carinatus*);
5. CRESTED TRUMPETER HORNBILL (*Bucanistes cristatus*);
6. PAPUAN WREATHED HORNBILL (*Phylidoceros plicatus*);
male.

or typical hornbills, of which there are many genera and species scattered over Northwestern Africa, India, and the Oriental region. All are rather large birds, the biggest five feet in length from the tip of the beak to the end of the tail; have long, full tails, and strong feet, fitted for arboreal habits. Their colors are mainly black and white; the great bills are yellow, often strongly marked with red and black. They are omnivorous, and in captivity show an ostrich-like voracity, swallowing anything offered, bones and all. The food is always caught in the tip of the bill, then tossed into the air and recaught. In nature they feed largely upon flowers and fruit, cut from their fastenings by the saw-edged beak. Their flight is slow and heavy, but it may be long sustained. It is said to be very noisy, the sound of the wings of a large hornbill being audible for a mile, and when two or three are flying together the noise is said to resemble a steam-engine.

BREEDING HABITS. Some, if not all of the species, have the remarkable habit of imprisoning the female during incubation. This is done by stopping up the entrance to the nest, which is in a hollow tree, with mud or excrement. There seems to be some doubt whether it is done from the outside by the male, using mud, or from the inside by the female, using her own excrement. Perhaps the method differs in different species. In any case, a small opening is left through which the female can extend her bill and secure the food which the male brings. Such nests are an excellent protection against enemies, and are said to be used repeatedly. The young are born naked.

This remarkable method of nidification is connected with a strange feature of bird economy first noticed and studied by Bartlett, who shows (*Proceedings Zoological Society of London*, 1869) that hornbills, at intervals, cast the epithelial layer of their gizzards—a layer formed by the secretions of certain glands. This is ejected entire in the form of a bag, the mouth of which is closely folded, and which is filled with the fruit the bird has been eating. Whether these castings form a nutritious and partly digested supply of food for the sitting female is not known. Consult Newton, *Dictionary of Birds*, London, 1896.

SPECIES. The bird ordinarily presented as 'the' hornbill is *Buceros rhinoceros*, from the East Indies, which was known and quaintly described, from preserved heads alone, by Pliny and the naturalists of the Middle Ages. A closely allied species of Java (*Buceros sylvestris*) is shown on the accompanying plate. Another style of casque, the flat table, is shown in Figure 1 of the plate (*Hydrocorax planicornis*, of the Philippines), which illustrates almost equally well the 'homurai' of India (*Dichoceros bicornis*), whose plate-casque is bent into a trough, and terminates in two horns in front. This familiar species is found eastward to Sumatra, where also, among other kinds, lives that solid-casqued one (*Rhinoplaea galeatus*), out of whose 'helmet' ivory-like ornaments are carved. This seems to be a remarkable species in several ways. Another curious form of beak is that of the Papuan *Phylidoceros plicatus*, in which the top of the bill has numerous curving transverse folds. Prominent among African genera are the trumpeter hornbills, one species of which is the 'crested' (*Bycanistes cristatus*). Here the beak is com-

paratively short. In some genera the bill approaches the shape of a toucan's, and has little or no casque. A history of the family, with colored plates, by D. G. Elliot, entitled *Monograph of the Bucerotidae*, was published in London in 1882. An excellent popular account is given in the *Royal Natural History* (London, 1895). See Plate of HORN BILLS AND TOUCANS.

HORNBILL CUCKOO. A channelbill (q.v.).

HORNBLLENDE (*horn + blende*, Ger. *Blende*, from *blenden*, to blind). A greenish-black or black variety of amphibole that crystallizes in the monoclinic system, and is a ferrous magnesium-calcium-aluminum silicate. It is found both in crystals and granular masses. Hornblende is a common constituent of various igneous rocks, such as granite, syenite, diorite, and those of more basic composition. Hornblende schist and hornblende slate are varieties of rocks that contain hornblende with more or less feldspar, quartz, or mica. The black crystallized varieties of hornblende are sometimes called *schorl*, and may be cut into ornaments.

HORNBLENDITE. An igneous rock of granitic texture very largely composed of hornblende. Hornblendite occurs in the so-called Cortland series of eruptives in the Highlands of the Hudson River, near Peekskill, N. Y.

HORNBLOWER, or HORN-WORM. A local name in the Southern United States for the tobacco-worm (*Protoparce Carolina*). See TOBACCO-WORM.

HORNBOOK. The primer for learning the elements of reading, used in England before the days of printing, and common down to the time of George II. It consisted of a single leaf, containing on one side the alphabet large and small, in black letter or in Roman, often followed by a number of monosyllables. Then came a form of exorcism and the Lord's Prayer, and the Roman numerals. The leaf was usually set in a frame of wood, with a slice of transparent horn in front; hence the name. There was a handle usually with a hole for a string, whereby the apparatus was slung to the girdle of the scholar. Sometimes the leaf was simply pasted against a slice of horn. At first the leaf was of vellum, with the characters in writing; later, of paper, and printed. The hornbook was prefaced and ornamented with figures of the cross, and hence came to be often called *Christeross-row*, or *Crisscross-row*. Common as hornbooks at one time were, copies of them are now exceedingly rare. Consult Ties, *History of the Hornbook*, with illustrations and facsimiles (London, 1897).

HORNBY, Sir GEOFFREY THOMAS PHIPPS (1825-95). An English admiral, son of Admiral Sir Phipps Hornby (1785-1867), born at Winwick, Lancashire. He entered the navy when he was twelve; was present at the bombardment of Acre; served under Wyvill hunting slavers (1844-46) and under his father in the Pacific (1846-50); and was sent to Hong Kong (1858) and took the *Tribune* to Vancouver's Island, then disputed property, and to all appearances the probable source of open war. He became vice-admiral and Lord of Admiralty in 1875, and two years afterwards was put in command of operations in the Mediterranean. In February, 1878, he 'proceeded to Constantinople,' in spite of the protests of the Turkish Government, and prepared to meet any

attack on the city by Russia. He was made an admiral (1879), president of the Royal Naval College (1881-82), and Admiral of the Fleet (1888). Consult the life by his daughter, Mrs. Edgerton (London, 1896).

HORNE, GEORGE (1730-92). An English bishop, born at Otham. He was educated at Oxford, and spent the greater part of his life there, becoming principal of Magdalen College in 1768, and in 1776 vice-chancellor of the university; He was made Dean of Canterbury in 1781, and in 1790 Bishop of Norwich. His only important work, *A Commentary on the Psalms* (1771), exhibits a deep acquaintance with Hebrew and biblical lore, and is marked by a spirit of earnest piety. He wrote many pamphlets against such antagonists as Sir Isaac Newton, Hume, Adam Smith, and David Law, all of whom he ludicrously underrated. He adopted the views of John Hutchinson (q.v.), and wrote in his defense.

HORNE, RICHARD HENGIST (1803-84). An English author. He was born in London; received a military education, and served as a midshipman in the Mexican Navy during the war of that country with Spain. After a few years spent in adventurous wanderings, he returned to England, and from 1828 devoted himself to literature. In 1837 he published two tragedies, *Cosmo de Medici* and *The Death of Marlowe*. But he is best known as the author of *Orion: An Epic Poem* (1843). During the period 1839-46, he carried on a correspondence with Elizabeth Barrett (afterwards Mrs. Browning), and her letters to him were afterwards published in two volumes in 1877. A report prepared by him on the employment of children in mines and factories inspired Mrs. Browning's *Cry of the Children*. Going to Australia in 1852, he served as a gold-fields commissioner and a magistrate, and published *Australian Facts and Figures* (1859). Returning in 1869, he wrote thereafter a number of books, few of which were of any special note.

HORNE, THOMAS HARTWELL (1780-1862). An English Bible scholar. He was born in London, October 20, 1780, was educated at Christ's Hospital, and became clerk to a barrister. His leisure hours were devoted to study and to miscellaneous literary labors. In 1818 he published his *Introduction to the Critical Study and Knowledge of the Holy Scriptures* (11th ed. 1860), a work which procured for him admission into orders without the usual preliminaries. In it he presented the results of seventeen years of hard work. In 1824 he became senior assistant librarian in the department of printed books in the British Museum. In 1831 he became a prebendary of Saint Paul's Cathedral; in 1833 rector of the united parishes of Saint Edward the King and Martyr and Saint Nicolas Acons, London. He resigned his assistant librarianship in 1860. He died in London, January 27, 1862. Consult his life by his daughter, Mrs. S. A. Cheyne (London, 1862).

HORNED DACE. A fish. See DACE.

HORNED FROG. One of the large toad-like South American frogs of the genus *Ceratophrys*, especially *Ceratophrys cornuta*, which has horn-like protuberances on the head. It is one of the most beautiful frogs known. The ground colors are black, brown, and green, with an orange stripe over the head and back; and these

colors are irregularly and most pleasingly arranged and blended. Various other gaudy and interesting species are known in the American tropics. See Colored Plate of FROGS AND TOADS, under TOAD.

HORNED GREBE. See GREBE.

HORNED LARK. See SHORE-LARK.

HORNED OWL. Any owl with plumicorns, that is, tufts of upright feathers on the top of the head which simulate horns. The eagle owls (q.v.) are thus distinguished, and their American representative is commonly called the 'great horned owl.' Other horned species are mentioned and illustrated under OWL.

HORNED PHEASANT. A sportsman's name in India for the tragopans (*Cerionis*), especially the black-headed species (*Cerionis Satyrus*), common in the Eastern Himalayas.

HORNED POUT. See BULLHEAD; CATFISH.

HORNED RATTLESNAKE, or SIDEWINDER. See RATTLESNAKE.

HORNED SCREAMER. A bird. See SCREAMER.

HORNED TOAD, or HORNED FROG. The common name of several short-legged, depressed, toad-like horny lizards, all of which occur in North America. According to Cope and others there are two genera, *Phrynosoma* and *Anota*, containing eleven species, eight of which occur in the United States. *Anota* differs from *Phrynosoma* only in the fact that the tympanic drum is concealed by a scaly integument. Horned toads range from British America into Mexico. They feed mainly on insects, which they capture with a rapid thrusting out of their mucilaginous tongues. They are sluggish, harmless lizards, with little power of self-defense save their pointed scales, which, when bristled up, are a disagreeable mouthful for snakes, their most formidable foes. They will, however, fight and even kill a snake small enough to be an even match. Some of the species are said to squirt blood from the eyes when much irritated. The majority of the species are desert inhabitants, and escape pursuit by hiding beneath the prickly agaves, yuccas, and cacti of the plains. Other species live in cedar and pine belts. Both those forms that live on the bare stones or sand of the plains and those that occur in the pine belt are remarkably well protected by resemblance to their background. The young, a dozen or more at a time, are born from eggs, which are laid by the mother only an hour or so before they are ready to hatch. When the little ones emerge they are able to begin at once to catch and eat minute insects. Both young and old make interesting pets, largely because of their amusing irascibility, and can be taught to take flies from the hand, and do other simple things. See LIZARD; and Plate of IGUANA AND OTHER AMERICAN LIZARDS.

HORNED VIPER. See VIPER.

HORNELLVILLE. A city in Steuben County, N. Y., 91 miles southeast of Buffalo, on the Canisteo River, and on the Erie and other railroads (Map: New York, C 3). It has a free academy, a public library of 10,000 volumes, and public parks; and manufactures brick, silks, white goods, railway supplies, furniture, leather, sash, doors, and blinds. The government is administered under a revised charter of 1890, which

provides for a mayor, elected biennially, in whose power, subject to the consent of the council, rest the appointments to subordinate offices; and a unicameral council. Settled in 1790, Hornellsville was part of Canisteo, and was called Upper Canisteo until 1820, when it was incorporated as a separate town under its present name, given in honor of Judge George Hornell, who was prominent in the town's early history. Population, in 1890, 10,996; in 1900, 11,918.

HORNER, FRANCIS (1778-1817). A British statesman and political economist. He entered Edinburgh University in 1792, but left before finishing his course to take up the study of law, and was called to the Scotch bar in 1800. Later, in 1807, after a course at Lincoln's Inn, London, he started practice in the western circuit of England. Elected to Parliament in 1806, he sided with the Whigs, gaining special prominence in the debates on questions of finance and political economy. Horner was very much interested in the 'bullion' question which arose in 1810, and was chairman of the committee which drew up the first report on the subject. The recommendations embodied therein failed of adoption, but as a result of his influence, restrictions were placed upon the issue of paper money, thus paving the way for the success of Peel's Currency Reform Bill in 1841. Horner was one of the three original founders of the *Edinburgh Review*, to which he was a frequent contributor. Consult Horner, *Memoirs and Correspondence of Francis Horner* (Boston, 1853).

HORNER, WILLIAM EDMONDS (1793-1853). An American physician, born in Warrenton, Va. He graduated at the University of Pennsylvania in 1814, was surgeon for a time in the United States Navy, and from 1831 until his death was professor of anatomy in the University of Pennsylvania. In 1847 he founded Saint Joseph's Hospital. In 1824 he announced the discovery of the muscle (tensor tarsi) known as 'Horner's muscle.' He published a number of medical works, including: *Pathological Anatomy; Practical Anatomist* (1856); *Special Anatomy and Histology* (8th ed. 1851); *The United States Dissector* (5th ed. 1856); and superintended the preparation of an *Anatomical Atlas* by Henry H. Smith (1844).

HORNER, WILLIAM GEORGE (1786-1837). An English algebraist. He was educated at Kingswood School, near Bristol, and afterwards became master there. He also established a school at Bath (1809), where he remained until his death. He had no university training, and was not a profound mathematician. He is known solely for his discovery of the ingenious algorism for approximating the roots of higher numerical equations, which was made known in a paper read before the Royal Society in 1819, and published in the *Philosophical Transactions*. The process is commonly known in England and America as *Horner's method*, and may be found in any higher algebra. Related to it is a process of synthetic division which also bears his name.

HORNES, PHILIP, Count of. See HOORNE.

HORNET (AS. *hurnet*, *hurnitu*, OHG. *hornuz*, *hornaz*, Ger. *Horniss*; connected with Lat. *crabro*, OChurch Slav. *sráshenŭ*, Lith. *szirszone*, hornet, OChurch Slav. *srúsha*, Lith. *szirszá*, wasp; less plausibly connected with *horn*, either from its antennæ or from its buzzing sound). A name ap-

plied to several large stinging insects belonging to the family Vespidae and genus *Vespa*. They differ from *Polistro*, the other common genus of this family, in having larger, thicker bodies, and always inclosing their nests with a grayish paper covering. In color, they are usually black or dark brown, conspicuously ornamented with white or yellow. The hornet builds its nest, which is in the form of a number of combs placed one above another, in a hole in the ground, or in the open, attached to the branches of a tree, or under the eaves of buildings. Its manner of constructing the nest and caring for the young is the same as that described elsewhere under the title WASP. It is among the most voracious of insects, eagerly laps up all sorts of sweets, and seizes and devours other insects of various kinds. One of the most common species in the United States is *Vespa maculata*, which builds its great nest in the branches of trees. It is very vigilant, and especially irritable when attending to the duties of its nest, but it may often be found hibernating in the autumn and winter in decaying wood, when it may be handled with impunity.

The European hornet (*Vespa crabio*) has been accidentally introduced into the United States, and has established itself in the vicinity of New York City. Its spread has been very slow, and although its original introduction and establishment must have taken place many years ago, it is still apparently restricted to an area of little over 100 miles square. See WASP; and consult the authorities there referred to.

HORNE-TOOKE, JOHN. See TOOKE.

HORN-FLY. A European fly (*Hæmatobia serrata*), which was imported into the United States about 1888, multiplied with excessive rapidity, and soon spread over the entire country. It breeds in cow-dung, and with very great rapidity and prolificacy. It is a biting fly, and greatly annoys cattle. The name 'horn-fly' is de-

HORN-FLY.

The adult horn-fly; and a cow's horn about the base of which is clustered a swarm of the flies.

rived from a habit which the flies have of clustering in great numbers so as to form black bands around the bases of the horns of cattle. They do not damage the horns, as has been supposed, but simply rest in this location, where they cannot easily be reached by the cow. Consult: Lintner, "The Cow-Horn Fly," in *The Country Gentleman* (London, 1897); Parrot, "Horn-Fly Remedy," in the *Kansas Farmer* (Topeka, 1899); Osborn, *Insects Affecting Domestic Animals* (Department of Agriculture, Washington, 1896).

HORNING, LETTERS OF. In Scotch law, a writ which issues to compel a party to execute or carry out a judgment or decree of the court. The writ was formerly the only form of enforcing civil decrees by imprisonment, except in the case of small debt decrees. The process has been shortened, and other forms of execution are now more commonly employed. The title of the writ is derived from the ancient custom of denouncing a person disobeying the writ with three blasts of a horn. This was technically called 'putting him to the horn.'

HORNITOS, hōr-nē'tōz, or **HORNOS** (Sp., little ovens). The name given to the low oven-shaped hillocks which emit smoke and vapors, and which occur in great numbers on the sides and in the neighborhood of the large volcanoes of South America.

HORNPIPE. See BLACK GUM.

HORNPIPE. A lively English dance, originally in $\frac{3}{4}$, later in $\frac{4}{4}$ time. The universal peculiarity of the music was the length of the final note in each phrase. Its history can be traced back to the sixteenth century in England, and to about 1740 in Scotland. During the eighteenth century it was widely popular, but since then it has been distinctively a sailor's dance.

HORNS. Under this term are commonly confused two very distinct structures forming outgrowths on the head of ungulate animals, to which order they are confined. The word ought not, strictly, to include the bony antlers of deer or the giraffe, since these, although to a certain extent epidermal outgrowths, consist of true bone built up from blood deposits, and are not at all transformed cuticle or 'horn.' Nevertheless, as Beddard points out (in *Mammalia*, London, 1902), the difference is one of degree rather than of kind. The simplest condition is seen in the giraffe, each of whose paired horns is a straight, bony outgrowth, the os cornu, originally separate from the skull, but becoming permanently fused with it early in life, and is covered with wholly unmodified furry skin. In deer there is the same os cornu, which may here be branched, and never becomes fused with the skull, but, on the contrary, is shed and renewed annually, and is covered with a skin modified into 'velvet' (see DEER) which decays and drops off as soon as the horn-core (antler) is perfected. Between these two falls possibly the extinct *Sivatherium* (q.v.), and certainly the modern pronghorn (q.v.). Here the bony core (os cornu) is fixed as in the giraffe, but begins to be branched as in the deer; and it is covered by a sheath formed of agglutinated hairs, the hairy skin beginning from the tip of the horn and proceeding downward, gradually transforming into perfect horn, which is shed and renewed annually. This is an isolated case, but connects the giraffe and deer with the Bovidae, or proper 'hollow-horned' ruminants (*Caviornia*). In this family the males of every species, and in most cases the females also, possess upon the top of the skull protuberances of bone into which air-cells often extend from the frontal sinuses. These are called 'horn-cores,' and form the support of the cornubus sheaths that cover and often extend far beyond them. They are not present at birth, for obvious reasons, but begin to grow immediately afterwards. The horn-sheaths grow with them, and continue even after they have reached normal size to push out at the

base as fast as they wear away at the tip. Their form and position on the head is characteristic of each group: round and lateral in the oxen; slender, retrocurved or twisted, and somewhat compressed or sharply keeled in most antelopes; heavy, cross-ridged, triangular in section, and often spiral in the sheep and goats, and so on.

Evolutionists regard horns as, in most cases, a secondary sexual character. An examination of the fossil history of the tribe shows that these appendages have been gradually acquired, and it is only recently that the females of many forms, now provided with small horns, have acquired them by heredity. Moreover, castration or injury to the reproductive organs is likely to affect the growth and size of the horns. Lastly, among the deer, where the does (except in the reindeer) are hornless, these appendages are acquired just previous to the mating season and are dropped when the breeding season is over. Their service as weapons of defense and offense is, therefore, largely, if not primarily, in contests with each other for the supremacy of the herd—that is, in the combative process of sexual selection. They are, nevertheless, in many instances, powerful weapons in resisting and attacking outside enemies. The spear-like thrusts of the lowered horns of an enraged sable, or other large, long-horned antelope, are feared even by lions and leopards, which more than once have been killed by them. The goring power of a bull is irresistible. A heavy sheep, armed with its great horn-coils, is a 'battering-ram,' indeed, not to be despised. Many, however, seem to be ornaments rather than weapons of value; or tools helpful in various ways, as snow-shovels, for one pertinent example, among the reindeer. Some of the great extinct ungulates of Tertiary time had very powerful horns, especially *Coryphodon* and the group of great *Dinocerata*, where in some cases a pair upon the forehead was supplemented by one or a pair on the snout. At present, a ruling distinction between the artiodactyls and perissodactyls is, that in the former the horns are always paired (in one modern case, *Tetraceros*, two pairs) and on the forehead; while in the latter they are set on the nose, and are single or two in number, one behind the other. This is the case with the rhinoceroses (of which one very early form only had a paired arrangement), where the horn is a growth from the skin of the nose, composed of a solid mass of agglutinated hairs, based upon a knob of the underlying nasal bones.

HORN/SEY. A suburban municipality of London, England, six miles north of Saint Paul's (Map: London, C 7). It is a favorite holiday resort of Londoners, contains several parks, a public library and branches, museum, and public baths. The administration is progressive and provides artisans' dwellings, cottage allotments, etc. Population, in 1891, 44,523; in 1901, 72,000.

HORN-SNAKE. See HOOP-SNAKE.

HORNSTONE. A variety of quartz, resembling flint, but more brittle, and having a structure that is more splintery. See QUARTZ.

HORNTAIL. One of a group of hymenopterous insects forming the superfamily *Siricoidea*, ranked by early writers as a series—*Xylophaga*, the wood-eaters. They are distinguished from the saw-flies by the fact that the fore shanks have only one spur at the tip instead of two. They are called 'horntails' because the end of the body

with the adults usually bears a spine or horn. The ovipositor is fitted for boring, and the eggs are usually laid in the woody tissue of trees and plants. The larvæ feed beneath the outer bark. The group is not a large one, but contains a number of common and interesting species in the United States. The large 'pigeon tremex,' for example, is often a rather serious enemy to certain shade-trees, such as the elm, sycamore, oak, and maple. The holes of this borer may be recognized by their regular, evenly cut shape, about the diameter of a lead pencil. Another species is known as 'the willow-shoot horntail' (*Phyllæus integer*) and does much damage by ruining the terminal shoots of osier willow plantations in parts of the United States. The families included in this group are the Oryssidæ, Siricidæ, Xyphidridæ, and Cephidæ. Consult: Howard, *The Insect Book* (New York, 1901); Comstock, *Manual for the Study of Insects* (Ithaca, 1895).

HORNUNG, ERNEST WILLIAM (1866—). An English novelist, born in Middlesborough, Yorkshire. He passed two years (1884-86) in Australia. In 1893 he married a sister of Conan Doyle. After returning to England he began a series of adventure novels dealing mostly with criminal life in Australia. Among his novels are: *A Bride from the Bush* (1890); *Under Two Skies* (1892); *Tiny Luttrell* (1893); *Irralie's Bush-ranger* (1896); *The Rogue's March* (1896); *The Amateur Cracksmen* (1899); *Dead Men Tell No Tales* (1899); *The Belle of Toorak* (1900); *The Fate of Faustina* (1901); *The Shadow of a Man* (1901); and *The Shadow of the Rope* (1902).

HORNYPHEAD. One of the most widespread and numerous of American minnows (*Hybopsis Kentuckiensis*). It is a graceful, highly colored fish, six to nine inches long, the fins all pale orange without a black spot; and the males in spring marked with a crimson spot on each side of the head. The distinguishing feature, however, is the tubercle-covered crest on the top of the head of the adults, and especially of the males in nuptial dress. It is a congener of the silver chub, and is known as 'river chub,' or 'jerker,' in some places.

HORODENKA, hō'rō-dēn'ká. A town in the Austrian Crownland of Galicia, on an affluent of the Dniester, 33 miles north-northwest of Czernowitz (Map: Austria, J 2). It has an agricultural school, linen-weaving factory, potash and soap works, and considerable trade in cereals. Population, in 1890, 11,162; in 1900, 11,615.

HOROL'OGY (from Lat. *horologium*, Gk. *ὥρολόγιον*, from *ὥρολος*, *hōrologos*, telling the hour, from *ᾠρα*, *hōra*, hour + *λόγος*, *logos*, word, from *λέγειν*, *legein*, to say). That branch of applied science that has for its object the measurement of time. Although it is easy to look back on a period when time, according to the modern conception of it, as measured by hours, and minutes, and seconds, was unknown, yet we find progress early made in the measurement of larger periods of time, by observations of the heavenly bodies; and although, in the later progress of astronomy, it is found that the movements of the more conspicuous heavenly bodies do not afford accurate marks for the equable measurement of time, they were, for practical objects, sufficient, and afforded at least a better measure of time than any other phenomena which came under the observation of mankind. Thus, time

was early divided into years, according to the motion of the sun among the constellations; into months, according to the motion of the moon relatively to the sun's place in the heavens; and into days, by the alternate light and darkness caused by the rising and setting of the sun. It was long, however, before any accurate measure was found for a division of the day itself. The earliest measure employed for this purpose that we can trace is the shadow of an upright object, which gave a rough measure of time by the variations in its length and position. This suggested the invention of sun-dials (q.v.). Another means early adopted for the measurement of short periods of time was by the quantity of water discharged by dropping from one vessel into another. Instruments for the measurement of time on this principle were called clepsydræ (q.v.). The running of fine sand from one vessel into another was found to afford a still more certain measure, and hence the invention of the hour-glass (q.v.). King Alfred is said to have observed the lapse of time by noting the gradual shortening of a lighted candle. It is not very easy to trace to its source the history of the invention to which the modern clock owes its parentage; the earliest clock, however, of which we have a complete description, and perhaps the earliest which attained any distinct superiority over the rude contrivances already mentioned, was the clock of Henry Vic (De Vick or De Wyck), a German, erected in the tower of the palace of Charles V., King of France, in 1379.

For the description of this first mechanical timekeeper, and for the subsequent history of clock and watch making, see CLOCK; WATCH; PENDULUM; ESCAPEMENT. The history of the science of horology and of the mechanical art of the clock, watch, and chronometer maker are so intermingled that they cannot be considered separately. They may, therefore, be found under these heads. See also TIME; STANDARD TIME; TRANSIT.

HOROSCOPE (Fr. *horoscope*, from Lat. *horoscopium*, from Gk. *ὥροσκοπεῖον*, *hōroskopeion*, *ὥροσκόπιον*, *hōroskopion*, horoscope, from *ὥροσκόπος*, *hōroskopos*, one who observes the hour of a birth, from *ᾠρα*, *hōra*, hour + *σκοπεῖν*, *skopein*, to view). In astrology, strictly speaking, that part of the ecliptic which is ascendant or rising in the east at the moment of an occurrence whose outcome is to be calculated, such as the birth of a child; thence, more generally, the figure of the heavens, constructed with this as starting-point, on which the subsequent predictions are to be based. See ASTROLOGY.

HORR, ROSWELL G. (1830-96). An American journalist and campaign speaker, born in Waitsfield, Vt. He graduated at Antioch College (Ohio) in 1857, served as clerk of the Court of Common Pleas of Lorain County, Ohio, from 1857 to 1863, and was subsequently admitted to the bar. He spent some years in mining in Missouri, and in 1872 resumed his law practice at Saginaw, Mich., where, in 1878, he was elected to Congress as a Republican. He was reelected in 1880 and 1882, and after 1884 became one of the best known campaign speakers in the Republican Party, touring the country from Maine to California in the Presidential campaigns of 1884, 1888, 1892, and 1896, and attracting particular attention by his joint debates with Senator Stewart, of Nevada, in 1893, and with 'Coin'

Harvey in 1895. In 1891 he became a staff writer on the New York *Tribune*, to which he contributed over his name notable articles on the tariff and currency questions.

HORROCKS, JEREMIAH (c.1617-41). An English astronomer, born at Toxteth Park, near Liverpool. He entered Emmanuel College, Cambridge, in 1632, and remained there until 1635, devoting himself principally to the study of astronomy. In the latter year he returned to Toxteth and commenced, under extremely unfavorable circumstances, his original observations. In 1639 he was appointed to the curacy of Hoole, Lancashire, and in that village, on November 24, 1639 (O.S.), he made his famous observation of the transit of Venus—the first observation of this phenomenon ever made. Hearne, in his memoranda, tells us how Horrocks was called away, during his observation of the transit, "to his devotions and duty at church," the day being Sunday. Newton, in the *Principia*, bears honorable testimony to the value of Horrocks's astronomical work, especially commending his lunar theory as the most ingenious yet brought forward; adding, "and if I mistake not, the most accurate of all." Horrocks is frequently mentioned by the scientific men of the seventeenth century; the observation of the transit is by no means regarded as the most important of his astronomical achievements. He died suddenly at the age of about twenty-three, on January 3, 1641. Hevelius printed Horrocks's Latin treatise entitled *Venus in Sole visa* in 1662. In 1672 Horrocks's fragmentary works were published under the auspices of the Royal Society, being edited by Wallis, with the title *Jeremiae Horroccii Opera Posthuma, etc.* Other works of Horrocks's perished in manuscript.

HORSA. See HENGEST AND HORSA.

HORSCHULT, hōr'shēlt, THEODOR (1829-71). A German painter, born in Munich. He was a pupil of the Munich Academy and of Albrecht Adam. He began with studies of horses, and afterwards painted military pictures. Among these first is "The Poacher" (1850). He then went to Spain and Algiers, and afterwards took part in the Caucasian campaign of 1858-59, and made some of its episodes the subjects of his pictures, such as: "The Seizure of Shamyl," "Taking of the Citadel on Mount Gunib," and "Cossacks Returning from a Razzia." His many water-colors of Spanish and Algerian scenes show the same vigor and spirit.

HORSE (AS. *hors*, OS., Icel. *hross*, OHG. *ros*, Ger. *Ross*; possibly connected with Lat. *currere*, to run, less probably with Skt. *kārd*, to spring, Gk. *κρόδαξ*, *kordax*, wanton dance, or with AS. *hrōdan*, OHG. *rusten*, Ger. *risten*, to adorn). One of a genus of pachydermatous quadrupeds of the family Equidæ (q.v.). Since the domestication of the horse it has become next to man himself the most important factor in the business and pleasures of the world, and in fact all the practical details of every-day human life. According to the monuments, the horse was introduced into Egypt at the time of the shepherd kings. His use, however, was very limited, both the Egyptians and Assyrians confining the use of the horse to warfare. Subsequently, however, his services to man increased, and he became an emblem of rank and an object of luxury or sport, as well as an aid in war.

The speed of a horse is its greatest asset, because it is its chief value to man. It is the recognition of this value that has been the important factor in the evolution of the horse, an animal especially plastic in the hands of the breeder. His size, form, action, and instincts are subject to modification to a degree unknown in that of any of the other larger species. During his early history modifications of type were due to the changing conditions of warfare; but to-day the principal variations of type are, to a far greater extent, due to the exigencies of commerce, or the demands of sport. It has been suggested that the different breeds of the modern domestic horse have been developed out of the interbreeding of several original wild species; this, however, is only conjecture. What is known is that domestic breeds have existed in Europe from prehistoric times, and also that they have been improved continually by blending with Oriental horses.

Arabian horses are divided into three classes, which have been recognized as sub-breeds since the fifteenth century. The genuine Arabian is found in the region from Damascus to the Euphrates, as well as in Arabia proper. The breed is found in its greatest purity and excellence in the stables of the Sultan of Turkey. The Turk, or Turkish horse, found in portions of European Turkey, but principally in Asia Minor, was of considerable importance in the seventeenth century, but it has deteriorated very much since then. The Barb is a native of the Barbary States, whence its name. It is found in greater perfection among the Moors, who introduced the Barb blood into Spain during their rule in that country, and so improved the Spanish horse that for several centuries it occupied the first place throughout Europe. Spanish horses of this stock brought to America by the Spaniards are regarded as the progenitors of the mustangs and the other wild breeds common to Mexico and California. (See below, *The Horse in America*.) About the middle of the sixteenth century Italian and Spanish horses (the former heavy types, and the latter, owing to their Barb blood, very much lighter and fleet) were in the greatest demand. It is during this period that horsemanship (q.v.) began to be studied as a science, the first book concerning which was published by Grisoni in Italy in 1552. The Italians were also the first to take up the teaching of horsemanship as an accomplishment, after which riding came into vogue throughout Western Europe. The English thoroughbred is spread over a larger portion of the earth to-day than is that of any other breed, and the literature bearing upon it equals that of all the other animals combined. It is used more than any other to improve the blood of horses of general utility throughout the world, and, according to statistics, more capital is influenced by it than by any other two or three breeds combined.

The history of English horse-breeding has been divided into three periods: the first extending from the earliest records to the end of the sixteenth century; the second from the accession of James I. to the first year of the *Stud Book* (q.v.), 1791 (in which period the thoroughbred came into existence); and the third period extending to the present time, in which the thoroughbred has become a clearly defined as well as a pure breed. The original British horse was a small pony, shaggy and hardy, and rarely more

than 14 hands high, but the importation of stallions from Spain, Italy, and France improved the breed from time to time. During the Crusades and the consequent general use of heavy armor, which continued up to about the year 1600, large horses came into vogue. A knight in armor, together with his horse-accoutrements, weighed from 350 to 425 pounds, so that during the age of chivalry all breeding was directed toward improvements in the size of the horse. Stallions under a certain size were condemned by law, and in 1217 one hundred stallions were imported from Normandy, and for nearly five hundred years subsequently size was sought for rather than speed; thus laying the foundation of the different modern breeds of British draught-horses. What was the case in England was equally so with the nations of Western Europe and their horses; so that the horse of this period is particularly remarkable for its broad chest, heavy neck, and round buttocks. With the appearance of gunpowder and firearms, and the disappearance of armor, these breeds became useless for the purpose of warfare, which now demanded fleetness as a first essential. They passed, however, to a greater sphere of usefulness, and to-day constitute the heavy draught breeds known as the Dutch and Flemish, the Percherons (q.v.) of France, the Clydesdale (see SHIRE HORSE) of Scotland, and the cart and shire horse of England.

Before the days of the tournaments in England large horses were scarcely known, but the needs of the knights compelled the keeping of a sufficient number, so that by intermixture with smaller native animals the size of the British horse gradually increased; but the result proved that, although they were bigger, they did not nearly possess the qualities of the smaller horse. During the Crusades the excellence of the Saracen horses deeply impressed the British Crusaders, who brought many Asiatic horses with them on their return to England. The Eastern horses were Barbs, Turks, Arabs, and Persians, not more than 14½ hands high, and it is to them that the English horse owes in part its present conspicuous qualities. Laws were passed to promote the breeding of large horses by improving the type of British ponies. During the reign of Henry VIII. it was ordained by law that no stallion less than 15 hands and no mare less than 13 hands should run wild in the country. Colts two years of age and under 11½ hands high were not permitted to run on any moors, forests, or commons where mares were pastured, and to guard against any mishaps it was further ordered that at Michaelmas the magistrates of the neighborhood were to search the countryside, the forests, and the commons, for the purpose of destroying all stallions under the required height, as well as "all unlikely tits, whether mares or foals." Prelates and nobles, and every one whose wife wore a velvet bonnet, were compelled to do their "leaping and riding upon stallions not less than 15 hands high." There were two classes of horses throughout the country; the first a "very indifferent, strong, slow, heavy draught-horse," and the second "light and weak." Private matches were often arranged, showing that speed was becoming a greater factor than size and weight.

Although there had been public horse-racing in Elizabeth's time, it was not until James I. ascended the throne that horse-racing was legally established. He introduced into England the

Markham Arab, which was known to be a pure-bred animal, and in many other ways did much to improve the breed of horses. A distinction was drawn between race-horses and common horses; the race-horses were trained for their competitions, and 140 pounds was the average weight of a professional jockey. During the reign of Charles I. a memorial was presented to the King bewailing the gradual disappearance of stout horses fit for the defense of the country, by stating that the breed of strong horses was likely to disappear unless measures were taken for their propagation. The tournament was no more, the pack-horse had practically disappeared, the introduction of the coach had removed a large part of the pack from the horse's back, and everything was done to encourage cross-breeding with foreign importations. From such ancestors the modern thoroughbred has descended. After the civil wars and during the reign of Charles II. the race-courses at Newmarket and at Datehet Mead, near Windsor, were laid out, and the King himself became the first great supporter of the turf. The most conspicuous English horseman of this time was the Duke of Newcastle, who in 1667 published his celebrated work on horsemanship, the reading of which is said to have so interested Charles that he became the largest individual importer of foreign blood in the country. The Stuart kings maintained magnificent studs and constantly employed purchasing agents to secure the best Oriental blood; but, unfortunately, the pedigree of many of these animals is largely a matter of tradition, owing to the fact that the *Stud Book* had not been issued. In spite of the infusion of foreign blood, however, the English race-horse in the time of the Stuarts was a clumsy-looking animal in comparison with the pure Oriental type, or with the race-horse of to-day. He was strong and of large build, but neither as elegant nor as swift on the race-course as was the Barb. The combination of native English stock and such horses as the Helmsley Turk, Byerly Turk, Pace's White Turk, D'Arcy's White Turk, Selaby Turk (see *STUD BOOK*), and by such Barbary stallions as Dodsworth, Carwen, Bay Barb, Greyhound, Compton Barb, and Toulouse Barb, produced a horse remarkable for its well-proportioned locomotive parts, legs, shoulders, etc., strong carcass and deep chest, the typical animal of speed and endurance.

Since the middle of the eighteenth century the practice of interbreeding with Oriental blood has been discontinued, and although half-bred horses were raced until the first part of the nineteenth century, the thoroughbred has ever since the foundation of the "racing calendar" been the recognized race-horse, and his pedigree has been strictly and authentically kept. During the seventeenth century speed was not the sole qualification of a race-horse; it was required to have strength and endurance. From racing matured horses at long distances, it was an easy transition to shorten the length of the course and increase the speed of the horse, besides which, the element of gambling entered into the sport, and it soon happened that three-year-old horses were used in the races. It was found, however, that they could not 'stay' the old four-mile course, so that of necessity the distances had to be reduced to accommodate the horses. The result of this policy is seen in modern horse-racing (q.v.), in which two-year-old horses developed for speed

alone take part in races over courses less than half a mile in length.

THE HORSE IN AMERICA. According to paleontology, the horse is indigenous to the American Continent, but it is certain that the American horse of to-day is the descendant of animals brought here by Europeans and the first settlers. Cortez used but few horses in his Mexican conquest, but undoubtedly some of them became progenitors of the American wild horse; and similarly, the horses abandoned by the unfortunate Ferdinand De Soto near the Texas border became the progenitors of all the wild horses of North America. (See HORSE, FOSSIL.) The character and action of the American horse will be found fully described under TROTTER and PACER.

THE COLONIAL PERIOD. The earliest colonists of Virginia were not remarkable for the qualities that make the ideal pioneer, so that it is not surprising to learn that their first supply of domestic animals (including horses) was consumed as food. Although there had been several shipments of horses from London down to about 1640, in 1646 there were only between 200 and 300 horses of both sexes in the colony. In 1656 the exportation of mares was prohibited by law, but in 1667 the restriction was removed. The horses of the period are described as having been of hardy and strong quality, but undersized, and, like the horses in other colonies, they were branded and turned loose to find their own subsistence. Owing to the rapidity of their increase, they were soon very numerous and became practically wild; so much so that at the close of the seventeenth century it was a common as well as profitable sport to hunt wild horses, for an animal without a brand became the property of its captor. On the island of Chintoteague, off the coast of Virginia, there are still in existence bands of wild horses, and only within recent decades has there been any attempt to domesticate any of their number. They are of all colors, and uniform in size, not averaging over 13 hands, and are accounted for in their present location as being the descendants of a band of Virginian wild horses which located there when it was a peninsula, and had their retreat cut off when time converted what had been a peninsula into an island. Notwithstanding occasional efforts to increase its size, the Virginian horse retained the characteristics of its English ancestor.

The settlers of New Netherlands brought their horses from Utrecht. They were larger, better, and more valuable, so far as prices were concerned, than the English horses of the other colonies, but were not regarded as being as good for saddle work. The two breeds soon intermixed, and a larger breed resulted, for at the time of the Revolution the average height was 14 hands and 1 inch. Horse-racing was introduced by Governor Nicholls, of New York, in 1665. He established a race-course on Hempstead Plains, Long Island, which was the first official and properly organized race-course on the Continent. It is supposed that the horses were of the Dutch breeds, because the people attending were largely of that nationality. The English race-course was not at that time thoroughly developed, and in any case was not imported into New York until nearly one hundred years afterwards. The New England colonies played a very important part in the development of the modern American horse. In 1629 the first horses were

imported into New England from the proprietary company in London. In 1635, 27 mares and 3 stallions were shipped from Holland, and sold in Salem; and five years later conditions were such that the colonists were enabled to export a shipment of 80 animals to the Barbadoes. It has been ascertained from an investigation covering the period 1756-59 that the average height of horses was 14 hands 1 inch, and that three-fourths of the total number were pacers and one-fourth trotters. The founders of Hartford, Conn., brought horses with them (1636), and in 1653 the General Court at New Haven ordered all horses to be branded, and instituted a system of public saddle-horses for hire. The average size was 13 hands and 3 inches. Roger Williams and the settlers of Rhode Island Colony (1636) obtained their horses from Massachusetts, and succeeded so well in the breeding of them that in 1690 horses were their principal export, and they shipped them to all the colonies of the coast. Pacers were raised in Rhode Island, and were widely known as Narragansett pacers. Trade with Canada was not permitted, but there is no reason to doubt that an occasional trade was made, whereby a Narragansett pacer changed owners for the consideration of a bale of peltry, such as only the French Canadian could offer. Racing was especially encouraged in Rhode Island, and thus was developed the speed that made their horses famous. In 1768 the average size of a Narragansett was 14 hands and 1 inch. The horses of Pennsylvania were not handsome, but good. In the early part of the seventeenth century the Pennsylvania horse was the largest and heaviest horse in the country; but one hundred years later they seem to have ranked in both respects below the horses of all the other colonies. Up to 1750 the average size in eastern Pennsylvania was about 13 hands and 1¼ inches. Philadelphia boasted the speediest and finest horses, and pacers were the most fashionable and popular. New Jersey supplied itself from New York and Pennsylvania, and by the beginning of the eighteenth century racing had become so common as to be a nuisance; so much so that in 1748 there was enacted a law for the suppression of 'running, pacing, and trotting races.' The year before the Colony of Maryland, which had in all probability received its supply of horses from Rhode Island, Pennsylvania, and Virginia, passed a similar law. North and South Carolina secured their horses from Virginia. In Canada horses were received from Picardy, France, in 1665, and it is assumed they were largely of the English type. Many of them are supposed to have been pacers; but whether they were, or whether, as is sometimes argued, the Canadian pacer is derived from the illicit trading with Rhode Islanders for their Narragansetts, is a question much discussed.

The American horse was for two hundred years the sole means of travel, and the great essential to all business in and between the various colonies of the country. Improved roads have made him a driving horse, and none of the inventions of modern times, from the introduction of railroads to bicycles and horseless vehicles generally, has affected his popularity or his value. To the superficial observer it would appear as if improved means of vehicular transport would diminish the breeding of horses, as well as decrease their value, but thus far such has not been the

case. Good horses have a higher value than ever, and as the demand for cheap or poorly bred horses diminishes, the better bred ones survive, and what is lost in number is more than balanced in breed and consequent value. *Bashaws, Clays, Black Hawks, Hambletonians, Mambrino Chiefs, Pilots, American Stars, Blue Bulls, etc.*, are all discussed under TROTTER and PACER. Under PONY a discussion will be found of the Shetland, Galloway, and other breeds; Palfrey, Percheron, and Roadster are discussed under TROTTER; under SHIRE HORSE will be found the Suffolk Punch, Clydesdale, and other heavy and draught breeds.

mon to Wales and North Britain. It seldom ranges above 14 or 14½ hands in height, and is not a particularly valuable animal. Specimens below 13 hands are called ponies (q.v.). The *hunter* is not required to be a thoroughbred animal, although where the hunting warrants it he is frequently thoroughbred, or half-bred at least. He is chosen to suit the country over which he is hunted, as well as to carry the weight of his rider. In any case he should have the following characteristics: A lean head and neck, firmly set on good oblique shoulders; a strong back and loin, deep body, wide hips, good quarters, and firm legs and feet. Among horsemen

the following terms are in use: A *stallion* is a male horse, and when gelded is termed a *gelding*. A *mare* is the female. Animals of both sexes when young are termed *foals*; the male foal is a *colt*, and the female a *filly*. Young animals become 'of age' when the outer incisors (corner nippers) are developed. A horse is 'aged' when in its eighth or ninth year, a fact determined by the front teeth. The period of gestation is eleven months, the foal usually being dropped in the spring.

EXTERIOR PARTS OF THE HORSE. Many excellent works on the anatomy of the horse are published, several of which will be found included in the bibliography of this article. Below will be found described the more important external parts, together with their position and boundaries. *The Head*.—The point of demarcation between the head and the neck may be described as follows: Observing the animal in profile, the head is divided from the neck by

an imaginary line drawn from the back of the ear, along the rear edge of the lower jaw to its angle. The upper part of the face is called the forehead, and the forelock is a tuft of hair which, although a part of the mane, lies between the ears. The temples lie on each side of the forehead, between the ear and the eye; the nose is a continuation of the forehead, ending opposite the nostrils. The lower end of the head is called the muzzle; it includes the nostrils, lips, and the bones and teeth covered by them. The bars of the mouth are those portions of the gums of the lower jaw situated between the back teeth and the tushes (or the place usually occupied by the tushes). Just under the bars of the mouth is the chin-groove, in which rests the curb chain of the curb bit, when such is used. The neck lies between the head and the shoulders, from which latter it is separated by an imaginary line drawn from

HEAD—1, muzzle; 2, nostril; 3, forehead; 4, jaw; 5, poll.

NECK—6, crest; 7, thrope or windpipe.

FORE QUARTER—8, 8, shoulder-blade; 9, point of shoulder; 10, bosom or breast; 11, true arm; 12, elbow; 13, fore-arm (arm); 14, knee; 15, cannon-bone; 16, back sinew; 17, fetlock or pastern joint; 18, coronet; 19, hoof or foot; 20, heel.

BODY OR MIDDLE PIECES—21, withers; 22, back; 23, 23, ribs (together forming the barrel or chest); 24, 24, circumference of chest—called the girth; 25, the loins; 26, the croup; 27, the hip; 28, the flank; 29, the sheath; 30, the root of the dock or tail.

HIND QUARTER—31, hip-joint or whirl-bone; 32, stifle-joint; 33, lower-thigh or gaskin; 34, the quarters; 35, the hock; 36, point of the hock; 37, the curb place; 38, the cannon-bone; 39, the back sinew; 40, pastern or fetlock-point; 41, coronet; 42, foot or hoof; 43, heel; 44, spavin-place.

The *hackney* is bred chiefly for carriage purposes, and is a type indigenous to the eastern counties of England. It is of excellent symmetry of proportion, and is capable of a very true rhythm in action; although it is slower and heavier than the roadster, it is faster and much lighter than the middle-weight draught-horse. A well-bred hackney should be properly balanced in fore and hind quarters and middle piece. Since 1890 there have been large importations of this breed to America, although the hackney has been known here by occasional single importations since 1822. It has been especially valuable in the breeding and development of the American trotter. The *cob* is a native of Norfolk and Lincolnshire, in England, and is a stoutly built, short-legged animal of from 13.3 to 14.3 hands high. It is smaller than the hack and larger than the pony. The *Galloway* is a horse com-

the dip in front of the withers to the depression caused by the union of the neck and breast. On the top of the neck, and immediately behind the ears, is the poll; and extending from the withers to the ears, along the upper part of the neck, is the crest. The groove on each side of the neck just above the windpipe is known as the *jugular groove*. The *chest* is divided from the belly or abdomen by the diaphragm, and includes the cavity in which are situated the lungs and heart, and which occupies nearly the front third of the trunk. The term *breast* is frequently used to describe the part herein treated under chest. The upper boundary of the shoulders is formed by the withers, and the rear border may be taken from behind the 'swell' of the muscle, situated just below the withers to the elbow. A little below the junction of the neck and shoulder, on each side of the chest, is a prominent bony angle, known as the point of the shoulder. The withers are the bony ridges which constitute the forward continuation of the back and end abruptly in the crest. The elbow is the bony projection at the upper posterior part of the forearm, which latter is found between the shoulder and the knee. The upper boundary of the knee may be decided by a line drawn at right angles to the direction of the leg above the knee-joint, and the lower boundary by a line joining the point where the line of the cannon-bone meets that of the knee, with that where the line of the back tendon is terminated by the trapezium, at the back of the knee. The cannon-bone is situated between the knee and the fetlock. At its back are two small bones, known as the outside and inside splint-bone. The cannon is the very confusing name applied to that part of the leg situated between the knee and the fetlock (i.e. footlock, a tuft of hair growing behind the fetlock joint). The joint which the cannon-bone makes with the pastern is called the fetlock joint. Between the fetlock and the hoof is a short column of bones called the pastern, the lower portion of which, called the coronet, is immediately above the hoof. The hoof is a horny box inclosing the lower part of the limb. The lowest front part of the hoof is the toe; the sides are quarters; and the lowest rear part the heels. The exterior or outer part of the hoof is termed the wall, which in turn is divided into an outer covering or crust, and a soft inner layer of non-fibrous horn. In the centre of the ground surface of the hoof is a triangular buffer called the frog, in the middle of which is a division termed the cleft of the frog; turned inward at the heels, and running more or less parallel to the sides of the frog, are the portions of the wall called the bars of the hoof. The ground surface of the foot between the wall, bars, and frog, is called the sole. The back includes the withers, but not the loins; which parts, together with the ribs on each side, constitute the boundaries of what may properly be termed the back. It has been described as an ill-defined region, owing to the many different opinions on the subject. The loins are found between the back and croup, with the flanks on each side. The ribs lie between the shoulders, flanks, belly, and brisket or sternum. The flank is that part of the horse's side between the loins, ribs, thigh and hip-joint, and the belly. The hollow of the flank is the upper portion of the flank. The belly is the cavity which contains the stomach, liver, spleen, intestines, kidneys, bladder, etc. The brisket is

the lower part of the chest. The *croup* is that portion of the upper part of the body placed between the loins and the tail. Broadly stated, it extends down on each side to the point of the buttock. The thigh has been cleverly defined as separated from the stifle, flank, croup, buttock, and gaskin by a horizontal line drawn from the upper end of a straight line made by the hamstring, which proceeds toward the thigh from the point of the back. While not anatomically correct, it is the general acceptance of the term. The gaskin lies between the thigh and the back, which latter is found between the gaskin and the hind cannon-bone. The dock is the solid part of the tail.

INDICATIONS OF AGE. It is very difficult, if not impossible, to formulate any rules by which the age of a horse may be accurately determined. To an expert horseman the lightness and elasticity of step of the animal under examination will afford a general clew; or better still, the contour of the lower jaw, which grows more and more angular with increasing age. It is to some structure of the animal little liable to change, however, that we must look for any very accurate gauge, and the only structure answering that requirement is that of the teeth, which must be examined according to the following rules: The six teeth or nippers, situated in the front of the lower jaw, are the ones examined to determine the question, although the tushes are a partial indication, and are sometimes used in arriving at a decision. In this article, the two middle nippers will be referred to as the central nippers; the ones on each side of these, as the middle nippers, and the ones at each end of the group as the corner nippers. At two and a half years of age, the permanent central nippers are just through the gum, the temporary middle and corner nippers still remaining; one year later the permanent middle nippers are in evidence, and between the fourth and fifth year the corner nippers will be through. About this time changes will be noticed in the condition of the earlier teeth; for instance, the middle pair look as the central pair did at two and one-half years, and the central nippers are showing signs of wear. Between the ages of five and nine, considerably more experience is necessary for an accurate judgment than has been required before. At nine years of age the previous oval shape of the teeth becomes more triangular; at ten the central nippers take a pronounced triangular shape, and the middle pair give evidence of a like tendency, followed at eleven years by the growth of the corner nippers in the same direction. The tushes become rounded at the points, and the nippers are longer and project more, the central nippers being completely triangular. The signs of wear and tear, and the growth of the evidences already described, continue with increasing age, so that at twenty years the nippers are all exceedingly triangular, projecting forward to a great degree, and are very long.

The *character* or temperament of a horse cannot be discerned short of actual experience, by any known formula or given rules; for while the experienced horseman may judge approximately by noting the shape of the face and head, and the expression of the eyes, he will, as a rule, be unable to explain the method or rules upon which his conclusions are based. Like men, horses are of different dispositions, and exhibit such varied

AGE-MARKS ON THE TEETH OF THE HORSE

- 1. One Year Old.
- 2. Two Years Old.
- 3. Three Years Old.
- 4. Four Years Old.

- 5. Five Years Old.
- 6. Six Years Old.
- 7. Seven Years Old.
- 8. Nine Years Old.

- 9. Eleven Years Old.
- 10. Thirteen Years Old.
- 11. Fifteen Years Old.
- 12. Seventeen Years Old.

characteristics as pride, dignity, intelligence, stupidity, courage, cowardice, etc. Generally stated, an intelligent horse shows considerable width between the eyes, which latter are very prominent. The width between the ears is taken to indicate courage and strength of character; and roundness and elevation between the eyes, as denoting a mildness of disposition. A timid horse is usually narrow between the ears, and a stupid one, narrow between the eyes.

DISEASES OF THE HORSE. No other domestic animal is so large a sharer with humanity in the accidents and dangers incident to modern civilized life as the horse. It is practically a co-partner with man in every detail of his life and work, and yet no other animal suffers so much from ignorance, abuse, maltreatment, and quackery. Modern civilization is doing much to alleviate the condition of the less fortunate of his kind, notably the various societies for the prevention of cruelty to animals. (See *CRUELTY TO ANIMALS, PREVENTION OF.*) The practice of veterinary surgery has become one of the most exacting and advanced of professions, and diseases long considered incurable are now amenable to treatment. In European countries the horse is an object of governmental solicitude, as much for his value as a factor in warfare as for purely humanitarian reasons; and a careful census record is kept (particularly in Germany) of the number, pedigree, and value of the horses throughout each country. The Government of the United States, through its Department of Agriculture, alone of all the nations of the world has compiled a special *Report on the Diseases of the Horse*, which is published as a guide and aid in the cultivation of a proper knowledge of the care and treatment of the animal. Below are described some of the more prevalent diseases, which will be found more fully treated in the above-named publication.

THE TEETH. Dentition covers the period during which the young horse is cutting his teeth, usually from birth up to the age of five years. As a rule the horse has more difficulty in cutting the second or permanent teeth than he has with his first or milk teeth. With regard to the latter the mouths of young horses should be frequently examined in order that the milk-teeth may not remain too long and thus cause the permanent teeth to grow in crookedly. Toothache is rare with the average horse, and then only where a tooth is allowed to decay. Usually it is only observed in the molar teeth, and may be discovered by the evidences of pain given by the horse when feeding or drinking cold water.

DISEASES OF THE MOUTH. (1) *Lampas* (q.v.): A swelling of the mucous membrane of the hard palate, projecting in a more or less noticeable ridge immediately behind the upper incisors. (2) *Stomatitis* (q.v.): An inflammation of the mucous membrane of the mouth, generally produced by irritating medicines, foods, or other substances such as often follows in the case of city horses from eating out of ash-barrels. (3) *Glossitis*: An inflammation of the tongue very similar to stomatitis, both in origin and in symptoms. (4) *Ptyalism*, or salivation, is an abnormal and excessive secretion of saliva, often caused by irregular teeth, inflammation of the mouth or tongue, or the use of medicines, and occasionally by the eating of second-crop clover. (5) *Pharyngitis* (q.v.): An inflammation of the mucous mem-

brane lining of the back part of the mouth, or pharynx. (6) Paralysis of the pharynx, or as it is more generally called, paralysis of the throat, is a disease first discovered from the fact that the animal is unable to eat, and the manger is found to contain much saliva and frothy food that has been returned through the nose.

DISEASES OF THE OESOPHAGUS OR GULLET. It will be found in the vast majority of instances exhibiting these diseases that the cause is the introduction into the organ of foreign bodies too large to pass, or else that there are present erosions and ulcerations of the throat (followed by constriction or narrowing of the gullet) caused by the administration of caustic medicines not thoroughly diluted. The designations pharyngeal, cervical, and thoracic choke are used to denote where the obstruction is located, the symptoms varying according to the position of the agent responsible for the choke.

DISEASES OF THE STOMACH. (1) *Stomach staggers* (see *STAGGERS*), or gorged stomach (*Impaction*): Distension of the stomach caused by food, in which the stomach loses the power of contracting upon its contents. (2) *Tympanites* of the stomach: A disease corresponding to that of 'hoven' or 'blown' in cattle, and frequently due to the overloading of the stomach with young, succulent herbage, which, after its arrival in the stomach, liberates quantities of fermentation gas sufficient to distend the stomach seriously. Overfeeding is a very frequent cause of stomach-bloat, particularly if the overfeeding is followed immediately by hard work. The symptoms are very much the same as for stomach staggers, and the treatment must be at once vigorous and immediate. As a rule, cases of this trouble occur away from the stable. From two to four ounces of common baking-soda should be given as quickly as possible, an additional half-ounce of cayenne pepper being given to aid the stomach to contract and expel the gas. Charcoal may be given in any amount, and any medicine that will check fermentation or absorb the gases will be found useful. Cold water dashed with force over the stomach is frequently an aid. (3) *Rupture of the stomach*: If convinced that the diagnosis is correct it is better to destroy the animal at once. If, however, there is a possibility of mistake, powdered opium in one-dram doses may be given every two or three hours, thus keeping the stomach as quiet as possible. The case should be kept under the observation of a skilled veterinary. (4) *Bots*: There are so many opinions extant concerning this disease, many of which are erroneous, that it will repay any owner of stock to make a careful study of it. With regard to the insect itself, see *BOT* and *GADFLY*. Of the numerous insect parasites or solipeds, the gad-flies (*Estridæ*) are the most important. The species responsible for the above-named disease infest chiefly the stomach and duodenum—a small gut leading from the stomach. Nearly all country horses, as well as those experiencing their first year in the city, have the bots, but the common opinion that bots frequently cause colic pains is erroneous. If in large enough numbers they may sadly interfere with digestion. The animal may not thrive and emaciation may follow, but beyond this they are harmless. It is fortunate that such is the case, for there are no medicines that affect them: neither acids, alkalies, nor anodynes are capable of securing

their ejection from the stomach. The best that can be done is to watch for their eggs on the legs and body of the horse during the late summer and autumn, and carefully scrape them off and burn them. (5) *Indigestion*: Indigestion is imperfectly performed digestion, which in the horse causes symptoms closely resembling those of dyspepsia in man. A great cause of indigestion with the horse is found in the food itself. (See *Care of the Horse*, below.) The teeth are in many instances to blame, their sharp, irregular, or decayed condition preventing any perfect mastication, and causing the animal to swallow his food before it receives the requisite admixture of saliva. The principal seat of indigestion is in the stomach or small intestine. It is characterized by an irregular appetite, refusal of food or gorging, and a disposition to eat unusual substances, as wood, salt, bedding, and frequently his own feces. The animal loses flesh, and the skin becomes hard and dry and hide-bound. The treatment usually consists of a careful regulation of food as regards quality, quantity, and time of feeding, and an exercise of similar care as regards the water-supply. The condition of the mouth and teeth must also be attended to, and the teeth if sharp or irregular must be rasped down, or extracted if decayed. If the indigestion is caused by ravenous eating, the animal should be fed from a manger sufficiently wide to allow the spreading of the grain, which will usually compel the horse to eat slowly. Frequently a cathartic is given at the outset.

INTESTINAL WORMS. Worms are very frequently found in young horses, as well as in those that are weak or debilitated. They almost invariably exist in horses pastured on low, wet, or marshy ground, as well as in those that drink stagnant water. The most common form of intestinal worm is the lumbricoid worm, which closely resembles the common earthworm. It is white or reddish in color, measuring from four to twelve inches in length, and varying in thickness from the size of a rye straw to that of a cigar, being thickest at the middle and tapering toward each end. At first, slight colicky pains are noticed, or a vigorous switching of the tail, and frequent passages of manure; the animal does not shed its coat, and is hide-bound and potbellied. He will be particularly fond of salt, and will bite at the woodwork of his stall; the bowels are irregular, either constipation or diarrhœa being present. Among the best medicines for worms are santonin, turpentine, tartar emetic, infusion of tobacco, and bitter tonics. Whatever remedy is given, it will be found much more effective if administered after a long fast, and then the worm medicine must be supplemented by physic to force out the worms. There are many varieties of worms, the treatment for which is usually along the lines above described.

SPASMODIC OR CRAMP COLIC is the name given to colic which is produced by contraction or spasm of a portion of the small intestines. It is usually caused by indigestible food; foreign bodies; excessive drinking of cold water when overheated; draughts of cold air, etc. To insure correct treatment, it is very necessary to keep in mind the type of horse, the force of the attack, the intervals of ease or violent pain, the temperature and pulse, and a frequent attempt to urinate, which will prevent the confounding of this with any other form of colic. The treatment

indicated is any antispasmodic medicine, of which probably there is none better than chloral hydrate given in a dose of one ounce in a half-pint of water as a drench. *Flatulent colic*, *tympanites*, *wind colic*, *bloat*, are common among animals subject to sudden changes of food, careless feeding or treatment; too much green food, or any other food that has become stale and sour.

Herniæ: There are several kinds of herniæ, not all of which, however, are to be regarded as serious or dangerous. Abdominal herniæ, or ruptures, are divided into reducible, irreducible, and strangulated, according to their condition; and into inguinal, scrotal, ventral, umbilical, and diaphragmatic, according to their situation. In many instances treatment is not necessary; or, where the hernial sac is extensive, treatment is ineffective. A good deal will depend on whether any one is present when the hernia happens, as to the possibilities of a perfect cure. Umbilical hernia, or diaphragmatic hernia, calls for the most skilled treatment, and even then little or nothing can be done.

ACUTE INFLAMMATION OF THE KIDNEYS. The causes of this disease are many and varied. Congestion occurs from retained products passed through the kidneys during recovery from inflammation of other parts, or fevers. Detained urine, and the possible production of ammonia and other irritants, are also frequent causes. The symptoms consist of fever, stiffness of the back, straddling gait, difficulty in lying down, rising, or walking in a circle. The recognized treatment is as follows: Removal of any cause that can be discovered; then, if suffering from high fever, the removal of from two to four quarts of blood, which should be followed as much as possible by throwing the work of the kidneys on the bowels and skin. *Catarrh*, or *Cold in the Head*: A fluid discharge from the mucous membrane. Inflammation, as a rule, extends to the membrane of the sinuses of the head, and of the larynx and pharynx, causing the added complication of sore throat. Frequently the eyes are also affected. At the first stage of the attack the membrane is dry and irritable, followed by a watery discharge from the nostrils. Fever, more or less, makes its appearance, which is usually detected by placing a finger in the animal's mouth. In itself the disease is not very serious, but if neglected, or treated wrongly, may become complicated and dangerous. A few days of cessation from work, together with pure air and good food, is regarded as the best treatment. *Roaring* (q.v.): A chronic disease, evidenced by a loud, unnatural noise in breathing, and caused by an obstruction to the free passage of the air in some part of the respiratory tract. External causes are nasal polypi, thickening of the membrane, the pharyngeal polypi; deformed bones; paralysis of the wing of the nostril; and more than anything else, paralysis of the muscles of the larynx.

Grunting: A horse is usually first tested by veterinarians for grunting, when if the fault is discovered he will be further tested for roaring. Grunting is a sound emitted during exhalation, when the animal is suddenly moved or struck at.

High Blowing is distinctly a nasal sound, but it must not be confounded with roaring; it is a habit, and does not constitute unsoundness. In the same class should be placed whistling and thick wind. **Bronchitis**, or **Inflammation of the Bronchial Tubes**: While the causes of this disease

are of the same order as for other diseases of the respiratory organs, some special causes are the inhalation of irritating gas or smoke, and fluids or solids gaining access to the parts. It is also occasionally associated with influenza, or fever, and frequently supervenes a common cold or sore throat. The animal appears dull, the appetite is partially or wholly lost, the head hangs, and the cough, at first light, is succeeded by a high rasping cough. He prefers to stand with his head to a door or window to secure fresh air, and persists in standing. He has more or less thirst, and frequently the mouth will be found full of saliva. The first step in the treatment of the disease is to secure a pure atmosphere and comfortable quarters whenever possible; a well-ventilated box-stall will be found the best. The body should be covered with a blanket according to the season of the year; the legs should be hand-rubbed until they are warm, then flannel bandages applied to the knees and hocks. If the legs cannot be made warm after hand-rubbing, take any liniment used for sore throat and thoroughly rub in, after which the legs should be covered with bandages. It will be well to rub the same liniment over the chest, the elbow, and shoulder-blade; and from the elbow below, to within about six inches of the ridge of the backbone above. *Pneumonia*, or *Lung Fever* (q.v.), may attack both lungs, but as a rule one lung only is affected.

DISEASES OF THE EYE. It is impossible to over-estimate the value of sound eyes in a horse, for not only does disease or injury depreciate the selling price of the animal, but it is a great source of danger at all times. Some diseases, like recurring inflammation or moon-blindness, as it is called, are congenital. The structure of the eye is that of a spheroidal body, flattened behind. The posterior four-fifths is inclosed by an opaque, strong, fibrous membrane, which has on its inner side a more delicate membrane consisting principally of blood-vessels and pigment-cells, which in its turn is lined by the extremely delicate and sensitive expansion of the retina. The anterior fifth of the globe of the eye bulges forward from what would have been the direct line of the sclerotic, forming a segment of a much smaller sphere than is inclosed by the sclerotic. There are four straight muscles of the eye, and two oblique and one retractor, enabling the eye to turn inward, outward, upward, and downward, and when all act together the eyeball is drawn deeply into its socket. One of the most common diseases is inflammation of the eyelids, which is caused usually by exposure, bites, or stings of insects, pricks with thorns, or by a whip or club, or as a result of infecting inoculations. All the known causes may ordinarily be divided under the following heads: (a) Inflammations due to constitutional causes; (b) those due to direct injury, mechanical or chemical; and (c) those due to inoculation with infecting material. The local treatments ordinarily advised consist of astringent, soothing lotions (sugar of lead, 30 grains; laudanum, 2 teaspoonfuls; rain-water—boiled and cooled—one pint) applied with a soft cloth kept wet with the lotion and hung over the eye by tying it to the headstall of the bridle on the two sides. The horse should be fed from a high manger, so as to help the return of the blood from the head; and his diet should be laxative and non-stimulating. For a sty or boil of

the eyelid, the practice is to apply a poultice of chamomile flowers, with the addition of a few drops of carbolic acid. The poultice should be applied in a very thin muslin bag. Wounds such as torn eyelids, caused by the horns of cattle, or with the teeth, or by nails, or the barbs of wire fences, are also frequent. In such cases the edges should be brought together as promptly as possible, so as to secure union without any unsightly distortions. It is an operation that requires experience and skill.

LAMENESS. By this is meant any irregularities or derangements of the functions of locomotion. There are innumerable forms of lameness, the sources of many of which are so obscure as to defy location until the resulting disease has gained sufficient headway to be serious. In veterinary nomenclature each two of the legs, as referred to in pairs, are denominated a biped, the two fore legs being the anterior biped, and the two hinder the posterior; the two on one side are designated the lateral; and either the front or the hind biped, with the opposite leg of the hind or the front biped, forms the diagonal biped. In health, each biped as well as each individual leg has to perform an equal and uniform duty and carry an equal share of the total weight of the body, so that the result ought to be a regular, evenly balanced, and smooth displacement of the body. According to the rapidity of the motion of the animal in different gaits, each single leg is required at certain moments to bear the weight which had the moment before rested on its congener; or again the legs of one biped may be required to carry the weight of its opposite biped. Beginning with diseases of the bones as a common source of lameness, the 'splint' (q.v.) will be found to be of the commonest occurrence. Indeed, a horse which does not possess one or more belongs to a very small minority. The splint is a bony enlargement on the cannon-bone, between the knee or hock and the fetlock joint. *Ringbones* (q.v.) usually result from heavy labor before the animal was of sufficient age, and consequently before the bones were sufficiently ossified; or else from bruises, sprains, or other forms of violence. *Spavin* (q.v.), or exostosis of the hock-joint, is a disease of the most serious kind for many reasons, not the least of which is the slowness of its development and the insidiousness of its growth. *Fractures* are of less serious consequence in the horse than in man, but nevertheless they are always a matter of grave import and demand at once a most skillful treatment. *Wind-galls* (q.v.) is a name given to the dilated bursa found at the posterior part of the fetlock joint. *Sprains* are diseases of the muscles and tendons. Ordinarily the cause of a sprain may be attributed to a fall or overstrain, and subsequent soreness, swelling, and suspension of functions. Rest is the prime essential, the treatment consisting of local applications, stimulating liniments, counter-irritation, and occasionally firing. Lameness of the shoulder from sprain is the most frequent, and is popularly described as slip of the shoulder. With draught-horses it frequently is caused by the effort necessary to move off a heavily loaded vehicle. In the great majority of cases a rest is all that is necessary to effect a cure. Under the general classification of diseases of the fetlock, ankle, and foot are to be found many of the most common as well as most fatal (so far as the value

of the animal is concerned) diseases known to veterinary science. Many horses are predisposed to injuries and diseases because of imperfectly formed feet, in consequence of which they are peculiarly liable to diseases of this character. Flat-footed horses are liable to corns, pumiced sole, bruises of the sole, and kindred troubles, owing to the fact that the soles of their feet have little, if any, convexity. The flat foot has no arch, so that the weight of the animal falls on the entire plantar surface instead of on the wall, which allows of little, if any, elasticity in the sole. In *clubfoot* the feet have the wall set nearly perpendicular, and consequently the heels stand high and the fetlock joint is either thrown forward or knuckled, and the weight of the animal is thrown onto the toes. In *crooked foot* one side of the wall is higher than the other, causing the animal to be pigeon-toed as well as making it 'interfere.' *Interfering* is when one foot in action strikes the opposite leg. *Knuckling* is another fault, which causes stumbling, and while not always an unsoundness in itself, yet frequently leads to fracture of the pastern. It is a partial dislocation of the fetlock joint, and is caused more often by heavy work in hilly districts or fast work on race-tracks or hard roads than anything else. The principal remedy for all faults of conformation will be found in suitable horse-shoeing; which subject is discussed at some length under HORSESHOEING (q.v.). *Sprains of the fetlock* are the invariable result of knuckling or any diseases which interfere with proper locomotion, as, *navicular disease*, *chronic laminitis*, *contracted heels*, *side bones*; or such external causes as a rut or hole in the road, or any accident which causes the animal to fall. For slight injuries cold-water bandages and a few days' rest will be found sufficient. Should there be severe lameness or much swelling, a stream of cold water playing upon the leg will be found very beneficial. On the subsidence of the inflammation a blister should be applied to the joint. When the shoe of the hind foot strikes the heel or quarter of the fore foot the animal is said to *over-reach* (q.v.), a trouble common to trotting and running horses. When the hind foot catches well back on the heel of the fore foot the horse will frequently be thrown on his knees or the shoe torn from the fore foot, an accident known colloquially as *grabbing*. The art of the shoeing smith is demanded, if future injuries are to be avoided. Wounds should be dressed with tincture of aloes, oakum, and a roller bandage; and in any case the animal should never be driven at a very fast gait unless his heels and quarters are protected with quarter-boots. Heavy or draught horses are liable to calk wounds, caused from tramping either on themselves or each other. Good shoeing and the use of boots will be found the best remedy. *Quittors* (q.v.) have been authoritatively divided into four classes: (a) Cutaneous quittor; (b) tendinous quittor; (c) subhorny quittor; and (d) cartilaginous quittor. *Thrush* (q.v.) is more common with draught-horses than any other breed, and is usually caused by a filthy, ill-kept stable. *Corns* are injuries to the living horn of the foot, appearing in that part of the sole which is included in the angle between the bar and the outside wall of the hoof. They are described, according to the character of the conditions which follow the primary injury, as the *dry*, the *moist*, and the *suppurative*. The dis-

ease is confined almost exclusively to the fore feet, because of the greater weight which they support, and because the heel of the fore foot in action first strikes the ground and thus receives much more shock or concussion than the heel of the hind foot, in which the toe first makes contact with the ground. Faulty shoeing is the great predisposing cause, or else the presence of small stones or other objects between the sole and shoe. Lameness caused by bruises of the frog is best treated by putting the foot at once in a bath of cold water in order to prevent suppuration, which will frequently be effective if the disease is caught at the beginning. If suppuration, however, has already commenced, the horn of the frog and of the bars and branches of the sole, if necessary, is to be pared thin in order that the foot may be poulticed and all pressure removed. When the lameness has subsided and the exposed part covered by a new layer of horn, the foot may be shod. Punctured wounds of the foot are of everyday occurrence, and when they, as frequently happens, involve the more important organs contained in the hoof, no disease or wound can be more serious. Most frequently a 'picked-up' nail is the cause of trouble, and again the wounds may happen from sharp pieces of rock, glass, wire, etc. The nearer the injury is to the centre of the foot the more possibilities there are of disastrous results. Punctured wounds of the anterior parts of the sole are the more dangerous because of the possibility of injury to the coffin-bone, the most serious wounds being those which puncture the centre of the foot. Sometimes it happens that a nail has penetrated the frog and remained there for several days without causing lameness, the first evidence of an injury betraying itself when the foot is being cleaned. It must be remembered that if the injury is not too deep, suppuration will be established before lameness develops, so that the feet should always be most closely scrutinized. Should the coffin-joint have been penetrated either by the external cause or by the process of suppuration, an acute inflammation of the joint will follow, which will be invariably accompanied by high fever as well as less of appetite. The treatment recommended in all cases of punctured wounds is the thinning down of the horn near the seat of injury, a free opening created for the escape of suppurated matter, and the foot itself placed in a poultice. Where the injury is not serious, recovery in a few days' time is ordinarily assured; but where serious injuries have been inflicted, the foot should be treated to a cold bath or the stream of cold water described in the treatment for quittor (q.v.). *Contracted heels*, or, as it is more frequently called, *hoof-bound*, is common among saddle-horses and those kept on hard floors in dry stables. Ordinarily, but one foot is affected at a time, and it affects the fore feet principally. The disease itself is an atrophy or shrinking of the tissues of the foot, which diminishes in particular the diameter of the heels. Another very prevalent cause is faulty shoeing, although it sometimes happens that it results from other diseases of the foot, as, for instance, thrush, side bones, corns, etc. The disease is indicated by a pinched and shrunken frog, high heels, long bars, straight walls, and hoof so dry that it is almost impossible to cut it. The treatment consists first of all of preventive measures. The feet are kept moist and the horn is prevented from drying

out by the use of moist sawdust, occasional poultices of boiled turnips, and a free use of greasy hoof ointments to the sole and walls of the feet. Careful shoeing, however, will be found to be one-half of the cure. *Sand-cracks* may happen on any part of the wall, although usually they appear directly in front and are called *toe-cracks*, or on the lateral parts of the walls, and are known as *quarter-cracks* (q.v.). The latter usually affect the fore feet, and the former the hind feet. A sand-crack, which is a solution of continuity or fissure in the horn of the wall of the foot, may be superficial, involving only the outer parts of the wall, or it may be deep, involving the whole thickness of the wall as well as the soft tissues beneath. The disease is most serious when it involves the coronary band; and may be further complicated by hemorrhage, inflammation of the laminae, suppuration, and gangrene. The predisposing cause of sand-cracks is the relative dryness of the horn, although excessive dryness is not more dangerous than alternate changes from damp to dry. Other predisposing causes are heavy shoes, large nails, and bad shoeing in general, together with such diseases as canker, quitor, and suppurative corns. Very little can be done in the way of prevention, but the suppleness of the horn may be maintained by the use of ointments, damp floor, bedding, etc., as well as by proper shoeing. After the fissure has made its appearance, all efforts should be directed to prevent its growing longer and deeper, the usual method being to arrest all motion in the edges. A very simple appliance for holding the borders of a toe-crack together is the *vachette clasp* (q.v.). They are made of stiff steel wire and are strong enough to prevent all motion in the borders of the crack. Where these instruments cannot be obtained a good substitute is to drill a hole through the horn across the fissure, and close the crack by means of a thin nail made of tough iron and neatly clinched at each end.

CARE OF THE HORSE. Careless and improper feeding and watering are responsible for most of the digestive disorders with which the horse may be troubled. With the horse, digestion takes place principally in the intestines, and in selecting food for a horse the anatomical arrangement of its digestive organs and the physiological functions they perform should be carefully studied. All food should be wholesome and clean; the animal should be fed regularly, and because of his small stomach, in small quantities, and frequently. A horse should never be fed too soon after a hard day's work. He may be given a small quantity of hay, but one or two hours should elapse before he gets his regular meal. When it is contemplated to change the food, care should be taken to make the change very gradually, and in any case, the quantity of food given must be in a direct proportion to the amount of labor performed. Should the horse stand several days in the stable, his food should be of a more laxative nature. The following foods are considered the best: The best hay for horses is 'timothy,' but care should be taken that it is about one year old, of a greenish color, and possessing a sweet aroma. A horse fed on grain should be allowed from ten to twelve pounds of good hay a day. Straw should not be fed unless cut and mixed with hay and crushed grain. Wheat and rye chaff should never be used. Of the grain foods, oats easily take the precedence. The best oats

are one year old, plump, short, hard, bright, and sweet. They are given either whole or crushed. A fair allowance for the average horse is about twelve quarts of good oats a day. Wheat and rye should not be used except in small quantities and mixed with other grains or hay. The bran of wheat is the one most used, although its value is variously estimated. It is always fed with other grains and tends to keep the bowels open. Maize or corn is not suitable as an exclusive food for young horses, owing to its deficiency in salts. Corn on the cob is generally used as food for horses affected with 'lampas.' It is better given ground, and fed in quantities of from one to two quarts at a meal, mixed with crushed oats or bran. Linseed is occasionally fed with other foods to improve the condition of the skin and keep the bowels open. It is of particular service during convalescence. Steamed or boiled roots and potatoes are frequently used as an article of food, but carrots make the best diet, particularly during sickness. Grass is the natural food of the horse, but it is not sufficient to keep it in condition for work. The amount of water required by the horse varies according to the character of his food; but roundly stated, about eight quarts a day will be a fair average. When resting, water should be given three times a day; when at work, more frequently. The very prevalent impression that when a horse is warm he should not be allowed to drink is very erroneous. No matter how warm a horse may be, it is always safe to allow him from six to ten swallows of water. The danger is not in the water, but in the excessive quantity that the animal will take when warm, if not restrained. It should never be given when ice-cold. A water-trough should always be placed in such position that the sun may shine on it during the winter mornings.

HORSE. A miner's term, applied to any intruded material which is the apparent cause of a sudden interruption in the continuity of a mineral that is being quarried, as when a dike of igneous rock cuts across an ore body. In vein-mining a detached mass of rock or spar which fills the vein is called a horse, while colliers apply the term to the shale which replaces the coal-bed, as well as to such interruptions as seem to have been the channels of small streams, and which were subsequently filled up by the clay that formed the roof of the coal.

HORSE. On shipboard, an iron jackstay or rail used as a traveler's guide or securing bar, usually called a *horse-rail*. Also the old name for a foot-rope on a yard; and the secondary foot-rope at the end of a yard is still called the *Flemish horse*.

HORSE, FOSSIL. Remains of horses, often of extinct species, have been found in the cave-beds, river-gravels, bone-licks, and loess deposits of the Quaternary Period, or 'Age of Man,' in almost all parts of the world. In the more ancient deposits of the Tertiary Period, or 'Age of Mammals,' have been found remains of a series of ancestors of the horse, which illustrate the evolution of this race through this entire geological period, a time probably of some millions of years. Fossil horses of the Age of Man are much like the existing species, and are included for the most part in the same genus (*Equus*). They have been found in Europe, Asia, Africa, North and South America, but none in Australia or in the Oceanic islands, except in those which, like the British Isles, were joined to the continental mainland during the early part of the Quaternary Period. With these exceptions the animal was of world-wide distribution, and inhabited especially the open grassy plains and high plateaus of the interior of the great continents, at the beginning of the Age of Man. All these races were at first wild.

In the New World they became extinct. When the Spaniards first invaded the two Americas they found no horses, wild or domesticated. The Indians, who had domesticated the llama, the alpaca, and the dog, knew nothing of the horse, and were astonished and terrified at the sight of the strange and unfamiliar animals which the newcomers rode. Yet, when introduced by the white races, the horse ran wild and flourished and increased greatly in the same regions where its native cousins had formerly lived, showing how well the country was suited to their needs. Why the earlier native horses became extinct is a problem not yet solved.

In Central Asia, two wild races, Przewalsky's horse and the Asiatic wild ass, or kiang (q.v.); persist to the present day; others were domesticated by man in the earliest times, and their use in Chaldea and Egypt for draught and riding is depicted in the ancient mural paintings. In Africa the larger species became extinct, but the smaller zebras still survive in the southern part of the continent, and the African wild ass in the northern part (Somaliland).

The wild species of Europe, a small race, short-legged and shaggy-haired, was domesticated by man, for it is represented in rude prehistoric

drawings scratched on bone or ivory by men of the Neolithic or Polished-Stone Age.

The domesticated horses now in use are chiefly derived from the Asiatic race, but it is probable that in some breeds there is a considerable strain of this European species or variety, and it is possible also that African races may have been domesticated and to some extent mixed with the Asiatic species. The existing wild horses of North and South America, the broncos and mustangs, are descendants of the animals brought over by the Spaniards; but it is possible that in South America some survivors of the native races still existed at the time of the discovery of the continent, and mixed with the introduced species when it ran wild.

In general, only fragmentary specimens, parts of skulls, bones, or teeth of these extinct horses have been found fossil, so that their characters are very imperfectly known. A number of complete skeletons were found in Texas in 1899, one of which was placed in the American Museum of Natural History, New York. This species, *Equus Scotti*, was of the size of a trotting horse, but in proportions more like a zebra, with deep jaw, short neck and legs, and small feet. Another extinct species, the Hippidium of Argentina and Patagonia, was large-headed, with extremely short and stumpy legs and feet, exaggerating some of the peculiarities of the Shetland pony, although of larger size.

TERTIARY ANCESTORS OF THE HORSE. The history of the evolution of the horse through the Tertiary Period affords the best-known illustration of the doctrine of evolution by means of natural selection (q.v.), and the adaptation of a race of animals to their environment. The ancestry of this family has been traced nearly as far back as the beginning of the Tertiary without a single important break. During this long period of time, estimated at nearly three millions of years, these animals passed through important changes in all parts of the body, but especially in the teeth and in the feet, by which they became adapted more and more perfectly to that particular environment, namely, the open plains of a great plateau region with their scanty stunted herbage, which are the natural habitat of the modern horse.

EQUINE CHARACTERISTICS. The horse (including under his name the asses and zebras, as well as the true horses—see *EQUIDÆ*) is unique among modern animals in the fact that it walks on the extreme tip of the central digit of the foot, corresponding to the middle finger-nail of man, and that all the remaining toes have completely disappeared. The feet are greatly elongated, so as to equal the other segments of the limbs in length, and to raise the animal much higher above the ground than if he walked, as does a man or a bear, on the sole of the foot. In each foot the first and fifth digits (thumb and little finger) have completely disappeared and left no trace, while of the second and fourth digits only a small slender rudiment exists which represents the metapodial, or bone of the palm, and is called a 'splint.' These two splint-bones lie closely against the cannon-bone, or metapodial of the central digit, and are not indicated on the surface of the foot. The modern horse is therefore one-toed.

The teeth are equally peculiar. There are six grinding teeth in a closely set row on each side

THE EVOLUTION OF THE HORSE.

Hypothetical Ancestors with Five Toes on Each Foot and Teeth like those of Monkeys etc.

of each jaw; the crowns of these are very much elongated, so that they can be pushed up in their sockets as fast as they wear away at the grinding surface. The grinding surface displays a complicated pattern caused by infoldings of the enamel of the tooth, the enamel edges being supported on one side by the dentine of the tooth, on the other by a similar substance called cement, deposited on the outer surface of the unworn enamel before the teeth are extruded from the gums. This arrangement secures at all stages of wear a series of hard enamel ridges projecting a little above the surface of the softer dentine and cement, and makes a remarkably efficient grinder for the hard, dry grasses which are the natural food of the horse (q.v.). In the series of animals which lead up to the modern horse, we can trace every step in the evolution of these marked peculiarities of teeth and feet, from an ancestor so little suggesting the horse that when first found it was named by Richard Owen, the greatest comparative anatomist of his time, *Hyracotherium*, or 'coney-like beast.' Its relation to the horse was not at all suspected, and was recognized by Huxley and Marsh only when the series of intermediate stages between *Hyracotherium* and the modern horse was discovered. This first ancestor of the horse line is very much more like the contemporary ancestors of other lines of descent, and indicates how all the modern quadrupeds have diverged from a single type, each becoming adapted to its especial mode of life.

STAGES IN THE EVOLUTION SERIES. The *Hyracotherium* (renamed *Eohippus*) of the Lower Eocene was a small animal, no larger than the domestic cat, with four complete toes on each fore foot, and three on each hind foot. There is reason to believe that the still more ancient ancestors of this and all other mammals had five toes on each foot, and in the *Hyracotherium* fore foot we find a splint-bone representing the missing first digit or thumb, while in its hind foot there is a splint-bone representing the missing outer or fifth digit, but here no trace is left of the innermost (first) digit. The proportions of the skull, the short neck and arched back, and the limbs of moderate length, were very little horse-like, recalling some modern carnivorous animals, especially the civets. The teeth, short-crowned, covered with low rounded knobs of enamel, suggested those of monkeys and of pigs, but not at all the long-crowned complicated grinders of the horse. Beginning with this small and primitive animal, eleven stages have been recognized from as many successive formations, showing the gradual evolution of the race into its modern form. Each stage is characteristic of its particular geological horizon. Some have been found in several parts of the world, but by far the most complete and best-known series comes from the Tertiary Badlands of the Western States. Besides the main line of descent, which has led into the modern horses, asses, and zebras, there were also collateral branches, which have left no descendants. Only the more important stages can be mentioned here.

The successors to the *Hyracotherium* were the *Protorhippus* and *Orohippus* of the Middle Eocene. A complete skeleton of the former animal, from the Wind River Valley, Wyoming, is in the American Museum of Natural History in New York City. It is about the size of the kit-fox,

and much like its predecessor, the *Hyracotherium*, except that the splint representing the fifth digit in the hind foot has disappeared.

In the Upper Eocene the *Epihippus* occurs, but only fragmentary specimens have been found. These show that the middle toe was becoming more prominent, and the side toes, especially the outer toe of the fore foot, were quite slender. Contemporary with this animal was the very much larger *Palæotherium* of Europe, related to the horses, but not in the direct line of descent.

In the Oligocene is found *Meshippus*, of which several complete skeletons are known. The various species range in size from that of a red fox to a mastiff. There are but three toes in each foot, the outer digit of the fore foot being now reduced to a splint-bone, and no longer appearing as a separate toe. The central toe in both fore and hind feet is much larger, and the side toes, although they still reach the ground, are quite slender, and can support but a small part of the weight of the animal.

The teeth are of the crested or 'lophodont' type, the crests higher and sharper than in the preceding genera. This constitutes the necessary intermediate stage in the conversion of the low, round-knobbed or 'bunodont' crown into the high, sharply crested crown with cement bracing, which characterizes the later horses. See TOOTH.

In the Miocene is found *Protohippus*, in which the side toes, although still complete, are extremely small and slender, and do not reach the ground. They can therefore no longer assist in supporting the weight of the animal, and are merely useless rudiments. Various species range from the size of a mastiff to that of a Shetland pony. The teeth in this animal are much more like those of the modern horse; the crown is greatly lengthened, the crests or ridges being higher and more complicated, and the 'valleys' (between the ridges are filled up with a material ('cement') approximating the dentine in texture and hardness. A new and very effective method of grinding is thus begun, for when the sharp enamel crests wear down, they form a double ridge of enamel supported within by dentine and without by cement; the two latter are softer than the enamel and wear away more rapidly, leaving it as a sharp projecting ridge, continually renewed with the wear of the tooth. The tooth is pushed up from the jaw as fast as it wears off on the grinding surface, so that it becomes an efficient grinder for those hard, siliceous grasses which would rapidly wear down a tooth of the old pattern to a useless stump.

In the Pliocene lived the *Plihippus*, of which very little is known, except that it was either one-toed or had the side toes reduced to extremely small rudiments, and the teeth were much like those of *Protohippus*, which it a little exceeded in size.

In the Pleistocene is found the modern genus *Equus*, of larger size, with but one toe on each foot, the lateral digits represented by splint-bones, and with teeth longer-crowned than those of *Protohippus*, enabling the animal to grind hard grasses still more efficiently. Extinct species have been found in Europe, Asia, Africa, North and South America, as we have seen above.

MEANING OF THE CHANGES IN FEET AND TEETH. Along with the disappearance of the side toes in the evolution of the horse there is a consider-

able increase in the proportionate length of the limbs, and especially of the lower part of the leg and foot. The surfaces of the joints, at first more or less of the ball-and-socket kind, permitting of free motion of the limb in all directions, become keeled and grooved like a pulley, thus permitting free motion forward and backward, but limiting the motion in all other directions, and increasing considerably the strength of the joint. By this means the foot is made more efficient for locomotion over a smooth, regular surface, but less so over very rough ground, of little use for striking or grasping, or the varied purposes for which the feet of many-toed animals are used.

The increased length in the lower leg and foot increases the length of the stride without decreasing its quickness, for the heavy muscles of the leg are chiefly in the upper part, and to increase the length of the lower part changes the centre of gravity of the limb very little, and it consequently swings to and fro from the socket nearly as fast; for in an ordinary step the leg swings like a pendulum, and the speed of the swing is regulated by the distance of the centre of gravity from the attachment, as that of a pendulum is by the height of the bob.

To increase the length of lower leg and foot will therefore give the animal greater speed; but it puts an increased strain on the ankle and toe joints, and these must be strengthened correspondingly, by converting them from ball-and-socket joints to 'ginglimoid' or pulley joints. Additional strength, likewise at the expense of flexibility, is obtained also by the consolidation of the two bones of the forearm (ulna and radius) and leg (tibia and fibula) into one, the shaft of the lesser bone practically disappearing while its ends become fused solidly to its larger neighbor.

Corresponding with the increase in length of limb, it is necessary for a grazing animal that the head and neck should increase in length in order to enable the mouth to reach the ground. So in the modern horse we find the neck and head much elongated when compared with the little Hyracotherium, and this elongation has taken place at equal pace with the elongation of the legs. The reduction and disappearance of the side toes, and the concentration of the step on the single central toe, serve likewise to increase the speed over smooth ground. The soft yielding surface of the polydactyl foot is able to accommodate itself to a rough, irregular surface, but on smooth ground the yielding step entails a certain loss of speed. An illustration is afforded by the pneumatic tire of a bicycle; a 'soft' tire accommodates itself to a rough road, and makes easier riding, but a 'hard' tire is faster, especially on a smooth road. Similarly the hard, firm step from the single toe allows of more speed over a smooth surface, although compelling the animal to pick its way slowly and with care on rough, irregular ground.

The change in the character of the teeth from 'brachydont,' or short-crowned, to 'hypodont,' or long-crowned, enables the animal to subsist on the hard innutritious grasses of the dry plains, which require much more thorough mastication before they can be of any use as food than do the softer green foods of the swamps and forests.

All these changes in the evolution of the horse are adaptations to a life in a region of level, smooth, and open grassy plains, which are the

natural habitat of the horse. The race, better fitted at first for a forest life, has become more and more completely adapted to live and compete with its enemies or rivals under the conditions which prevail in the high, dry plains of the interior of the great continents. The great increase in size, which has occurred in almost all races of animals whose evolution we can trace, is dependent on abundance of food. A larger animal, as may be shown on ordinary principles of mechanics, requires more food in proportion to its size than does a smaller one, in order to keep up a proper amount of activity. On the other hand, a larger animal is better able to defend itself against its enemies and rivals. Consequently, as long as food is abundant, the larger animals will have the advantage over their smaller brethren, and by the laws of natural selection the race will tend to become continually larger until a limit is reached when sufficient food becomes difficult to obtain, and the animal is compelled to devote nearly all its time to getting enough to eat.

CAUSE OF THE EVOLUTION. The evolution of the horse, adapting it to live on the dry plains, probably went hand in hand with the evolution of the plains themselves. At the commencement of the Age of Mammals the western part of the North American continent was by no means so high above sea-level as now, great parts of it had but recently emerged, and the Gulf of Mexico still stretched far up the valley of the Mississippi. The climate at that time was probably very moist, warm, and tropical, as is shown by the tropical forest trees found fossil even as far north as Greenland. Such a climate, with the low elevation of the land, would favor the growth of dense forests all over the country, and to such conditions of life the animals of the beginning of the mammalian period must have been adapted. During the Tertiary the continent was steadily rising above the ocean level, and at the same time other influences were at work to make the climate continually colder and drier. These conditions restricted and thinned the forests, and caused the appearance and extension of open grassy plains. The ancient forest inhabitants must then either retreat and disappear with the forests, or adapt themselves to the new conditions of life. The ancestors of the horse, adopting the latter course, changed with the changing conditions, and the race became finally—as we see it to-day—one of the most highly specialized of animals in its adaptation to its peculiar environment. At the end of the Age of Mammals the continents stood at a higher elevation than at present, and there was a broad land connection between Asia and North America, as well as those now existing. At this time the horses became cosmopolitan, and inhabited the plains of all the great continents, excepting Australia.

It is a question whether the direct ancestry of the modern horse is to be searched for in Western America or in the little known interior plains of Eastern Asia. It is also unknown why the various species which inhabited North and South America and Europe during the early part of the Age of Man should have become extinct, while those of Asia (horse and wild ass) and of Africa (wild ass and zebra) survive. Man since his appearance has played an important part in the extermination of the larger animals; but there is nothing to show how far he was responsible for

HORSE CHESTNUT

1. HORSE CHESTNUT TREE (*Asculus Hippocastanum*) IN BLOOM

2. OHIO BUCKEYE (*Asculus glabra*)

the disappearance of the native American species of horse.

PARALLEL EVOLUTION IN OTHER RACES. It is interesting to observe that while the evolution of the horse was progressing during the Tertiary period in North America another group of hoofed animals, now extinct, the Litopterna, in South America evolved a race adapted to the broad plains of Argentina and Patagonia, and singularly like the horse in many ways. These animals likewise lost the lateral toes one after another, and concentrated the step on the central toe; they also changed the form of the joint-surfaces from ball-and-socket to pulley joints; they also lengthened the limbs and the neck; and they also lengthened the teeth, and complicated their pattern; but, unlike the true horses, they could not form cement on the tooth, and it was by no means so efficient a grinder. This group of animals, native to South America, became totally extinct, and were succeeded by the horses, which immigrated from North America, which in their turn became extinct before the appearance of civilized man. Many of the contemporaries of the horse in the Northern Hemisphere, such as the camels in America, the deer, antelopes, sheep, and cattle in the Old World, were likewise lengthening the limbs, lightening and strengthening the feet, and elongating the tooth-crowns, to adapt themselves to the changing conditions around them, but none paralleled the horse's evolution quite so closely as did the pseudo-horses of South America.

(New Haven, 1892); Flower, *The Horse: A Study in Natural History* (London, 1891); Hutchinson, *Creatures of Other Days* (New York, 1894); Lucas, *Animals of the Past* (New York, 1901); Matthew, *The Evolution of the Horse*, No. 9 in series of Popular Guide Leaflets to the American Museum of Natural History (New York, 1902).

For technical articles on fossil horses, consult the bibliography in Woodward, *Vertebrate Palæontology* (Cambridge University Press, 1898); and in addition Gidley, in *Bulletin of the American Museum of Natural History* (New York, 1900, 1901).

HORSE-ANT. A popular name for certain hymenopterous insects forming the family Mutillidæ. They are also known as 'cow-ants,' 'cow-killer ants,' 'solitary ants,' and 'velvet ants.' Although they resemble the true ants, they are more closely related in structure to the social wasps, in spite of the fact that they are not winged, and are solitary in their habits. They are ferocious stingers, and are clothed with hair, which is frequently brightly colored—often bright red. In their early stages some and possibly all are parasitic in the nests of wild bees.

HORSE ARTILLERY. Cannon for use with cavalry troops or flying columns of any kind where great mobility is required. In horse artillery all the personnel is mounted, and the gun is lighter than the ordinary field gun. Horse artillery must be mobile enough to keep up with the cavalry in attack and pursuit. When cavalry charges cavalry, the horse artillery takes up a position and fires upon the enemy's horse. In successful attack it follows its cavalry; in defeat it covers retirement.

In the English Army, which in 1900 had 18 batteries of horse artillery in the home establishment and 11 in India, the gun used is the 12-pound breech-loader, calibre three inches, firing shrapnel (q.v.), shell, and case-shot. See **ARTILLERY**; **FIELD ARTILLERY**.

HORSE-BOT. The bot-fly of the horse (*Gastrophilus equi*). See **BOT**.

HORSE-CHESTNUT (so called probably from the large size of the nuts; less plausibly explained from the former use of them when ground as food for horses), *Æsculus*. A genus of trees of the natural order Sapindacæ in which the

A HORSE-CHESTNUT TWIG.

leaves are large opposite digitate; flowers with five spreading unequal petals, and the capsule leathery, three-valved, and covered with soft spines. The seeds, of which there are from one to three in each fruit, are large and somewhat resemble chestnuts; but the habit of the trees, its leaves and flowers, are very unlike those of chestnuts, with which it has no botanical affinity. The common horse-chestnut (*Æsculus Hippocastanum*) is a much esteemed ornamental tree, very frequently planted whenever the climate is suitable, on account of its rich foliage and its erect racemes of beautiful reddish-white flowers, which are produced on the extremities of the branches, and contrast admirably with the dark green of the leaves. It is supposed to be a native of Persia or some parts of the East, and was introduced into Western Europe from Constantinople at the end of the sixteenth century. It attains a great size, sometimes rising to the height of 100 feet, and extending its branches very widely. Sometimes they droop almost to the ground. The leaves have long stalks, and five to seven obovate wedge-shaped leaflets. The wood is soft, not very strong, nor very durable in the open air; but is used for many ordinary purposes, and by carvers, turners, etc. The bark is bitter and astringent, contains a bitter principle called

HORSE-CHESTNUT FRUIT.

called *æsculine*, and has been used in tanning and dye-

ing. The seeds are unpleasantly bitter, and contain so much of the saponaceous substance peculiar to this natural order that when reduced to powder they may be used for washing. They contain, however, a large quantity of starch, which may be extracted and freed from bitterness by means of an alkaline solution or repeated washing. This starch is prepared on a large scale and at a cheap rate in France. Horse-chestnuts have long been employed in various countries as food for oxen, sheep, swine, and horses, all of which are fond of them, and grow fat upon them.

In the other species of *Æsculus* which are natives of North America the foliage is very similar to that of the common horse-chestnut. Both the leaves and fruit of the American buckeye (*Æsculus glabra*) are poisonous. This tree ranges from Pennsylvania to Alabama, and west to Kansas and Texas. North America possesses a number of other species with very similar foliage, smaller flowers, and smooth fruit. In California the seeds of *Æsculus California* are used as food by some Indian tribes, as are those of *Æsculus turbinata* in Japan. The seeds of *Æsculus parviflora*, the edible buckeye, are eaten, either boiled or roasted. This species is a shrub with long and beautiful racemes of fragrant white flowers, which have long projecting stamens. It is a native of the Southern States. *Æsculus Indica* is a lofty tree which grows at elevations of 8000 to 10,000 feet in the Himalayas, and produces seeds very similar to those of the horse-chestnut, which, although bitter, are eaten in time of scarcity.

HORSE-CREVALLÉ, kre-vál-lá'. See CAVALLY.

HORSE FAIR, THE. A well-known painting by Rosa Bonheur, exhibited at the Salon of 1853. After passing through several hands it formed part of the Stewart collection, and was finally purchased by Cornelius Vanderbilt, and presented by him to the Metropolitan Museum, New York, where it now hangs. There are several replicas by the artist in England, and an engraving of the painting by Landseer. The canvas shows a number of horses in motion, some with riders, some led, and some free.

HORSE-FISH, or HORSEHEAD. See MOON-FISH.

HORSE-FLY. See GADFLY.

HORSE-FOOT SNIPE. See TURNSTONE.

HORSE-GENTIAN. A North American medicinal plant. See FEVERWORT.

HORSE GRENADIERS. See MOUNTED INFANTRY.

HORSE GUARDS. The military headquarters of the British Army, and the offices of the Field-Marshal Commander-in-chief, War Office, Pall Mall, London, S. W. It is a term used to distinguish the purely military part of the army organization from that of the civil authority, the Secretary of State for War. The oldest cavalry regiments of the British Army are also known as the Horse Guards, the term including the Oxford Blues, first raised by the Earl of Oxford in 1660, and now styled the Royal Horse Guards, or The Blues; and the First and Second Regiments of Life Guards (q.v.), organized in 1661-62.

HORSE LATITUDES. See CALM LATITUDES.

HORSELESS CARRIAGE. See AUTOMOBILE.

HORSE-MACKEREL. A name given to several species of fishes of the family Carangidæ, and especially, in Great Britain, to the scad (*Trachurus trachurus*), and in the United States to the crevallé (*Caranx hippos*). The carangids are all trim, vigorous fishes, and are peculiar in that the teeth, when present, are villiform or conical. Usually the scales are very small, or they may be altogether wanting. In many instances the lateral line is entirely or partially armed with shield-like, overlapping plates. (See Fig. 2, Plate of HORSE-MACKERELS AND ALLIES.) The horse-mackerels are distributed over all seas except the polar, and their remains go back to Cretaceous time, while they are profusely represented in marine strata of Eocene date. They sometimes gather in enormous shoals, and are captured in vast quantities in seines. They are carnivorous, and swift and fierce in pursuit of lesser fishes. Their flesh is excellent food. The typical genera are slender, compressed, mackerel-like fishes, but the family includes many others of different form, such as the amber-fishes (*Seriola*), the pilot-fishes (*Naucrates*), the moonfishes (*Vomer* and *Selene*), and the pompanos. These are described individually under their names elsewhere. Consult Goode's *American Fishes* (New York, 1888); Gunther, *Introduction to the Study of Fishes* (London, 1880).

HORSEMANSHIP. The art of managing horses. It is to the Greeks that we must look for our first knowledge of the history of horsemanship, for when primitive man first ventured upon the back of a captured horse is, at the best, a matter of conjecture. The 'bit' could not have been known before the age of bronze, but undoubtedly the first horsemen employed a halter or thong of rawhide passed through the animal's mouth in order to direct and control it. According to the evidence of the Egyptian monuments, bit, bridle, harness, and chariot were employed; and we know from other sources that the bridles of the early horsemen of Egypt and Asia were considerably decorated with tassels, crests, and embroidery, in a manner both rich and elaborate; but anything approaching the modern saddle was unknown to either Egyptian, Assyrian, or Persian. Instead, a decorated and fringed cloth fastened to the animal by a girth was employed to afford the horseman a seat. The warlike tribes occupying the northern border of Greece are credited with the introduction of horsemanship among the Greeks, among whom the art was held in very high esteem. Horse-races were a conspicuous feature of their festivals and games; a noteworthy feature in connection with which was the fact that the tact and judgment of the rider was frequently a more important factor in gaining the decision than the superiority of the horse. The Athenians were especially devoted to the art, and the rules of horsemanship, so far as the seat is concerned, did not differ in essence from the good horsemanship of to-day. That the Greeks excelled in the exercise is evident from the fact that they were in the habit of taking all sorts of 'leaps' (according to Xenophon), "across ditches, over walls, upon and from banks;" and in military evolutions particularly, demonstrated

9. POMPANO (*Trachynotus carolinus*).

their mastery of the art of equitation. The stirrup was not known to the Greeks, and probably its absence helped to make them the finished horsemen they undoubtedly were. The Romans undoubtedly learned the art of horsemanship from the Greeks, and, in fact, ascribed the inventions of bridle and chariot, as well as attributed the first conquest of the horse, to their teachers. With the Romans as with the Greeks, equestrianism was a conspicuous feature of their games; and in the time of Cæsar the youths of the aristocracy vied with each other in the practice and public exhibitions of difficult feats of horsemanship.

MEDÆVAL HORSEMANSHIP. Although there is no proof of the fact, it is nevertheless probable that the saddle-tree had been used for pack-animals from a very early date, and that the riding saddle in some form or shape was known before the fifth century B.C., the era of its reputed first appearance. The difficulty of mounting into the saddle encumbered with heavy armor led through a series of contrivances to the introduction of the stirrup. While the horsemanship of the age of chivalry cannot be said to compare with that of the Greeks and Romans, the demands of the tournament prevented its being neglected.

MODERN HORSEMANSHIP. The first treatise upon the subject was that published by Federico Grisoni, entitled *Gli ordini del cavalcare* (Naples, 1550). A contemporary of Grisoni was the celebrated teacher Pignatelli, who is regarded by many as the author of the foundation of our present system of riding. Two of his pupils, La Broue and Pluvinel, became famous throughout Europe. Subsequent important writers and their works in England are: Blundeville, *The Fower Chiefest Offices Belonging to Horsemanshippe* (c.1570); translations from the Italian, by Gervase Markham (1593) and Sir William Hope (1696); Thomas de Gray, *Complete Horseman and Expert Farrier* (London, 1639). The Duke of Newcastle's *Méthode nouvelle de dresser les chevaux* (Antwerp, 1648) was first written in English, and afterwards translated into the language in which it was published. It was for a long period regarded as the great standard authority on horsemanship, although to-day its teaching would be regarded as impossible. Cavalry horsemanship was the subject of a little manual published by the Earl of Pembroke in 1761.

At the present time there are several methods of mounting a horse, each one with its own distinct advantages and disadvantages. Ordinarily, the young horseman is taught to mount from either side, but usually from the 'near' or left side of the horse. The common English method is to place the snaffle rein round the third finger of the left hand, grasp a wisp of the horse's mane between the finger and thumb of the same hand, placing the left foot in the stirrup, and the right hand on the cantle, then with a spring the right leg is thrown over the horse and the rider seats himself in the saddle, meanwhile releasing the mane. He next secures the curb reins in the left hand, in such a manner that the left rein is outside the little finger, and the right between the first and second fingers. When the rein has been drawn in sufficiently for the rider to feel the horse's mouth gently, the loose part or slack is thrown over the first finger and

held between that and the thumb. In America both reins are placed in position in the left hand before mounting. The whip in mounting is held in the fork of the thumb of the left hand and afterwards taken into the right hand. The manner of holding the reins differs in different countries of Europe as well as in America, the more general method, other than that of the English already described, being its exact opposite in that the curb is held inside the snaffle. Upon mounting, the rider should firmly seat himself in the middle of the saddle, which ought to be placed well behind the rise of the shoulders, his legs, which should work in sympathy with his hands, just about covering the girth, so that when using leg pressure to the horse, it may be easily and effectively applied immediately behind the girth. The elbows should hang loosely and naturally from the shoulder, permitting a free use of the hands, which latter should always be in a position to 'give and take' without compromising control over the horse, irritating, or otherwise fretting him. When riding at a walk the horseman should maintain a natural upright position, the legs from knee to heel remaining perfectly straight; toes a little higher than the heels, the feet horizontal with the horse's body. The action of the leg, like that of the hand, should be sensitively active and supple, exerting as little pressure as possible, but ready and in position to exert sufficient pressure to maintain the rider's seat and position under any and all circumstances. A beginner will find it to his advantage to practice guiding his horse in every possible manner and direction, selecting for this purpose some inclosed place, as a riding-school, inclosed yard, etc. The horse must at all times be kept well up to the bit, and the rider will do well to remember that guiding the horse military fashion by the pressure of the reins on the animal's neck is not generally advised. *Pacing* in America and *ambling* in England are practically the same gait. The two legs on each side rise and fall together. It does not call for any different method of riding than that employed for the walk. The *trot* is a diagonal pace, the right fore and left hind legs working together and alternately with the left fore and right hind legs. To make the animal trot, raise its head slightly, and press its body with the knees and side of the leg below the knee, and, if necessary, touch it with the whip, but not under any consideration should the rider give any indication by sound of mouth. Serious accidents frequently happen because of the disregard of this very necessary precaution. The horse of a fellow rider is apt to answer to the command, and possibly unseat its own rider, owing to his unpreparedness. The *trot* is possibly the most perfect pace of the horse. The body should be erect, but playing loosely from the hips; the legs must not be allowed to swing backward and forward, nor must the rider work his shoulders. The expert horseman rides by the aid of grip and balance, the former always ready should the balance be disturbed and there be any danger of a throw. The pressure of the legs should be according to the demand of the moment, ready to keep the rider from losing his balance, which latter saves the strain of a constant exercise of the grip. The *canters* is a very comfortable pace to the rider. It is not a natural pace, however, but, on the contrary, is fatiguing to the horse, and particularly injurious to the animal's

fore legs. When cantering in a circle the horse should be made to lead with his inside leg, i. e. with the right leg if cantering to the right, and with the left if cantering to the left. To secure this the rider when preparing to canter should pull the right rein rather tighter than the left one, so that the horse in describing a small portion of a circle will, of necessity, lead with the right leg. *The Gallop.*—In this pace the movements of the horse follow so quickly one on the other that the eye cannot detect the various positions which constitute a cadence. The first preparation for the rider is a firm seat, which should be well down in the saddle. The reins are shortened slightly, and the hands kept low; at the same time the body should be leaning slightly forward and a moderate grip maintained with the legs. Care must be taken that the horse is held together and restrained from breaking into a headlong gallop, and possibly beyond the rider's control. To avoid this the reins are held somewhat tighter in the gallop than in any of the other paces.

Leaping requires good nerves as well as a good seat. The rider must be careful to maintain an upright position in the saddle until the horse is close to the jump, when (if it is a fence) he should swing well back from his hips, keeping his hands low and clear of the withers. The feet should be drawn back, and never under any circumstances allowed to swing forward toward the animal's shoulders. Should the feet be forward and the horse make a mistake on landing, the rider would be more easily thrown than if his feet were in the proper position. In brief, the rider should in every form of leaping keep his body at right angles to the ground; thus, the higher the jump, the more he will be required to lean back. In landing, the horse makes contact with the ground on one fore leg followed instantly by the other, after which come the hind legs. When jumping natural obstacles, such as water, ditch, etc., the general rule never to ride fast at an obstacle holds good, although expert horsemen interpret the rule to suit themselves; in any event, the rider must be careful not to pull at the reins or in any way check the horse in his effort to jump either water or ditch. Much depends on the horse in leaping, no two going at the jump in exactly the same style. One may need a little encouragement and another a great deal of steadying, so that it is an important essential for the rider to know his horse. When nearing the jump, the reins should be tightened so as to secure a firm hold of the head and at the same time make him shorten his stride so that he may the better gauge his distance. It requires some little experience on the part of the rider before he is able to tell when the horse is in his proper stride. When the animal is properly collected, and is nearing the obstacle, the hold on the reins should be relaxed and care taken that the free action of his head or limbs is in no way interfered with by pulling, etc. On landing the rider should gently feel his mouth. The horse will then collect himself, all four legs will make contact with the ground, and he will be away again without any hesitation.

The common vices of shying, bolting, kicking, rearing, etc., are much more serious in a horse kept for the saddle than in one used for driving. The horseman will usually be able to tell when his mount is about to shy, so that he will slacken

the pace gently, and at the same time keep a firmer hold upon the rein on the side toward which the horse is leaning. On no account should he prepare for it by giving his horse any intimation that something unusual is to happen; neither should he whip or spur, or, as is sometimes done, strike him on the head on the side toward which it is feared he will plunge. The important thing for the rider is to grip fast with the legs, preserve his balance, and be careful not to hang on by the reins. If necessary, stop and encourage the horse by patting him on the neck and otherwise making much of him.

Perhaps the most dangerous vice next to rearing is that of *bolting* or *running away*, which in many instances, however, is only exuberance of spirits on the part of the horse which temporarily overcomes the control of the rider. With a skillful and ordinarily strong horseman it is very rarely that a horse runs away, but where such does happen the method of combating it will depend very much on the country and route the runaway selects. Where the route abounds with sharp turns or shut gates, the danger to be feared will be the running into a fence or gate; but on a road not much frequented and well known to the rider, it will generally be possible to guide the horse past any vehicle which may be met or overtaken. In such a case the rider should not hesitate to turn the rein around his hand and pull with all his strength toward the side he desires the horse to take. 'Sawing the mouth,' though not horsemanship, is permissible, if by its employment only the runaway can be brought to a standstill. A kicking horse should be approached and treated very carefully, and if a vicious kicker should, if possible, be just as carefully avoided. The rider usually has some sort of warning, such as the laying back of the animal's ears, in which case he should sit well back and secure his grip. Only the expert horseman should attempt to ride a rearing horse; for no amount of nerve will suffice to guard the rider from the terrible injuries likely to occur if a rearing horse should fall back on him. Of all horses, the rearer should be the most carefully shunned. There is only one thing for the rider to do in such an emergency—to remember not to hold the reins tight or use them in any way as a support. On the contrary, he should catch hold of the horse's mane, or place an arm round his neck and try in that manner to force him back on his feet.

Military horsemanship is designed to secure a uniformity of style and method, and the best results from both horse and rider. Long stirrups are used; the rider sits well down in the saddle, his seat being preserved largely by balance. *High school* riding is largely an accomplishment of the manège, and includes skill in horsemanship, and in the performance of feats requiring a trained animal. Women are now taught to ride astride, as well as by means of the side-saddle. Hygienic reasons are advanced in favor of the former method, but authorities generally are doubtful of their reasonableness. A fair statement of the question would be that a poor horsewoman derives little benefit from either method, and runs a minimum of risk of injury when riding astride; a clever horsewoman will invariably ride side-saddle with a greater degree of comfort, enjoyment, and safety, than when riding astride.

HORSE-NETTLE. See SOLANUM.

HORSENS, hör'səns. A seaport of Denmark, in the Province of Aarhus, situated at the head of the fiord of Horsens, 25 miles southwest of Aarhus (Map: Denmark, C 3). The town possesses a fine church with carvings of the seventeenth century, an old convent chapel, and a high school. The chief industries are weaving, iron-working, ship-building, and the manufacture of woodenware and lime. The town carries on an active trade, importing grain, hay, and fertilizers, and exporting dairy products, pork, and beef. Population, in 1890, 17,290; in 1901, 22,322.

HORSE-POWER. A unit of rate of work, used to measure the performance of motors. It is based upon the assumption that horses in general perform a certain constant amount of work in a specified time; an assumption which is evidently erroneous. The fundamental unit of work is the foot-pound (q.v.); but in measuring the work of a horse by this unit, the estimates of the most celebrated engineers differed widely from each other. Boulton and Watt, basing their calculations upon the work of London dray-horses (working eight hours a day), estimated it at 33,000 foot-pounds per minute. D'Aubuisson, taking the work done by horses working on capstans at Freiberg, estimated the work at 16,440 foot-pounds, working eight hours a day; under similar circumstances, Desagulier's estimate was 44,000; Smeaton's, 22,000; and Tredgold's, 27,500 foot-pounds. It matters little, however, what number is assumed, provided the same be always used; and accordingly the original estimate of Watt is still counted a horse-power. In calculating the power of a steam-engine in terms of this unit, the general rule is to multiply together the pressure in pounds on a square inch of the piston, the area of the piston in inches, the length of the stroke in feet, and the number of strokes per minute; the result divided by 33,000 will give the horse-power. There is an increasing tendency, particularly in electrical machinery, to use the kilowatt as a unit of rate work. This unit is equal to $\frac{746}{1000}$ of a horse-power.

HORSE-RACING. The earliest recorded organized trials of speed with horses were the

chariot-races at the Greek national festivals, of which the most notable were the Olympic games (q.v.), held every fourth year. Greek sculpture frequently represents the horse as used for riding, apparently without a saddle in most cases; but not as so employed for sport, except as an incident to the chariot-racing. On the other hand, the horses in the Roman contests were to a very great extent ridden. All the formalities of entering, and of differentiation of classes, and of starting were minutely laid down and followed, even to the color of the riders' uniforms. In the earlier times these Roman races were held on the open plain. There has always been a tradition in England that on Salisbury Plain, just outside Stonehenge, the remains of a Roman race-course exist; and the oldest race which still takes place in England is run over a flat meadow just outside the walls of the Roman city of Chester. In fact, the conclusion seems almost certain from the similarities in officers and methods that horse-racing was one of the legacies left to Britain by its Roman conquerors. The natives, too, were great horsemen and charioteers, and contests were likely enough to be provoked at the feats which the Romans took with them the world over. Their successors, the Saxons, maintained the use and training of the horse; when Hugh Capet sought the hand of the sister of King Athelstan, in the ninth century, he brought as a propitiatory present several 'running horses.' Fitzstephen, in his description of the city of London, written at the end of the twelfth century, says that "races are common, of which the gentry and wealthy citizens are very fond." In the metrical romance of "Bevis of Hamtoun," we get our first glance of a regular recurring annual meet of racing horses. In 1540 the Mayor of Chester presented a silver bell to be given to the winner of a race five times round 'The Roody.' The horse that won not only bore away the bell, but eight or ten pounds, "which moneys were collected of the citizens for that purpose." By the reign of James I. (1603-25) public race meetings were held at Garterly in Yorkshire, Croydon in Surrey, Linton in Cambridgeshire, and on Enfield Chase. In the days of his successor, Charles I., Newmarket, now the metropolis of the racing world, first came into prominence, and Oliver Cromwell, whose farm at Coveney was only a few miles from Newmarket, bred and kept race-horses. Charles II. was a great patron of the turf. He built a house at Newmarket, and was a regular attendant there. From that time onward modern flat racing has a uniform history of progress.

The horses that practice flat racing are known the world over as thoroughbreds, yet as a matter of fact they are the product of cross-breeding continued for many centuries. Vegetius, who wrote in the fourth century, gave to African horses of Spanish blood the first place as chariot-racers, but commended the Persian as the best saddle-horse. James I. bought a very celebrated Arab for breeding purposes; but the Darley Barb, imported in 1705, laid the foundation (through his great-grandson Eclipse, born 1764) of the modern turf. He was the sire of Almanza and Aleppo, but his best-known son was Flying Childers. This importation was followed by many others of sires and dams, among which the Tafolet Barb and the white-legged Lowther Barb are the best known. The Byerly Turk pro-

duced Highflyer, and the Godolphin Arab was the grandsire of Matchem. Among the horses whose names have become household words may be mentioned: Diomed (who won the Derby in 1780 and was imported to America); Bay Middleton, The Flying Dutchman, West Australian, Blink Bonny, Hermit, Galopin, Bend Or, Saint Simon, Saint Blais, Ormond, and Persimmon.

There is no radical difference between the methods of training horses for flat racing in England and America, except in the time of taking the foal in hand. In England the majority of foals are practically left to nature until well into the second year. In America, on the other hand, so considerate a trainer as W. E. Wishard would have them backed when weanlings at nine months, and tried out when fifteen months old. But then, in California, owing to climate and grass, the young ones mature very quickly. In England the training of the young racer commences in his second year under a trainer. A thorough preparation for a great race is a long and troublesome operation, depending largely upon constitution, general capacity, and temperament. Ordinarily the colt is gradually brought from a naturally loose condition to the greatest perfection possible; first by steady and continuous walking exercise, then proceeding by gradual stages to gentle galloping and sweating, and finishing by testing the capacity of the colt against a competitor at a distance equal to the forthcoming race. It has been found that, practically, the speed of almost all horses can be equalized by addition or subtraction of weight to be carried when running; and so nicely is this adjusted that the handicaps arranged on this principle provide some of the best races in the year. See HANDICAPPING.

The most celebrated race-course in England is Newmarket, established in 1667, where the Cambridgeshire, the Cesarewitch, the 1000-guineas, and the 2000-guineas are annually run. There are six meets there in the year, in May, July, and October, each occupying two weeks, with an interval of a week between them. The Derby (see DERBY DAY) has been run at Epsom since 1730, and the Oaks since 1779. The Ascot meeting has been continuous since 1727, and Goodwood since 1802. The other most important races are at Doncaster, Lincoln, Chester, and on the Curragh of Kildare, Ireland. The Jockey Club, a semi-public organization, is the flat racing authority. In France within the last thirty years great interest has been taken in breeding and racing the thoroughbred. The Grand Prix de Paris, which is run at Longchamps, near the capital, is one of the great races of the world. Austria, too, has its enthusiasts, and in Australia flat racing is a national pastime.

In America, the first and natural home of the thoroughbred was in the South, where the early settlers were of the class which in England made the breeding and care of high-mettled horses one of their delights. Many well-known horses were imported. Diomed, the Derby winner already mentioned, of the Byerly Turk blood, was one of them. He was brought over by Col. John Hoopes, of Virginia, and became the sire of Sir Archy, who in turn was the father of American Eclipse, Vingt Un, and other well-known horses. Another of these importations was Messenger, by Blais (the son of Flying Childers and grandson of the Darley Barb) out of Turf, a de-

scendant of the Godolphin Arabian, thus combining on both sides the best thoroughbred blood in the world. Breeding continued with great success; so that in 1881 the late Pierre Lorillard was able to send over to England his Iroquois and win the Derby. Breeding establishments known all over the world are scattered throughout Kentucky and Tennessee, and there are many enthusiastic owners of thoroughbreds.

Even in the North, flat racing flourished as early as 1812. In 1830 Barefoot, a Saint Leger winner, found a home in Westchester, N. Y., and was raced there against his great rival American Eclipse. The Wagner-Grey Eagle contests caused unparalleled interest there in the autumn of 1839; and Lexington and Le Comte had their famous meetings in New Orleans in 1854-55.

The Civil War was a temporary check to thoroughbred racing, and although scarcely a city of any size was without a course, it was not until the American Jockey Club was formed, with the late August Belmont as chairman, and Jerome Park (in 1886) was made the Mecca of the sport by Leonard W. Jerome, that racing in the modern sense became a widely spread pastime. In 1881 the Coney Island Jockey Club opened the Sheepshead Bay Track; in 1888 Mr. John A. Morris built Morris Park; the next year Monmouth Park at Long Branch was created by Mr. Withers, and this was followed by the Brooklyn Jockey Club's course at Gravesend. On these four courses sums approaching \$500,000 were annually added to the entry fees, for competition. Saratoga has long had an annual meet of importance, and the Washington Park Club of Chicago and the Kentucky Racing Association have an antiquity greater than any of the Eastern associations. Other important racing centres are New Orleans, Louisville, Little Rock, Ark.; Roby, Ind.; Newport, Ky.; and Washington, D. C. The Pacific Slope is represented by the San Francisco Jockey Club and the New California Jockey Club, whose principles are gradually coming into accord with those guiding the Eastern Jockey Club, probably with a view to an often discussed amalgamation.

Many noted horses, besides Iroquois, already mentioned, have been produced in America, of which the best known have been Lexington (a direct descendant of Diomed), Silver Fox, a son of Blais, Maud Hampton, Kentucky, Tournament, Firenze, La Tosca, Ethelbert, Salvator, Imp, Kinley Mack, Ballyhoo Bey, Commando, Tommy Atkins, and Nasturtium.

One fundamental difference between American and English thoroughbred race-courses is that the former are bare earth floors, and the latter are covered with a close-fitting carpet of grass. The straight mile record on the grass was, singularly enough, made at Lingfield by the American bred Caiman in 1 m. 33 s.; while on the dirt course the mile record on a circular track was made by an imported horse, Orimer, at Washington Park, Chicago, in 1 m. 38 s.

The advent of American jockeys in England in the years 1900-01 worked a complete revolution in the style of riding in a flat race, and their fame has extended to every part of Europe where thoroughbred racing exists. The main point in the American style is the placing of the jockey's weight well forward on the horse's withers and a crouching attitude, which reduces the resistance of the air against the jockey's body.

HORSERADISH (*Cochlearia Armoracia*). A perennial herb of the natural order Cruciferae, with long, cylindrical white roots of strong pungence, due to a volatile oil which resembles mustard oil. It has flower-stems about two feet high, large, much-veined, oblong, crenate root-leaves on long stalks, and elongate-lanceolate stem-leaves. It grows in damp meadows in the middle and south of Europe, is naturalized in many places in America, and is cultivated for the sake of its roots, which are scraped or grated down and mixed in salads or used as a condiment. Horseradish-root is used also in medicine as a stimulant, and is often useful in promoting digestion; it is also regarded as an antiscorbutic, and is sometimes applied as a rubefacient instead of mustard. Since horseradish does not produce seed, it is generally propagated by root-cuttings planted in rich, moist soil and treated as an annual. The crowns are also sometimes used, but they do not produce as good roots. Horseradish is very difficult to eradicate from the ground in which it has become established, as almost any portion of the root will grow.

ROOT OF
HORSERADISH.

HORSERADISH - TREE (*Moringa pterygosperma*). A tree of the natural order Moringaceae, native of India, and introduced into the West Indies and other tropical countries, in many of which it is cultivated for its fruit, which is either pickled or eaten as a vegetable. The fresh root and the leaves suggest the odor and flavor of horseradish—hence the common name. Its winged, triangular, globose, bitter seeds furnish about 30 per cent. of a bland, inodorous, nearly colorless fixed oil of long-keeping qualities which resembles olive oil and is similarly used. At a temperature of about 32° F. a deposition of its solid fats occurs, and the remaining clear fluid is removed for use in the extraction of perfumes from flowers, and the lubrication of delicate machinery. The oil is known as ben-oil or behen-oil, a name which is said to be misapplied, since it is claimed properly to belong to the oil obtained from the wingless seeds of *Moringa aptera*, a tree native to Abyssinia and Arabia. The oil of neither species should be confounded with bene-oil, which is derived from the seeds of *Sesamum indicum*. See SESAMUM.

HORSESHOE BAT. See BAT.

HORSESHOE, or HORSEFOOT, CRAB. See KING-CRAB.

HORSESHOE FALL. The name given to the portion of Niagara Falls included between Goat Island and the Canadian shore, also called the Canadian Fall. See NIAGARA FALLS.

HORSESHOEING. An artificial protection of some kind for the horse's foot has been well said to be "one of the penalties which civilization inexorably exacts." When it is remembered that every time that a horse is shod it implies damage to the foot and that the best and most expert shoeing of necessity inflicts some injury, the importance of horseshoeing to the horse-owner is evident. All authorities agree "that there is no

such thing as absolute immunity from an evil which must always exist in inverse ratio to the skill displayed in the execution of the work." The value of the domesticated horse to man is in his fleetness and strength. It was early discovered, however, that his usefulness was limited by the condition of his feet, so that the history of horseshoeing is practically an account of the various devices that have led up to the modern shoe.

The entire weight of the body, as well as the pressure of every muscular effort, is largely concentrated in the feet. The nails or claws and their corresponding digits of other animals have in solipeds disappeared from atrophy, with the exception of the middle digit, which became much more developed and surrounded by an hypertrophied nail called the hoof, the structure of which is designed to meet every requirement of the animal except those that have devolved upon it since its domestication, such as constant traveling over hard roads or stony ground. Should the horn of the hoof be worn away, the structures which it was designed to protect are of necessity injured, the animal becomes lame, unable to work, and consequently ceases to have any value. According to Diodorus, Cinnamus, and Appian entire armies were occasionally jeopardized through the breaking down of their horses by reason of worn hoofs. Xenophon sought to solve the problem by making the hoofs hard and tough; and from other Greek and Roman writers we learn that resort was had to socks or sandals (*ippopodes, embatai, carbatinae, solea*, etc.). These were clumsy as well as ineffectual means of protection, but, strangely enough, they have their modern counterpart in the straw sandals still to be seen in various parts of the Japanese Empire. According to Beckmann, *Beiträge zur Geschichte der Erfindungen* (Leipzig, 1792), it was greatly to be doubted whether the Romans practiced, as was alleged, the art of shoeing, by attaching a metal plate or rim to the horse's foot; a doubt strengthened by the fact that on no monuments or sculptures (so far as was then known) in which horses appear could any evidence of shoeing be seen. On the other hand, a bas-relief dating from the second century, at present in the museum of Avignon, shows a chariot drawn by horses which are unmistakably shod; and Cohen in his *Description des monnaies frappées sous l'Empire Romain* tells of a medal supposed to date from the time of Domitian commemorating a cavalry victory upon which was a design of two horseshoes, surrounded by two twined serpents. Another coin, in the British Museum, from Tarentum, about B.C. 300, is supposed to represent a horse being shod. According to historical writers the horses of the Huns when they invaded Europe were shod. Some evidence that nail shoes were employed previous to the sixth century is perhaps supplied by Chifflet (*Monuments de la monarchie Française*), who tells of a fragment supposed to be part of a horseshoe found by him at Tournay in the tomb of Childeric (King of the Franks, died A.D. 481). Absolute evidence as to nail shoes in the ninth and tenth centuries is comparatively plentiful, not the least important being the *Tactica Imperatoris Leonis* of Emperor Leo VI., dating from the ninth century. There is no reason to doubt that the Arabs of the Hejira (A.D. 622) shod their horses with iron; while, according to the *Chroniques de Saint-Denis*, Char-

lemagne was capable of breaking with his hands an 'iron' shoe belonging to his horse. In the nature of things it was not likely that shoeing with iron was at all common in the early part of the Middle Ages. William the Conqueror is believed to have introduced the art into Britain. For centuries the art of the shoemaker ranked with that of the scholar and bard in England and France, and not only noblemen, bishops, and squires, but even kings practiced the craft. In fact, according to Solleysel (c.1665), a knowledge of the art was a necessity for all persons of high estate, which explains the fact that many of the oldest families of England, France, and Poland have to-day a horseshoe device in their insignia. Occasionally shoeing took the form of extravagance, as when Poppæa, the wife of Nero, had her mules shod with shoes of gold—a fantastic fashion often recorded in history. As late as 1616 the English Ambassador to France entered Paris riding a horse whose silver shoes were so lightly fastened on that when he came to a spot where "eminent men or beautiful women were standing" he caused his steed to prance, and so cast its shoes, which were scrambled for by the crowd. His 'argentier,' wearing a rich livery, replaced the shoes with similar ones just as loosely fastened.

harmful concussion. Normally, the resilience of the frog helps to maintain the natural expansion of the hoof; a vital function which is entirely destroyed by the too common use of the 'draw-

NORMAL FOOT READY FOR SHOEING.

MODERN HORSE-SHOEING. The advanced farriery of to-day owes its excellence to modern veterinary science; so that there is no longer excuse for the ignorance which in comparatively recent times was universal, and which even to-day is prevalent to some extent. Notwithstanding State examinations and increased general knowledge, it is admitted

that the horse's feet are unnecessarily mutilated by wholesale cutting, regardless of the anatomy, physiology, and economic relations of the parts of the hoof. This practice is followed solely on the score of tradition; and,

ing-knife,' and which converts what should be a means of protection into a source of danger. The further fault of paring down the sole, until the living structures within are almost exposed through the soft, moist, half-formed horn, which is all that the paring-knife has left, is very severely condemned. Bad farriery and shoeing are frequently guilty of still further maiming the horse in endeavoring to improve upon nature by removing the bars, or 'opening' the heels; such a foot becomes predisposed to contraction of the heels. In the effort to use a shoe too small for

great as the financial loss has been, it is little compared to the agony which horses have endured. The frog of the hoof is designed to act as a cushion which by its elasticity protects the other structural parts from jar and

the foot the rasp is brought into play, and the foot made to fit the shoe. It is generally conceded that the outside or horny wall of the hoof, together with that portion of the sole which is in immediate contact with it, and upon which the

shoe should rest, are the only portions which require paring, and then not with the knife, but with the rasp. There is considerable difference of opinion among authorities with regard to the various details of shoeing, but all are agreed on the barbarity as well as uselessness of the frog and sole mutilation already described.

The shoe should be as light in weight as the circumstances will permit, the determining factors being the weight of the horse and the nature of the work it must do. The old adage that 'an ounce at the toe means a pound at the withers' is undoubtedly true in essence, but a still greater handicap is the increased concussion inseparable from progression. It is not true that a heavy shoe necessarily wears longer than a light one, while it is well known that a light shoe is just as effective as a heavy one in performing its legitimate mission of preventing undue wear of the walls of the hoof. The shoe should be made to conform exactly to the natural tread of the foot, and should be permitted on no account to remain on for too long a time, as the truncated cone of the hoof, which has its base downward, constantly increases in circumference, so that in time the shoe becomes too small and a source of pain to the horse. Common errors in shoeing are the employment of too many and too heavy nails, and the driving of them too high up into the walls. If shoes could be securely attached and safely worn without the use of nails much would be gained; but although numerous alternative devices have been put on the market, the best of which fastens the shoe by means of metal bands or stubs, none has been found to be generally satisfactory.

Winter shoeing demands that the shoe be capable of affording foothold as well as protection against undue wear, and for this purpose shoes are made fashioned with toe and heel calks, or calkins. Care is necessary to avoid making the calks any larger than is absolutely necessary, or else serious injury may be done to the horse. The art of shoeing for specific purposes is of American origin, and is a result of the development of the trotter (q.v.). At first, designed to influence speed or action, shoes are now made to remedy defects, natural or acquired, due to faulty conformation or bad habits. Shoes for racers, trotters, and speed horses generally have an adaptable variety of form and principle. Among those designed to remedy defects in the horse most generally employed in the business and pleasure of the community at large may be mentioned the scoop-toed or roller-motion shoe for the fore feet and a shoe for the hind feet, designed to do away with 'forging' or 'clicking.' The scooped or rolled toe hastens the action of the fore legs, and enables them to avoid being struck by the hind foot; while the lengthening of the branches of the hind shoes, by increasing the ground surface, retards the 'breaking over' of the hind foot. A common practice to 'open' the action is to increase the outside web of the hind shoes. The faults of 'dishing' or 'padding' are remedied by similar devices. The principal diseases common to neglected or faulty shoeing will be found treated under HORSE, or under their own title throughout the book.

HORSESHOES, LUCK OF. See SUPERSTITION.

HORSESHOE - SNAKE (so called from its markings). A large, handsomely marked colubrine serpent (*Zamenis hippocrepis*) of the Mediterranean region, closely allied to the American blacksnake.

HORSETAIL (so called from the shape). A common name given to species of *Equisetum* ('scouring rush'), a genus which represents one of the three great divisions of fern plants (pteridophytes). See EQUISETUM.

HORS'FORD, EBEN NORTON (1818-93). An American chemist, born at Moscow, N. Y. He graduated as a civil engineer at the Rensselaer Polytechnic Institute in 1838, and was engaged during the following year on the geological survey of New York State. In 1840 he became professor in the Albany Female Academy. In 1844 he went to Germany and studied chemistry for two years under Liebig. From 1847 to 1863 he held the Rumford professorship of applied science at Harvard College. He endowed the library and laboratory of Wellesley College, and was one of the first professors in the Lawrence Scientific School. He left Harvard to engage in chemical manufactures. He was interested in antiquarian research, and was generally credited at one time with having identified the site of the supposed Norse settlement Norumbega (q.v.) as being on the Charles River near Boston. His dictionary of the Iroquois and Algonquin languages is a valuable contribution to Indian philology. He published *The Discovery of Norumbega* (1892).

HORSLEY, HORS'LII, CHARLES EDWARD (1822-76). An English organist, pianist, and musical composer, born in London. A pupil of his father, William Horsley, of Moscheles, Hauptmann, and Mendelssohn, and a friend of Spohr, he began musical composition while studying in Germany, and an overture by him was rendered at Cassel in 1845. He was organist of Saint John's, Notting Hill, London (1853-57), but went to Australia in 1868, and thence to America in 1876, where he died. He was the author of three oratorios: *David* (1846); *Joseph* (1849); and *Gideon* (1860); besides music for Milton's *Comus* (1860); *Euterpe*, an ode for the inauguration of Melbourne City Hall (1870); and a *Text-Book of Harmony* (1876), published after his death.

HORSLEY, JOHN CALCOTT (1817—). An English genre painter. He was born at Brompton, and studied at the Royal Academy's schools. Later he was one of the head masters at the School of Design, Somerset House. He received several prizes for his cartoons at the Westminster Hall competition in 1843, and painted al fresco the "Spirit of Prayer" in the House of Lords, and "Satan Touched by Ithuriel's Spear," in the Poets' Hall of the Palace of Westminster. Some of his other works are "Malvolio the Sun," "L'Allegro," and "Il Penseroso," "Under the Mistletoe," "Caught Napping," "Scenes from Don Quixot," "Healing Mercies of Christ," "Wedding Rings," and "Hide and Seek." The coloring

of his pictures is good, but their genre motives are often strained. He was elected to the Royal Academy in 1866.

HORSLEY, SAMUEL (1733-1806). An English prelate. He was born at Saint Martin's-Place, London, September 15, 1733. He was educated at Westminster School and Trinity Hall, Cambridge. In 1758 he became curate to his father, then rector of Newington, and the next year succeeded to the rectory, a living which he held for thirty-four years, though he also enjoyed in the interval many other preferments. He was a scientist as well as a theologian, and first attracted attention by scientific writings. He is chiefly remembered, however, for his controversy with Dr. Joseph Priestley, growing out of the publication of the latter's *History of the Corruptions of Christianity* (1782), among which corruptions was included the orthodox doctrine of Christ's uncreated divinity. Horsley reviewed the work with great severity in his charge delivered to the clergy of the Archdeaconry of Saint Albans, May 22, 1783. Priestley replied the same year in a publication entitled *Letters to Dr. Horsley in Answer to His Animadversions*, etc. In 1784 Horsley retorted in seventeen *Letters from the Archdeacon of Saint Albans in Reply to Dr. Priestley*, etc. These were, in return, met by a new series from Priestley. After a silence of eighteen months, Horsley again replied in his *Remarks on Dr. Priestley's Second Letters*, etc., and in 1789 collected and published the whole that he had written on the subject. His services were rewarded with the Bishopric of Saint Davids in 1788, whence he was translated to the Bishopric of Rochester in 1793, then to Saint Asaph's in 1802. He died at Brighton, October 4, 1806. His collected theological works were published (London, 1845).

HORSLEY, VICTOR ALEXANDER HADEN (1857—). An English surgeon and neurologist. He studied medicine in London, and in 1881 received the gold medal in surgery from the University School. He has been president of the Medical Defense Union, and is Fellow of the Royal Medical Chirurgical Society; member of the Pathological, Clinical, and Physiological societies; corresponding member of the Biological Society of Paris, and of the Medical Society of Budapest; honorary fellow of the American Surgical Society and of the American Neurological Society; surgeon to the University College Hospital; professor of pathology in University College; surgeon to the National Hospital for paralyzed and epileptic; and secretary of the Government Commission on Hydrophobia. The results of his researches in cerebral localization are of the greatest value, and have made him eminent. He is the author of a *Report on Septic Bacteria* (1882); articles in Heath's *Dictionary of Surgery* and Quain's *Dictionary of Medicine* (1883); *Surgical Reports of University College Hospital* (1882 and 1883); "Functions of the Marginal Convolutions," in *Proceedings of the Royal Society* (1884) and *Philosophical Transactions of the Royal Society* (1888); "Analysis of Movements Produced by Stimulating Ferrier's Cortical Arm Centre" (ib., 1886-89); "On the Thyroid and Pituitary Bodies," in *British Medical Journal* (1886); *The Pathology of Epilepsy and Canine Chorea* (1885-86); "On the Functions of the Thyroid Gland," in *British Medical Journal*

(1885); *Brain Surgery* (1887); "On Localization of Disease in Cerebrum," in *International Journal of the Medical Sciences* (1887); *Hydrophobia and Its Treatment* (1888); *An Experimental Investigation of the Central Motor Innervation of the Larynx*, with Felix Semon (1890); *The Structure and Functions of the Brain and Spinal Cord* (1892); with Boyce, *Preliminary Report on Edema* (1893); with Schäfer, *Experiments upon the Functions of the Cerebral Cortex* (1888).

HORSLEY, WILLIAM (1774-1858).—An English organist and composer, born in London. He early began the composition of glees, in which he did his best work, and his first appointment as organist was to Ely Chapel, Holborn (1794). Three years afterwards he became assistant, son-in-law, and successor (1802) to Dr. Calcott at the Female Orphan Asylum, having by that time received the degree of Mus. Bac. from Oxford. He was also organist at Belgrave Chapel, Grosvenor Place (1812-37), and afterwards at the Charterhouse (1838). He was one of the founders of the Philharmonic Society (1813), and belonged to several other musical organizations. He will long be remembered for his anthem, *When Israel Came Out of Egypt* (1800), *Celia's Arbor* (1807), and for five collections of such glees as *See the Chariot at Hand, Mine be a Cot, Cold is Cadwallo's Tongue, and Oh, Nightingale*, published 1801-27. He wrote also pianoforte pieces, hymn and psalm tunes, and several works on harmony, such as *An Explanation of Musical Intervals of the Major and Minor Scales* (1825).

HORT, FENTON JOHN ANTHONY (1828-92). A distinguished English theologian. He was born of English ancestry at Leopardstown, near Dublin, Ireland, April 23, 1828, was educated at Rugby and Cambridge, fellow of Trinity College, Cambridge, 1852-57; vicar of Saint Ippolyts, Hertfordshire, 1857-72; lecturer and professor at Cambridge from 1872 to his death, November 30, 1892. Hort was one of the most learned men of the nineteenth century. He distinguished himself not only by his marvelous attainments in classical and patristic literature, but by an extensive acquaintance with botany and mathematics. Nevertheless he was always reluctant to publish the results of his studies. The great monument of his life-work is the Westcott-Hort Greek Testament (1881). For over thirty years he made the Greek text of the New Testament his chief study, and at his death was one of the first authorities in the world on this subject. To him textual criticism owes the clear and convincing exhibition of the principles of genealogical evidence presented in the *Introduction to the New Testament in Greek* (1881). Since his death many of his lectures have been edited and published. Consult his *Life and Letters*, by his son, A. J. Hort (New York, 1896).

HORTA, hōr'tā, *Port. pron. õr'tā*. A seaport of the island of Fayal, Azores, and capital of the District of Horta. It has a safe and good harbor. Population, in 1900, 6734.

HORTENSE EUGÉNIE DE BEAUHARNAIS, õr'tāns' ãzhā'nã' de bõ'är'nã'. See BONAFARTE.

HORTENSIO, hõr-tën'shĩ-õ. A suitor of Bianca, the younger sister of Katharine, in Shakespeare's *Taming of the Shrew*.

HORTENSIVS, hōr-těn'shī-ūs, **QVINTVS** (c.350-286 B.C.). A Roman legislator. His *Lex Hortensia*, passed in his dictatorship (286), decreed that the laws passed by the plebs were binding on the whole people, and brought to an end the struggle between plebeians and patricians. Hortensius died while he was dictator.

HORTENSIVS, **QVINTVS** (B.C. 114-50). A Roman advocate and orator, a contemporary of Cicero, with whom he was personally on good terms, though opposed in politics, and often matched against him in legal contests. Hortensius had already obtained a name as an orator before he was twenty, and he passed through the several grades of the public service until he obtained the consulship in B.C. 69; afterwards he withdrew largely from politics and devoted himself to pleading in the courts. He was an effective, though florid, orator, but often showed himself unscrupulous in attaining his ends. None of his orations or writings have been preserved.

HORTICVLTVRAL SVCIETIES. Associations for the encouragement of gardening. They are now numerous in almost all civilized countries, but seem to derive their origin only from the beginning of the nineteenth century, when the London Horticultural Society was formed. The society obtained a charter in 1808. The Experimental Garden of the society, the first of its kind, was established in 1817, and was removed to its present situation at Chiswick in 1822. The progress of the society was very rapid, and its usefulness is still very great. Societies of the same kind soon began to spring up in Germany and other parts of the Continent of Europe, and now exist in almost all parts of the civilized world. In the United States there are about five hundred horticultural societies. The New York Horticultural Society, organized in 1818, and now extinct, was the first to come into existence. The American Pomological Society, established in 1850, is now one of the strongest organizations of its kind in the world. The purpose of these societies is education and the development of interest along horticultural lines.

HORTICVLTURE (from Lat. *hortus*, garden + *cultura*, cultivation, from *colere*, to cultivate). The branch of general agriculture that deals with the raising of fruits, vegetables, and ornamental plants. On the one hand, horticulture merges into agriculture in its restricted sense, i.e. the raising of cereal, forage, textile, and root crops; on the other into landscape gardening, which is really a fine art. To illustrate, peas raised to be used as an esculent are classed as a horticultural crop, but if grown for the dry seed they are considered an agricultural crop; the names 'garden peas' and 'field peas' sufficiently indicate the distinction. Again, plants raised for their intrinsic ornamental merit are properly subjects of horticulture (see **FLORICVLTURE** and **SYLVICVLTURE**); but if their primary use is as units in a general landscape effect, they are subjects of landscape gardening (q.v.). While the development of agriculture, in the restricted sense of the term, springs from sheer necessity, that of horticulture, which serves to gratify the sense of beauty and the desire for comfort, naturally implies a state of communal or national ease, of thrift, and even luxury. This fact is emphasized by the time at which horticulture becomes industrially important in a nation's history. For

it attains commercial importance in a community only when the pioneer days have passed, when the rugged soil has been educated by the practices of general farming, and prosperity seeks new channels by diversification of interests.

But horticulture is really much less simple than may be inferred from the ordinary definition of its scope. Problems of plant physiology, of breeding and variation of plants under domestication, of the operation within its domain of natural laws in opposition or in conjunction, of the life histories of innumerable organisms, such as insects, mites, bacteria, and microscopic fungi, are closely connected with the ordinary problems of horticulture proper, and render it an art of great complexity. Further, with its growth, which, especially in America, has been phenomenal, many industries, such as the nursery and the seed industries; the manufacture of tools and implements; of artificial fertilizers; baskets, barrels, tins, jars, and other packages; the preparation of canned, evaporated, or otherwise preserved fruits and vegetables; storage by refrigeration; the transportation of all materials for manufacture and of the finished product—these and other industries have either sprung into existence or have been vastly increased in magnitude with the development of horticulture. Moreover, since each of its branches may be carried on in the open air or under glass by specialists; since each species, and in many instances each variety, cultivated, demands some special knowledge of its peculiar needs; since a total of fully 25,000 plants, some of which have thousands of varieties, are cultivated for use or ornament; since climates, soils, and other conditions differ as widely as do details of raising; since markets are as whimsical in their demands as persons; and finally, since improvements and discoveries in plants, varieties, methods of culture, marketing, etc., are annually reported, it is apparent that the realm of horticulture is exceedingly broad.

The main divisions of horticulture are floriculture, or flower-growing; pomology, or fruit-growing; and olericulture, or vegetable-growing. Each of these divisions may be further subdivided into amateur and commercial branches, the former dealing with personal ideals, the latter with commercial demands. Of course, these two are blended to some extent, and it should be noted that examples of the former are annually increasing to the no small advantage of the community, the nation, and the world.

The ancient methods of gardening were so crude, the means of disposal so limited, and the areas devoted to horticultural industry, if such it might be called, so small that the term horticulture, as now understood, if applied to that early gardening would be a misnomer. Not until within the past two hundred years was the term more than occasionally employed, and only during the past century did it come into general use. As proof of the interest taken in horticultural matters during the nineteenth century may be mentioned the development in America of a horticultural literature. In 1800 there were very few agricultural works that devoted more than a few chapters or even pages to fruits and vegetables. The first American horticultural book was published in 1804. Not only was there at the time no periodical devoted wholly to horticulture, but there was none that had even a horticultural department. Not until 1821

did a horticultural column appear in the *Massachusetts Agricultural Repository*, the first agricultural journal printed in America. During the nineteenth century fully 600 books were published and 500 horticultural journals were started, of which about 40 were in circulation in 1900. The tendency of recent horticultural literature has been to substitute for the long series of specific rules formerly popular a set of general principles, which, if thoroughly grasped, might enable the reader to judge as to what working method may best suit any given case under any combination of local conditions. Outside of North America, during the past century, the development of horticulture, though less marked, has been, nevertheless, very remarkable as compared with previous centuries.

BIBLIOGRAPHY. For history of horticulture in America and the bibliography of American horticulture, consult: Bailey, article "Horticulture," in *Cyclopedia of American Horticulture* (New York, 1900); for account of European horticulture, consult: Johnson, *The History of English Gardening* (London, 1829); Jäger, *Gartenkunst und Garten, sonst und jetzt* (Berlin, 1887); Hüttig, *Geschichte des Gartenbaues* (Berlin, 1899); André, historical chapters in *L'art des jardins* (Paris, 1879); De Candolle, *Origine des plantes cultivées* (Paris, 1893).

For somewhat detailed discussions of special horticultural topics, see: FRUITS, CULTIVATED; HARVEST AND HARVESTING; FUNGI, ECONOMIC; DISEASES OF PLANTS; FUNGICIDE; INSECTICIDE; ELECTROCULTURE; PLANT-BREEDING; POMOLOGY; HORTICULTURAL SOCIETIES; IRRIGATION; MANURES AND MANURING; NITRIFICATION; WIND-BREAK; GRAFTING; also AGRICULTURE, and the articles on various plants grown for use or ornament.

HORTON, SAMUEL DANA (1844-95). An American publicist, born in Pomeroy, Ohio. He graduated at Harvard College in 1864, and at the Harvard Law School in 1868; studied in Berlin from 1869 till 1870, and was admitted to the bar in Ohio in 1871, practiced in Cincinnati until 1874, and afterwards in Pomeroy. He soon became interested in questions of coinage, was among the first to argue the advantage of the establishment of an international ratio between silver and gold, and was the author of books on coinage and currency, characterized by careful historical research. In 1878 he served as secretary of the International Monetary Conference assembled in Paris, and was a delegate to the second conference held there in 1881. His most important writings are: *The Monetary Situation: An Address* (1878); *Silver and Gold, Their Relation to the Problem of Resumption* (1880); *The Silver Pound and England's Monetary System Since the Restoration*, together with *The History of the Guinea* (1887); *Silver in Europe* (1890).

HORTUS SICCUS. See HERBARIUM.

HORUK, ἠὸρυκ. The name of a Greek pirate, also called Barbarossa (q.v.).

HORUS (Lat., from Gk. Ὄρος, Egyptian *Hôr*). An Egyptian deity. His name *Hôr* (*u*) is by some scholars explained as meaning 'the superior, highest,' but this is an improbable etymology, not more probable, perhaps, than the earlier comparison with Hebrew *ôr*, 'light,' which is generally ridiculed at present. It is question-

able where Horus had his original local cult; usually Edfu, where a large temple is still standing, is considered to have been the locality, although the god was worshiped at a great many other places. He was patron of Upper Egypt. On the very earliest monuments we find Horus as the chief god and type of the King; from the first the hawk is his symbol, and there are allusions to his antagonism to Set, so that the later theological ideas seem to be traceable to the time of the First Dynasty. The original dominating position of Horus within the pantheon is shown by the fact that his hawk stands as hieroglyph for 'god' in general. He personifies the sun, originally thought to fly over the sky in form of a hawk, and is usually represented as a young warrior with the head of a hawk, wearing the crown of Egypt. More specially he personifies the young sun, rising victoriously in the morning out of the hostile darkness. Therefore, he is connected with Osiris, the sun dying in the west, and as his son he takes vengeance for his father on the powers of darkness. More rarely he is called the son of Rê, the midday sun. He is frequently called a posthumous son of Osiris; his mother, Isis, is even said to have formed him from the mutilated members of her murdered husband. Rising gloriously, Horus begins the fight with Set-Typhon, his wicked uncle, every morning—although later (partly euhemeristic) views consider the great fight between the gods as a single event, occurring at the beginning of the world. Avenging his murdered father, Horus overthrows and emasculates Set; but he loses one eye in the contest. Possibly this refers to the moon, which loses its light every month; or else the sun may be the single eye in the face of the god, i.e. the sky. The wounded eye is healed by the moon-god (Dhouti, Thoth), which means that the second eye appears in the night. The blood of the wounded eye drips down and creates plants, animals, and all good and useful things on earth. It is curious to note how Horus is differentiated in regard to his various functions and phases. We find, for example, Harpoerates (Horus as a child) distinguished from Haroëris (the adult Horus); Harondotes (Egyptian: Harnez-iotef) 'the avenger of his father;' Horus in Khemnis, as a babe hidden by his mother in the marshes of the Delta from the persecutions of Set; Harmachis (q.v.); 'Horus uniting both lands;' and various other forms became localized and had their special cults. Many details of the Horus myth are obscure; for example, the legend that he once cut off the head of his mother, which may have been borrowed from an Asiatic cosmogonic myth. The later theology explained this story by the statement that Isis had set free the wicked Set after Horus had delivered him to her in fetters, and that Horis mutilated her in his indignation at her act. The moon-god (see above) replaced the head of Isis by a cow's head. The story of the fight against Set-Typhon is told with a great many variations, and the wicked adversary and his many helpers resist Horus in many forms and at many places. Later, the serpent Apap, as the personification of night and the hostile ocean, became confounded with Set (q.v.). The later Egyptians, under Greek influence, made strange attempts to harmonize these hundreds of different, contradictory myths. (See especially Plutarch's *De Iside et Osiride*, and the accounts given by Diodorus.) Like Osiris,

Horus was explained as typifying everything good in nature, although the solar meaning of most of the mythological facts was too manifest to be entirely overlooked. The planets Mars, Jupiter, and Saturn were also considered as manifestations of Horus ('the red Horus,' 'the brilliant Horus,' 'Horus, the bull'). In the mythical accounts of the early history of Egypt, Horus was counted as the last of the divine rulers of the land. The principal temples of Horus were at Letopolis, in Lower Egypt, at Kus (Apollinopolis Narva), and at Edfu (Apollinopolis Magna—the Greeks identified Horus with their Apollo); he was worshiped also at Ombos, Denderah (Tentyra), Damanhur (Hermopolis Parva), etc. In Imperial Rome he became as popular as Iris and the other members of the Osirian family. See Plate of EGYPTIAN DEITIES, in the article EGYPT.

HORUS. An Egyptian name, usually understood as that given by Manetho to the last King of the Eighteenth Dynasty, the Har-em-heb of the hieroglyphic inscriptions. He had been Prime Minister of several of his predecessors, and by marrying a princess he ascended the throne somewhat after B.C. 1380. The duration of his reign is uncertain; five years are assigned to him by Manetho, while according to the monuments he reigned for twenty-one years at least, though this may be due to an artificial reckoning. His principal buildings are the pylons in the temple at Karnak. Of military achievements only an expedition against the negroes of the Sudan is mentioned in his rock-hewn temple at Silsileh. He completed the religious reaction against the reformation introduced by Amenophis IV. Harmais, of whom Herodotus has preserved some strange popular tales, is the same person. In other places, however, Manetho gives the name Horus to the heretic King Amenophis IV. (q.v.).

HORVATH, hōr'vāt, МИХАЛЪ (1809-78). An Hungarian ecclesiastic, statesman, and historian, born at Szentes, in the County of Csongrad. He entered the priesthood in 1830, and before 1841 held a number of pastorates. His liberal ideas led him to abandon, temporarily, his priestly calling, and he became, in 1844, professor of the Hungarian language and literature at Vienna. In 1848 he was made Bishop of Csanád, and in the following year, upon the declaration of Hungarian independence, became Minister of Public Education and Worship. After the collapse of the revolutionary movement he fled the country, and lived abroad under sentence of death, returning only in 1867. He reentered politics, and until his death was a member of the Lower House of the Diet, voting with the Déak party. His principal works are: *History of the Hungarians to 1823* (3d ed., 8 vols., Budapest, 1873); *Twenty-five Years of a Hungarian History, 1823-48* (2d ed., Budapest, 1868); *History of the War of Independence in Hungary, 1848-49* (2d ed., Budapest, 1872).

HORWICH, hōr'j. A town in Lancashire, England, five miles west-northwest of Bolton (Map: England, D 3). Its industries comprise railway works, paper-making, cotton manufactures, bleaching works, and coal-mining. It owns its water-supply. Population, in 1891, 12,850; in 1901, 15,100.

HOSACK, hōs'ak, DAVID (1769-1835). An American scientist, born in New York. He gradu-

ated at Princeton in 1789; studied medicine in Philadelphia and afterwards in Europe, and was chosen professor of botany in Columbia College in 1795. In 1807 he became professor of materia medica and of midwifery in the College of Physicians and Surgeons, then newly founded, and subsequently of the theory and practice of medicine, and of obstetrics and the diseases of women and children. He was the founder of the first botanic garden in the United States. He was connected with Drs. Mott, Macneven, and Francis in organizing the medical department of Rutgers College, at New Brunswick, N. J., and in New York City he held various medical positions in asylums and hospitals. He was one of the founders, and for twelve years president of the New York Historical Society, and was a fellow of the Royal Society of Great Britain.

HOSANNA, hō-zān'nā. The cry with which Jesus was greeted at His last entry into Jerusalem (Matt. xxi. 9; Mark xi. 9; John xii. 13), and which until recently was generally considered to be identical with the Hebrew expression *hoshia-na*, 'save now,' occurring in Psalm cxviii., abbreviated to *hosha-na*. This expression occurs as part of the Psalter used at the Feast of Tabernacles. When this word was said the boughs were waved. Gradually the boughs themselves came to be called hosannas, and the day on which the hosanna prayer was said seven times came to be called 'day of the great hosanna.' But in the New Testament passages 'hosanna' is used as an acclamation almost as 'hail!' in English, and it is not easy to account for this transition, especially as Jesus' entry took place at the Passover and not at the Tabernacles season, so that there would hardly be any occasion to introduce 'hosanna.' In view of this, it is possible that 'hosanna' in the Old Testament represents originally a different word, perhaps the Aramaic *ushua*, 'strength'—which has subsequently become confused with the Old Testament 'hosha-na.' Consult: the discussion in Dalman, *Die Worte Jesu*, vol. i. (Leipzig, 1898); id., *Grammatik des jüdisch-palästinischen Aramäisch*, p. 198 (ib., 1894).

HOSEA, hō-zē'ā (Heb. *Hōsē a*, deliverance). One of the prophets, whose discourses, forming the Book of Hosea, come first in the group of minor prophets. Of his life we know nothing except what may be inferred from references in the discourses. His father's name is Beeri (Hos. i.), and his home is in the Kingdom of Israel. In the first three chapters he uses as an illustration a strange incident in his own life. He had taken to wife a woman, Gomer, the daughter of Diblaim, who bore him three children, but who turned out to be a faithless and worthless woman. This personal experience, the substantial reality of which there is no reason to question, appears to the prophet as typifying the faithlessness of the people of Yahweh to their God. It is not necessary to go so far as to suppose that the prophet actually gave his children the symbolical names Jezreel (q.v.), Lo-ruhamah ('not beloved') Lo-ammi ('not my people'), as indicated in chapter i. This feature is clearly allegorical, but Hosea's divorce from his wife and his subsequent reunion with her (chapter iii., unless, indeed, another wife is meant) are probably incidents in his own life. According to the present heading of the book, his activity extended over the reigns of Uzziah, Jotham, Ahaz, and

Hezekiah of Judah (about 790-690 B.C.) and the reign of Jeroboam II. of Israel (c.782-743 B.C.). Scholars think that these indications cannot be correct, the former being too long a period, and the latter too short. Internal evidence points to the beginning of Hosea's activity as represented in his discourses at some time before the death of Jeroboam and ending before the attack of Tiglath-Pileser on the northern kingdom in B.C. 734. Hosea addresses himself chiefly to Israel, the northern kingdom, and the burden of his message is the people's infidelity toward Yahweh as exemplified by their adoption of foreign rites, by political alliances that subjected the people to foreign influences, and by the general neglect of moral standards in public and private life. These conditions were brought about by the energetic political policy inaugurated by the dynasties of Ahab and Jehu, and the prophet fairly exhausts the vocabulary in his denunciation of this policy and in predicting the dire destruction, not only of the dynasty, but of the people. The book may be divided into two parts: (1) Chapters i.-iii., detailing his personal experience of marriage to a faithless woman, and the application of the experience to conditions existing in the northern kingdom; (2) chapters iv.-xiv., in which (a) the Canaanite features in the Hebrew cult are denounced and the attendant moral degradation of the people; (b) the misrule of the Kings, the riotous life of the Court, and the fondness for foreign alliances are pictured in vivid colors. Scholars are agreed in recognizing a number of later additions and interpolations to the original text of the discourses. In these additions (1) references are supplied to the Kingdom of Judah with which it appeared the prophet did not concern himself at all; and (2) the gloomy outlook is modified by holding out the hope that a remnant at least, uncontaminated by the prevailing religious and political conditions, will escape the awful doom and form the nucleus for the reconstitution of the people on the basis of true Yahweh worship and with obedience to Yahweh's laws as the corner-stone. Consult: the commentaries mentioned in the article *MINOR PROPHETS*; Cheyne, in the *Cambridge Bible for Schools and Colleges* (Cambridge, 1889); Valeton, *Amos and Hosea* (London, 1894); W. R. Smith, *The Prophets of Israel* (London, 1895).

HOSEA BIGLOW. The fictitious signer of a number of Lowell's *Biglow Papers* (q.v.).

HOSEMANN, hō'ze-män, ANDR. See *OSIANDER*.

HOSEMANN, THEODOR (1807-75). A German painter and illustrator, born at Brandenburg. He studied lithography under Arnz and Winckelmann, and then was a pupil of Cornelius and Schadow. Afterwards he went to Berlin, and in 1857 was made professor at the Academy. His works include genre pictures in oil and water-color, such as "Shoemakers' Apprentices" and "Peasant Girls and Boys," and illustrations for *Baron Münchhausen*, *The Mysteries of Paris*, and *Andersen's Fairy Tales*.

HOSIERY (from *hose*, AS., OHG. *hosa*, Ger. *Hose*, hose, stockings). In its most limited sense, this term refers to the manufacture of stockings (hose); but in its more general application it comprises all knitted goods, either made by hand or by machinery. The use of stockings originated in the cold countries of the north of Europe, and

probably the first were made of skins, and subsequently of cloth; they were also, until a comparatively late period, made all in one piece with the trousers, constituting trunk-hose. These garments were separated, and the art of knitting was invented, it is supposed in Scotland, about the commencement of the sixteenth century. Knitted stockings found their way to France from Scotland, and led to the establishment of a guild of stocking-knitters, who chose for their patron saint Saint Fiacre of Scotland. In 1589 William Lee, of Woodbridge, Nottinghamshire, entirely altered the hosiery trade, by inventing the knitting-frame. See *KNITTING*.

HOSIUS, hō'sh'ūs (c.256-c.358). Bishop of Cordova. He became bishop about 295, and retained the office till his death about 358. Having suffered persecution under Maximian, he was honored for his steadfast faith. The Emperor Constantine was strongly attached to him, and it may be owed his conversion to him. In 324 he sent him to Alexandria to mediate between the Bishop of that city and Arius, as well as to settle the dispute concerning the observance of Easter. In the following year the Council of Nicæa was called for the purpose of considering both subjects, and Hosius was the president, or, at least, one of its presiding officers. At the close of the council he drew up, or, as some say, announced the decree, signed it first, and prevailed on the Emperor to sanction it. He was president of the Council of Sardica, called in 343-344 by Constantius and Constans at the desire of Athanasius. In 355 Constantius requested him to join in condemning Athanasius, but instead of doing so, Hosius defended him. Having persisted in this course a second, and even a third time, he was, at the close of the year, banished by the Emperor. Two years afterwards he was summoned to attend the Council of Sirmium, where, worn out with extreme age and hardship, he was prevailed on to sign a document favoring Arianism, yet he steadfastly refused to condemn Athanasius. He was then allowed to return to his home and office. Consult Gams, *Die Kirchengeschichte von Spanien* (Regensburg, 1864).

HOSMER, HARRIET (1830—). An American sculptor. She was born in Watertown, Mass., and received her education in Lenox. She was instructed in modeling under Stevenson at Boston, but later studied anatomy in the Saint Louis Medical College. Her real instruction in art was received in the studio of John Gibson (q.v.) at Rome, where she has chiefly resided. In his studio she modeled her original heads "Daphne" and "Medusa," executed for Samuel Appleton, of Boston; "Beatrice Cenci," in the public library of Saint Louis; and "Enone" (1855), her first full-size figure. Her spirited and original statue of "Puck" was esteemed so successful that copies were ordered, among others, by the Prince of Wales and the Duke of Hamilton. Her most ambitious work is a colossal statue of "Zenobia in Chains," completed in 1859. Her bronze statue of Thomas H. Benton is in Lafayette Park, Saint Louis. The "Sleeping Faun," exhibited in Paris in 1867, is one of her best works. Its companion is called "A Waking Faun." The fountain in Central Park, New York, and the heroic statue of Queen Isabella of Castile, unveiled in San Francisco in 1894, are by her, as are also the "Queen of

Naples" and the "Heroine of Gaeta." Her latest works are two fountains in private possession in England. Miss Hosmer's art is classic in tendency, like that of her master, Gibson. She has also invented technical processes of note in connection with her art.

HOSMER, JAMES KENDALL (1834—). An American author, born in Northfield, Mass., and educated at Harvard. He left the Unitarian church at Deerfield, of which he was pastor, to go to the Civil War as a private soldier, and upon his return took a professorship in Antioch College. Thence he went to the University of Missouri, taught English and German literature for two years, and in 1874 was appointed professor of the same branches at the Washington University, Saint Louis, a post he retained until his appointment as librarian of the Minneapolis Public Library in 1892. His published writings are: *Color Guard* (1864); *Thinking Bayonet* (1865); *Short History of German Literature* (1878); *Memorial of G. W. Hosmer, D.D.* (1882); *Story of the Jews* (1885); *Life of Samuel Adams*, in the "American Statesmen Series" (1885); *Life of Sir Henry Vane* (1888); *Short History of Anglo-Saxon Freedom* (1890); *How Thankful Was Bewitched* (1894); and *Life of Thomas Hutchinson* (1896).

HOSPICE. See INN.

HOSPIT'IAN, RUDOLF (1547-1626). A Swiss Reformed polemical writer. He was born in the Canton of Zürich. After studying there he went to Marburg and Heidelberg, and on his return in 1568 combined the position of preacher with that of school-teacher. From 1576 to 1595 he was head of the famous Karolinschule attached to the Great Minster. Meanwhile he pursued distinctive studies and entered the lists as a doughty champion of the Reformed Church against Roman Catholics and Lutherans. Bellarmine wrote against him on the side of Rome and Hutten on the side of Luther. His fellow townsmen highly honored him. In 1588 he was made an archdeacon of the Great Minster, and in 1594 pastor of the Fraumünster Church. He died in Zürich, March 11, 1626. His works were collected under the editorship of J. H. Heideffer, and published in seven folio volumes (1681). The latest of his writings was *Historia Jesuitica* (1619), trans., *The Jesuits' Manner of Consecrating Persons and Weapons Employed for the Murdering of Kings and Princes by Them Accounted Heretics* (Dublin, 1681).

HOSPITAL (from OF. *hospital*, Fr. *hôpital*, from ML. *hospitale*, inn, from Lat. *hospitālis*, relating to a guest or host, from *hospes*, guest, host). A place used for the shelter and treatment of the sick or wounded. In the earlier days, orphans and helpless children were brought up in institutions called hospitals. Leper hospitals were established in early times and were called 'spitals' or *hospitia*.

Hospitals were founded in very early times. India, Persia, and Arabia had hospitals supported by their kings and rulers before the Christian Era. As far back as the earliest period of Greek history the sick are said to have been treated in the Temple of Æsculapius at Epidaurus. In the early Jewish period a house for the reception of the sick was called Beth Holem. Such an institution was Beth Saida, mentioned in the New Testament. These hospitals seem to

have been wooden huts. In ancient Egypt hospitals were unknown, the sick being tended at home or in temples. Plato says that the Greeks, on the other hand, maintained shelter houses for the sick in various parts of the country, supplied with attendants. The best institutions of the kind in ancient times were undoubtedly in Rome. The inscription upon a tablet discovered near Piacenza, dated in the time of Trajan, shows that the Romans not only possessed such houses, but that they were actually endowed. One of the earliest hospitals on record was probably that founded by Valens in Cæsarea, between A.D. 370 and 380.

At the present time two general classes of hospital relief work are carried on in the large cities of the world. In *dispensaries* patients are treated who are able to be about and have temporary or serious illness, not sufficiently severe to confine them to bed. In *hospitals* patients are treated who must be confined to their beds, for certain times at least. Many dispensaries are associated with teaching institutions and are then termed *clinics*, and the patients who come are, in some instances, utilized to instruct the students of medicine. The word infirmary is a common English term for both dispensaries and hospitals.

The term hospital is now rarely used for those custodial and teaching institutions that care for foundlings and orphans. These are termed asylums, or homes, or colleges. A number in England retain the old name, such as Christ's Hospital in London, Heriot's Hospital, Donaldson's Hospital, Edinburgh, etc. Similarly, institutions for the aged and indigent at the present time are rarely termed hospitals, but homes, almshouses, etc. Thus the term hospital has come to be restricted to an institution in which the sick are treated, whether such illness be of the brain or of other parts of the body.

The history of the development of the modern hospital is both interesting and instructive. One of the earliest of recognized hospitals was in France, and the present Hôtel Dieu of Paris is supposed to have had its origin as early as the seventh century. During the Crusades many hospitals were built, and there arose a special class, the *Hospitaliers*, or knights whose duty it was to take care of the sick. The present Orders of Sisters of Mercy, Sisters of Charity, and allied societies, had a somewhat similar origin. With the establishment of the schools of learning, and more particularly with the development of the study of medicine, many of the hospitals formed departments in the universities, and the university towns developed large and important hospital facilities. Bologna and the Italian towns led the way. Paris and the schools of France followed, and in England and Scotland the hospitals of London and Edinburgh were the great medical schools. Thus Saint Thomas's, of London, was established in 1553; Saint Bartholomew's in 1546, where, in 1609, Harvey, who discovered the real nature of the circulation, was physician; and Bethlehem in 1547. The hospitals of the United States were largely founded on English models, although the influence of the French school was not absent in the early history of this country. It seems probable that the earliest hospital founded in the United States was the Pennsylvania Hospital, although there were earlier institutions in Canada and in Mexi-

co. Efforts were started as early as 1709 to establish a hospital in Philadelphia. In 1730-31 the city almshouse was founded, and did medical work; but it was not until 1750-51 that the Pennsylvania Hospital first had its actual birth. Joshua Crosby was the first president of the board of managers, and Benjamin Franklin the first clerk. The New York Hospital was the second hospital of importance. Its charter was granted in 1771. From these early beginnings there has now grown up in the United States a veritable forest of hospitals. Every city, town, and village has its duly appointed hospitals, and the hospitals of the United States are now acknowledged the most handsomely and thoroughly equipped in the world; they serve as models for European architects.

In most of the larger cities of the United States there are two or more hospitals that are under the control of the city government, and used exclusively for the city poor. Such are the Johns Hopkins Hospital, in Baltimore; the Philadelphia Hospital, in Philadelphia; Bellevue, City, Fordham, Harlem, and Gouverneur hospitals in New York; Massachusetts General, and Boston City, in Boston; Cook County Hospital, in Chicago; etc. In addition to these municipal hospitals there are numerous institutions founded by private gift and by sectarian societies, such as the New York Hospital, Roosevelt, Presbyterian, Saint Luke's, German, French, Mount Sinai, Saint Vincent's, Saint Mark's hospitals, etc., in New York, and hundreds of others in other cities. Further, there are numberless special hospitals for the treatment of separate diseases: hospitals for diseases of the eye, the ear, the nose, the throat; cancer hospitals; hospitals for diseases of women; for diseases of the skin, and for all the various specialties.

The details of hospital management cannot be entered into here. The medical side of the work is usually fashioned on well-established lines. In the larger hospitals the patients are immediately cared for by the nurses (nurses are paid a small salary unless they are sisters of some religious denomination); these are under the orders, so far as the treatment is concerned, of the *internes*, or young graduates in medicine who have gained this privilege by competitive examinations, and who serve in graded positions for periods of time of from one to three years. These generally reside in the hospital, receive no salary, save their living, and are constantly in attendance. The *externes*, on the other hand, are under the supervision of the *attending* or *visiting physicians*, who are practitioners in the city, chosen by the governing boards of the hospitals for their ability or for other reasons. These visit the hospitals at specified times, and outline the plans of treatment for the patients. Their time and services are usually given gratis, always so in the municipal hospitals. Many hospitals have consulting physicians who may be called in to diagnose rare conditions, but such appointments are usually rewards for work done in the other grades, and carry with them honor and position in the estimation of the laity.

In the smaller hospitals this system may be much modified to meet the circumstances, but the main features are preserved.

Chiefly within the past century a system of hospitals specially designed for the care and treatment of the insane has been established all

over the world. In this country these institutions are supported by the several States. The State of New York has sixteen such hospitals, each accommodating from a few hundred to a few thousand patients. The physicians who serve in these hospitals are specialists in mental diseases, and receive salaries which vary with the length of service. Very recently acute psychopathic hospitals have been established in some of the large cities in connection with the principal general hospitals. In these institutions patients afflicted with mild and curable forms of mental trouble receive treatment without being regularly committed to an insane asylum. Such are the insane pavilions in Bellevue and Kings County hospitals, in New York. See NURSES, TRAINED. Consult Burdett, *The Hospitals and Asylums of the World* (London, 1891).

MILITARY HOSPITALS. These are hospitals designed and erected for the exclusive use of soldiers, and in some instances sailors, including every form of establishment, from the field dressing station, or first hospital, keeping pace with the firing line, to the permanent institutions of the home country. Naturally, military hospitals are of comparatively recent origin; born of the needs of warfare, and the advance of medical science and hygiene. In the Crimean War of 1854 the French alone of the allied powers possessed anything approaching the equipment now common to all armies. The English wounded were carried off the field in rough-and-ready fashion, sailors' hammocks being ultimately utilized as a rude substitute for the French stretcher and ambulance. Surgeons dressed the wounded on the field, for whom there was little or no after accommodation, until, spurred by the publication of Florence Nightingale's description of conditions, and the reports of special committees, the Government appointed Lord Herbert's commission, which resulted in more effective hospital service. Similarly, the great Civil War of America in 1861 may be said to be the parent of the present United States Army Hospital Service, if not also of the entire European system, the English branch of which proved so effective in the Boer-British War of 1899. The dread of soldier and sailor alike, and the equal despair of the surgeon, had up to 1861 been a swift and often fatal form of gangrene, peculiar to naval and military hospitals; this, with many other equally deadly phases of the old system, was effectually remedied during the Civil War. The desperate character of the fighting taxed the general surgical capacity of the nation; and with the gradual advance in hygiene, bacteriology, and antiseptic surgery, undoubtedly led to the comparative perfection of to-day.

PERMANENT AND FIELD HOSPITALS. Modern military hospitals may be divided into two general classes—permanent, and war or field hospitals. To the former belong the hospitals attached to army posts and permanent military stations, as well as such institutions as the General Military Hospital, Fort Bayard, N. M.; Netley Hospital, England; and the Val-de-Grace, Paris, France. The United States Army shares with the Navy the advantages of the general hospital at Hot Springs, Ark., which is set apart for patients suffering from such diseases as the waters of the hot springs have the reputation of benefiting, except that cases of venereal diseases are not admitted. Admission to this hospital is re-

stricted to the army and navy, including officers of the revenue-cutter service and of the marine-hospital service, and honorably discharged soldiers and sailors of the regular and volunteer army and navy, in the following order of preference: (1) Officers and enlisted men of the army, navy, and marine corps on the active lists, and cadets at the military and naval academies; (2) officers and enlisted men of the same service on the retired lists; (3) officers of the revenue-cutter service and of the marine-hospital service; (4) honorably discharged soldiers and sailors of the regular and volunteer army and navy may be admitted by authority of the Surgeon-General when there are vacant beds. The general hospital at Fort Bayard, N. M., is set apart as a sanitarium for the treatment of officers and enlisted men of the army suffering from pulmonary tuberculosis. In the regular hospital service of the United States a limited number of women are employed as hospital matrons at posts and arsenals, and also as nurses in numbers fixed by the Surgeon-General, as described below.

Field hospitals are organized according to the needs and character of the campaign, the theatre of operations, climate, and season of the year—the primary object being to evacuate the front of sick and disabled troops without interfering with the mobility of the combatants. In connection with field hospitals there is always present the transport difficulty, consequently every effort is made to lighten the total weight of equipment carried. Bearer and ambulance companies and field hospitals are essentially mobile units—their equipment usually consisting of a few small tents without beds. In the British-Boer War of 1899 the English field hospital weighed about eight tons, accommodated 100 patients, and could be pitched or struck and packed on wagons in an hour's time. Stationary hospitals are usually rest camps on long lines of communication. *General hospitals* are places to which all sick and wounded are ultimately sent; where all important surgical and medical treatment, not imperatively urgent, is carried out; and where it is determined whether the patient shall be returned to civil life or active service. In every army special corps of men are enlisted and trained during time of peace; the field-hospital section during the great annual army manoeuvres of Europe receiving very practical instruction. While all civilized countries are quick to avail themselves of needed improvements, France is usually in the lead.

HOSPITAL TRAINS. Modern wars of Continental Europe have developed a phase of hospital service peculiar to themselves and known as hospital trains, of which there are three distinct types—permanent, improvised, and ordinary. The first named will serve as an illustration. They are constructed so as to contain kitchen, storeroom, and compartments for the sick, who are invariably lying-down patients, demanding constant attention. There is through communication from the front to rear. In Germany they are known as *Lazaret-Züge*, and consist of 41 carriages, with an average total capacity of 300 patients; the *Trains-Sanitaires-Permanents* of the French have 23 coaches, with a capacity of 128; the Austrian *Eisenbahn Sanitäts-Züge*, 19 carriages and 104 sick-berths; and the Italian *Treni Ospedali*, ranging from 19 to 24 carriages, with accommodations for about 200. There are also

similar trains belonging to the Société Française, and the Austro-Hungarian Knights of Malta. Hospital trains are conspicuously marked with the badge of the Geneva Society, but are so arranged internally that distinctions of rank and caste are rigorously maintained in the accommodations set apart for sufferers, utterly regardless of the necessities or circumstances of the case.

THE ARMY NURSE CORPS is an auxiliary branch of the medical department. In accordance with an army bill passed February 2, 1901, it was ordered that army nurses should be assigned to duty at military hospitals, and at hospitals where more than one nurse is serving one will be assigned to duty as chief. They are appointed for three years, two years of which period must be served without the limit of the United States. The pay and allowance of a nurse on active service is \$40 per month, when on duty in the United States and abroad. Chief nurses receive \$5 extra, except where there are five or more nurses under them, when they receive \$10 extra, and \$25 extra when they have charge of ten or more subordinates. Nurses are retired on reaching the age of forty-five years, or if they cease for five years to practice their profession, or if they become permanently incapacitated, from illness or other good or sufficient reason. The uniform of the corps consists of a waist and skirt of suitable white material, adjustable white cuffs, bishop collar, white apron, and cap. The badge of the corps is the cross of the medical department and hospital corps, in green enamel with gilt edge, pinned on the left side of the collar of the uniform, or on a corresponding part of the nurse's dress when she is not in uniform. See **MEDICAL DEPARTMENT**; and **SURGEON, MILITARY**.

HOSPITAL CORPS, UNITED STATES. In the United States recruits are enlisted for the Hospital Corps, and permanently attached to the Medical Department; and in time of war perform the necessary ambulance service under such officers of the Medical Department and assistants as may be detailed for that duty. They are not required to perform any military duties other than those pertaining to their corps; receiving instruction in such drills, both foot and mounted, as are necessary for their efficiency. Their equipment consists of canteen complete, waist-belt and plate, one-half shelter tent complete, and in the case of privates, pouch and litter-sling. At every permanent military post there is at least one non-commissioned officer of the Hospital Corps, and an additional one for every additional four privates of the corps. Special instructions in the duties of litter-bearer and the methods of rendering first aid to the sick and wounded are given to all enlisted men of the line of the army by their company officers, for at least four hours in each month, except in the case of the sea-coast artillery, which is limited to one hour per month, post surgeons under the direction of post commanders being responsible for the professional instruction of the company officers.

In field service troops are accompanied by detachments of the Hospital Corps, each medical officer, on the march, being attended by a mounted private of the hospital corps. Members are not permitted to carry arms except under circumstances where their rights as non-combatants, under the Geneva Convention, are not likely to be recognized.

HOSPITALERS (OF. *hospitalier*, from ML. *hospitalarius*, from *hospitale*, hospital, inn, from Lat. *hospitalis*, relating to a guest, from *hospes*, guest). Charitable brotherhoods, founded at various times and in different countries, for the care of the sick in hospitals. The vow to devote one's self to this work of mercy is usually superadded to the ordinary vows of poverty, chastity, and obedience, commanded by Saint Augustine. One of the earliest recorded instances of such a brotherhood is the Order of Madonna della Scala, in Italy in the ninth century. The Knights of Saint John of Jerusalem (q.v.), as also the Teutonic Knights (q.v.), were originally hospitalers. There are many other local institutes or congregations having various names and living under various rules.

HOSPITAL SHIP. A ship designed to take care of the sick and wounded either as a floating hospital or as a transport hospital. The second Geneva Convention in 1868 provided that hospital ships, merchantmen (i.e. unarmed ships not used for any military or naval purpose), having wounded on board, and boats picking up wounded or wrecked men, shall be neutral. They are required to fly the red cross flag and their men must wear the red cross armet. Government hospital ships are required to be painted white with a broad longitudinal green stripe on each side extending from bow to stern; hospital ships belonging to aid societies to be similarly painted, but the stripe is to be red. Both varieties of ships must fly the red cross flag as well as their national ensign, and no arms of any sort are to be allowed on board. Any evidence amounting to presumption that the enemy is violating the rules of the convention and using the ships for improper purposes constitutes sufficient ground for refusing the further granting of immunity until the contrary is proved.

HOSPITAL SUNDAY. In the United States, the last Sunday of December; in England, the Sunday nearest June 15th, on which days the collections in the churches are devoted to the support of hospitals. The custom has been generally adopted since 1873.

HOSPODAR (Upper Sorbian, master, lord). A title formerly given to the governors of Moldavia and Wallachia. Hospodar (*gospodar*, *gospod*, *gospodin*, in the various Slav languages) means simply 'master.' The hospodar held his power at the pleasure of the Sultan, who made a practice of farming out the office to the highest bidder. The incumbent held his office for a short period, or else secured reappointment by repeated gifts. The Lithuanian princes were likewise called hospodars, and the Polish kings, down to the time of Sobieski, assumed that title in their diplomatic negotiations with Russia. *Gosudar* (ruler, monarch) is even now one of the titles of the Emperor of Russia.

HOST. See MASS; LORD'S SUPPER.

HOSTAGE (OF. *hostage*, *ostage*, Fr. *ôtage*, It. *ostaggio*, from Lat. *obsidatus*, state of being a hostage, from *obses*, OLat. *opses*, hostage, from *obsidere*, to remain, from *ob*, at + *sidere*, to sit; influenced in popular etymology by Lat. *hostis*). A person or thing given in pledge for the performance of conditions. When a town capitulates, victors and vanquished usually give into the custody, one of the other, several officers, as

pledges that each party will duly carry out the terms stipulated. When the terms are fulfilled the hostages are exchanged; but if the terms be evaded the opposite side holds the right to put to death or otherwise punish the hostages in its possession.

HOSTILIUS, TULLUS. A semi-legendary King of Rome, grandson of Hostus Hostilius, the champion of Rome in the first war with the Sabines; he succeeded Numa Pompilius on the throne of Rome, B.C. 670 (according to the common chronology). According to Livy and other writers, Hostilius made the famous arrangement, by the combat of the Horatii with the Curiatii, for the decision of the question of supremacy between Rome and Alba, which was decided in favor of the former; he fought against Fidenæ and Veii, and conquered these cities, destroyed Alba, and removed the inhabitants to Rome, settling them on Mons Cælius, and carried on war against the Sabines. He is said to have reigned to about B.C. 638. The story of the earlier Kings of Rome is mere legend, but doubtless contains some germs of truth, though the personality and name of Tullus Hostilius are not to be credited.

HOS'TIUS. A Roman poet of the second century B.C., author of metrical annals after the manner of Ennius, and *Bellum Histricum*, a poem on the Istrian War. Fragments of the latter work, quoted by Macrobius (v. i. 3, 5) and Servius (ad *Æn.* xii. 121), are printed in Baehrens, *Fragmenta Poetarum Romanorum* (1886). Some authorities think he is the original of the *doctus avus* of Propertius (iv. 20, 8).

HOSTRUP, hös'trup, JENS CHRISTIAN (1818-92). A Danish poet and dramatist, born at Copenhagen. His first comedy, *Gjenboerne* (1843, published in 1847), was acted by his fellow students before he left the university. It was played afterwards at the Royal Theatre, and remains a favorite piece. Among his other plays, composed under the pseudonym of Krstrup, are *Intrigerne* (1846); *En Spuro i Tranedans* (1850); *Eventyrpaa Fodreisen* (1850); *Soldaterløjer* (1849); *En Vat Mellem Fjeldene* (1852, music by Emil Hartmann), and *Mester og Lørling* (1852). From 1855, when he took orders, to 1881, he had charge of a parish. A volume of his poems, *Sange og Digte*, appeared in 1884, and his drama, *Eva*, in 1881. After this he wrote little but what was demanded by his parochial work. The last years of his life were spent at Copenhagen. His popularity is largely due to the national character of his plays, his humor without vulgarity, and the vivacity of his dialogue. His poetical writings were collected in six volumes (1852-56), and a fifth edition of his comedies was published in 1888-89.

HOT-AIR ENGINE. See CALORIC ENGINE.

HOTBED. A bed of fermenting compost or manure covered with a layer of earth, and generally surmounted by a frame, for the cultivation of plants which require more than the natural heat of the climate or season, but not so much as to render the hothouse necessary. The heat is the result of fermentation. Hotbeds are in very general use for growing plants from seed in spring, to be planted in the open ground as summer advances, and for forcing vegetables and flowers. The material mostly used is horse

manure, either alone or mixed with litter; but tan-bark, leaves, the waste of flax, cotton, or woolen factories, etc., are sometimes substituted for it. It is necessary that the heat of very rapid fermentation be expended before the hotbed is planted; and it is usual, on this account, to prepare the materials some days in advance of planting. A hotbed is made highest at the back, sloping toward the south. The bed extends on all sides 12 inches or more beyond the frame, according to the temperature of the outside air. The frame has a movable glass sash or sashes, according to its size, or is covered with cloth. The thickness of the hotbed, and of the earth upon it, is accommodated to the purpose intended and the degree of heat required. When the heat decreases it is for some purposes necessary to keep it up by 'linings' of the same material as the hotbed, added to the sides of it. The sashes of hotbeds must be partially removed during the day to permit ventilation and the escape of vapor.

HOTCH-KISS, BENJAMIN BERKELY (1826-85). An American inventor, born in Watertown, Conn., of humble parentage. He was at an early age employed in a gun-factory, where he came into contact with Samuel Colt (q.v.), in the manufacture of revolvers. During the Civil War he was engaged in the manufacture of ordnance in New York, and later invented the Hotchkiss magazine gun, used by the United States troops in the West and the United States Marine Corps. This was followed in 1882 by the Hotchkiss machine gun, for use in the fighting tops of war-vessels. He was also the inventor of several important improvements in projectiles and heavy ordnance. His guns were in general use throughout the armies and navies of the world until displaced in the more advanced nations by later inventions. His death occurred in Paris, where in 1870 he established a gun-factory, a branch of which he was organizing in England at the time of his death. See MACHINE GUN and RAPID-FIRING GUN.

HOTCHKISS GUN. See MOUNTAIN GUN; MACHINE GUN; RAPID-FIRING GUN; ORDNANCE.

HOTCHPOT (OF. *hochepot*, from ODutch *huts*pot, chopped beef or mutton boiled in a pot, from *hutsen*, *hotsen*, to shake + *pot*, AS. *pott*, from Ir. *pota*, *puite*, Welsh *pot*, Bret. *pōd*, pot; connected with Lat. *potare*, Skt. *pā*, to drink, Gk. *πρός*, *potos*, drunk). The mixing and blending together of advancements made to children during a parent's life and of property left at his death, in order that the whole may be equally divided among all the children. According to Blackstone the doctrine came into English jurisprudence from the law of the Lombards, but the term is explained by him in the language of Littleton, as follows: "Hotchpot is in English a pudding; for in a pudding is not commonly put one thing alone, but one thing with other things together." By this housewifely metaphor, adds Blackstone, our ancestors meant to inform us that the lands which had been given to one or more daughters in frank marriage, as well as the lands descending in fee simple, should be mixed and blended together and then divided among all the daughters. After estates in frank marriage fell into disuse the principle of the law of hotchpot was revived and applied by the statute of distributions (22 and 23 Car. II., ch. 10). The provisions of this statute have been reënacted by the Legislatures of our States with

some shades of difference, and on the basis of the rules as to hotchpot throughout this country. The great object of these rules is to produce equality among the children of a deceased person. Property which has been turned over to a child as an advancement, instead of a pure gift, is to be brought into hotchpot as a condition of his taking a child's share in the parent's estate. It is not necessary that he actually bring and surrender the very chattel or other form of property advanced to him. It is enough that its fair value be accounted for and added to the decedent's estate. In arriving at this value its worth is to be estimated at the death of the parent, relation being had to its situation at the time of advancement. Accordingly, where a slave boy, twelve years old, was given to a child as an advancement, the child was chargeable with the fair value of such a boy at the father's death; not the value of the particular slave who was then an adult. So the profits of an advancement, or the enhanced value due to improvements, are not to be accounted for. Consult the *Commentaries* of Blackstone and Kent.

HOTEL (Fr. *hôtel*, OF. *hostel*, from ML. *hospitale*, large house, palace, inn). The origin of the modern hotel, especially in the United States, dates from the introduction of the railroad. Its advent transformed the small road-house, which was planned for occasional guests, into the more pretentious hotel. Again, about 1888, came another revolution in hotel-building, and the modern fireproof structures began to replace their poorly planned prototypes. Still later, the idea of specialization, that is, of providing particularly for a certain class in the community, began to gain ground. In the United States there are three general kinds of hotels: (1) Those which are run on the American plan; (2) those using the European plan; and (3) those combining both systems. The European plan, on which practically all the great hotels of Europe are run, consists in paying a certain daily rate for a room, and then paying separately for whatever food is ordered. By the American plan the guest pays a certain amount a day for both room and meals. The difference between an American hotel which is run on the European plan and the Continental hotel, is that in the former the various minor items, such as light and service, are included in the price of the room; while on the Continent these items are often charged for separately. One of the most characteristic establishments of Europe is the road-house, which is found throughout the Continent, but especially in France, Germany, and Austria. It is, as a rule, marked by simplicity and comfort and is preferred by many to the more elaborate hotel. Indeed, the small hotel in Europe is a model of its kind, and its cuisine is generally superior to that of second-class hotels in this country. The large first-class hotels of the United States are, however, unexcelled. The following description applies to the modern hotel.

By far the greater part of the space in a hotel is occupied with private rooms for guests, but the central feature of the design of a modern hotel is the great office and lobby, which is the common place for arrival and departure, and for meeting people from both without and within the building. A large and generally imposing entrance and vestibule lead to the office

or lobby, which frequently occupies an inclosed central court, two or three stories in height. The lobby generally contains not only the public office of the hotel, but also news and cigar stands, a telegraph office, and telephone booths; or, if these are not in, they are adjacent to and connect with the lobby. Reading, writing, and smoking rooms also adjoin the lobby, and there may be a parlor or reception-room near at hand. The hotel parlors are more generally on an upper floor, commonly on the second. Both public and private parlors are usually provided. Another marked feature of a hotel is its dining-room. Here the object is to get a large, unobstructed floor-space, with plenty of natural light, where possible, and at the same time to have the room only second in general accessibility to the lobby or office. Smaller public dining-rooms, frequently called breakfast-rooms, are generally provided, and also a gentlemen's café, besides which there are private dining-rooms in proportion to the size and general character of the hotel. A conspicuous feature of hotels in this country is the bar, which is likely to be near, if not connected with, the café. The bar is often on the office floor, but where this floor is well above the street level the bar and café, together with barber-shops, lavatories, and, perhaps, the public baths, are in the basement. The hotel kitchen must be either near or in speedy communication with the dining-room. It may be on a different floor, if dumb-waiters are provided. Where there are numerous dining-rooms, public and private, several kitchens are a practical necessity.

Spacious stairways almost invariably lead from the office or lobby to the parlor or dining-room, although the universal use of elevators has lessened their importance. An impressive feature of some of the finest hotels is a gallery above and around the lobby, giving access to whatever public rooms may be located on the second floor. The elevators should be conveniently arranged so as to give quick access to private dining-rooms, ballrooms, and parlors; and there should be separate elevators for servants and freight. The guests' rooms, if any, on the second floor of large hotels, are generally in suites (bedroom, parlor, and bathroom), but similar suites may, of course, be distributed on the other floors. Above the second floor the building commonly assumes, at least in city hotels, the form of a hollow square, or rectangle. The guests' rooms are arranged along corridors, the outer ones fronting on the street, the inner ones on the court. Even third or fourth rate hotels of the present day rarely offer guests a room which does not have an ample window opening into the outer air. Fire-escapes must be provided on each floor, and red lights are placed near them and at the heads of staircases to mark their location. Besides the various rooms, public and private, already mentioned, baggage and storage rooms, ballrooms, halls for concerts, conventions, and other assemblies, music-rooms, and sometimes roof gardens, are, some or all, found in the best hotels.

Mountain and seaside resorts call for various modifications in design, including many spacious verandas and balconies, sun-parlors for winter use, and other features suited to the changed conditions of a hotel life where recreation and social amusements, or perhaps the search for

health, are the main objects. The constructional features of hotels are not sufficiently different in the material employed and the way in which it is put together to require separate treatment.

The governing principle in the design of a hotel should be to make it as safe, convenient, comfortable, and generally attractive as possible. Unfortunately, the order of these requirements sometimes is reversed; or, at least, inadequate attention is given to the safety of the guests. Safety is used broadly here, to include all that goes to make the building structurally sound, to reduce dangers from fire, and to conduce to good sanitation. Fireproof construction (q.v.) should be employed as far as possible, and there should be adequate fire-escapes and fire-protection facilities. The latter, at least in all large hotels, include apparatus in the way of fire-pumps, stand-pipes, hose, chemical extinguishers, and the like. A plentiful supply of water is, of course, essential. This necessity frequently entails an independent pumping plant, and always requires an extensive system of piping for both hot and cold water. To meet the demands for purity in drinking-water, it is frequently advisable to install a filter plant in the basement of the hotel, or, where possible, to sink deep artesian wells. Spring waters are often supplied at table.

Both public and private baths are required. The latter should be in separate rooms with independent air and light. Private water-closets generally accompany private baths. The public lavatories and water-closets, both as regards spaciousness and good sanitation, may be taken as a fair index of the rank of most hotels. In general, all plumbing should be of the simplest possible design and should be readily accessible for inspection and repairs. In the choice of floors and floor-coverings, wall finish and decorations, window and other hangings, it should never be forgotten that frequent and thorough cleansing is imperative, and that everything that creates or serves as a lodging-place for dust, or that cannot be thoroughly disinfected, is a menace to health. Ventilation is most important and, together with heating, its arrangement should be intrusted to a heating and ventilation engineer. In the best hotels in the colder sections of America, the buildings are heated with steam or hot water throughout, supplemented, in some instances, by open fireplaces. Well-equipped laundries, with drying closets, are becoming more and more common even in smaller hotels. Either gas or electric lights, and frequently both, are provided in most hotels.

Whatever the rank of a hotel, some means is provided for making known wants without leaving one's room. The most common method is a simple push-button electrically connected with an annunciator in the hotel office. In some hotels elaborate signal systems are provided so that by moving a pointer over a dial in one's room any want may be made known in the office. Such cumbersome devices, however, bid fair to be superseded by the house telephone system, with a telephone in every room.

The management of modern hotels presents a difficult executive problem. The number of employees (which varies according to the hotel, but which is always over 50 per cent. of the guests), the constantly shifting crowd of guests, the numberless mechanical details, and the large amount of provisions and supplies which is necessary, all

complicate the problem. Under the manager, and directly responsible to him, are a steward and a chef. The former has charge of the supplies and general supervision over the housekeeper, storekeeper, head laundress (and their subordinates), and over the clerks of the accounting department and the plumbers, carpenters, and upholsterers. The steward also generally buys the necessary provisions and supplies. Most of the provisions are ordered fresh every day, though usually the larder is stocked with a supply sufficient for two days, while the supply of dry stuff on hand is sufficient for a week. The chef has absolute charge of the kitchen and its staff. The steward makes his purchases according to lists furnished him by the chef, who oversees all details in connection with the cuisine. A head waiter superintends the dining-rooms and arranges for private dinners and suppers. For the history of the early hotel, see INN.

HOTEL (in law). See INN; INNKEEPER.

HÔTEL DE CLUNY, ô'têl' de klû'né'. See CLUNY, HÔTEL DE.

HÔTEL DE RAMBOUILLET, de rân'-bô'yá'. See RAMBOUILLET, HÔTEL DE.

HÔTEL DES INVALIDES, dô zân'vá'léd'. See INVALIDES.

HÔTEL DE VILLE, de vêl. The city hall of Paris. The seat of the municipal government was originally on the left bank of the Seine, whence it was transferred to a position near the Châtelet on the right bank in the thirteenth century, and in 1357 was established in a building on the Place de Grève, now the Place de l'Hôtel de Ville. Under Francis I. the building had been outgrown, and a new edifice was begun, which was completed under Henry IV. It was totally destroyed by the Communists in 1871, with the loss of 600 of their companions who were unable to escape from the building, and was rebuilt between 1873 and 1883. The new building is a fine Renaissance structure, with an imposing façade enriched with allegorical groups and single statues typifying the principal French cities. The interior is richly ornamented with sculpture and paintings by great French artists, and contains a fine grand staircase and a large decorated hall. Generically, the name is applied by the French to any town hall.

HÔTEL DIEU, dyê. One of the oldest hospitals in Europe and the most important in Paris, said to have been founded in 660. It formerly stood on the south side of the Ile de la Cité, and was connected with an annex on the right bank of the Seine. In 1772 the hospital was destroyed and subsequently rebuilt on the same spot. The institution was transferred in 1868 to its present position on the north side of the island, near Notre Dame. It contains 559 beds, and three medical professorships are attached to it.

HOTHO, hō'tó, HEINRICH GUSTAV (1802-73). A German art historian, born in Berlin. He studied at the university of his native city, in 1829 became one of its professors, and the next year was appointed assistant director of the gallery of paintings in the Royal Museum. He was well known as a disciple of Hegel, for the complete edition of whose works he elaborated the *Vorlesungen über Aesthetik* (3 vols., 2d ed. 1842-43). In addition he published *Geschichte der deutschen und niederländischen Malerei* (1842-

43); *Die Malerschule Huberts van Eyck* (2 vols., 1855-58); *Die Meisterwerke der Malerei vom Ende des 3. bis Anfang des 18. Jahrh. in photolithographischen Nachbildungen* (1865); and an unfinished work entitled *Geschichte der christlichen Malerei* (1867-72).

HOTHOUSE. A building intended for the cultivation of exotic plants which require a higher temperature than that of the open air. The term is more generally applied to those buildings in which artificial heat is used. It includes such terms as 'stove,' 'bark stove,' etc., in the former of which the heat was derived from fires, and in the latter by fermenting tan-bark, which not only produced heat, but kept the air moist. See GREENHOUSE.

HOTMAN, ô't'mân', or **HOTMAN'NUS**, FRANÇOIS (1524-90). A French jurist and author, born in Paris. He received the degree of doctor at Orleans, and afterwards, though but twenty-two years old, gave lectures on Roman law at the University of Paris. At this time he became a convert to the reformed religion, and was forced to take refuge in Geneva. On the recommendation of Calvin, he was made professor of belles-lettres at Lausanne in 1549. Afterwards he went to Strassburg as professor of civil law; then to Valence (1562) and Bourges (1567). For a short time he returned to Paris, but the massacre of Saint Bartholomew sent him back to Geneva. His last years were spent at Basel. Hotman's books had a great influence on the time, and wrought a reformation in the study and teaching of law. His two most important works are *L'Anti-tribonian, ou discours sur l'étude des lois* (1567), and *Franco-Gallia* (1573), often reprinted with changes of matter and titles.

HOT SPRINGS. A city and the county-seat of Garland County, Ark., 50 miles west by south of Little Rock; on the Choctaw, Oklahoma and Gulf, and the Saint Louis, Iron Mountain and Southern railroads (Map: Arkansas, C 3). It is one of the most beautiful towns in the United States, and is widely noted for the hot waters that flow from 72 springs, included in a space of 10 acres on the west side of Hot Springs Mountain. The waters of these springs range in temperature from 76° to 157° Fahr., and are beneficial in a multitude of diseases. In 1832 four sections of land, the thermal springs being in the centre of the district, were set off by Congress as a Government reservation. Since then the Government has established on the mountain the Army and Navy General Hospital, and expended large sums in improving and developing the reservation. The Government bath-houses, extending along Central Avenue, are tasteful in design, and have attractive surroundings. There are many hotels here, the Eastman, the Arlington, and the Park ranking among the largest in the country; and the city is one of the most popular resorts in America, having annually 100,000 visitors. Settled about 1804, Hot Springs was incorporated as a town in 1876, and was chartered as a city of the first class in 1879. The government is administered by a mayor, elected every two years, and a municipal council, of which the executive is a member. Population, in 1890, 8086; in 1900, 9973.

HOT SPRINGS. A town in Madison County, N. C., 38 miles northwest of Asheville; on the

French Broad River, and on the Southern Railway (Map: North Carolina, B 4). It has a fine site at an elevation of over 1300 feet, in a picturesque valley inclosed by high mountains, and is a noted health resort because of the medicinal value of its hot mineral waters. Dorland Institute, a mission boarding-school for mountaineers, was established here in 1894. The principal industries are lumbering and mining. Population, in 1890, 695; in 1900, 445.

HOT SPRINGS. A city and the county-seat of Fall River County, S. D., 106 miles south of Deadwood; on Fall River, and on the Burlington and Missouri River and the Fremont, Elkhorn and Missouri Valley railroads (Map: South Dakota, B 6). It is noted for its thermal and medicinal springs, and is the seat of the State Soldiers' Home and of Black Hills College (Methodist Episcopal), opened in 1890. The city is the commercial centre for important mining, live stock, and lumber interests, and has a good water-power and manufactures of stucco. Population, in 1890, 1423; in 1900, 1319.

HOTSPUR. A name given to Henry Percy (q.v.).

HOTTENTOT FIGS. See ICE-PLANT.

HOTTENTOTS (*Khoi-Khoïn*, Men of Men). A dwarf race in Namaland, South Africa (census of 1891, 50,388). Their domain is said to extend from Orange River to Walfisch Bay and far into the Damara upland. A study of their somatology shows them to have the following characteristics: Cranial capacity, 1290; cephalic index, 74.3. Their skin is yellow, brown, or gray, not black; the hair is long and woolly; the cheek-bones are prominent; eyes are dark chestnut or black, wide apart; the nose is very broad and flat, nostrils thick; the mouth is large, with heavy, upturning lips, and enormous prognathism, chin pointed, and receding jaw. They have little beard, and no hair on the body. The ears are large, without lobules. (See Colored Plate of AFRICA, DARK RACES OF.) *Steatopygia* is common. There are three divisions of them, the Hottentots proper, the mongrel Griquas of Griqualand West, and the Koranas on the Orange, Vaal, and Modder rivers. They, or the Bushmen, their kindred, and not the negroes of the family of Bantu, are doubtless the aborigines of the country, but between the persecutions of the spreading Bantu tribes and later the occupation of the lowlands by Dutch and English settlers, most of them have been driven into the mountains and waste places, and they are slowly dying out. They live in low, oval, dome-shaped huts, made by setting rough poles in the ground, bending them down and tying them together. Over all is a thatch or layer of mats woven by the women. In the centre of each hut is the fire-pit where meat is roasted, and around the sides are holes in which they sleep. They wear little costume beyond a cloak of skin, but smear their bodies lavishly with fat and soot. At the time of the advent of the Europeans their wealth consisted largely in cattle. Their chief weapons were bows and poisoned arrows. In their villages the huts were arranged in a circle, forming what is known as a kraal. A portion of the Hottentots shared the fortunes and stood the oppressions of the settlers, and their descendants form a mixed race, many of whom are prosperous in flocks and herds.

Hottentot men do little work besides helping to

tend cattle and occasionally hunting and fishing. Some pursue the trades of smith or armorer, tailor or tanner. The women make cords, mats, and pottery, cook, tend cattle, and perform most of the labor.

Trade is carried on by barter in cattle, and oxen are used for bearing burdens. Little beef is eaten, and meat is procured by hunting, milk being the chief food; from their environment the Hottentots secure many roots and fruits, which supply the vegetable element in their diet. Cooking of meat is by roasting or seething in a skin bag by means of hot stones. They make an intoxicating mead and chew a narcotic root.

Puberty, marriage, and funeral feasts are held. Their amusements are mock fights, games accompanied with music, drinking, and smoking. Family affection seems strong, and they are friendly, liberal, and hospitable among themselves.

Their yellow skin has been an enigma to anthropologists, and the discovery of similarities in grammar, together with the existence of words representing abstractions of a high order, strengthened the theory that the Bushmen Hottentots had separated from the Caucasian kindred in the north in prehistoric times, settling the southern portion of the continent, where they were pressed upon later by the black Bantu tribes. More probably they are an isolated race, like the Australians. The theory that they are lost Hamites is weakened by the fact that their language has elements resembling those of other races. The clicks in the vocal sounds, resembling the smacking of the mouth in clucking, etc., are made by pressing the tongue against the teeth, the palate, the sides of the upper jaw, or doubling it backward and then producing an explosive noise. These clicks usually occur at the beginning of words, and while each one is not difficult to imitate, the European is quite unable to follow them up with the vocal sounds that make up the word. The name Hottentot is an effort of the Dutch to imitate the dental clicks pronounced like the expression of surprise, tut! tut! with an inhalation.

The unit of government among the Hottentots was the kraal, with its subchief, who, with the leading men, had jurisdiction even to the extent of the death penalty. The tribes were ruled by hereditary chiefs, who were greatly revered and received their pay in kind, being entitled to a share of whatever was killed or produced. Descent was in the female line for sons, and initiation into the tribe was with ceremonial scarification of the body. Their instruments of music were the gorah, or musical bow, a rude fiddle, *v'gutha*, an imitation of European violin, a *tomo*, a bow rubbed with another bow, and a single-head drum.

The religious belief of the Hottentots was in keeping with their social scale and organization. They held to the existence of the soul after death. The ruler of all things is a deified patriarch, Heitsi-Eibib, or a Great Captain, *Tsu-goab*, who was formerly one of their mighty chiefs, and came from the East. Hence all Hottentots' graves are oriented, and when they pass a cemetery they leave stones on the spot to express good will and ask a blessing. The existence of this practice in former times enables the student to follow the trail of the Hottentot in his wanderings. The cult of these people is obscure. It has been stated that they had no temples or places of

united worship, no altars on which offerings or sacrifices were laid, and no class with priestly function, yet medicine men, witch doctors, or sorcerers, were common among them, called in to heal the sick by magic. An immense folklore is based on the primitive conceptions of ghosts, charms, signs, offerings, luck, and causation by spirit influences that cram the air.

Accounts of the Hottentots are to be found in the narrative of Francisco de Almeida (1509); also in the records of the Dutch East India Company from 1652, and of the British occupation after 1795. Consult also: P. Kolben, *Present State of the Cape of Good Hope* (London, 1731-38); A. Sparman, *Voyage to the Cape of Good Hope* (Perth, 1786); Sir John Barrow, *Travels into the Interior of South Africa* (London, 1801); Emil Holub, *Seven Years in South Africa* (Eng. trans., Boston, 1881).

HOTTENTOT'S BREAD (*Testudinaria Elephantipes*). A species of the order Dioscoreaceæ, indigenous to South Africa. Its slender, many-branched, vine-like stems, which die down during the dry season, grow to a height of 30 to 40 feet, and bear bright, heart-shaped leaves. The hemispherical or nearly globular rootstock, sometimes three feet in diameter, protrudes conspicuously above ground, and is covered with a brown, cork-like substance with many-sided protuberances separated by deep cracks and fissures. Both the scientific name and one of the common names, elephant's foot, have been derived from fancied resemblances to the foot of an elephant. It is sometimes called tortoise-plant. The fleshy interior affords food to baboons and other animals, but it is said that the natives do not eat it. The rootstalks are exported apparently dead, but when placed in the ground they soon throw out rootlets and stems grow rapidly from the upper surface. The plant is cultivated as a greenhouse curiosity.

HOTTINGER, hôt'ting-ēr, JOHANN HEINRICH (1620-67). A Swiss Orientalist and biblical scholar. He was born at Zürich. After studying at Geneva, Groningen, and Leyden, he became professor of church history in Zürich, where he remained until 1655, holding successively the chairs of theology and Oriental languages, and rhetoric and logic. In 1655 he became professor of Oriental languages at Heidelberg. In 1661 he returned to Zürich to take charge of a German translation of the Bible; and in 1662 he was elected rector of the University in Zürich, which title he kept for life. In 1667 he was called to Leyden, but was drowned at Zürich by the capsizing of his boat while on a pleasure excursion before leaving for his new work. Hottinger was a prolific writer on Oriental subjects. The most important of his works are the following: *The-saurus Philologicus seu Clavis Scripturæ* (1649); *Historia Ecclesiastica* (1651-67); and the *Etymologicon Orientale, sive Lexicon Harmonicum Heptaglotton* (1661).

HOTTINGER, JOHANN JAKOB (1783-1860). A Swiss historian and educator. He was born at Zürich, studied there and at Leipzig, and, returning to his birthplace, taught history in the girls' academy, in the art school, and in the university (1833). As a member of the council on education, Hottinger was prominent in the introduction of reform measures. He edited the *Archiv für schweizerische Geschichte und Landes-*

kunde (1827-29) and the *Schweizerisches Museum für historische Wissenschaften* (1837-39); and wrote: *Geschichte der Eidgenossen während der Zeiten der Schweiz. Kirchentrennung* (1825-27); *Huldreich Zwingli* (1841); *Geschichte des Untergangs der Eidgenossenschaft der 13 Orte* (1844); and *Hans Konrad Escher von der Linth* (1852).

HOUARIOS, hō-ā'rê-ōz. Small coasting vessels and pleasure-boats used in parts of the Mediterranean. They bear lateen sails, and have each two masts and a bowsprit.

HOUBARA, hō-bā'rā. See BUSTARD.

HOUBRAKEN, hou'brā'ken. A Dutch family of artists. ARNOLD (1660-1719) was born at Dordrecht, and studied under Samuel van Hoogstraeten. In 1713 he visited England. He painted a number of historical pictures and figure subjects, none of great value, and wrote a biography of Dutch painters, *Groote schoubourgh der nederlandsche konstschilders en schildersessen* (1718), which is not reliable.—His brother and pupil, JACOBUS (1698-1780), a well-known engraver, was also born at Dordrecht. His first work was a series of portraits for his brother's book. He did a hundred plates for *The Heads of Illustrious Persons of Great Britain* (1743-52), by T. Birchs. His individual portraits are said to number four hundred, but his best work is a series of scenes after C. Troost. After Houbraaken's death engraving in the Netherlands became almost a lost art.

HOUDAN, hōō'dān. A breed of domestic fowls, in the French class with the crevecœur and la fleche. They are widely bred in the United States, and are hardy and profitable. These fowls are of medium size, mottled black and white in color, with black wing-bars and primaries, and a heavy crest divided in the middle of the crown in the cock, but falling backward in the hen. They have five toes, like Dorkings. A hen should weigh 6 pounds; a cock 7. The other breeds mentioned are highly esteemed in France, but little known in America.

HOUDETOT, hōō'd-tō', ELISABETH FRANÇOISE SOTHE DE LA LIVE DE BELLEGRADE, Countess d' (c.1730-1813). The mistress of Rousseau and also of Saint-Lambert. She was the wife of a French general and the sister-in-law of Madame d'Epinay. Rousseau mentions her in his *Confessions*, and attributes to her influence much of his poetical inspiration. Their love is partly represented in *La nouvelle Héloïse*. Her face was plain and slightly scarred with smallpox; but she possessed a brilliant wit and a sunny disposition.

HOUDIN, hōō'dān', ROBERT (1805-71). A French conjurer and mechanic. His apprenticeship to the watch-making trade schooled his fingers in the manipulation of intricate machinery, and his hatred of shams led him to apply his mechanical knowledge to the unveiling of the conjuring tricks of his time, especially those which appealed to the religious side of human nature. By producing more wonderful illusions, with the credit given to natural causes, than those which his predecessors had attributed to supernatural, he completely revolutionized the art of magic, and was honored by medals in 1844 and 1855 for his mechanical toys and the practical value of some of his inventions. He was the author of an autobiography, *Robert Houdin*

(1857); *Confidences* (1859); *Les tricheries des Grecs dévoilées* (1861); *Secrets de la prestidigitacion et de la magie* (1868), which was reprinted ten years later as *Comment on devient sorcier*. This work and *Magie et physique amusante* (1877) were translated into English by Hoffmann.

HOUDON, ʰoʰdɔn', JEAN ANTOINE (1741-1828). One of the foremost French sculptors of the eighteenth century. He was born at Versailles, France, March 20, 1741, the son of a domestic attached to the house of De la Motte, a courtier. His first impulse toward art came from the splendid decorative sculpture of the park at Versailles, and as a boy of ten or twelve he haunted the ateliers of the Royal School of Sculpture. In the catalogue of the Salon of 1795 he calls himself a pupil of Slodtz, but he was really much more influenced by Pigalle and the younger Lemoyne. In 1761 Houdon won the Prix de Rome, but was not influenced greatly by the treasures of art in Rome. His personality was too healthy and powerful to follow the lead of any other master, and could only be satisfied by its own direct and intelligent interpretation of nature. His stay in Rome is marked by two characteristic and important productions: the superb "Ecorché," an anatomical model, which has served as a guide to all artists since his day, and the statue of Saint Bruno in the Church of Santa Maria degli Angeli in Rome—a work of very powerful characterization.

After ten years' stay in Rome Houdon returned to Paris, and soon became one of the foremost French sculptors; he was admitted to the Academy April 23, 1769. In 1785 he visited America in company with Benjamin Franklin, in order to make the statue of Washington which had been ordered by the Legislature of Virginia. He visited Washington at Mount Vernon, and the bronze statue which followed now adorns the capitol at Richmond. During the French Revolution Houdon was in danger before the Tribunal for executing a statue of Saint Scholastica, but succeeded in convincing the judges that his saint was in reality a statue of Philosophy. Houdon died July 16, 1828, in Paris.

Houdon was a perfectly trained and competent technician, producing easily and abundantly, with equal success both in marble and bronze. His knowledge of anatomy was marvelous, and he was a thorough naturalist who succeeded best in portraiture. His name is principally connected with a fine series of more than two hundred portrait busts, which form one of the chief monuments of French sculpture. Among these were those of Diderot (about 1769), Benjamin Franklin (1766), and of Gluck (1777); on the death of Rousseau in 1778 he made two busts in bronze and terra-cotta from a cast of his face. One of the most characteristic of his busts is that of Molière in the Théâtre Français, Paris. Among his statues are those of "Morpheus," in the Ecole des Beaux-Arts; "Diana the Huntress," the best of his nude female figures; and especially the portrait statue of Voltaire (1781), in the Théâtre Français, one of the finest in modern art.

HOUGH, hūf, GEORGE WASHINGTON (1836—). An American astronomer, born in Montgomery County, N. Y. He graduated at Union College in 1856, and three years afterwards was

appointed assistant astronomer at the Cincinnati Observatory. The next year he became astronomer and director of the Dudley Observatory in Albany, and in 1879 went West to become director of the Dearborn Observatory and professor of astronomy in Chicago University; but in 1887 he gave up the latter position to accept a similar one in the Northwestern University. He discovered more than 600 double stars, and invented a number of astronomical instruments. His chief publication is *Annals of the Dudley Observatory* (1866-71).

HOUGH, WALTER (1859—). An American ethnologist, born at Morgantown, W. Va. He was educated at Monongalia Academy, West Virginia Agricultural College, and the University of West Virginia. He entered the employ of the Smithsonian Institution in 1886, and soon became assistant curator of its ethnological department. In 1892 he went with the United States Commission to Madrid, and was made Knight of the Order of Isabella. He was a member of Dr. J. Walter Fewkes's expedition to Arizona (1896-97), and went to Mexico with Dr. J. W. Rose (1899). He became a corresponding member of the Anthropological Society of Paris in 1899, and two years later was chosen secretary of the Anthropological Society of Washington.

HOUGHTON, hō'ton. A village and the county-seat of Houghton County, Mich., 94 miles northwest of Marquette; on Portage Lake, near Lake Superior, with which it is connected by a canal, and on the Duluth, South Shore and Atlantic and the Copper Range railroads (Map: Michigan, E 1). It is the centre of a rich mineral district, copper being mined and exported in great quantities. The Michigan College of Mines, established here in 1885, occupies a fine building, which, with the high school and county courthouse and jail, is among the finest structures of the village. The water-works are owned by the municipality. Population, in 1890, 2062; in 1900, 3359.

HOUGHTON, GEORGE HENDRICK (1820-97). An American Episcopal clergyman. He was born in Deerfield, Mass.; graduated at New York University in 1842, and at the General Theological Seminary in 1845. In 1848 he organized, and until his death was rector of the Church of the Transfiguration, better known as 'The Little Church Around the Corner,' in New York City. The story which explains the origin of this name is that a certain actor having died, his friends requested one of the city pastors to conduct the funeral services. The latter refused, but advised them to try the 'little church around the corner.' Dr. Houghton was distinguished for his activity in benevolent work. At his death he was succeeded by his nephew, George Clarke Houghton.

HOUGHTON, HENRY OSCAR (1823-95). An American publisher, born at Sutton, Vt. He graduated in 1846 at the University of Vermont, and worked in Boston as compositor and newspaper reporter. In 1849 he entered the Cambridge firm of Messrs. Bolles & Houghton, and in 1852, upon Mr. Bolles's retirement, transferred the office to its present site, and established the well-known Riverside Press. In 1872 he was elected Mayor of Cambridge. In 1878, by acquiring control of the large list of the old firm of Messrs. Ticknor & Fields, the Houghton house secured exclusive publication rights for the works

of many leading American authors, such as Emerson, Longfellow, and Holmes. For many years *Webster's International Dictionary* has been printed by the Riverside Press.

HOUGHTON, hɑʹtən or houʹtən, RICHARD MONCKTON MILNES, Lord. See MILNES, RICHARD MONCKTON.

HOULTON. A town and the county-seat of Aroostook County, Maine, 140 miles northeast of Bangor; on the Bangor and Aroostook and the Canadian Pacific railroads (Map: Maine, H 3). It is surrounded by a farming and lumbering district, and has considerable commercial importance. There are a foundry and machine-shops, saw, planing, and molding mills, woolen-mills, starch-factories, a flour-mill, a butter-factory, and a large slaughter-house. The town has a public library and the Ricker Classical Institute. The government is administered by town meetings. Population, in 1890, 4015; in 1900, 4686.

HOUMA, hōʹmá. A town and the parish-seat of Terrebonne Parish, La., 70 miles southwest of New Orleans; on the Bayou Terrebonne, and on the Southern Pacific Railroad (Map: Louisiana, E 4). It has several oyster-packing establishments, a large moss-factory, manufactures of sugar, molasses, and lumber, and considerable trade in rice and grain. Population, in 1890, 1280; in 1900, 3212.

HOUND (AS. *hund*, OHG. *hunt*, Ger. *Hund*, Goth. *hunds*; connected with Lat. *canis*, Gk. *κῶν*, *κύν*, OIr. *cú*, Lith. *szù*, Skt. *śvan*, dog). Broadly, the term 'hound' distinguishes hunting-dogs, who follow their animal quarry by scent, from the greyhound group, who hunt by sight; and also from the field dogs (q.v.).

Hounds, then, comprise the bloodhound or sleuth-hound, as he is still called in Scotland, the buck or stag hound, the foxhound, the otter-hound, the harrier, the beagle, the basset, and the Great Dane. The origin of all the breeds of hounds is the Talbot, or old Southern hound (*Canis sagax* of Linnæus), of which probably no true example exists to-day, although a few were preserved well up into the nineteenth century. These dogs were remarkable for their great size and strength, the depth of the chest, length of ears, and the breadth of the head in the region covering the olfactory nerves; hence their capacity for tracing the 'sleuth,' 'slot,' or track. Before the Christian Era the bloodhound or sleuth-hound of Great Britain had become so celebrated for these qualities that, as we know on the authority of Grattius, they were imported into Gaul. Strabo, who flourished somewhat later, confirms this, and Oppian praises their powers of scent and their courage.

THE BLOODHOUND. This hound is the nearest to the original Talbot, and for centuries was the hound of the huntsman whose quarry had to be followed by scent. During many centuries he was the principal agent in Europe in bringing the bear, the boar, and the stag to bay; but swifter breeds were gradually evolved, and the bloodhound's occupation dwindled to that of employing his extraordinary capacity to maintain a trail, however crossed and faint, in tracking human poachers to their hiding-places. Had it not been for this need, the breed would in all probability have entirely disappeared, as, in fact, it nearly had, when in the middle of the nineteenth century a few enthusiasts took up

the breeding and restored the dog to his rightful position. The stories of carnage following the dog's overtaking man do not apply to the true bloodhound. When he has treed or fixed his man, he gives tongue and takes care that the pursued does not escape; but he will never lay hold viciously and maliciously. The bloodhound's practical use to-day is in tracking fugitives, refugees, and missing persons; and for this purpose packs of them are maintained by many public authorities. Their capacity to do this borders on the incredible; for, however the footsteps of the one sought for may be crossed by others, in country or street, the nose of this hound, once it has taken up the trail, will follow it. Running water is apparently the only medium that will baffle him. This sense is, of course, natural; but to develop it and bring the dog's use of it into subjection, and make it intelligently useful, the puppy has to be trained and his powers gradually extended and kept in practice.

The characteristics adopted as the standard by the American Bloodhound Club depict the modern dog. He should be from 25 to 27 inches high at the shoulder for dogs, and a little less for the other sex; in color, black and tan; the black, extending to the back, top of neck, and top of head, is, however, always more or less mixed with tan. The tan is a deep rich red; the coat should be short and hard on the body, but silky on the ears and top of head. The ears should be long enough to overlap each other when drawn down together in front of the dog's nose. The eyes should be hazel, deeply sunk, and with triangular lids, showing the third eyelid or 'haw.' The head should be large in all dimensions except width; the muzzle deep and square; the brows fairly prominent. The skin covering the forehead and cheeks is wrinkled, and the general expression of the whole head is majestic. The neck is long, to enable him to drop the head to the trail without altering his pace. The chest and ribs wide and deep, and the legs straight and muscular; the ankles of full size, and the feet round and cat-like.

THE FOXHOUND. As a breed distinctly characteristic and solely used for the hunting of the fox, the foxhound is a comparatively modern development, not reaching further back than two hundred years; but it has been developed from the bloodhound and the Talbot or old Southern hound, traceable for two thousand years. When England gradually became more or less deforested, and animals of the chase had more open spaces for their speed, it naturally followed that this dog had to have increased pace, and for all kinds of game except the very heaviest the bloodhound and Talbot gradually gave place to lighter hounds grafted on the old model. The stag or buck hound was the first variety of what we now class under the general term 'foxhound.' He was the first to come, and practically the first to go, for not one pack of the larger buckhound exists to every hundred packs of the true foxhound. The establishment of regular packs of hounds for hunting the fox, the first of which was the Pytchley in 1750, stamped the breed on the lines from which the English hound has never varied—indeed, into some packs not a single drop of extraneous blood has ever been introduced. Most of the packs established in the latter part of that century are still, so far as other blood is concerned, in unbroken exist-

ence; such are the Belvoir (founded, 1756), the Quorn, and the Cottesmores.

Where the game chased is as swift and crafty as the fox, and the country as open, yet studded with hedgerows and walls, which act as an ever-recurring screen from sight, it follows that the pursuing hound must have unfailing powers of scent, endurance, and swiftness. These are the three characteristics of the bony, muscular, compact, big-bodied, typical foxhound. His height is not so material as are other points; 23 to 24 inches at the shoulder is a safe medium. Nor is color imperative, though necessarily, from the jealousy with which the breed has been guarded, there are no variations outside the yellow or tan, black and white, in ever-varying and clearly marked blotches over the whole body. The head should have a girth in front of the ears of fully 16 inches; the nose should be $4\frac{1}{2}$ inches long, and wide, with open nostrils, and ears set low and lying close to the cheeks. The neck should taper from the shoulders to the head. The chest of a dog 24 inches high should be more than 30 inches in girth, to give the necessary lung capacity, and the ribs must be deep and grade into the loins without an observable break. The hind quarters must be very strong, and the front legs straight and strong. So important are these two features that in judging they call for 20 points out of the total 100. The modern dog, being better trained, is lighter than his ancestor; 70 to 80 pounds is the limit of a dog's weight, and the female may be ten pounds lighter.

In America the local conditions differ so widely, and are so various, that it is almost impossible to define the American foxhound. In some districts, like Maryland and in the Genesee Valley, the fox is followed very much after the English fashion, on horseback, over rolling grasslands; elsewhere, the dog does the hunting and the man waits behind a wall on the supposed runway with a gun; in a third, the men follow the dogs afoot; in still others, they hunt the fox at night. It follows, therefore, that the dogs locally needed must be as various as the methods, and they are so; but, speaking broadly, and of the hound favored by the American Foxhound Club, it need only be said that it is bred on lighter and finer lines than its English ancestor. It is shorter at the shoulder—21 to $23\frac{1}{2}$ inches—and weighs not more than 57 pounds. The chest is narrower in proportion to depth than the English standard; 20 inches in a $23\frac{1}{2}$ -inch hound is considered good. In most other respects, naturally the requirements are very similar. One minor point of some importance may be noticed: the English dog always has his ears artificially rounded, while the American dog retains them untrimmed.

THE HARRIER. From the earliest times the hare has been hunted by dogs. There is a cameo among the Greek gems which depicts him chased by his especial enemy, the long dog or greyhound; but he had an equally persistent foe in the old Southern hound, the immediate ancestor of the modern harrier. The original harriers must not be confused with the dwarf foxhound, which does duty as a harrier to-day. It was only after the draining and clearing of England and Ireland at the beginning of the nineteenth century, when, for the first time, the chase could be followed on horseback, that the old Sussex blue-mottled harrier, the first step in refining

the old stock, came into fashion. The persistence with which a scent-hunted hare can be worried by dogs with good noses, and the sport it afforded to watch the tricks and subtleties of hare and hounds, made hare-hunting very popular. In order further to insure the needed qualities, the smaller foxhound strain was called into requisition, and 'Tyrant,' a sire from the Duke of Grafton's kennel, became the foundation of the pack of Sir John Dashwood King, of West Wycombe, whence the strain spread throughout Great Britain. There are still packs of the older and slower kind, however, and there is a 'standard of points,' but it is scarcely worth repeating here.

THE BEAGLE. The harrier looks like a diminutive foxhound, and the beagle looks like a diminutive harrier; but he is not that. He has a most ancient lineage, and for beauty of form, gentleness of manner, sweetness of voice, and hunting qualities he has no equal. The length of the separate existence of the beagle has allowed opportunity for many varieties besides the 'rough' and the 'smooth.' A very pygmy breed called 'lap-dog beagle' was once popular. So small were one pack of these that the whole ten or twelve couples were carried to the field in a pair of panniers slung across a horse. Even the common-sized beagle is slow enough to allow any ordinarily active man to follow the chase afoot. There is a Beagle Club in America which sets the standard, and field trials are annually held under its auspices. Though diminutive, some classes not exceeding 15 inches, the beagle is every inch a dog, with a wiry frame and a determined, though placid, look. His standard of form closely follows that of the foxhound.

THE BASSET. This dog is the French equivalent of the English beagle, inasmuch as he is the diminutive of an ancient breed, and his quarry is the rabbit. In other respects, as the beagle follows the characteristics of the old Southern hound, the basset resembles their other ancient common ancestor, the bloodhound. His body is longer, and his legs even shorter than the beagle's. His head is long and narrow, with heavy flews, and his forehead wrinkled to the eyes, which, like the bloodhound's, show the haw; his expression is dignified; the neck is very powerful, with heavy dewlaps, and the ears so long he is likely to tread on them, for his legs are not more than four inches long. The stifles are bent, and the quarters full of muscle. He is very barrel-like, and has a character easily recognized.

THE DACHSHUND. Except that this dog hunts rabbits, and, like the beagle and the basset, is short on the leg and long in the body, he has nothing in common with the others. He is a curious mixture. He has the smooth coat and body of a pointer, the tail and nose of a black and tan terrier, the ear of a foxhound, with more than the foxhound's sensitiveness, the hinder legs taller than the front ones, and the latter comically bowed. He is a very ancient breed. One of his kind is painted on an Egyptian monument of the period B.C. 2000. He has many modern admirers, and a club devoted to his interests, whose standard calls for a general appearance long, low, and graceful—not cloddy—a wedge-shaped head, long and lean, broadest at its base; skull moderately arched, bridge of nose somewhat curved or nearly straight, no stop; muzzle strong, not snipey, but fairly pointed, with open

nostrils; ears medium, long, broad and soft, round at end, set on high and well back; eyes showing no white, and with keen expression; jaws strong, with strong and regular teeth; neck tapering from the shoulders to the head; shoulders well muscled and plastic; chest well developed, especially the breastbone; body long, back ribs very short; fore ribs well sprung; fore legs short and strong in bone; forearms crooked; feet large, round, and strong; hind legs smaller in bone and higher than fore legs; lower thigh very short and forming nearly a right angle with the upper thigh; feet of hind legs smaller than those of fore legs; coat short (except on the wire-haired), dense, strong, and glossy, but short and fine on the under side of the body; skin loose and supple; color, red in all tints, black and tan, liver and tan, grey and tan, and spotted. White is objectionable, except in a small stripe from the breastbone (which is prominent) downward.

TURNSPIT. A dog closely akin in build to the dachshund, and called the bath-hound or turnspit, was used in England in some localities well into the nineteenth century to drive a wheel by which the roasting-spits were turned before the fire. He was put in a box in such a position that he could apply his fore feet one after another to a paddle-wheel, and by that means the spit went round. A similar dog, used for rabbiting, was early known to English hunters as the 'wry-legged terrier.'

THE OTTER-HOUND. This is the gamiest and pluckiest of dogs. His prime requisite is such hardihood as will enable him to follow the otter to its water den and fight him there, withstanding without complaint the severest bites from this most vicious of animals. If fish are to be 'preserved' in certain streams, otters must be limited, and to this end otter-hounds are a necessity. This dog must have powerful jaws and good teeth, also a rough grizzly coat, which defies alike the chill of the water and the teeth of the otter. Beneath the wiry outer coat, an under coat of oily wool is essential. This hound is a large dog, standing about 25 inches high, and weighing 50 to 75 pounds.

THE GREAT DANE, OR GERMAN BOARHOUND. This is the last visible remnant of one of the two great classes into which dogs were divided by Xenophon and the early Greek writers—the 'fighting dogs,' famed for their huge frame, their pugnacity and ferocity under training. Most of the ancient nations cultivated this dog as an ally in their armies. Arrian enumerates those of "the Mede, Celt, Ser or Indian, Albanian, Iberian, Lycaonian, Libyan, Egyptian, Magnesian, Molossian, Briton, Arcanian, and a few others nearly allied." Cyrus had his war-dogs, and at Marathon dogs shared the honors of the day. That their use was continued by the Romans is evidenced by the fact that from the ruins of Herculaneum have been exhumed the calcined corpses of dogs wearing mail armor. The use of this huge dog for aggressive pugnacity has long since passed, but as a companion and safeguard he has always been valued by German game wardens.

The standard adopted by the Great Dane Club of America maintains all the great and marked qualities of this giant of the canine world, decreeing for dogs a minimum height of 30 inches and a weight of 100 pounds, with an approximate

height of 32 inches and a weight of 140 pounds. It requires a powerful and elegant brute. The body must be long, round, and compact; the coat short and fine; the ears small and carried high; the eyes small, deeply set, and with a sharp expression. The recognized colors are the various shades of gray or blue, mouse color, black, white, red or fawn; also brindle or tiger-striped or white ground, with patches of dark colors.

THE MASTIFF. This dog (the *Canis Anglicus* of Linnaeus) is a true hound, and undoubtedly is of British origin, for he was exported from there before the Roman conquest of the islands. He was used by the Britons as a guard-dog for their persons and their flocks, more than in the hunt; and he remains preëminently the watch-dog of the present day. Watching has become almost instinctive with him. He is the largest and most muscular dog known, exceeding even the Great Dane, and has the courage of the bulldog, yet withal is so gentle that he is the especial favorite of children. In color he is apricot, or silver fawn, or dark fawn brindle, with the muzzle, ears and nose black in all cases; his coat is short and close-lying; his head is a very ideal of strength and massiveness, and it is set on a neck and chest in proportion. No height is set in the standard, but a dog which must weigh from 155 to 175 pounds should be very little under three feet tall.

BIBLIOGRAPHY. Consult authorities mentioned under DOG—DOMESTIC DOGS.

HOUND. A small shark. A name more common in Great Britain than in America for the 'dogfish' of the genus *Mustelus*, especially the blue or 'smooth' hound (*Mustelus canis*), common to both sides of the Atlantic. See DOGFISH.

HOUNDFISH. (1) A needle-fish, especially *Tylosorus raphidoma*, also called 'guardfish.' See AGUJA, and Plate of NEEDLE-FISH, PIKES, ETC. (2) A dogfish.

HOUND, HOUNDING. A hound is a dog employed in the chase; specifically, in England, one adapted to fox-hunting. Hounding is the pursuit of game by hounds. The keeping of hounds and the sport of hounding are, to a greater or less extent, regulated by law. Those who follow hounds in fox-hunting, in England, are exempt to some extent from the common-law liability of other trespassers, such sport ranking as a privileged pursuit. The employment of hounds in deer-hunting is prohibited by statute in some of our States. Fox-hunting with hounds, however, is becoming popular in certain parts of this country. Consult Peer, *Cross Country with Horse and Hounds* (New York, 1902), and the authorities referred to under GAME LAWS.

HOUND'S-TONGUE (so called from the appearance of the flowers), *Cynoglossum*. A genus of coarse-appearing, small-flowered plants of the natural order Boraginæ, of which there are many species. The common hound's-tongue (*Cynoglossum officinale*) is a native of Europe, Asia, and Africa introduced in North America. It has soft downy leaves, of a dull-green color, purplish-red flowers, and a stem about two feet high. Its odor is very disagreeable. The root was formerly administered in scrofula, dysentery, etc., and is said to be anodyne. It is also one of the pretended specifics for serpent-bites and hydrophobia. The hound's-tongue is considered a pernicious weed on account of its burs, which

adhere to the wool of sheep and to other animals. *Cynoglossum Virginianum*, known as wild comfrey, is a common plant from Canada to Florida. The species of *Echinosperrum*, formerly united with *Cynoglossum*, are weeds, *Echinosperrum* being the beggar's lice or stick-tights. The quality of sheep's wool is often considerably lowered from the abundance of their burs in it.

HOUNS'LOW HEATH. A region west of the township of Hounslow, London, covering in 1546 an extent of 4293 acres. It was formerly notorious as the resort of highwaymen, and it was customary to leave the bodies of those who had been executed hanging on gibbets along the road. In 1686 James II. established a camp on the Heath for the purpose of overawing the Londoners. Extensive barracks were erected in 1793, and part of the land is now occupied by powder-mills. The region is in great part under cultivation and inclosed.

HOURL (Af. *ure*, OF. *ure*, *hure*, *ore*, *hore*, Fr. *heure*, from Lat. *hora*, from Gk. *ὥρα*, hour, season). A measure of time equal to one twenty-fourth part of a day (q.v.). As there are two kinds of days, the solar and sidereal, so there are two kinds of hours, the solar and sidereal. The latter is shorter than the former by 9.856 solar seconds. Sidereal time is used by astronomers in discussing the motions of the stars; but in the ordinary affairs of life solar time only is employed. Twenty-four ordinary solar hours correspond to an interval of time equal to the mean or average period elapsing between two successive returns of the sun to any given meridian. The first hour of the civil or ordinary day is numbered XII., and commences at midnight. The following hours are then numbered I., II., etc., up to XII., which number is attached to the hour beginning at noon. In Italy, until November, 1893, when the standard time was adopted, time was reckoned from sunset continuously, from 1 to 24 hours. On the Continent, France is to-day the only country that is outside the time-zone, i.e. that uses local time.

HOURL-GLASS. An instrument for measuring intervals of time. It is made of glass, and consists of two bulbs united by a narrow neck; one of the bulbs is nearly filled with dry sand, fine enough to run freely through the orifice in the neck, and the quantity of sand is just as much as can run through the orifice in an hour, if the instrument is to be an hour-glass; in a minute, if a minute-glass, etc. The obvious defects of this instrument are the expansion or contraction of the orifice produced by heat or cold, and the variations in the dryness of the sand, all of which produce deviations from the true measurement of time. Instruments constructed on this principle are still used by navigators in 'heaving the log,' for the purpose of measuring the time during which the log-line is allowed to run out. Similar instruments are also employed by cooks in fixing the proper time for boiling eggs.

HOURI, *hou'ri* (Ar. *ḥawrâ*, woman with bright black eyes, from *ḥawira*, to have brilliant black eyes). The beautiful celestial maidens, described in the Koran (Sura lvi. 24; lv. 55; et al.) and Mohammedan tradition as dwelling in Paradise, whose companionship is one of the rewards held out to the pious Mussulman. Numerous descriptions amplifying the notices in the Koran

are found in Mohammedan writers. They repose on gorgeous couches in pavilions of pearl. Their countenances are so bright one can see his face reflected from a houri's cheek. They are made by 'a peculiar creation,' not of clay, like ordinary women, but of musk, saffron, incense, and amber. While retaining all the qualities of virgins, they have none of the failings of women, remain ever young and free from physical defect, and have the power to conceive and bear children at will, who within an hour grow to maturity. The later Mohammedan theologians, like Ghazzali (q.v.), whose more refined instincts were offended by this rather sensual picture of Paradise, endeavored to place an allegorical interpretation upon the houri; but there can be little doubt that to Mohammed and to his immediate followers, as to the bulk of present-day Mohammedans, they represent an intense reality. This follows from the details of the houri given by Mohammed and amplified by subsequent writers, on the basis of tradition, and which accord with the general view of Paradise as a place where life will be full of secret delights, where there will be plenty of water, delicious fruits, with attendants waiting on the pleasure of the inhabitants, and the like. Mohammed's conception of Paradise, while based in part on the current Jewish, and more particularly Christian views, embodies as its original factors the adaptation of these views to his own mental horizon and to that of his surroundings; and one is inclined to conjecture that the houri represent the reverse of the popular conception of demoniac beings, frequently pictured as female spirits, who plague and torture man in this world.

HOURS, in mythology. See HORÆ.

HOURS OF LABOR. See LABOR LEGISLATION.

HOUSATONIC, *hō'sá-tōn'ík*. A river of New England, rising in the Berkshire Hills, Massachusetts, and flowing south through Connecticut (Map: Connecticut, C 4). It empties into Long Island Sound, four miles east of Bridgeport, after a course of 150 miles through a region full of wild and beautiful scenery. It supplies water-power to numerous manufactories.

HOUSE-ANT. The little red ant of households (*Monomorium Pharaonis*), a species which has accommodated itself perfectly to the conditions of civilization. It nests in the walls of houses or in rubbish in cellars or old closets, and feeds on all sorts of household stores. It becomes a great nuisance, not so much from the amount it eats as from its inordinate propensity for getting into things, especially sugar, syrup, and sweet substances generally. Careful watching will some-

RED HOUSE-ANT.
a, female; b, worker;
in relative proportions.

times reveal the crack from which most of them come, and the nest may thus be found and destroyed. They may be trapped by thousands by a sponge moistened with sweetened water, which is daily relieved of its burden of ants by plunging it into scalding water. The cracks by which the ants enter storerooms and pantries may be plugged with cotton soaked with kerosene, or

the entire house may be fumigated with bisulphide of carbon or hydrocyanic acid gas. Directions for such fumigation are printed in circular form by the Department of Agriculture at Washington and are sent to all applicants free of charge. Two little black ants (*Monomorium minutum* and *Tetramorium cæspitum*) are also found in houses, but nest outside. Consult Howard and Marlatt, *Household Insects* (Department of Agriculture, Washington, 1896).

HOUSEBOATING. The passing of the summer-time, as a recreation, on what really is a flat-bottomed raft supporting a more or less extensive and luxurious suite of rooms, occupying the centre of the raft. At each end of the house is an open deck, and an open gallery along the sides; the top, which is railed round and covered by an awning, forms an open court or garden. There are endless varieties in design, but this general description substantially covers the characteristics of most modern houseboats. This manner of passing the summer holidays began about 1870 on the Thames. To-day a hundred houseboats are to be found on it, and a regular weekly paper is published, which gives the whereabouts of every such boat from day to day. Some of these boats are models of beauty in decorations and fittings, and veritable floating palaces of luxury and fashion. They are either poled from point to point, or towed from the path by a horse, or else tugged by an auxiliary launch. The proximity of riverside villages and inns precludes the necessity of giving up much of the internal space to stores. American conditions are so different as to need a much greater variety of treatment, and in every section of the country houseboating is popular. Houseboats are abundant on the Pacific Coast, and the Mississippi system is dotted with them wherever a great city forms the necessary social nucleus. On the Saint Lawrence and the Lakes George and Champlain they are a summer feature, and the neighborhood of New York is especially favorable to them. In the Florida waters are some of the largest ever built, as well as many of the humbler and truer kind.

For convenience of description, houseboats may be divided into four classes, according as they (1) simply float, and are moored to stay; (2) are meant to move from place to place, but have no power; (3) carry their own sails; or (4) are propelled by their own engines. Within these divisions every kind of craft is in service. There is the *Alameda*, a converted 85-foot schooner, which can cruise by sail or steam, and the *Caiman*, a double-decker, 97 feet long, capable of navigating with her own steam power the inlets and inland waters of Florida. Scarcely less pretentious are the *Idler* and the *Wanderer*, designed especially for the shallow rivers of the upper Mississippi Valley. Among sailing houseboats there are the *Sommerheim*, 70x20, on which a house 30x16 is carried, and the *Nautilus*, with a deckhouse constructed of four abandoned street cars. Others are floating studios, like *Dragon*, 30x16; and *Outing*, built for the waters inside the keys of the Jersey coast, a roomy sloop-rigged houseboat 35x11 and 13 inches draught; hunting-boxes, like the *Ruth*, with her house sunk level with her deck, for use in duck-shooting; and broad-beamed rafts, like the *Belvidere*, of which half a hundred may be found in San Francisco Bay and its tributaries.

An ordinary flat-boat, without power, except some simple sails, steered by a rudder, and carrying a house of Georgia pine, can be built (home-made) or purchased anywhere for \$300 to \$800. Practical working designs and instructions for building will be found in articles by Norton in *Outing* for July (New York, 1892) and August (New York, 1900).

HOUSEBOTE (from house + ME. *bote*, AS. *bôt*, Goth. *bôta*, OHG. *buoza*, Ger. *Busse*, recompense, atonement). At common law, the right of a tenant for life or years to cut and take from the premises occupied by him sufficient wood for repairing the house and other buildings on the estate and for use as fuel, without becoming liable for waste. It belongs to the class of tenants' rights known as estovers. See ESTOVER.

HOUSEBREAKING. See BURGLARY.

HOUSE CENTIPEDE. A myriapod with very long legs and long antennæ, which is numerous in the Southern States, and brightly colored. It haunts houses and is feared by ignorant persons as poisonous, but is harmless and really beneficial, as it feeds on small insect vermin. It is the only representative in this country of the chilopodous family *Cermatiidæ*, and is named *Scutigera forceps*. Consult Marlatt, *Household Insects* (Washington, 1896). See MYRIAPOD.

HOUSE CENTIPEDE.

HOUSE-CRICKET. See CRICKET.

HOUSE-FINCH, or LINNET. A small finch (*Carpodacus frontalis*) very common throughout California, Arizona, and Northern Mexico, and familiar in all valley towns and rural gardens, where it is welcome for its beautiful plumage and exceedingly sweet, canary-like song, heard throughout the year. It is related to and resembles the purple finch of the Eastern States, but is smaller and trimmer. The head and breast of the male are a rich red-wine color, varying from carmine to crimson, and the remainder of its plumage a mixture of reds, soft grays, and browns; the females and young have no red, and in winter the colors are less bright than in early summer. This finch makes its nest normally in trees, but now also occupies holes and crannies about houses and buildings, where it is never disturbed by the people, although much harassed by swallows in competition for desirable quarters. The eggs are pale blue, sparingly marked with dark lines and dots about the large end. Other

names for this bird are 'adobe finch,' 'red-headed linnnet,' and 'burion.'

HOUSE-FLY. The most common and familiar fly of civilization (*Musca domestica*), the type of the family Muscidae (see FLY). It is remarkable for its extensive geographic distribution, and is found practically in every spot where man has been. It is a very rapid breeder and swarms in enormous numbers during the summer and in warm regions. Its eggs for the most part are laid in horse-manure, and it is safe to say that more than 90 per cent. of the house-flies in America to-day were reared from horse-manure. In the absence of this substance, however, they will breed in cow-dung, in decaying vegetation, and in privies. The eggs are small, slender, and white in color, and in summer-time hatch in four or five hours. The larvæ become full grown in three days, and the pupa stage lasts only three to five days. The total life-round of a generation may be as short as seven or eight days. Each female lays about 150 eggs, and this prolificness and rapidity of breeding, taken in connection with the general abundance of larval food, readily accounts for the enormous numbers of flies which infest dwellings.

The house-fly is undoubtedly an important factor in the spread of certain diseases, especially enteric fevers and cholera, as it may breed in human excreta and afterwards visit food-supplies or dining-tables. The best remedy is the exercise of great care and cleanliness. Stables where horses are kept should be cleaned every day or so. The manure should be put in a close room or pit, and each day's additions should be sprinkled over with a shovelful of chloride of lime.

HOUSEHOLD, ROYAL (of Great Britain). The personal attendants upon the reigning sovereign. Among all primitive Germanic peoples we find such attendants. The chief officers of the household are usually four in number: the steward, who is the head of the household; the marshal, or head of the royal stables; the cup-bearer; and the chamberlain, who has charge of the King's chambers. These four officers are found among the Anglo-Saxons and at the Court of the Norman dukes. As the royal power developed, the household attendants became officers of state, and the King's household is his ministry. Under the Norman kings of England the royal household consisted of two sets of officers, whose functions greatly resembled each other. Foremost among them was the justiciar, the King's chief adviser and his representative in England when the King was abroad. The steward, whose most important functions of state passed over to the justiciar, remained head of the royal household. Other members were the treasurer, who had charge of the King's treasury, and the chamberlain, who audited the accounts; the constable, a sort of quartermaster-general of the Court and the army, who had a seat in the exchequer, and the marshal, whose functions were similar. Some of these officers, viz. the steward, the constable, butler and marshal, were hereditary in the great Norman families, and either lost their importance or became merely household officers. Others which were appointed, like the justiciar, chancellor, and treasurer, became the important officers of state.

In the present organization of the royal house-

hold the lord steward is the chief officer. His authority extends over the treasurer, the controller and the master of the household, and over all the other household officers and servants except those of the chapel, the chamber, and the stable. The dean and the subdean are the principal officers of the chapel, which is composed of a number of clerks and chaplains. The lord chamberlain controls the officers and servants of the royal chambers, and appoints the tradesmen who are purveyors to the sovereign. The master of the horse is in charge of the royal stables, and has under his charge the master of the hounds, the grand falconer, the crown equerry, and other servants. In the court of a female sovereign the ladies of the household play an important part. The mistress of the robes is the head of this department, and under her are the ladies of the bedchamber, maids of honor, and other attendants. The ladies of the bedchamber are the personal attendants of the Queen. Besides these there are a large number of physicians, surgeons, apothecaries, druggists, and dentists in attendance. The other members of the royal family have similar households, but on a much smaller scale.

The expenses connected with the royal household have varied greatly in the different periods of English history. In the Middle Ages the King was always attended by a large following of lords, both spiritual and temporal, besides knights, esquires, and other inferior attendants. He obtained provisions for his Court by exercising the right of PURVEYANCE (q.v.), which has been abolished. Notwithstanding this, the expenses of the royal household often proved a burden to Parliament, which sometimes regulated them. This was most carefully done in the *Household Book* of Edward IV., which rigorously defined the officers of the household and the duties of its members. The expenses of the household of Edward IV. were £13,000 a year, which may be taken as a fair average sum for the household expenses of a king during that period. Since the accession of William III., Parliament has fixed the amount of the appropriation at the beginning of each reign. Queen Victoria received an allowance of £385,000 a year, distributed as follows: Privy purse, £60,000; household salaries and retired allowances, £131,260; household expenses, £172,500; royal bounty, arms and special services, £13,200; leaving an unappropriated balance of £8040, to be used at discretion. The Prince of Wales received an annuity of £40,000 over and above his other revenues, the Duke of Connaught £25,000, and the other members of the royal family in proportion to their rank. By a grant of May 9, 1901, Parliament increased the civil list to £415,000 for Edward VII., the King's privy purse being increased to £110,000.

For the early period consult: Kemble, *Saxons in England*, vol. iii. (London, 1886); Stubbs, *Constitutional History of England*, vol. i. (6th ed., Oxford, 1897); *The Ordinances and Regulations for the Government of the Royal Household* were published by the Society of Antiquaries (London, 1790); Lindsay, *The Royal Household* (London, 1898).

HOUSEHOLD GODS (Lat. *di familiares*, or *domestici*). Among the ancient Romans, the divinities supposed to preside and watch over the house and the family. Thus Vesta was the goddess of the hearth and guardian of domestic

unity. But the name was applied especially to the *lares* and *penates*, spirits of the deceased ancestors under whose beneficent care the household prospered. The *lares* had special charge of the members of the family, and the *penates* of the dwelling; and they were worshiped at the *lararium*, or family shrine, which stood in the *atrium*, or central hall.

HOUSEHOLD SUFFRAGE. The form of the Parliamentary franchise at present in force in Great Britain. It was established in the boroughs by the Reform Bill of 1867-68, which conferred the right of voting for members of Parliament on all adult male household owners or lodgers who were the occupants of a dwelling capable of bringing in a yearly rental of £10 and over. By the Franchise Bill of 1884 the right was extended to the inhabitants of the counties who possessed the same qualifications.

HOUSEHOLD TROOPS. Specifically, the term applies to those regiments of the British Army which form the permanent garrison of the city of London, and whose especial duty it is to attend the sovereign. Details from these troops mount guard over the royal residences and important public buildings and institutions. The term includes the following troops: Two regiments of the Life Guards (First and Second); the Royal Horse Guards; the first, second, and third battalions of Grenadier Guards; the first and second battalions of Coldstream Guards; the first and second battalions of Scots Guards; and the Irish Guards. (See GUARDS.) The term household troops is frequently used by English and American writers to describe the élite regiments of Germany and other monarchical countries.

HOUSEHOLD WORDS. A weekly periodical founded March 30, 1849, by Charles Dickens, who became its chief editor. The opening numbers contained a serial story by Mrs. Gaskell. *Hard Times*, and many of Dickens's minor stories, first appeared in it. It was discontinued in 1858, and was succeeded by *All the Year Round* (April 30, 1859).

HOUSE INDUSTRY. A form of industrial organization in which the workman labors at home for a manufacturer or contractor. It is to be contrasted, on the one hand, with the artisan organization of industry in which the master craftsman was his own business manager and produced for the needs of a local market, and, on the other, with the factory organization with its groups of workmen coöperating under a common direction and division of labor. Historically it forms a transition from the former to the latter. It was the outgrowth of a widening market for goods, and marked a change in the mercantile organization of industry which kept pace with and in many cases outstripped its technical progress. As a dominant form of organization it marked especially the closing years of the eighteenth and early years of the nineteenth centuries, and while it still lingers in backward regions, and even grows up anew under peculiarly favorable circumstances, it is in the main a thing of the past.

The characteristics of the system are the isolation of the worker's production by the crude processes of hand labor, and the marketing of the product by third persons. The workman may in the first instance supply his materials, but the need of uniformity in the product soon brings

it about that the latter are supplied to him and he is paid at piece rates for the work he does upon them.

Such an organization can compete with factories only when the technical processes of production remain comparatively primitive. When complicated machinery and minute subdivision of labor is introduced into factory work, house industry is doomed. It has under such circumstances kept up for a time an unequal struggle in which long hours of labor and the assistance of the entire family marked the labor in the homes. Bad as were the conditions in the factories of England in the early part of the last century, their misery was exceeded by that of the poor hand workers with whom the factories competed.

The modern counterpart of house industry in Great Britain and America is found in the sweating system. This is confined to the garment trade, in which the mercantile transformation was later than in other lines of industry, and in which the relative scope of hand labor as compared with use of machines is very large. The textile industries and the manufacture of boots and shoes both passed through this stage. While spinning-machines and power-looms were yet primitive, the hand workers were able to maintain themselves for a while by working for others. In New England the factory system had its beginnings in the domestic occupations of the people. Throughout northeastern Massachusetts may still be seen about the farms ruins of small workshops where during the winter the farmers made shoes for the merchants of Lynn and Boston. Elsewhere in the State, straw for the manufacture of hats was plaited by the women on the farms, and by men, in the winter-time. In Sweden and Russia such industrial occupation among the rural population is quite frequent. In Central Europe house industry is far more extensive. The hilly region of Central Germany, from the Thuringian to the Silesian mountains, is its peculiar home. See SWEATING SYSTEM.

HOUSELEEK, or LIVE-FOREVER (*Sempervivum*). A genus of plants of the natural order Crassulaceæ, the members of which have the petals equal in number to the sepals, and inserted in the base of the calyx; the leaves are generally very succulent, and form close rosettes. The common houseleek, or cyphel (*Sempervivum tectorum*), grows wild on the rocks of the Alps, but has long been common in almost every part of Europe, planted on walls, roofs of cottages, etc. It sends up leafy flowering stems of six to twelve inches in height, which bear branches of pale-red star-like flowers, equally curious and beautiful. The leaves cut or bruised, and applied to burns, insect-stings, ulcers, and inflamed sores, afford immediate relief. They were formerly in high esteem as a remedy for fevers and other diseases, and an edict of Charlemagne contributed greatly to the extensive distribution of the plant. Other species possess similar properties. *Sempervivum globiferum*, with yellowish-green flowers, is very frequently planted on walls in Germany. Some of the species, natives of the south of Europe, the Canary Isles, etc., are shrubby; others are common greenhouse plants.

HOUSEMAID'S KNEE. A term commonly applied to an acute inflammation of the bursa

or sac that intervenes between the patella, or kneecap, and the skin. Housemaids are especially liable to it from their kneeling on hard surfaces. It causes considerable pain, swelling, and febrile disturbance. The only disease for which it can be mistaken is acute inflammation of the synovial membrane lining the cavity of the joint; but in this disease the patella is thrown forward, and the swelling is at the sides, while in housemaid's knee the swelling is very superficial, and is in front of the patella. The treatment consists essentially in the employment of rest, cold applications, and bandaging. Where the condition has become chronic, radical relief can be secured by the excision of the bursa, or injection of iodine into it. If suppuration take place, the sac must be freely opened and the pus evacuated.

HOUSE-MARTIN. See HOUSE-SWALLOW.

HOUSE OF COMMONS. See PARLIAMENT.

HOUSE OF CORRECTION. See PRISONS.

HOUSE OF FAME, THE. A poem by Chaucer, in three books, probably written in 1384. The influence of Dante is evident in the construction of the poem, which tells first of the poet's dream of the glass temple of Venus, a direct suggestion from Vergil; next, his flight on an eagle to the House of Fame, where names of great men were written on walls of ice, and awards were made by the goddess of fame to claimants in the presence of the poet.

HOUSE OF KEYS. See MAN, ISLE OF.

HOUSE OF LIFE, THE. A century of sonnets by Dante Gabriel Rossetti, published among the *Ballads and Sonnets* in 1881. Some of the poems contained in it were merely reprints from the *Poems* of 1870.

HOUSE OF LORDS. See PARLIAMENT.

HOUSE OF THE FAUN (It. *Casa del Fauno*). One of the largest and finest houses of Pompeii, famous for its elaborate decorations. In it was discovered the statue of the "Dancing Faun," from which the house received its name. Its mosaics are the most beautiful that have been preserved to the present day. Among them, occupying the floor of the exedra, was discovered the celebrated mosaic of the Battle of Issus, showing Darius fleeing from Alexander, now in the Naples Museum, where the other mosaics belonging to the House of the Faun are also preserved. These include a representation of the creatures of the Nile, which formed the threshold to the Battle of Issus; the Genius of Autumn riding on a panther, doves pulling a necklace out of a jewel-box, and other compositions.

HOUSE OF THE SEVEN GABLES, THE. A novel by Nathaniel Hawthorne, written at Lenox, Mass., in 1850, and published in 1851. It is the story of a decayed New England family, and deals with the heritage of evil which has been passed down to an inoffensive generation. The leading character, Hepzibah Pyncheon, a spinster, finds herself obliged, in her old age, to open a toy-shop in the old homestead.

HOUSE-SNAKE. See MILK-SNAKE.

HOUSE, or 'ENGLISH,' SPARROW. This typical sparrow (*Pyrgita domestica*) is the most familiar fringilline bird of Europe, and latterly of the whole civilized world. It is indigenous to Europe and Asia, where it is only partly

migratory, and a constant attendant upon mankind. It was not known south of the Sahara, nor in Australasia, until the European colonization of those regions caused its introduction there; and since 1850 it has become a resident of both North and South America. Everywhere it flourishes, increases with amazing rapidity, and impresses itself upon the locality by its adaptability, and pugnacity toward native birds. From the earliest times it has associated fearlessly with mankind, and has been a denizen of towns more than of the country. This characteristic is most prominent in the new countries, where it clings at first to cities, and later spreads along railroads and other highways to the interior towns. It remains everywhere a town bird, rarely visiting, and never nesting in, the wilderness. To this urban habit is due in large measure its extraordinary hardihood and prolificacy, for in town it can always find an abundance of food in the streets, or about warehouses, railroads, etc. Consequently it is nearly independent of season in breeding, and may rear several broods a year; moreover, its nests and fledgelings are safe against nearly all the enemies and dangers which beset the lives of wild birds. The result is a longevity and a rapidity of multiplication which may speedily render the species a serious local nuisance. This is felt in the more populous parts of the Old World, as well as in the countries to which it has been transplanted, and where it flourishes with aggressive vigor.

While the sparrow seems able to eat all sorts of food, it is naturally graminivorous, and only when young, or in feeding its young, does this species consume insects in any considerable quantity. Its services to agriculture in this way are so limited in time and amount that they are insignificant, and more than overbalanced by its incessant attacks upon the smaller insect-eating birds, which otherwise would come freely about villages, orchards, and farmhouses. In the United States it has greatly lessened the number of such birds in some localities, or at any rate has driven them away from villages and farmsteads—particularly bluebirds, wrens, and all sorts of swallows, whose nests it destroys or appropriates; but there is reason to believe that the native birds are learning more and more how to cope with this bandit. Moreover, in some districts, besides great destruction wrought to the buds of fruit-trees, the sparrows annually migrate in summer in large companies to the grain-fields, and devour or shake down quantities of ripening grain. A third evil attributed to this bird is the spread of disease, due to its propensity for using feathers and rags in the construction of the nest, and for placing this nest upon or as near as possible to the house; since it may, and frequently does, gather these materials from infected clothing or bedding thrown out of sick-rooms.

INTRODUCTION INTO AMERICA. The house-sparrow was first brought to the United States from England in 1850 by Nicholas Pike and other directors of the Brooklyn Institute, when eight pairs were liberated in Brooklyn, N. Y.; but a second importation in 1853 was needed to establish the race. Sparrows were brought in and colonized elsewhere during the next twenty years, in various parts of the country, including California, the city government of Philadelphia im-

porting and letting loose in that city over 1000 pairs in 1869. The motive in most cases was to free the shade-trees of devastating caterpillars, which about that time were especially numerous and annoying throughout the Eastern States. A few far-seeing persons protested, but were not listened to. Only a few years elapsed, however, before a mass of evidence was presented that the sparrows were of no practical service as insect-destroyers, and were an increasing nuisance and menace. The outcome of much discussion and writing was an exhaustive inquiry, conducted by the United States Department of Agriculture, the results of which, unfavorable to the bird, were published in 1889 in *Bulletin No. 1*, of the Department, a document of 400 pages. Whether, as many believe, a balance will after a time be obtained, and these imported sparrows cease to be relatively more numerous and troublesome than native birds of the same nature, remains to be seen. The fact that the people of Great Britain make the same complaint as the United States against their prolificacy and destructiveness discourages this expectation.

BIBLIOGRAPHY. Barrows, *The English Sparrow in North America, Especially in Its Relation to Agriculture* (Washington, 1889); Gentry, *The House Sparrow at Home and Abroad* (Philadelphia, 1878); Coues, *The Present Status of Passer Domesticus in America* (Washington, 1879); Newton, *Dictionary of Birds* (London and New York, 1896).

HOUSE-SWALLOW, or HOUSE-MARTIN. The English name of the familiar European swallow (*Hirundo rustica*), which makes its mud nest about houses and barns, more often than otherwise in the interstices of farmhouse chimneys, so that it is also called 'chimney-swallow' (q.v.). It is widely distributed throughout the Old World, and everywhere a familiar of civilization. See SWALLOW, and Plate of SWALLOWS.

HOUSE TAX. In England, as early as 1428, a tax was levied on houses; but the practice was soon dropped and did not reappear until 1696, when it was introduced in imitation of a similar tax then existing in Holland. In the latter year a fixed tax of two shillings was levied on all houses, with a higher rate for those which had more than a specified number of windows, on the theory that in this way occupants could be taxed in proportion to their means. With certain modifications as to rate, this tax continued to be levied until 1778, when it was changed to a tax on inhabited houses, proportioned to the rental value, again in imitation of the Dutch practice. The tax was repealed in 1834, but was renewed in 1851, and is still in force. At present houses of less than £20 rental value are exempt; the tax is graduated up to £60. The theory of the tax on houses is that expenditure for house-rent is one of the best available tests of income. The tax is, however, unpopular and unproductive, and for these reasons does not find a place in the fiscal systems of other modern States.

HOUSE THAT JACK BUILT, THE. A nursery rhyme in *Mother Goose*. It relies for its interest on the accumulative manner in which it is told. Hallowell conjectures that its original was a Chaldean hymn or fable, in *Sepher Hag-gadah*, which is strikingly like the rhyme of *The Old Woman and the Crooked Sixpence*.

HOUSING PROBLEM. The increase of crowded tenements and unsanitary slum districts which resulted from the rapid growth of cities in the latter half of the nineteenth century aroused the philanthropist and the public to the realization that they must solve the problem of housing the working classes and the poor. In view of the fact that much emphasis is placed upon the characteristic feature of American architecture—the middle-class home with its many comforts and conveniences—the housing problem as a question of environment for the individual is taking on larger proportions than a mere tenement-house reform. Comfortable housing involves questions of heat, light, sanitation, and conveniences, better facilities for which the increased production and the inventions of the nineteenth century are continually putting within reach of the masses. In small cities, in rural industrial centres, and especially in the expanding suburbs, the kind of housing facilities provided are recognized as an important element in the standard of living.

Previous to the nineteenth century little attention was paid to the homes of the common people. Ancient and mediæval history tells of great personalities, and we possess to-day tombs and temples, palaces and arches, churches and castles, as relics of the past civilization; but the daily life of the people is not recorded, and has passed away with the rude hovels and noisome dens in which they herded. Southern nations easily adapted their dwellings to the climate, although extreme squalor frequently existed. Real comfort, however, was unknown to the northern nations until the great merchant princes introduced into Europe the conveniences familiar to southern potentates. The means by which modern life is made comfortable are the distinctive features of Western civilization, especially of the United States; but certain conditions have prevented the working classes from sharing these benefits. The workman must live near his work. The demand for property in the centre of cities for business purposes has increased the value of the land, and also lessened the amount available for homes for the workers. As the demand for dwellings exceeded the supply, it became profitable to subdivide and sublet old mansions, stores, or cottages built when the city was a country town. These buildings became entombed in blocks of buildings, with no provisions for ventilation, sanitation, or conveniences, and often one hydrant supplied a whole house with water. As the demand increased, the rents rose and more people were crowded into a few rooms. Forty per cent. is said to have been an average return on such property, upon which no repairs were made. To reap this harvest, badly constructed buildings were erected, often by ex-tenants who recognized the opportunity to make money. All available space was used. Back-to-back cottages were put on the same lot. The worst type of tenement is the 'double-decker dumb-bell,' peculiar to New York. In English manufacturing towns, small cottages—rows upon rows in narrow alleys—were built on leased land. No unnecessary expenditures were made, as the houses were intended to fall when the lease expired. (Consult Engels, *The Condition of the Working Class in England in 1844*.) Damp cellars, dark halls, vermin, filth, lack of repair, no ventilation or adequate water-supply are characteristic of all slum dwellings. Not only does a whole family

often occupy one room, but sometimes several families. Boarders are taken to help pay exorbitant rents, and the rooms are rented in the daytime for manufacturing purposes. The mortality in such dwellings is very high, the prevailing diseases being typhoid fever, diarrhœa, and all contagious diseases. Tuberculosis is characteristic of the tenement.

For the individual, bad housing means uncleanness, sickness, lack of privacy, and often contact with criminals and prostitutes. This causes the corruption of the young, lack of self-respect, discouragement, intemperance, and low morality. In New York City it was estimated that out of a population of 255,033 only 306 had access to a bath. Ordinarily the most primitive provisions for cleanliness are lacking. Home life, with normal parental and marital relations, is impossible. Furthermore, every working man and woman loses, on an average, twenty days a year on account of sickness. Economists are agreed that where more than 20 per cent. of the income of the head of a family goes for rent, as is often the case among the poor, privations must be endured along other lines of consumption, especially in food. The districts where overcrowding and bad housing prevail are centres of crime, vice, and epidemics, and impose upon society not only a large bill for the maintenance of hospitals, almshouses, and prisons, but greatly lessen production through the inefficiency of workers. It is estimated that the working population of England between the ages of fifteen and sixty-five lose 20,000,000 weeks in a year. To this loss in working time must be added the inferior quality of the work of people enfeebled in mind and body by poor food and unsanitary homes.

In England the housing question was taken up as a municipal problem, and it has recently become a question of public policy. Lord Shaftesbury was influential in obtaining legislation as early as 1851. The housing problem on the Continent represents a phase of industrial life. Small homes for operatives are built near the large factories. As early as 1835 André Kœchlin, a manufacturer at Mulhouse, France, began building houses for his workers. The United States has been far behind European countries. Public interest has finally been aroused by the reports of tenement-house commissions, and the knowledge of what has been done abroad. The American public was astonished to learn that New York below the Harlem was the most densely populated city in the world, with 143.2 persons to the acre in 1890, and 156.7 in 1900. The eleventh ward had in 1890 a population of 763.59 to the acre.

Efforts to improve housing conditions have been made by cities and by private individuals. The municipality has two methods: (1) Expropriation; and (2) regulation. (1) Expropriation has been carried on to some extent in all English cities. It involves questions of increased taxation resulting from the expense incurred, the displacement of the population who will overcrowd neighboring districts if not provided for, and occasionally the building of model tenements, by the city. Liverpool (1866), Glasgow (1866), and London (1868) first undertook to reconstruct unsanitary districts. Later, general laws were passed, the most important of which is that of 1890, which provides for displacement and for the intervention of the municipality only

when private initiative fails. Expropriation may be very expensive. The London acts of 1875-78 made unsanitary conditions a source of profit to the owners. Glasgow has been especially successful in her financial management of these areas. Edinburgh and Liverpool have left much of the expropriated ground as open space, while Dundee has converted these districts into thoroughfares. London, Liverpool, Glasgow, Huddersfield, and Birmingham have erected model dwellings. Expropriation is a success in lowering death-rates and decreasing crime. Better methods of construction make it possible to house more people in the same area. (2) Municipalities may also improve housing conditions by sanitary and building codes and provision for inspection. Such legislation includes requirements as to light, air, cellars, halls, windows, fire-escapes, plumbing, and sanitary conveniences. The New York laws are in advance of all others, for which they serve as a model, but adequate inspection is seldom provided. If owners are compelled to keep their property in a good condition, they become more careful in the choice of tenants. Thus the undesirable classes are gathered into one district where they are easily looked after. Private associations do a good work in looking up abuses until laws are well enforced and the people taught to deal directly with boards of health. In New York City there are over thirty societies. The Sanitary Aid Society, Ladies' Health Protective Association, and the New York Association for Improving the Condition of the Poor may be mentioned. The Mansion House Council on Dwellings of Poor and the Sanitary Society of Edinburgh are prominent in Great Britain. In France and Belgium the elements of household hygiene are taught in public schools.

Efforts undertaken by private individuals may be classified as: (1) Commercial, (2) semi-philanthropic, (3) philanthropic, and (4) houses built by private employers for the benefit of their employees. The commercial enterprises pay as large a per cent. as possible, giving at the same time good accommodations. The semi-philanthropic companies limit their dividends to a normal commercial rate on high-class investments. The profits of the philanthropic trusts are used in improvements and erecting new property. Housing by employers usually pays a good return. The buildings put up by these various enterprises are blocks, small houses, and lodging-houses. The very poor must rent rooms or small houses. For the lowest classes, so degraded that they cannot make use of improvements, the methods of the Octavia Hill Association are most satisfactory. Miss Hill began the work in 1864, when John Ruskin spent £3000 in purchasing unsanitary property in a vicious neighborhood. The plan is to take old property, to put in necessary repairs, to demand a prompt payment of rent, and gradually to add improvements out of the surplus from a repair fund. The standard of living of the people is raised by making the tenants realize that care on their part results in improvements. Thrift is encouraged by discounts for payment of rent in advance. When the tenants are ready, new buildings are erected. The association owns property, or, as agents, collects rents. Women volunteers have happily combined rent-collecting with friendly visiting. Similar methods have been adopted in other cities. Philadelphia has an Octavia Hill Association, Gotham

Court in New York has been improved, and Mrs. Lincoln has used this method in Boston.

Among the companies providing better housing facilities may be mentioned: In England—the Metropolitan Association for Improving the Dwellings of the Industrious Classes (1841), which owns fourteen estates in London, and pays 4½ per cent.; the Peabody Donation Fund, which owns enormous blocks of tenements; the Improved Industrial Dwellings Company of London, founded by Sir Sidney Waterloo as the result of a successful experiment (1862), and which endeavors to combine beauty and utility in large blocks; the Guinness Trust. On the Continent of Europe are the Berlin Mutual Building Company (1849), and other commercial and semi-philanthropic companies in different cities. In the United States A. T. White founded the Improved Dwelling Company of Brooklyn (1876), which has erected the Home Tower and Riverside buildings, the older buildings paying 10 per cent., the new buildings 5 or 6 per cent. Other New York enterprises are the Astral Apartments (Brooklyn) of Pratt Institute; Improved Dwellings Association with model tenements at Seventy-first Street, paying 6 per cent.; Tenement House Building Company, with property on Cherry Street. In Boston, the Harrison Avenue Estate, the Rufus Ellis Memorial Building, Coöperative Building Company (1871), and the Improved Dwelling Association (1885). In Philadelphia, Theodore Starr Property. The City and Suburban Company of New York City was organized in 1896 as the outcome of the Improved Housing Conference. It aims to offer a safe investment returning 5 per cent., and to provide the best accommodations for working classes. The company is willing to undertake the reconstruction of the East Side of New York City. In this connection the Marylebone Association of London, which undertakes to improve the immediate surroundings of working-class homes, should be mentioned.

Companies have been formed to build and sell property, or to make it possible for the artisans themselves to build. The Artisans', Laborers', and General Dwelling Company of London has opened up suburban estates; the Workingmen's Dwellings Company of Passy-Auteuil, the Discount Bank of Paris, and the Berlin Building Association are important examples. In the United States, building and loan associations, started in Philadelphia, have reached low-salaried clerks and artisans. The best and cheapest method originated in Belgium in 1889, and it has been tried in France and Germany. General savings banks with Government guarantee loan capital to companies of responsible individuals, who act as intermediaries in making loans to workingmen. There are two general forms of companies: (1) Joint-stock and coöperative-loan companies, which allow the individual to select his land and lend him money to put up his house; and (2) joint-stock and coöperative-building companies, who build houses and sell them. The workman pays 10 per cent. and gives a mortgage. The important feature of this system is the arrangement for a life insurance which prevents any loss to his family in case of death.

Railroad, mining, and manufacturing companies in several countries have erected dwellings for their employees. Among the cottages and even entire villages put up by employers are those

of Friedrich Krupp at Essen; Pullman Palace Car Company, Pullman, Ill.; Lever Brothers, Birkenhead, England; James Smieton & Son, Canouster, Scotland; Van Marken Modern Dwellings, Delft; Merrimac Manufacturing Company, Lowell, Mass.; Howland Mill Corporation, New Bedford, Mass.

Another important aspect of the housing problem is the question of lodging-houses (q.v.).

Thus far the improvements in housing have hardly reached the class who need them the most. It has been satisfactorily demonstrated that commercial enterprises for building homes for the working classes pay a fair return on the investment. Of the 160,000 Londoners living in model tenements less than 25 per cent. live in tenements maintained by bequests. The tendency for rent to rise in the centre of the city makes it imperative to take away the competition of the artisan class by moving them to the suburbs. This is largely a question of rapid transit.

In the United States the twentieth century opens with a widespread interest in housing problems, largely stimulated by charity organization societies. Investigations have been set on foot in Chicago, Kansas City, Boston, New York, and Cincinnati, illustrated lectures given, and associations formed to seek to improve conditions.

See TENEMENTS; HILL, OCTAVIA; STANDARD OF LIVING; and MUNICIPAL REFORM.

HOUSMAN, LAURENCE (1867—). An English author and illustrator. His drawings, engraved on wood by his sister, Clemence Housman, with a flavor of the pre-Raphaelite, illustrate *The Goblin Market*, *The Werewolf*, *Jump to Glory Jane*, and other grotesque stories and poems, as well as several of his own books, notably *The Field of Clover* (1898); *A Farm in Fairyland* (1894); and *The House of Joy* (1895). Housman wrote, besides the critical essays, *The Writings of William Blake* (1893) and *Arthur Boyd Houghton* (1896), a book of verse, *Green Arras* (1896); *All Fellows*, illustrated by the author (1896); prose allegories, with inserts of verse in the Old French manner; the clever satire, *Gods and Their Makers* (1897); a book of devotional verse, *Spikenard* (1898); and the popular *Love Letters of an Englishwoman* (1901, anonymously), which is scarcely typical of the author.

HOUSSA. See HAUSA.

HOUSSAYE, ō'sá', ARSÈNE (1815-96). A French author, born at Bruyères. He went to Paris at an early age, and at twenty-one became widely known as the author of two romances, *La couronne de bluets* and *La pécheresse*. He attracted attention particularly as an art critic, publishing his *Histoire de la peinture flamande et hollandaise* in 1846. In 1849 Houssaye was appointed director of the Comédie Française at the suggestion of Rachel, and held the place until 1856. He was a prolific writer in many departments of literature, producing poetry, dramas, romances, philosophical, historical, and critical works—the last being of especial merit. He was long editor of *L'Artiste*, and for some years was editor and proprietor of *La Presse*. Among his works are: *Histoire du quarante et unième fau-teuil* (1845), dealing with the great men who failed of election to the French Academy; *La poésie dans les bois* (1845); *Le voyage à ma fenêtre* (1851); *Le roi Voltaire* (1858); *Rousseau et Mme. de Warens* (1864); and *Les confessions* (1885-91).

HOUSSAYE, HENRY (1848—). A French historian and critic, born in Paris. He distinguished himself in the Franco-Prussian War, and was subsequently an editor of the *Journal des Débats* and the *Revue des Deux Mondes*. His *Histoire d'Alcibiade et de la république athénienne depuis la mort de Périclès jusqu'à l'avènement des trente tyrans* (1873) received from the French Academy the prize established by Thiers. In 1864 he was elected to the Academy. His further works include: *Athènes, Rome, Paris* (1878); *L'art français depuis dix ans* (1882). He made a careful study from the original documents of the fall of Napoleon and of the first French Empire. The work is in three parts, the first entitled *1814*; the second, entitled *1815*, includes the first Restoration, the return from Elba, and the Hundred Days. The third volume, also entitled *1815*, is devoted to Waterloo. These books are among the most readable that have ever been published upon the latter part of Napoleon's career.

HOUSTON, hū'ston. A city and the county-seat of Harris County, Tex., 50 miles northwest of Galveston; on Buffalo Bayou, an arm of Galveston Bay, at the head of navigation, and on the International and Great Northern, the Southern Pacific, the Missouri, Kansas and Texas, the Houston and Texas Central, and several other railroads (Map: Texas, G 5). It is a railroad centre of great importance, and improvements by the Federal Government have added to its transportation facilities by giving direct water communication with the Gulf of Mexico and the Atlantic Ocean; while local transit is facilitated by several bridges across the bayou. Houston occupies an area of nine square miles. It has the Houston Lyceum and Carnegie libraries, the building of the latter costing \$50,000. Other prominent structures include the high school (\$155,000), the United States Government building, the city hall, the court-house, the cotton exchange and market, and the Masonic Temple. The William M. Rice Polytechnical Institute, endowed with the estate of the founder, amounting to about \$20,000,000, will be located in Houston. The city controls extensive commercial interests; it is one of the most important cotton markets in the United States, and in its lumber trade ranks

with the leading cities of the Southwest. Cotton-seed oil and sugar are also exported, and a large general trade contributes to the city's prosperity. There are extensive railroad car and machine shops, cotton-compresses and oil-mills, planing-mills, foundries and machine-shops, rolling-mills, potteries, brick and tile works, flour-mills, carriage and wagon shops, etc. The government, under a charter of 1897, is vested in a mayor, elected every two years, a municipal council, and administrative officials, who are chosen by popular vote. Houston spends annually in maintenance and operation about \$565,000, the principal items of expenditure being \$145,000 for interest on debt, \$100,000 for schools, \$70,000 for street expenditures, \$55,000 for the fire department, \$50,000 for the police department (including amounts for courts, jails, reformatories, etc.), and \$20,000 for the health department (including amounts for charitable institutions). Houston was laid out and settled in 1836, was named in honor of General Sam Houston, and temporarily (in 1837) was capital of the Republic of Texas. Population, in 1890, 27,557; in 1900, 44,633.

HOUSTON, SAM (1793-1863). An American soldier and political leader, who was instrumental in securing the independence of Texas. He was born near Lexington, in Rockbridge County, Va., March 2, 1793, of Scotch-Irish parentage. After his father's death in 1806, the family emigrated to Tennessee, where he entered an academy, but left to try a clerkship in a store, and wearying of this, went to live among the Cherokees. He remained with them three years, when he returned to civilization and taught school. In 1813 he enlisted as a private in the United States Army; served bravely in General Jackson's campaign against the Creeks, being wounded at Tohopeka, and soon rose to be lieutenant. In 1817 he was appointed agent to aid in negotiations with the Cherokees; incurred hostility for attempting to prevent the smuggling of negroes from Florida into the United States, and resigned his commission, 1818, and began the study of law at Nashville. He soon opened an office at Lebanon, was made Adjutant-General of the State in 1819, and major of the State Militia. He was elected to Congress in 1822, was reelected in 1824, and in 1827 was elected Governor. In January, 1829, he married Miss Allen, a Tennessee lady, but three months afterwards left her, and, resigning his office without giving either public or private reasons for his course, went to live among his old friends the Cherokees, who had emigrated to Arkansas. He championed their cause before Congress, incurring by this much enmity, especially from the 'Indian ring,' and becoming involved in an encounter with William R. Stanbury, Representative from Ohio, who had accused him of fraudulent attempts to obtain a contract for Indian rations. For beating Stanbury he was reprimanded in the House of Representatives, and was tried and fined, but President Jackson remitted the fine. The incident served to give Houston once more a national notoriety.

Visiting Texas in December, 1832, he was invited to settle there and become the leader of the American colonists in their struggle for their rights. He complied, and was elected a delegate to the convention held April 1, 1833, to form a State Constitution and seek membership in the

Mexican Republic, separate from the State of Coahuila, with which Texas had hitherto been joined and in which the anti-American party was predominant. The rejection of the Constitution and the attempt to disarm the Americans led to open warfare, and Houston was then chosen general of the military district east of Trinity River, and soon afterwards commander-in-chief of the Texan army. At the head of a small force of undrilled volunteers he led in the military movements which resulted in the defeat of Santa Anna on the San Jacinto, April 21-22, 1836, and in the independence of Texas. In September he was elected President of Texas, was inaugurated October 22d, and served again from 1841 to 1844. The annexation of Texas to the United States, in 1845, was due to his negotiations, and he was one of its representatives in the Senate from 1846 to 1859. In 1859 he was again elected Governor of Texas, but opposed secession in 1861, and refused to take an oath of allegiance to the Confederate States, for which, on March 18, 1861, he was deposed. He then retired to Huntsville, Tex., where, on July 25, 1863, he died. Consult: Williams, *Sam Houston and the War of Independence in Texas* (Boston, 1893); Crane, *Life and Select Literary Remains of Sam Houston* (Philadelphia, 1884); and Bruce, *Life of General Houston* (New York, 1891), in the "Makers of America Series." See TEXAS.

HOUTMAN, hout'mán, CORNELIUS. A famous Dutch traveler and founder of trade with the East Indies, born at Gouda in the middle of the sixteenth century. He went on a trading voyage with his brother, Frederik, to Lisbon in 1593, where he was thrown into a debtor's prison. Released by a friend, he studied the Portuguese routes to the Far East, and returning with charts to Amsterdam, organized an expedition which sailed in four ships out of the Texel (1595). He rounded the Cape of Good Hope, passed through the Straits of Sunda to the south coast of Java, and returned safely to Holland in 1597, having demonstrated an easy route to the Spice Islands. This voyage was followed by many others, and led to the formation of the Dutch East India Company. In a second expedition of two ships in a conflict with the natives of Achin, assisted by the Portuguese, he was killed.—His brother, FREDERIK, navigator of his fleet, also played an important part in the opening of the East to trade and commerce. In 1598 he was taken prisoner by the King of Achin, but, having been freed by Paulus van Caarden, he reached Holland in 1601, and in December, 1603, went again to the East Indies, and was Governor of Amboyna during six years. In 1609 he became commander of twenty-three ships, and in 1625 was honored with a gold medal for having opened the treasures of the East to Dutch enterprise. Almost as great as his exploits in war and commerce and explorations were his linguistic attainments. Having learned the Malay language during his captivity in Achin, he opened the Malay languages to European study. In 1603 he published a dictionary with grammatical notes of Malay and Madagascar, with comparison of many Arabic and Turkish words, which work was republished in 1680 as a grammar and dictionary of Dutch and Malay. In 1880 bronze statues of the brothers Houtman were erected at Gouda, from models by Strackée of Amsterdam.

HOUYHNHNMS, hōō'in'mz or hōō'in'mz. An imaginary nation of horses, of highly advanced civilization, gifted with reason and without passions, which Gulliver visits, in the fourth part of Swift's *Gulliver's Travels*. Their nature is supposed in the story to be as far superior to that of humanity as it is inferior in actual life.

HOVA. See MADAGASCAR, *Ethnology*.

HOVE. A town in Sussex, England, on the English Channel, west of and adjacent to Brighton (Map: England, F 6). It has all the characteristics of its larger neighbor, handsome streets, avenues, squares, public buildings, parks and recreation-grounds, marine walk, baths, etc., and is lighted with electricity. It maintains a free library, with news-room, lending and reference departments. Population, in 1891, 28,300; in 1901, 36,500.

HOVEDON, hūv'den or hōv'den, ROGER OF (?-c.1201). An English chronicler, born probably at Howden, in Yorkshire. He was clerk in the household of Henry II., and was employed by him on various missions. He was appointed an itinerant justice for the forests of Cumberland, Northumberland, and Yorkshire in 1189, and is supposed to have retired to Howden to write his chronicle. This begins with the year 732. Most of the work is copied, but from 1192 to 1201 is in his own writing, and has a certain value. The *Chronicle* was edited by Bishop Stubbs (1868-71, 4 vols.).

HOVELACQUE, ôv'lāk', ALEXANDRE ABEL (1843-96). A French linguist and anthropologist, born in Paris. He was a pupil of Chavée in languages, and of Broca in comparative anatomy. In 1876 he was one of the founders of the Ecole d'Anthropologie, in which he was made professor of linguistic ethnography, and of which, after the death of Gavarret, he became director (1890). In spite of his scientific interests, he took an active part in politics as an extreme Republican. His works include: *Mélanges des linguistique et d'anthropologie* (1889, with Emile Picot and Julien Vinson); *Les races humaines* (1882); and *Précis d'anthropologie* (1887, with G. Hervé). In 1886 Hovelacque and Chavée founded the *Revue de Linguistique*.

HO'VEN. See BLOAT.

HO'VENDEN, THOMAS (1810-95). An American genre painter, born in Dunmanway, Ireland. He studied at the Cork School of Art, and at the National Academy of Design after he came to America, in 1863. Afterwards he was a pupil of Cabanel in Paris. He was elected a National Academician in 1882, and was a member of the American Water-Color Society, the Society of American Artists, and the Philadelphia Society of Artists. His "John Brown Being Led to Execution" is in the Metropolitan Museum of Art, New York City. His other works include: "In the Hands of the Enemy," "Jerusalem the Golden," "Chloë and Sam," and "A Breton Interior." His composition is dramatic and effective, and his pictures are very popular.

HOVEY, hōv'y or hūv'y, ALVAH (1820—). An American Baptist theologian. He was born at Greene, N. Y., and graduated at Dartmouth in 1844 and at the Newton Theological Institution in 1848. After a year spent in the ministry he returned to Newton Centre as a teacher, became professor of Church history (1853), of theology and Christian ethics (1855), and was president from 1868 until 1899, and afterwards was pro-

fessor of apologetics. Among his works are: *The State of the Impenitent Dead* (1858); *The Scriptural Law of Divorce* (1866); *Manual of Christian Theology* (6th ed. 1900); *Systematic Theology and Christian Ethics* (1877); *Biblical Eschatology* (1888); *Studies in Ethics and Religion* (1892); and *Christian Teaching and Life* (1895).

HOVEY, hūv'í, ALVIN PETERSON (1821-91). An American soldier. He was born at Mount Vernon, Ind., attended the common schools, studied law, was admitted to the bar in 1843, and served successively as a circuit judge, judge of the Supreme Court, and United States District Attorney. At the outbreak of the Civil War he was appointed major of Indiana Volunteers, and later became major-general. The battle of Champion's Hill in 1863, which Grant considered the turning-point of his Vicksburg campaign, was won largely through General Hovey's efforts. When the war terminated he returned to his native State, and took an active part in politics. He became Minister to Peru in 1866, and a member of Congress in 1886, and from 1838 until his death was Governor of Indiana.

HOVEY, CHARLES MASON (1810-87). An American horticultural editor and nurseryman, born at Cambridge, Mass. He edited the *Magazine of Horticulture*, which prospered under his management longer than any other American horticultural journal. He was the first to introduced a pistillate strawberry, 'The Hovey,' the variety that marks the beginning of profitable strawberry culture in the United States. His *Fruits of America*, of which two volumes only were completed, is one of the best examples of art fruit-work attempted in this country.

HOVEY, RICHARD (1864-1900). An American poet, born at Normal, Ill. He was graduated at Dartmouth in 1885; studied for one year in the General Theological Seminary, New York; was for a time assistant in the Church of Saint Mary the Virgin, New York; and afterwards journalist, actor, dramatist, poet, and lecturer on English literature in Barnard College, New York. He passed some years in Europe, and was much influenced by French and Belgian poets, especially Maeterlinck, some of whose work he translated. His original verse was always marked by high aims, and he was ridding himself of affectations when he suddenly died. His many admirers felt that he had accomplished more than most of his poetic contemporaries, and that he died on the eve of great performances. Certainly his *Launcelot and Guenevere*—a series of dramas comprising *The Quest of Merlin*, *The Marriage of Guenevere*, and *The Birth of Galahad* (1880-98)—and *Taliesin: A Masque* (1900), though they scarcely show dramatic mastery, exhibit lyrical power and remarkable imagination. *Seaward* (1893) is an elegy upon T. W. Parsons (q.v.). Hovey also collaborated with Bliss Carman (q.v.) in *Songs from Vagabondia* (1893; another series, 1896), and published a collection of his miscellaneous poems in *Along the Trail* (1898). In these works he showed that he could touch the more immediate and ordinary human interests; but these are on the whole not emphasized in his work, which belongs to the idealistic school.

HOW, WILLIAM WALSHAM (1823-97). An English prelate, born at Shrewsbury. He was

educated at Oxford, and after holding several curateships became rector of Whittington Scropshire (1851), which position he held until he went to the Parish of Saint Andrew Undershaft, in London (1879). In that year he was appointed Suffragan Bishop of Bedford, and a year afterwards Bishop of Wakefield. His numerous works in prose include: *Private Life and Ministration of a Parish Priest* (1873); *Commentary upon Saint John* (1879); *The Papal Claims in the Light of Scriptural History* (1881); and some *Pastoral Lectures* (1883). He also wrote some *Poems* (1886) and *Hymns* (1886).

HOWADJI, hou-áj'í. A nom-de-plume of George William Curtis.

HOWARD. A city and the county-seat of Elk County, Kan., 72 miles south of Emporia, on the Elk River and on the Atchison, Topeka and Santa Fé Railroad (Map: Kansas, F 4). Farming and stock-raising are the leading industries. Population, in 1890, 1015; in 1900, 1207.

HOWARD. A noble English family, which for many centuries has stood at the head of the English peerage, and has held the dukedom of Norfolk since the middle of the fifteenth century. The earliest of the house to gain distinction was Sir William Howard, a learned Chief Justice of the Common Pleas under Edward I. and Edward II. His grandson, Sir John Howard, was admiral and captain of the King's navy in the north of England and also sheriff of Norfolk, in which county he held extensive estates, subsequently increased by the marriage of his grandson, Sir Robert, with the co-heiress of the House of Mowbray, Dukes of Norfolk. The only son of this union was Sir John Howard, one of the leading supporters of the House of York, who, having gained early distinction in the French wars of Henry VI., was appointed by Edward IV. constable of the important castle of Norwich, and sheriff of Norfolk and Suffolk. Afterwards he became treasurer of the royal household, obtained a grant of the whole benefit that should accrue to the King by coinage of money in the city and Tower of London, and elsewhere in England; and was raised to the peerage as Lord Howard and Duke of Norfolk. We find him in 1470 made captain-general of the King's forces at sea, and most strenuous in that capacity in his resistance to the House of Lancaster. Finally he was created Earl Marshal of England, an honorary distinction still borne by his descendants, and in 1484 was appointed Lord Admiral of England, Ireland, and Aquitaine. He fell next year, however, on Bosworth Field, and after his death his honors were attained, as also were those of his son Thomas, who had been created Earl of Surrey. The latter, however, after suffering three years of imprisonment in the Tower of London, obtained a reversal of his own and his father's attainders, and became distinguished as a general, winning fame by his defeat of the Scotch at Flodden in 1513. His son Thomas, third Duke of Norfolk, by his marriage with a daughter of King Edward IV., became the father of the accomplished but ill-fated Earl of Surrey, who was put to death by Henry VIII. Norfolk, too, was sentenced, but the death of Henry saved him from the block. The Earl's son Thomas, fourth Duke of Norfolk, suffered attainder, and was executed on Tower Hill for high treason, for

his communication with Mary, Queen of Scots. The family honors, however, were restored, partly by James I., to his grandson, and partly by Charles II., to his great-great-grandson, Thomas, who became eighth Duke, and whose cousin and successor, Charles, ninth Duke, was the direct ancestor of the present Duke of Norfolk.

In one or other of their widespread branches, the Howards either have enjoyed within the last three centuries, or still enjoy, the earldoms of Carlisle, Suffolk, Berkshire, Northampton, Arundel, Wicklow, Norwich, and Effingham, and the baronies of Bindon, Howard de Walden, Howard of Castle Rising, and Howard of Effingham.

Among the other distinguished members of the family, Sir Edward Howard, brother of the first Earl of Surrey, was made by Henry VIII. King's standard-bearer and admiral of the fleet, in which capacity he lost his life in boarding a French vessel off Brest in 1513; his brother, Sir Edmund, acted as Marshal of the Horse at Flodden, and his half-brother, Sir Thomas Howard, was attainted, and died a prisoner in the Tower, for aspiring to the hand of Lady Margaret Douglas, daughter of Margaret, Queen of Scotland, and niece of Henry VIII., one of whose ill-fated consorts was Lady Catharine Howard. Consult: Collins, *Peerage of England* (5th ed., London, 1779); Dugdale, *Baronage of England* (London, 1675-76); Doyle, *Official Baronage of England* (London, 1886); Howard, *Memorials of the Howard Family* (privately printed, 1834); Lodge, *Portraits of Illustrrious Personages* (London, 1835).

HOWARD, BENJAMIN CHEW (1791-1872). An American statesman, born at Belvedere, Md., son of John Eager Howard, Revolutionary officer, and grandson of Chief Justice Benjamin Chew. He was educated at Princeton (1809), studied law, and practiced in Baltimore. In 1814 he was active in the defense of the city, and he fought at North Point. He was a United States Representative (1829-33, 1835-39), became head of the Committee on Foreign Relations, and wrote its report on the boundary question. For twenty years he was reporter of the United States Supreme Court. He was nominated for Governor of his State in 1861, but withdrew his name. In the same year he was delegate to the Peace Congress. His *Reports of Cases in the Supreme Court of the United States from 1843 till 1855* was published in the latter year.

HOWARD, BLANCHE WILLIS (1847-98). An American novelist, born in Bangor, Maine. She was educated in New York City, but dwelt after 1878 in Stuttgart, where she taught and wrote. In 1890 she married Baron von Teuffel, a physician. The more noteworthy of her novels are: *One Summer* (1875); *Aunt Serena* (1880); *Guenn* (1882); *Aulnay Tower* (1886); *The Open Door* (1889); *No Heroes* (1893), a story for boys; *A Fellowe and His Wife*, in collaboration with William Sharp (1892); a volume of short stories, *Seven on the Highway* (1897); the posthumously published *Dionysius the Weaver's Heart's Dearest* (1899), and *Garden of Eden* (1900). She wrote also a book of travel, *One Year Abroad* (1877).

HOWARD, BRONSON (1842—). A well-known American dramatist, born at Detroit. He prepared for college at New Haven, but instead of entering Yale, turned to journalism in New

York. From 1867 to 1872 he worked on several newspapers, among them the *Evening Mail* and the *Tribune*. So early as 1864 he had written a dramatic piece called *Fantine*, which was played in Detroit, but his first important play was *Saratoga*, produced by Augustin Daly in 1870. It was very successful, and became the first of the long series of pieces which gave Mr. Howard a foremost position among American playwrights. Among his other best-known plays are: *The Banker's Daughter* (1878); *Old Love Letters* (1878); *Young Mrs. Winthrop* (1882); *One of Our Girls* (1885); *The Henrietta* (1887); *Shenandoah* (1889); and *Aristocracy* (1892). In 1899 he collaborated with Brander Matthews in *Peter Stuyvesant. Aristocracy*, which is a satire upon some features of Anglomania in American society, has been called its author's best play, though the war drama of *Shenandoah* is more ambitious, and *Old Love Letters*, in quite a different line, is an inimitable bit of sentimental comedy. Mr. Howard married a sister of Sir Charles Wyndham, the English actor, and he made his home in both New York and London, where some of his plays have been no less popular than in America.

HOWARD, CATHARINE (1520-42). Fifth wife of Henry VIII. She was a daughter of Edmund Howard, third son of the Duke of Norfolk. The King married her soon after the divorce of Anne of Cleves, in 1540. She was accused of immoral conduct before her marriage, and of suspicious conduct after it. After a trial, in which her guilt seems to have been established, she was beheaded with Lady Rochfort, who had connived at her intrigues, February 13, 1542. Consult Froude, *History of England*, vol. iv. (London, 1858).

HOWARD, GEORGE ELLIOTT (1849—). An American educator and author, born at Saratoga, N. Y. He graduated at the University of Nebraska in 1876, studied at the universities of Munich and Paris in 1876-78, and was professor of history in the University of Nebraska from 1879 to 1891. From 1891 to 1901 he was the head of the history department and professor of American and institutional history at the Leland Stanford, Junior, University, and in 1902 gave special courses in history at Cornell University and the University of Wisconsin. In 1885-91 he was secretary of the Nebraska State Historical Society. His writings, in addition to contributions to professional and other magazines, include: *Local Constitutional History of the United States* (1889); *The Evolution of the University* (1890); and *The King's Peace and the Local Peace Magistracy* (1891).

HOWARD, GEORGE WILLIAM FREDERICK. See CARLISLE, seventh Earl of.

HOWARD, HENRY. See SURREY, EARL OF.

HOWARD, JACOB MERRITT (1805-71). An American legislator, born at Shaftsbury, Vt. He graduated at Williams College in 1830, studied law, and began to practice in Detroit, Mich. He was a member of the State Legislature in 1838, and in 1840 was elected to Congress as a Whig, in which party he was an active campaign worker in 1844, 1848, and 1852. He took a prominent part in bringing about a coalition of the Whigs and Free-Soil Democrats in 1854; was the author of the platform drawn up at a State convention of the two parties held at Jackson, Mich., on

June 6, 1854, and is said to have suggested the name of 'Republican' for the new political organization thus brought into existence. He was nominated for Attorney-General of the State by the new party in that year, and was elected and reelected twice thereafter, serving until 1859. In 1862 he was elected to the United States Senate, to fill a vacancy caused by the death of Senator Bingham, and was reelected for a full term in 1864. He translated from the French the *Secret Memoirs of the Empress Josephine* (1847).

HOWARD, JOHN (1726-90). An English philanthropist, best known for his work in behalf of prison reform. He inherited a considerable fortune from his father, and spent his early life in travel. Settling at Cardington, Bedfordshire, in 1756, he erected model cottages for his tenants, and furnished schools for children of all sects. In 1773 he was appointed high sheriff of Bedfordshire, and soon the defective arrangements of prisons and the intolerable distress of prisoners were brought under his notice. Finding that all the abuses he had seen at home existed in neighboring counties, he traveled all over the United Kingdom, and finally became a self-appointed prison inspector, not only of Great Britain and Ireland, but of all Europe. He gave evidence before the House of Commons, and in 1774 laws were passed for the improvement of the sanitation of prisons and the abolition of jailers' fees. In 1777 he published his *State of the Prisons in England and Wales, with . . . an Account of Some Foreign Prisons*. After each of his many tours new editions, with additional facts, were published. One important result of this book was the adoption of the hard-labor system in English prisons. In 1785 Howard investigated the infection hospitals of Europe, with a view to discovering the best means of preventing the plague, and published *An Account of the Principal Lazarettos in Europe* (1789). He died of camp fever, while studying the Russian military hospitals. He was a man of deep religious feelings. He traveled more than 50,000 miles in making his investigations, on which he spent at least £30,000 of his own fortune, refusing all Government aid. Of the numerous works on Howard, consult, especially, his *Correspondence*, edited by J. Field (1855), and lives by Hepworth Dixon (1849), by J. Field (1850), and by John Stoughton (1853; new ed. 1884).

HOWARD, JOHN EAGER (1752-1827). An American soldier, born in Baltimore County, Md. He served throughout the Revolutionary War, participating in the battles of White Plains, Germantown, Monmouth, Camden, Cowpens, Guilford Court House, and Eutaw Springs, becoming lieutenant-colonel in 1780, and receiving a silver medal from Congress for his conduct at the battle of Cowpens. He was wounded at Eutaw Springs. At the close of the war he entered politics, and represented Maryland in Congress from 1787 to 1788. He was the Governor of his State from 1789 to 1792. In 1795 he was a member of the Maryland Senate; was a United States Senator from 1796 to 1803, declining in 1796 the portfolio of Secretary of War; and in 1798 was made a brigadier-general by Washington, when a war with France seemed certain. He organized a defense of Baltimore in 1814, when the English forces threatened the city, and two years later was a Federal candidate for Vice-President.

HOWARD, LELAND OSSIAN (1857-). An American entomologist, born at Rockford, Ill. He took a scientific course at Cornell, followed by post-graduate work at Georgetown University, and was for six years assistant in entomology at the United States Department of Agriculture. He was made curator of the same in 1895, edited "Insect Life" for its *Journal*, lectured on entomology, and wrote on that subject for the *Century* and *Standard* dictionaries. He was president of the Association of Economic Entomologists (1894), of the Washington Biological Society (1897-98), and a member of many other scientific bodies.

HOWARD, OLIVER OTIS (1830-). An American soldier. He was born in Leeds, Maine; graduated at Bowdoin in 1850, and at West Point in 1854; served as chief of ordnance during the Seminole troubles of 1857; and was assistant professor of mathematics at West Point from 1857 to 1861. Leaving the Regular Army in June, 1861, he became colonel of the Third Maine Volunteers, and commanded a brigade in the first battle of Bull Run. He was promoted to be brigadier-general of United States volunteers in September; participated in the Peninsular campaign; and in the battle of Fair Oaks (June 1, 1862) received a wound which necessitated the amputation of his right arm. After a short leave of absence he rejoined the Army of the Potomac; took a prominent part in the battle of Antietam; was promoted to be major-general of volunteers in November; and was engaged in the battle of Fredericksburg (December 13th). In April, 1863, he was placed in command of the Eleventh Army Corps, and as such took a conspicuous part in the battles of Chancellorsville and Gettysburg. He then served in the Chattanooga campaign, taking part in the battle of Chattanooga, and accompanying Sherman on his march for the relief of Knoxville. From April to July, 1864, he commanded the Fourth Army Corps of the Army of the Cumberland, and during the march to the sea and the campaign in the Carolinas commanded the Army of the Tennessee, which constituted the right wing of General Sherman's army. In December, 1864, he was appointed brigadier-general in the Regular Army, and in March, 1865, was brevetted major-general for services at Ezra Church and during the Atlanta campaign. From May, 1865, to July, 1874, he was commissioner of the Bureau of Refugees, Freedmen, and Abandoned Lands. Within less than three years 1400 schools (not including 700 Sabbath schools) had been established, and many of the freedmen had been enabled to buy and maintain homesteads of their own. (See FREEDMEN'S BUREAU.) In 1874 Howard was placed in command of the Department of the Columbia, and in this capacity conducted the operations against the Nez Percés Indians in 1877, and against the Bannocks in 1878. He subsequently was superintendent of the United States Military Academy at West Point (1881-82), and commanded successively the departments of the Platte, of California, and of the East. In 1886 he was appointed major-general in the Regular Army, and in November, 1894, retired from the service. In 1895 he founded the Lincoln Memorial University at Cumberland Gap, Tenn. Besides numerous magazine articles, his publications include: *Donald's School Days* (1879); *Chief Joseph, or the Nez Percés in Peace and*

War (1881); *General Zachary Taylor* (1892), in the "Great Commanders Series;" *Isabella of Castile* (1894); *Fighting for Humanity*; and *Henry in the War*. Consult Stowe, *Men of Our Times* (New York, 1868).

HOWARD, SIR ROBERT (1626-98). An English dramatist, son of Thomas Howard, first Earl of Berkshire, by Elizabeth, daughter of William Cecil, Lord Burghley. During the Civil War he took the Royalist side, and was knighted (1644). He was imprisoned under the Commonwealth in Windsor Castle; but after the Restoration lucrative posts were given him, and he sat in Parliament. He is the Crites of Dryden's *Essay on Dramatic Poesy*. Dryden married his sister Elizabeth. Of Howard's five extant plays, *The Committee* (1692), caricaturing the manners of the Commonwealth, is most interesting.

HOWARD, THOMAS, Earl of Arundel. See ARUNDEL.

HOWARD UNIVERSITY. An educational institution, situated in Washington, D. C., incorporated in 1867, and named for Gen. O. O. Howard, one of its founders and early presidents. The university was established by the Government, and, with the exception of its medical department, is supported by Congressional appropriations administered by the Secretary of the Interior. It has, in addition, a general endowment fund of \$175,000, and property valued at \$1,000,000. The university is non-sectarian, and is open to students of both sexes, without regard to nationality. It is chiefly known, however, for its work in the higher education of the negro. No tuition is charged in any department except the medical, and the outside expenses of worthy students are also partially defrayed by the university. In addition to preparatory, collegiate, and medical departments, the university maintains schools of pedagogy, law, pharmacy, dentistry, theology, music, and agriculture. Trade instruction is provided by the industrial department, in which students of the preparatory and English courses are given practice in carpentry, tinsmithing, printing, and bookbinding, under the direction of skilled workmen. The university printing-office issues monthly the *Howard Standard*. In 1902 the students, exclusive of those in the departments of agriculture and music, numbered 939. The library contains about 40,000 volumes.

HOWARTH, hou'érth, ELLEN CLEMENTINE (1827—). An American poet, born at Coopers-town, N. Y. She wrote a number of songs, such as "'Tis but a Little Faded Flower," and published a volume, *The Wind-Harp and Other Poems* (1864). Her later work has been edited, with an introduction by Richard W. Gilder.

HOWE, ALBION PARIS (1818-97). An American artillery officer in the War of the Rebellion. He was born in Maine and educated at West Point. He entered the Fourth Artillery, from 1843 to 1846 was a mathematical instructor at West Point, served creditably in the Mexican War, was made a captain in 1855, and after the outbreak of the rebellion became General McClellan's chief of artillery in western Virginia in 1861. During the campaign on the Peninsula, in 1862, he commanded a light-artillery brigade in the Army of the Potomac. Having been appointed a brigadier-general of volunteers in 1862, he was assigned to a brigade in Couch's division, Fourth Army

Corps; was in command of the artillery depot at Washington in 1864-66; and was brevetted major-general in the Regular Army in 1865 for meritorious service during the rebellion. General Howe took part in the battles of Manassas, South Mountain, Antietam, Fredericksburg, and Gettysburg. He was retired from the army in 1882.

HOWE, ELIAS (1819-67). An American inventor, born in Spenceer, Mass. His father was a miller, and after working in his mills the boy went, in 1835, to Lowell, where he entered a manufactory of cotton machinery. Two years later he lost his position on account of the financial panic, but finally secured work in a machine-shop, first in Cambridge, and later in Boston. About 1843 he commenced the practical working out of his idea for a sewing-machine, and by 1845 the invention was finished; but, despite its obvious advantages, met with bitter opposition. For the next nine years Howe was wretchedly poor. A trip to England in 1847 in hope of being able to interest capitalists there was unsuccessful, and he sold the English rights to his machine for \$250. Upon his return to this country he found that his invention had been pirated, and that many sewing-machines were already in use. He secured influential backing, and immediately began action to establish his patent. After long suits he won his case, and thereafter was one of the leading manufacturers in the United States. Although improvements on Howe's machines were subsequently made by Singer and others, there is no doubt that the Howe was the original prototype of the present machine. When the Civil War broke out, Howe volunteered as a private in the Seventeenth Connecticut Volunteers. In 1867 he received the gold medal and the cross of the Legion of Honor at the Paris Exhibition.

HOWE, HENRY (1816-93). An American historian and publisher, born at New Haven, Conn., son of Gen. Hezekiah Howe, the publisher. He entered the publishing business in 1839, and in 1840 began his historical research in New York and New Jersey, together with John W. Barber. He made like studies in Ohio, sketching old landmarks and interviewing old settlers. Soon after the publication of his work in Ohio he removed to Cincinnati, where he published subscription books for nearly thirty years. In 1878 he returned to New Haven, but in 1885 went back to Ohio, prepared a second edition of his history of that State, and entered the publishing business again. He wrote: *Eminent Mechanics* (1839); *Historical Collections of New York* (1841), of *New Jersey* (1843), and of *Ohio* (1847 and 1891); *The Great West* (1851); *Travels and Adventures of Celebrated Travelers* (1853); *Life and Death of the Ocean* (1855); *Adventures and Achievements of Americans* (1858); *Our Whole Country* (1861); *Times of the Rebellion in the West* (1876); *Over the World* (1883); *Outline History of New Haven* (1884); and *New Haven Elms and Greens* (1885).

HOWE, JOHN (1630-1705). A Puritan clergyman, called the *Platonic Puritan*. He was born May 17, 1630, at Loughborough, in Leicestershire. He studied both at Cambridge and Oxford, and after preaching for some time at Winwick, in Lancashire, and Great Torrington, in Devonshire, he was appointed domestic chaplain to Cromwell in 1656. He held the same position

under Richard Cromwell, but in 1659 returned to Torrington, where the position he had held during the Commonwealth made him an object of close suspicion to the Government. The Act of Uniformity ejected him from his parish (1662), and he wandered about preaching in secret till 1671, when he was invited by Lord Massereene, of Antrim Castle, in Ireland, to become his domestic chaplain. There he began his greatest work, *The Good Man the Living Temple of God* (1676-1702), which occupies one of the highest places in Puritan theology. In 1676 he became pastor of the dissenting congregation in Silver Street, London. In 1677 he published, at the request of Robert Boyle, *The Reconcilableness of God's Providence of the Sins of Men with the Wisdom of His Counsels and Exhortations*; in 1681, *Thoughtfulness for the Morrow*; in 1682, *Self-Dedication*; in 1683, *Union Among Protestants*; and in 1684, *The Redeemer's Tears Wept Over Lost Souls*. In 1685 he was invited by Lord Wharton to travel with him on the Continent; and, after visiting the principal cities, in 1686 he settled, owing to the state of England, at Utrecht. In 1687 King James's "Declaration for Liberty of Conscience" induced him to return to England, and at the revolution the next year he headed the deputation of dissenting clergymen when they brought their address to the throne. Besides smaller works, he published, in 1693, *Carnality of Religious Contention*; in 1694-95, several treatises on the Trinity; in 1699, *The Redeemer's Dominion Over the Invisible World*; and he continued writing till 1705, when he published *Patience in Expectation of Future Blessedness*. He died in London, April 2, 1703. His works have been several times reprinted. For his life, consult: Rogers (London, 1879), and Horton (ib., 1896).

HOWE, JOSEPH (1804-73). A Canadian statesman, born at Halifax, N. S. He was the son of John Howe, a Boston printer and Loyalist, who settled at Halifax on the outbreak of the Revolution. From the printer's office the son pushed his way into journalism, becoming in 1828 proprietor and editor of the *Nova Scotian*. To this famous newspaper he contributed remarkable sketches under the titles "Western and Eastern Rambles" and "The Club," and the no less remarkable papers called "Legislative Reviews." In his journal first appeared also T. C. Haliburton's (q.v.) "Sayings and Doings of Sam Slick." Elected to the local Parliament in 1836, Howe became the most conspicuous figure in his province. Mainly through his efforts a responsible government was won for Nova Scotia. He became a member of the Executive Council (1840), Speaker of the Assembly (1840), Secretary of State for the Dominion (1870), and Governor of Nova Scotia (1873). Consult: His *Speeches and Public Letters*, edited by Annand (Boston, 1858); and Fenety, *Life and Times of Howe* (Saint John, N. B., 1896).

HOWE, JULIA (WARD) (1819—). An American poet, philanthropist, and sociological writer, active in the agitation for the legal and political rights of women. She was born in New York, of wealthy parents, and married, in 1843, Dr. S. G. Howe, a philanthropist, best known for his labors for the education of the blind. With him she edited the Boston *Commonwealth*, an anti-slavery journal, lecturing also on social subjects

and preaching occasionally in Unitarian pulpits. After the war she became a noted advocate of female suffrage, and of prison and other reforms. Her early publications, *Passion Flowers* (1854), *Words for the Hour* (1856), and *Later Lyrics* (1866), were in verse, the best known of her pieces being the once immensely popular "Battle Hymn of the Republic," which was written in 1861, and inspired by the sight of troops marching to the tune of "John Brown's Body." She wrote also during this period two dramas, *The World's Own* (acted in 1855), and *Hypolytus* (1858). The more significant of her later works are: *Sex and Education* (1874); *Modern Society* (1881); a *Life of Margaret Fuller* (1883); and valuable autobiographical *Reminiscences, 1819-99* (1899). Her verse is collected in *From Sunset Ridge, Poems New and Old* (1898).

HOWE, RICHARD, Earl (1725-99). A British admiral. He was the second son of Emanuel Scrope, second Viscount Howe of the Irish peerage. He left school at Eton when only fourteen, and went with Anson on the *Severn* to attempt a voyage around the world. He commanded the *Baltimore*, which, with the *Greyhound* and *Terror*, fought two large French frigates off the west coast of Scotland, in 1746. The English squadron was beaten, and Howe was severely wounded. In 1755 his ship, the *Dunkirk*, captured the *Alcide* off Newfoundland. His next service was under Sir E. Hawke, in the expedition against Rochefort. Ordered to attack the fort on the Isle of Aix with his ship, the *Magnum*, he compelled it to surrender, and achieved the only material success which attended the expedition. He was commodore of the squadron which sailed in 1758 for Saint-Malo. The troops were landed and reëmbarked without loss, after destroying all the magazines and shipping in the port. In the same year he took Cherbourg and destroyed the magazines and cannon. A second attack upon Saint-Malo was repulsed with great loss of life. In 1758, after his brother, a brigadier-general, was killed at Ticonderoga, Howe succeeded to the Irish title of viscount and to the family estate. He continued his distinguished naval service to the end of the Seven Years' War.

In 1760 he was made colonel of the Chatham division of marines, and afterwards a Lord of the Admiralty and Treasurer of the Navy. In 1776 he was placed in command of the fleet on the American coast. In 1778 he held his own against a superior naval force under D'Estaing. He was made a viscount of Great Britain in 1782. In that year he set out with a fleet to relieve Gibraltar. He succeeded in disembarking troops, ammunition, and supplies, and then offered battle to the combined fleets of France and Spain, which declined an engagement. This achievement gave Howe a brilliant reputation. He was made First Lord of the Admiralty in 1783, and received an English earldom in 1788. When the war with France broke out in 1793, he took the command of the Channel fleet, and next year gained the victory known as that of 'the glorious first of June.' The French fleet consisted of twenty-six ships of the line, and the English of twenty-five. Howe, in his flagship, the *Queen Charlotte*, engaged, off Ushant, the French admiral, who in less than an hour crowded all the sail he could carry, followed by as many of his ships as could get away. The English captured two ships of 80 guns, and four 74's; another 74

sank immediately after she was taken possession of. London was illuminated three nights in honor of the victory; the thanks of Parliament were voted to Howe, and George III. gave him a sword and made him a Knight of the Garter. His last service was in bringing back the mutinous seamen at Portsmouth to their duty in 1797. Consult: Barrow, *Life of Richard, Earl Howe* (London, 1838); Beatron, *Naval and Military Memoirs of Great Britain* (London, 1804); Chevalier, *Histoire de la marine française* (Paris, 1900); *British Magazine and Review* (June, 1783); O'Beirne, *A Candid and Impartial Narrative of the Transactions of the Fleet Under the Command of Lord Howe from the Arrival of the Toulon Squadron, etc.* (London, 1780); Poggi, *A Narrative of the Proceedings of His Majesty's Fleet from the 2d of May to the 2d of June, 1794* (London, 1796).

HOWE, ROBERT (1732-85). An American patriot and soldier, born in Brunswick County, North Carolina. After serving against the Indians, he was elected to the Assembly in 1765, and the same year Governor Tryon nominated him commander of Fort Johnson on the Cape Fear River. He served in the Assembly until 1775, was a member of the Provincial Congresses of 1774 and 1775, and took a prominent part in the preparations for revolt. On September 1, 1775, he was made colonel of the second North Carolina Regiment, afterwards a part of the Continental line, and aided General Woodford in driving Lord Dunmore, the British Governor, from Virginia. He was made brigadier-general of the Continental troops March 1, 1776, and was especially excepted from the general offer of amnesty issued by Sir Henry Clinton. He was made major-general October 20, 1777, and placed in command of the Department of the South. An unsuccessful expedition to Florida resulted in the abandonment of Savannah in December, 1778, and Howe was succeeded in his command by Gen. Benjamin Lincoln. He commanded the North Carolina troops at the defense of Charleston (1780), and was in command of West Point the same year. In 1781 he was tried by court-martial for the loss of Savannah on the complaint of the Georgia Assembly, but was honorably acquitted. During this year and again in 1783 he was sent by Washington to reduce mutinous regiments, and was entirely successful. He was sent to pacify the Indians of the West in 1785, and the same year was elected to the North Carolina Legislature, but died before taking his seat.

HOWE, SAMUEL GRIDLEY (1801-76). An American reformer and philanthropist, born in Boston. He graduated at Brown in 1821, and took the degree of M.D. at the Harvard Medical School in 1824. Stirred by the poems of Byron, he offered his services to the Greeks in their struggle for independence. In Greece his services were not confined to the duties of a surgeon, in which capacity he had volunteered, but were of a more military nature, and his bravery, enthusiasm, and ability as a commander, as well as his humanity and nobility of character, won for him the title of 'the Lafayette of the Greek Revolution.' He continued in the service until 1827, when he returned to America to raise funds and supplies to alleviate the famine and suffering in Greece. Through his efforts more than \$60,000

was raised, besides large donations of food and clothing, with which, after writing his *Historical Sketch of the Greek Revolution* (1828), he went again to Greece, where he remained until 1830, and became surgeon-in-chief of the Greek fleet. Before leaving Greece he settled a successful colony of exiles at Corinth. He then spent some time in medical studies at Paris, where his enthusiasm for a republican form of government led him to take part in the July Revolution. In the following year he returned to the United States, and became interested in the work with which his name will be longest connected—the education of the blind. He returned to Europe to study the existing systems in England and France; but his investigations were interrupted in the winter of 1831-32, when he became chairman of the 'American-Polish Committee' at Paris, organized by himself, J. Fenimore Cooper, S. F. B. Morse, and several other Americans living in the city, for the purpose of giving relief to the Polish political refugees who had crossed over the Prussian border into Prussia. Dr. Howe undertook to distribute the supplies and funds personally, and while in Berlin was secretly seized by the Prussian authorities and imprisoned for five weeks. In the latter part of the same year (1832) he returned to Boston, where he met with great success in his educational work, and the Perkins Institution for the Blind, as it was named, in honor of its principal benefactor, became the greatest school of its kind in the world. Dr. Howe himself was the originator of many improvements in method, as well as in the processes of printing books in raised types. Besides acting as superintendent of the Perkins Institution to the end of his life, he was instrumental in establishing a large number of institutions of a similar character throughout the country. At the Perkins Institution his most remarkable achievement was in the education of Laura Bridgman. The care and education of idiots and feeble-minded, the reform of prisons, abolition of imprisonment for debt, and finally the abolition of negro slavery in the United States, all engaged Howe's attention. He entered publicly into the anti-slavery struggle for the first time in 1846, when, as a 'Conscience Whig,' he was an unsuccessful candidate for Congress against Robert C. Winthrop. In 1851 he was one of the founders and editor of an anti-slavery paper, the Boston *Daily Commonwealth*, upon which his wife, Julia Ward Howe (q.v.), whom he had married in 1843, assisted him. He was one of the most prominent members of the 'Kansas Committee' in Massachusetts, and with Sanborn, Stearns, Theodore Parker, and Gerrit Smith was interested in the plans of John Brown, although he disapproved of the latter's attack upon Harper's Ferry. During the Civil War Howe was one of the directors of the Sanitary Commission, and at its close entered into the work of the Freedmen's Bureau. He was the originator of the State Board of Charities of Massachusetts, in 1863, the first board of the sort in America, and was its chairman from that time until 1874. In 1866 he made a last trip to Greece to carry relief to the Cretan refugees, and in 1870 was a member of the commission sent by President Grant to inquire into the practicability of the annexation of Santo Domingo. It is probably not too much to say that no man ever lived in America who so truly deserved the name philanthropist in its

highest and best sense—a lover of his fellow-men; and no American certainly was ever connected with more great reforms that were brought to a successful conclusion. Consult Sanborn, *Dr. S. G. Howe, the Philanthropist* (New York, 1891).

HOWE, TIMOTHY OTIS (1816-83). An American lawyer and politician, born in Livermore, Maine. He was admitted to the bar in 1839, and in the following year became a Whig member in the Maine Legislature. In 1840 he was obliged by ill health to give up his career in Maine, and removed to Green Bay, Wis., which was his home during the rest of his life. In 1850 he was elected judge of the Circuit and Supreme courts of Wisconsin. From 1861 to 1879 he was a member of the United States Senate as a Republican, and served on the committees of Finance, Commerce, Pensions, and Claims. He declined an appointment to the vacancy in the United States Supreme Court occasioned by the death of Judge Chase. In 1881 he became Postmaster-General in President Arthur's Cabinet, and in the latter part of that year went to Paris as a United States delegate to the International Monetary Conference.

HOWE, Sir WILLIAM (1729-1814). A British soldier in the American Revolution, younger brother of Richard, Earl Howe (q.v.), whom he succeeded as fifth Viscount Howe in 1799. He was educated at Eton, was appointed a cornet in 1746, and saw service in Flanders. In 1750 he became captain, and in 1757, having attained the rank of lieutenant-colonel, he was placed in command of the Fifty-eighth Foot, and sent with it in the following year to America, where he took part in the siege and capture of Louisburg and accompanied Wolfe on his expedition to Quebec. After the capture of Montreal, in 1760, he returned to Europe, and in 1762 was adjutant-general of the expedition against Havana. After the close of the Seven Years' War he was made colonel of the Forty-sixth Foot (1764), was elected to Parliament as a Whig from Nottingham, and in 1768 was appointed Lieutenant-Governor of the Isle of Wight. He attained the rank of major-general in 1772. When the rupture with the American Colonies became imminent, Howe was pronounced in his condemnation of the Government's course. Nevertheless, in spite of this feeling, and of his dislike for General Gage, he commanded the reinforcements sent to the latter at Boston in March, 1775. He commanded the British in the battle of Bunker Hill, on June 17th following. Later he was made a lieutenant-general, and in October succeeded Gage in command of all the troops in America outside of Canada, with the local rank of general. He was besieged in Boston by Washington during the winter of 1775-76, and, being compelled to abandon the city, withdrew his troops to Halifax, and afterwards transferred his command to Staten Island, whence he moved on New York, winning the battle of Long Island on August 27, 1776, and occupying the city on September 15th. On October 28th he defeated Washington at White Plains, and afterwards captured Forts Mifflin and Mifflin, after which he settled down in New York for the winter. It was not until June, 1777, that he again took the field. Wishing to reach Philadelphia, and finding that he had not a sufficiently large force to advance across New Jersey in the face of Wash-

ington's army, he embarked his troops, and sailed down the coast and up the Chesapeake Bay as far as Elkton, where he landed his forces on August 28th. Marching northward, he encountered and defeated Washington at the Brandywine on September 11th, and on September 27th occupied Philadelphia. On October 4th the Americans were repulsed at Germantown. After hearing the news of Burgoyne's surrender at Saratoga on October 17th, Howe made arrangements to stay in Philadelphia during the winter, while Washington went into winter quarters at Valley Forge. Howe had sent in his resignation shortly after taking Philadelphia, but it was not accepted until May, 1778, when Sir Henry Clinton was appointed to succeed him. Before leaving Philadelphia his officers gave him a farewell entertainment in the shape of a mock tournament, which they named the 'Mischianza' (q.v.). He was severely criticised for his inactivity at Philadelphia, and in 1779, after his return to England, his conduct was the subject of a Parliamentary inquiry; but the examining committee reached no definite decision in the matter. In 1782 he became lieutenant-general of ordnance, and attained the rank of full general in the following year. During the remainder of his life he held various commands in England.

HOWELL. A village and the county-seat of Livingston County, Mich., 34 miles east by south of Lansing, on the Ann Arbor and the Pere Marquette railroads (Map: Michigan, K 6). It has manufactures of flour, condensed milk, sash and doors, etc. Population, in 1890, 2387; in 1900, 2518.

HOWELL, JAMES (c.1594-1666). An English author, born in Wales. He graduated B.A. from Jesus College, Oxford (1613); traveled extensively on the Continent as agent of a London glass house, and afterwards as a representative of the Government. He was imprisoned for a time during the Civil War, but after the Restoration he was appointed historiographer royal of England. Howell wrote with ease and grace many books, of which the best is *Epistolæ Holiæ; Familiar Letters, Domestic and Foreign, Divided into Sundry Sections, Partly Historical, Political, and Philosophical* (vol. i. 1645; vol. ii. 1647; together with a third vol. 1653). By 1737 this book had passed through ten editions. Consult: reprint of the tenth edition by J. Jacobs (London, 1890); and for a popular edition, the "Temple Classics Series."

HOWELL, JOHN CUMMING (1819-92). An American naval officer, born in Philadelphia, Pa., and educated at Washington College, Pennsylvania. He was appointed a midshipman in the United States Navy in 1836; saw some service in the naval operations of the Mexican War; became commander in 1862, and participated in many engagements during the Civil War, with especial distinction in the battle of Hatteras Inlet and in the two attacks upon Fort Fisher. He served as fleet captain of the European station in 1869-70; was commandant of the League Island Navy-Yard at Philadelphia in 1871-72, and of the Portsmouth Navy-Yard from 1872 to 1874. From 1874 to 1879 he was chief of the Bureau of Yards and Docks, at times acting as Secretary of the Navy; was in command of the European squadron from 1879 to 1881, and on

November 24, 1881, was retired with the rank of rear-admiral.

HOWELL, WILLIAM HENRY (1860—). An American physiologist. He was born in Baltimore and graduated in 1881 at Johns Hopkins, where he became associate professor of physiology (1888), and in 1893, after teaching in the University of Michigan and for one year at Harvard, was promoted to a professorship. He was made dean of the Medical School in 1899. Dr. Howell contributed to the *London Journal of Physiology*, the *Transactions of the Royal Society*, the *Johns Hopkins Biological Studies*, the *Journal of Morphology*, and the *Journal of Experimental Medicine*. In 1896 he edited *An American Text-Book of Physiology*. He contributed articles on physiology to the *New International Encyclopedia*.

HOWELLS, WILLIAM DEAN (1837—). An American novelist, editor, poet, and critic, born at Martin's Ferry, Ohio, March 1, 1837, of well-to-do Welsh-Quaker ancestry. Howells spent his youth among books. He began making verses almost as soon as he could read, serving a literary apprenticeship in his father's printing-office, afterwards as compositor on the *Ohio State Journal* and other newspapers, and still later as correspondent and editor. He first attracted marked attention by poems published in the *Atlantic Monthly*. In 1860 he published *Poems of Two Friends* with John J. Piatt (q.v.), and in the same year wrote a campaign *Life of Lincoln*, in recognition of which he received the Venetian consulate (1861-65), as a fruit of which we have *Venetian Life* (1866), a work of vivid realism, flexible style, and genuine charm, which was followed by *Italian Journeys* (1867). On his return to America Howells was connected editorially with the *Tribune*, the *Times*, and the *Nation* of New York, and, from 1866 to 1881, the *Atlantic Monthly* of Boston, of which he was the editor from 1871. *Their Wedding Journey* (1871), his first attempt at fiction, was followed, during his Boston residence, by *A Chance Acquaintance* (1872); *A Foregone Conclusion* (1874); *Out of the Question* (1876); *A Counterfeit Presentment* (1877); *The Lady of the Aroostook* (1878); and *The Undiscovered Country* (1880). *A Fearful Responsibility* (1882); *Dr. Breen's Practice* (1883); *A Modern Instance* (1883); *A Woman's Reason* (1884); *Three Villages* (1885); and *The Rise of Silas Lapham* (1885) were written during a residence in England and Italy. On his return in 1886 Howells assumed an editorial function for *Harper's Magazine*, developing strong critical powers, and steadily opposing the romantic or pseudo-historic in modern fiction, though he is himself given to fanciful thoughts. He was also for a short time editor of the *Cosmopolitan Magazine*. The more noteworthy volumes of fiction in this period are: *The Minister's Charge* (1886); *Indian Summer* (1886); *April Hopes* (1888); *Annie Kilburn* (1888); *A Hazard of New Fortunes* (1889); *The World of Chance* (1893); *The Coast of Bohemia* (1893); *The Story of a Play* (1899); *Ragged Lady* (1899); *Their Silver Wedding Journey* (1899); *A Pair of Patient Lovers* (short stories, 1901); *Heroines of Fiction* (1901); *The Flight of Pony Baker* (1902); and *The Kentons* (1902). Howells has written also many farces, of which *The Sleeping-Car*, *The Mouse-Trap*, *The Elevator*,

and *Out of the Question*, are characteristic. Noteworthy also are *Tuscan Cities* (1885); *Modern Italian Poets* (1887); *Criticism and Fiction* (essays); *A Boy's Town* (1890); *A Traveler from Altruria* (1894); *Impressions and Experiences* (1896); and *Literary Friends and Acquaintance* (1900).

His poems were collected in 1873 and 1886, and a volume under the title *Stops of Various Quills* appeared in 1895. Perhaps of all the books named above, *The Rise of Silas Lapham* and *A Hazard of New Fortunes* represent their author at his best. He is the founder of the school of American realists who derive through the Russians from Balzac, and has little sympathy with any other form of fiction, although full of encouragement for new writers in whom he discovers a fresh note. His style is admirable, and his knowledge of the details of life accurate and minute. Like all innovators, he has probably had in full measure the defects of his qualities, and has in consequence alienated many readers; but it can hardly be doubted that his has been the most influential work done in American fiction during the last quarter of a century.

HOWELL'S STATE TRIALS. See STATE TRIALS.

HOWTSON, GEORGE HOLMES (1834—). An American scholar, born in Montgomery County, Md. He graduated at Marietta College in 1852 and at the Lane Theological Seminary in 1855. After holding positions at Harvard and other universities, he was appointed Mills professor of philosophy at the University of California in 1884. His publications include: *Treatise on Analytic Geometry* (1869); and *The Conception of God* (1897).

HOWITT, WILLIAM (1792-1879) and **MARY** (1799-1888). Two English authors, who may well be treated together. William Howitt was born at Heanor, Derbyshire. His parents were Quakers. Though he attended several schools, he educated himself mostly by reading. From his youth he was fond of outdoor sports, and he celebrated in verse the scenery with which he was familiar. In 1821 he married Mary Botham, daughter of a prosperous Quaker of Uttoxeter, Staffordshire. After living for a year in Staffordshire, they settled in Nottingham, where William set up as a druggist. Here they remained for twelve years. They subsequently lived at Esher in Surrey, London, Heidelberg, and Rome. William spent two years in Australia (1852-54). Somewhat after middle life they became spiritualists. Both died in Rome and were buried there. Soon after their marriage they began to write in collaboration, and then independently. Among their joint works are contributions in verse and prose to annuals and periodicals; *The Forest Minstrel* (1823); *The Desolation of Eyam, and Other Poems* (1827); *Literature and Romances of Northern Europe* (1852); and *Ruined Abbeys and Castles of Great Britain* (1862). Among William's independent works are: *Book of Seasons, or Calendar of Nature* (1831); *Popular History of Priestcraft* (1833); *Pantika, or Traditions of the Most Ancient Times* (1835); *Rural Life of England* (1838); *Visits to Remarkable Places* (1st series, 1839; 2d series, 1841); *Boys' Country Book* (1839); *Rural and Domestic Life of Germany* (1842); *Popular History of England*

(1856-62); and *The Mad War Planet, and Other Poems* (1871). Among Mary's independent publications, numbering 110 distinct works, are translations from Fredrika Bremer and Hans Andersen; *Sketches of Natural History* (1834); *Popular History of the United States* (1859); a novel called *The Cost of Caergwyn* (1864); *Tales in Prose for Young People* (1864); *Tales in Verse for Young People* (1865); and *Tales for All Seasons* (1881). From these lists it may be seen that the Howitts did much for their generation by diffusing knowledge. On the other hand, they wrote little or nothing of permanent value. Consult *Mary Howitt: An Autobiography*, edited by her daughter, Margaret Howitt (London, 1889).

HOWITZER (from *howitz*, from Ger. *Hau- bitze*, formerly *Haubitze*, from Boh. *haufnice*, *haufenice*, howitzer, sling for casting stones). A type of artillery. Although a short cannon, it differs from the mortar (q.v.), in that the latter is used for vertical fire, while the howitzer discharges its shells in a horizontal direction. It is one of the oldest forms of artillery, and was used in Europe as early as the fifteenth century, and in America it was the first type of cannon to be manufactured. It is now one of the most important types of modern ordnance, howitzer batteries forming a part of the artillery corps of all the great nations of the world. The special value of the howitzer is in indirect fire when high trajectories are necessary, and when nothing but a large angle of descent of the projectile can be effective in attack. It has been found in recent military operations that the howitzer is of supreme importance in supplementing the gun in field and mountain artillery batteries, owing to the fact that the field gun with its flat trajectory fire prevents the enemy from exposing himself, and if the latter is strongly entrenched, he can hold his position until attacked by infantry. The curved fire of the howitzer, on the other hand, will clear the enemy's trenches, and compel resistance or a change of position. Many European authorities now advocate the addition of a howitzer gun to every battery of field and mountain artillery. In the frontier defense of Austria, the howitzer plays an important part. The pieces are of 24 centimeters (almost 10 inches) calibre, and fire a shell weighing 300 pounds, containing a heavy bursting charge of high explosive. Although not originally designed for field work, they can be moved and brought into position and fired in twenty minutes' time after arrival at the desired point. See ARTILLERY; ORDNANCE.

HOWLAND, ALFRED CORNELIUS (1838—). An American painter, born at Walpole, N. H. He studied under Schultz and Eppindale in Boston, and afterwards went to Düsseldorf and later to Paris, where he became a pupil of Lambinet. His works in genre and landscape are: "Sunlit Path" (1871); "Ford's Glen" (1878); "Monday Morning" (1879); "The Gossips" (1880); "Rendezvous of the Veterans" (1884); and "The Coming Circus" (1886).

HOWLER, or STENTOR. An American monkey of the genus *Mycetes*, remarkable for the dilatation of the hyoid bone into a hollow drum, which communicates with the larynx, makes a conspicuous external swelling of the throat, and gives prodigious power to the voice, enabling

these animals to emit hideous sounds, which are heard miles away, and to which all their names refer. There are two, and sometimes four, other resonators connected with the larynx, besides the one in the hyoid. The howlers live chiefly among the branches of trees, and make extraordinary leaps from one to another, taking hold by the tail as readily as by the hands, and often swinging by it alone. They are the largest monkeys in the New World. About seven species are known, occurring from Central America southward to the Rio Grande do Sul. - They are sometimes kept in captivity, but are always sullen and untamed. Their habits and brain-structure both show that their position is properly among the lowest monkeys. The best known forms are those of southern Brazil, such as the very black shaggy howler, or 'guereba' (*Mycetes caraya*), of which the females and young are dingy white, and the brown 'araguata' or ursine howler (*Mycetes ursinus*). The red howler (*Mycetes seniculus*) belongs to the Orinoco region, and is distinguished by its bright chestnut color and the ridge of upright red hair across the top of its head. This one is said to furnish the principal animal food used by the natives of the eastern slopes of the Andes, but they are obtained only in the lowlands. Still another species, abundant along the lower Amazon, is the yellowish 'arabata' (*Mycetes belzebul*). See MONKEY; and Plate of AMERICAN MONKEYS.

HO-WO, hō'wō'. See FUNG-HWANG.

HOWORTH, hou'érth, Sir HENRY HOYLE (1842—). An English scientific writer and politician, member of the Royal Society. He was born at Lisbon, was educated at Rossall School, and was admitted to the bar, though he practiced law very little, but devoted himself to Lancashire politics and to literature. He was elected to the House of Commons as a Conservative in 1886. He is member of many geographical and anthropological societies, and in 1899 was made a trustee of the British Museum. Howorth's writings, besides letters to the *Times* and contributions to the *Quarterly* and the *Edinburgh*, are on geological, archæological, ethnological, and historical subjects. Among these are: *History of the Mongols* (1876-78); *The Vicars of Rochdale* (1883); and *The Mammoth and the Flood* (1887).

HOWRAH, hou'rá. A town of Bengal, India, on the right bank of the Hugli, opposite Calcutta (q.v.), of which it is the most important suburb (Map: India, E 4). Population, in 1891, 116,600; in 1901, 157,900.

HOWSON, JOHN SAUL (1816-85). An English clergyman and author. He graduated at Trinity, Cambridge, in 1837; was classical master and later principal of the Liverpool Collegiate Institution (1845-65), and from 1867 until his death was Dean of Chester. During the latter period he practically restored the cathedral, raising nearly £100,000 for the purpose. He is best known for his *Life and Epistles of Saint Paul* (1852), written in conjunction with Rev. W. J. Conybeare. He also published: *The Character of Saint Paul* (1862); *The Metaphors of Saint Paul* (1868); and other religious works, including commentaries.

HOWTH. A picturesque peninsula, forming the north shore of Dublin Bay, Ireland. It is about two and one-half miles long by two miles

broad, and terminates in a cliff 563 feet high, at the foot of which is Howth village, an important fishing station.

HOY. One of the Orkney Islands (q.v.), in latitude 58° 50' N., longitude 3° 20' W., two miles southwest of Mainland (Map: Scotland, F 2). It is 14 miles long and 6 miles broad, and rises abruptly from the sea, with precipitous cliffs 1000 feet in height fronting the west. Ward Hill, 1555 feet high, commands a fine panoramic view of the islands. Population, in 1891, 1320.

HOY (Flem. *hui*, Dutch *heu*, *heude*, of uncertain etymology). A small vessel, usually sloop-rigged, formerly used in large harbors and rivers and to some extent as a coaster. The term is now obsolete except as applied to *powder-hoys*, *anchor-hoys*, and similar heavy-built barges (sailing or steam) used for carrying ammunition, anchors, or other heavy weights.

HOYDEN, MRS. The lively, romping daughter of Sir Tunbely Clumsy, in Vanbrugh's comedy *The Relapse*. The rôle, a great favorite, has been played by Mrs. Clive, Mrs. Jordan, and Miss Nellie Farren. In Sheridan's *Trip to Scarborough*, she is married to Tom Fashion, who passes himself off as Lord Toppington. Robert Buchanan adapted *The Relapse*, rechristening it, after the personality of this character, *Miss Tomboy* (1890).

HOYLAND NETHER. A manufacturing town in the West Riding of Yorkshire, England, three and one-half miles south-southeast of Barnsley (Map: England, E 3). Population, in 1891, 11,000; in 1901, 12,500.

HOYLE, EDMOND (1672-1769). An English writer on games. Of his early life nothing is definitely known, although it is asserted that he was educated for the law. For many years he lived in London, writing upon, and giving instruction in, games; and in 1742 he published the *Short Treatise on Whist*, which reached a thirteenth edition in 1763, and became the world's authority. See WHIST.

HOYT, ALBERT HARRISON (1826—). An American editor and author, born in Sandwich, N. H. After completing his law studies in Portsmouth, N. H., he began to practice there, and held various civil offices. He was a paymaster of the army during the Civil War, rose to be lieutenant-colonel, and after the peace was editor of the *New England Historical and Genealogical Register* (1868-76), and of *Memorial Biographies*, vol. iv. (1885). His other works include: *Necrology of the New England Colleges* (1869-70); *Captain Francis Golet's Visit to Boston, etc., in 1745-50* (1870); *Letters of Sir William Pepperrell, Bart.* (1874); and *The Name Columbia* (1886).

HOYT, CHARLES HALE (1860-1900). An American dramatist, born in Concord, N. H. He studied law, was connected for a time with the Saint Albans (Vt.) *Advertiser*, became musical and dramatic critic of the *Boston Post*, turned playwright, and wrote a series of farcical comedies, which netted the author a fortune, and contain some character-studies of more or less cleverness. The greatest success of these was called *A Trip to Chinatown* (1890). *A Midnight Bell* (1887) was his one serious attempt. He

was twice a member of the New Hampshire Legislature.

HOYT, JOHN WESLEY (1831—). An American educator and administrator, born near Worthington, Ohio. He graduated at Ohio Wesleyan University (1849), and studied law and medicine. In 1857 he removed to Madison, Wis., and there edited and published the *Wisconsin Farmer*. In 1862 Hoyt was appointed State Commissioner to the London Exposition, and he was United States Commissioner at the Paris Exposition of 1867. To the Vienna Exposition of 1873 he was sent as executive commissioner, and was president of the international jury for education and science. In 1873-74, as chairman of the Wisconsin State Board of Railway Commissioners, he was instrumental in settling the Granger War. He was special representative for foreign affairs at the Columbian Exposition of 1893. Hoyt reorganized the University of Wisconsin; suggested and framed a bill for the establishment of a national university, and was appointed chairman of a committee of four hundred thereon, and from 1878 to 1883 was Governor of the Territory of Wyoming. He was president of Wyoming University from 1887 to 1891. In 1897, acting as a commissioner of the king of Korea, he procured the admission of that country to the Universal Postal Union. His publications include: *University Progress* (1869); *Of Appointment and Removal* (1885); and *History of University Education* (1903).

HRABANUS MAURUS, rá-bá'nōos mou'fōos. See RABANUS MAURUS.

HRDLICKA, dlích'ká, ALES (1869—). An American anthropologist, born at Humpoletz, in Bohemia. After he had finished his secondary and academic studies he went to New York City, where he studied at the Eclectic College and the Homœopathic College. Hrdlicka made special studies of the insane; accompanied anthropological expeditions to Mexico and the Southwestern States (1898-1900), and in 1899 became director of the anthropological section of the Hyde Expedition. He became connected with the American Museum of Natural History in New York, and wrote: *Report on Anthropological Work in the State Institution for Feeble-Minded Children, Syracuse, N. Y.* (1898); *Anthropological Investigation on One Thousand White and Colored Children* (1899); besides contributions to periodicals.

HRODBERT, rōd'bērt, SAINT. See RUPERT, SAINT.

HROLF, or **ROLF**, rôlf, THE GANGER. The conqueror of Normandy. See ROLLO.

HROSWITHA, hrōs'vè-tá. See ROSWITHA.

HUACA, hwá'ká, or **GUACA**. See PERUVIAN ANTIQUITIES.

HUAINA CAPAC, wá-ē'ná kí'pák. A Peruvian Inca. See HUAYNA CAPAC.

HUALAPAI, wá'lá-pí. An Indian tribe in Arizona. See WALAPI.

HUALLAGA, wá-lyá'gá. See AMAZON.

HUAMBISA, wám-bé'sá. A savage tribe of the Jivaroan linguistic stock dwelling about the junction of the Santiago and Marañon-Amazon rivers, at the head of Amazon navigation, on the Peru-Ecuador boundary. They joined the Jivaro (q.v.) group in their revolt against the Spanish authority in 1599, and took part in the sack of Sevilla del Oro, when seven thousand Spanish women were carried off by the victors.
